

Supplementary Material

Figure 1. The FESEM micrographs of (a) poly(nBA-NAS) and (b) PSA latex microspheres captured by Zeiss Merlin field-emission scanning electron microscope operating at 15 kV; (c) PSA microparticles decorated with AuNPs; (d) the FTIR spectra of i) poly(nBA-NAS) and ii) PSA copolymer microspheres acquired by Agilent Cary 630 FTIR spectrometer from 500-4000 cm⁻¹; (e) the UV-Vis absorption spectrum and (f) TEM image of colloid AuNPs synthesized by citrate reduction method.

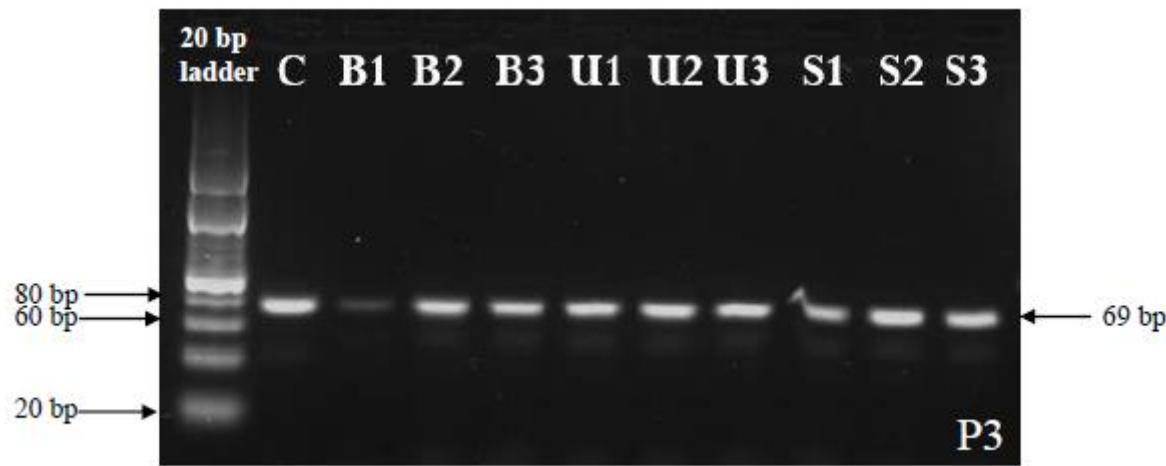

Figure S2 PCR electrophoretic results for dengue virus serotype 2 detection in blood, urine and saliva samples collected from patient 1 (a), patient 2 (b), patient 3 (c) and healthy volunteer (d and e). The lane numbers indicate patients' sample codes. Positive control of amplification was included and denoted as 'C'. Amplicon size: 69 bp (dengue virus serotype 2) and 50 bp (β -actin). DNA ladder used: O'Range Ruler 20 bp. PCR products were detected on 4% Agarose in TBE buffer at 90 V for 60 min.

Legend:
DNA Ladder: O'Range Ruler 20 bp
C : Positive Control
B1-B3 : Blood Sample
U1-U3 : Urine Sample
S1-S3 : Saliva Sample

Table 1. The RNA concentrations extracted from blood (B), urine (U) and saliva (S) samples of patient 1 (P1), patient 2 (P2), patient 3 (P3) and healthy volunteer (H) based on A260/280 and A260/230 absorbance ratios by using NanoDrop spectrophotometer. The right column shows the volume of RNA used in cDNA synthesis step. The results are presented as mean (n = 3).

Sample ID	RNA concentration (ng/µL)	A260/280	A260/230	Volume for 100 ng RNA (µL)
P1B1	43.6	1.38	0.17	2.29
P1B2	22.6	1.70	0.06	4.42
P1B3	39.0	1.56	0.30	2.56
