1. General Considerations

All solvents for reactions were purified and dried by a *Glass Contour Solvent System* unless otherwise stated. The dichloromethane used in reactions was dried and degassed at reflux over activated 4 Å molecular sieves for 1 hours under argon, then stored with activated 4 Å molecular sieves under argon atmosphere and was used directly.

Thin layer chromatographic (TLC) analysis was performed on Kieselgel 60 F254 aluminum-backed silica plates, visualizing with UV light and/or staining with aqueous KMnO_4 stain.

Flash chromatography was used for product purification and performed on a Biotage® Isolera™ device. Depending on the scale of the reactions, different sizes of columns were employed. The normal phase silica columns were purchased from RediSep® and Biotage ZIP®. Ethylacetate (EtOAc) in combination with hexanes or Methanol (MeOH) in combination with dichloromethane (DCM) was used in a certain gradient as the mobile phase.

^1H and ^{13}C NMR spectra were recorded at 600 MHz (^{13}C at 150 MHz) on Bruker-600 spectrometer or IVONA-600 spectrometer, or 500 MHz (^{13}C at 126 MHz) on INOVA-500 spectrometer. ^{19}F NMR spectra were recorded at 565 MHz on Bruker-600 spectrometer or 283 MHz on Mercury 300. Unless otherwise stated, NMR spectra were run in solutions of deuterated chloroform (CDCl_3) with tetramethylsilane (TMS) as an internal standard (0 ppm for ^1H , and 0 ppm for ^{13}C), and were reported in parts per million (ppm). Abbreviations for signal multiplicity are as follow: s = singlet, d = doublet, t = triplet, q = quartet, m = multiplet, dd = doublet of doublet, etc. Coupling constants (J values) were calculated directly from the spectra.

IR spectra were collected on a Nicolet iS10 FT-IR spectrometer and reported in unit of cm^{-1} .

Mass spectra were taken on a Thermo Finnigan LTQ-FTMS spectrometer with APCI, ESI or NSI.

Melting points (mp) were measured in open capillary tubes with a Mel-Temp Electrothermal melting points apparatus and are uncorrected.

Optical rotations were measured on Jasco P-2000 polarimeters.

Analytical enantioselective chromatographs were measured on either Varian Prostar instrument or Agilent-1100 series instrument, and used isopropanol/hexane as gradient. Chiral HPLC conditions were determined by obtaining separation of the racemic products using $\text{Rh}_2(\text{OAc})_4$, $\text{Rh}_2(R/S\text{-DOSP})_4$ or $\text{Rh}_2(R/S\text{-2-Cl-5-BrTPCP})_4$.

^aReaction condition are using general procedures with variants as indicated in the table. Results were determined on free secondary amines obtained after N-Boc deprotection by treatment of TFA. ^bIsolated yield of the C2-H insertion product. ^cDetermined from crude ¹H-NMR. ^dDetermined by chiral HPLC analysis of isolated product.

Variation of catalysts and conditions were examined for C–H functionalization at C2 position of N-Boc-piperidine. Using methyl diazoacetates (entry 1-10), most the dirhodium tetracarboxylate catalysts gave 1-2:1 diastereomeric ratio (d.r.), while the sterically demanding catalyst, Rh₂(S-2-Cl-5-BrTPCP)₄, gave highest d.r. (5.3:1, entry 8). Due to the recent advance in improving selectivity by using trichloroethyl (TCE) diazoacetates¹, some of the typical catalysts were examined. The d.r. for Rh₂(S-2-Cl-5-BrTPCP)₄-catalyzed reaction was decreased significantly, while the phthalimido-base dirhodium catalysts gave better d.r.. The highest enantioselectivity was obtained by using Rh₂(R-TCPTAD)₄ with good d.r. (10.5:1 d.r., 93% ee in entry 13).

Noticeably, the Rh₂(R-TPPTTL)₄-catalyzed reaction gave nearly single diastereomer (27:1 d.r. in entry 15), but its enantioselectivity was only moderate. Therefore, further exploration by changing the protecting group on the piperidine substrate was conducted (Table S2).

^aReaction condition are using general procedures with variants as indicated in the table. ^bIsolated yield of the C2-H insertion product. ^cDetermined from crude ¹H-NMR. ^dDetermined by chiral HPLC analysis of isolated product.

When the piperidine was protected by tosyl group, the standard catalyst, Rh₂(*R*-DOSP)₄, resulted in improved d.r. comparing to its selectivity on Boc-protected piperidine, but its yield and enantioselectivity were declined largely (entry 1). In additional, other C–H insertion products were observed in the reaction using Rh₂(*S*-2-Cl-5-BrTPCP)₄, in which the dirhodium carbene intermediate was reacted with the primary benzylic C–H bonds, so *p*-bromobenzenesulfonyl group was applied for further examination.

When the piperidine was protected by *p*-bromobenzenesulfonyl group, Rh₂(*R*-TPPTTL)₄ gave highest diastereoselectivity (entry 13, >30:1 d.r.). The yield for Rh₂(*R*-TPPTTL)₄-catalyzed reaction could be improved using higher temperature with small decrease in diastereoselectivity (entry 15), while the lower temperature (0 °C) resulted in significant lose in yield and decreased enantioselectivity.

Noticeably, most of the triarylcyclopropanated (TPCP)-based dirhodium gave only trace amount of C–H functionalization product, while Rh₂(*S*-2-Cl-5-BrTPCP)₄-catalyzed reaction produced C–H functionalization product at C4 position of the piperidine in additional to the C2-products. It led to the further studies on C4 functionalization using Rh₂(*S*-2-Cl-5-BrTPCP)₄ (Section 2.4.)

^aReaction condition are using general procedures with variants as indicated in the table.

^bIsolated yield of the cyclopropanation product. ^cDetermined by chiral HPLC analysis of isolated product.

Rh₂(DOSP)₄ gives good yields using non-polar solvents (pentane, trifluorotoluene and toluene in entry 1, 4 and 6). Remarkable decrease of the yield as well as the ee is observed with DCM as solvent (entry 5). This behavior was already observed in other reactions using Rh₂(DOSP)₄²⁻³. The performance of trichloroethyl (TCE) diazoacetates¹ was also examine here in comparison to its methyl analog (entry 8), and decreased enantioselectivity was observed with TCE diazoacetates (80% ee in entry 7). Further examination of different dirhodium catalysts was conducted using methyl 2-(4-bromophenyl)-2-diazoacetate, and Rh₂(R-DOSP)₄ was found unmatched for this type of cyclopropanation (76% yield and 89% ee in entry 8), while all other dirhodium catalysts tested gave 3-69% ee (entry 9-17) in either pentane or dichloromethane as solvents.

In an attempt of further enhancing the ee, the reaction was carried out at lower temperatures. Using Rh₂(DOSP)₄ as catalyst, in combination with methyl 2-diazo-2-phenylacetate in pentane, 0 °C as well as -40 °C

gave a very good ee of 95% while the yields stayed the same. As 0 °C is easier to handle as it only takes a bath of ice in water, further reactions were carried out at 0 °C.

In order to synthesize the 3-substitued piperidines that are aim of this part of the work, the cyclopropanes had to be opened in an acid catalyzed way. According to the strategies of PilsI *et al.*,⁴ the same reaction with the cyclopropanated piperidines as substrate. In contrast to PilsI's substrate the ring-opened product would contain two chiral centers and one of them would be affected by the enol-form during the transition state. The desired product was able to be obtained *via* Brønsted and Lewis acid catalyzed ring-openings in good to excellent yields. The Lewis acid, $\text{BF}_3 \cdot \text{OEt}_2$, gave yields of 95% with a good d.r. of 1:12. The ring-opening of Boc-protected substrate was then conducted using the $\text{BF}_3 \cdot \text{OEt}_2$ condition, and the deprotection of Boc group was observed, so the reaction was extended to 2 days to ensure the full conversion.

Scheme S1. Ring-opening of Ts-protected 2-azabicyclo[4.1.0]heptanes.

2.3. C4 Functionalization

N-Boc-1,4-dihydropyridine was chosen as substrate for the synthesis of 4-substituted piperidines. The double vinyl position and the +M effect of the nitrogen in addition should give this substrate an enormous reactivity and chemoselectivity towards C–H insertion making the possible cyclopropanation less favored.⁵

In the initial attempt for 4-substituted piperidine, a combination of methyl 2-diazo-2-phenylacetate and 0.5 mol% Rh₂(DOSP)₄ was applied. However, decomposition of the starting-material to pyridine and the poisoning of the catalyst was thought to be the major problem, as pyridine was found in the crude NMR-analysis of the reaction. A higher catalyst loading should ensure the presence of active catalyst (2.5 mol%). In addition, the freshly made N-Boc-1,4-dihydropyridine was used for the dirhodium carbene reaction, followed by immediately hydrogenation of the C–H insertion product after isolation to prevent loss due to decomposition.

^aReaction condition are using general procedures with variants as indicated in the table. ^bIsolated yield of the product after hydrogenation. ^cDetermined by chiral HPLC analysis of isolated product.

No reaction activity was observed using various solvent. However, decomposition of diazoacetate (bubble formation and heat generated) was observed when solvent was removed under reduced pressure. The analysis of the crude ¹H-NMR clearly showed the formation of the desired product. Then, the reactions were carried out under neat conditions without any solvent. To obtain more reproduceable results, the setup of the reaction was changed. Instead of adding the diazo compound slowly to a solution of substrate and catalyst, the catalyst and the substrate were dissolved in small amounts of DCM (pentane for Rh₂(DOSP)₄). Stirring the mixture 1 min

before adding the diazo compound in one portion, makes sure that all catalyst is inactive. Afterwards, the solvent was removed under reduced pressure. Residues of solvent were removed under vacuum. The reaction started after a few minutes under HV conditions. In the course of the reaction, the viscosity of the mixture increased, inhibiting proper stirring. Therefore, the viscous mixture was dissolved again, stirred and then dried again twice. The catalysts were consecutively screened under the new conditions.

Screening the catalyst gave moderate yields of 50-60% in many cases. The highest yield of 68% was obtained using $\text{Rh}_2(2\text{-Cl-5-Br-TPCP})_4$. However, this catalyst gives almost no chirality induction and only an ee of 5%. $\text{Rh}_2(\text{DOSP})_4$ gives reasonable yields of up to 52% with the best value in enantiomeric excess of 55%. A lower temperature of 0 °C while using $\text{Rh}_2(\text{DOSP})_4$ gives a small rise in yield (54%) as well as in enantiomeric excess (61%).

As yields and enantioselectivity was not very good even after catalyst screening and experiments with lower temperatures, investigations using N-Boc-1,4-dihydropyridine were stopped. A more innovative approach was explored with direct C–H functionalization at C4 position on piperidines controlled by catalyst with appropriate combination of protection group.

^aReaction condition are using general procedures with variants as indicated in the table. ^bDetermined from crude ¹H-NMR. ^cIsolated yield of the C4-H insertion product. ^dDetermined by chiral HPLC analysis of isolated product. ^eProtected piperidine was used as limiting reagent, with 1.5 equivalent of diazoacetates.

Variation of catalysts and conditions were examined for C–H functionalization at C4 position of N-protected piperidines. The sterically demanding catalyst, Rh₂(*S*-2-Cl-5-BrTPCP)₄, was found to be the only catalyst gave C4-functionalization product (entry 5 vs entry 1-4). Variation of the substituent on the *para*-position of the benzenesulfonyl groups showed small change of the regioselectivity with electron-withdrawing CF₃ substituent giving highest selectivity for C4 product (4.7:1 r.r. in entry 8). When it was a simple methyl group next to the sulfonyl group (entry 10), which is expected to give lower selectivity due to diminished steric hindrance, the selectivity for C4 product is unexpectedly higher than arylsulfonyl-protected ones (5.6:1 r.r.). Significant improvement was achieved using strong electron-withdrawing oxalyl group, in which C4 product was observed as single regio-isomer with 97% ee.

3. Acquisition and Preparation of Compounds

The substrates and reagents were purchased from commercial sources (Sigma-Aldrich, Alfa-Aesar, Acros Organic, TCI America, Oakwood Chemical, Fisher Scientific and Strem Chemicals) and used directly without further purification. The chiral dirhodium catalysts are available in our lab and they were made according to literature procedures.

The following substrates were prepared by procedures adapted from literatures:

2,2,2-Trichloroethyl 2-(4-bromophenyl)-2-diazoacetate;¹ 2,2,2-trichloroethyl 2-diazo-2-phenylacetate;² 2,2,2-Trifluoroethyl 2-diazo-2-(4-(trifluoromethyl)phenyl)acetate;⁶ 2,2,2-Trichloroethyl 2-(4-acetoxyphenyl)-2-diazoacetate;⁶ 2,2,2-Trifluoroethyl 2-diazoacetate;⁶ Methyl 2-(4-bromophenyl)-2-diazoacetate;⁶ Methyl 2-diazo-2-phenylacetate;⁷ Methyl 2-diazo-2-(4-(trifluoromethyl)phenyl)acetate;⁷ Methyl 2-([1,1'-biphenyl]-4-yl)-2-diazoacetate;⁸ *tert*-Butyl piperidine-1-carboxylate;⁹ 1-Tosylpiperidine;⁹ 1-(4-Bromophenyl)-2-(piperidin-1-yl)ethane-1,2-dione;¹⁰ *o*-NBSA (*o*-nitrobenzenesulfonyl azide);¹¹ 2-(3,4-Dibromophenyl)acetic acid;¹² *tert*-Butyl pyridine-1(4H)-carboxylate.¹³

Other sulfonyl protected piperidines were prepared using adapted procedure similar to the one for 1-tosylpiperidine:⁹

To a solution of corresponding sulfonyl chloride (50 mmol, 1.0 equiv.) in 150 mL of CH₂Cl₂, piperidine (5.9 mL, 60 mmol, 1.2 equiv.) was added drop-wise with the generation of white fume, followed by the slow addition of triethylamine (10.5 mL, 75 mmol, 1.5 equiv.). The mixture was allowed to stir at room temperature (23 °C) for 15 hours. The consumption of piperidine was monitored by TLC (30% ethyl acetate in hexane). The solvent was removed under reduced pressure and the residue was purified by flash silica gel column chromatography using gradient as indicated.

1-((4-Bromophenyl)sulfonyl)piperidine (**1b**)

Purification was carried out with 8-12% ethyl acetate in hexane to give **1b** as white solid in 78% yield (39 mmol, 11.9 g). The NMR data are consistent with literature values.¹⁴

¹H NMR (600 MHz, CDCl₃) δ 7.67 (d, *J* = 8.6 Hz, 2H), 7.62 (d, *J* = 8.6 Hz, 2H), 2.99 (t, *J* = 5.5 Hz, 4H), 1.69 – 1.61 (m, 4H), 1.48 – 1.39 (m, 2H).

¹³C NMR (151 MHz, CDCl₃) δ 135.5, 132.2, 129.1, 127.6, 46.9, 25.1, 23.5.

1-((4-(Trifluoromethyl)phenyl)sulfonyl)piperidine (**1d**)

It was done in 30 mmol scale of 4-(trifluoromethyl)benzenesulfonyl chloride. Purification was carried out with 8-15% ethyl acetate in hexane to give **1d** as white solid in 93% yield (28 mmol, 8.2 g). The NMR data are consistent with literature values.¹⁴

¹H NMR (500 MHz, CDCl₃) δ 7.90 (dt, *J* = 8.1, 0.7 Hz, 2H), 7.81 (dt, *J* = 8.3, 0.6 Hz, 2H), 3.03 (t, *J* = 5.5 Hz, 4H), 1.74 – 1.59 (m, 4H), 1.53 – 1.38 (m, 2H).

¹³C NMR (126 MHz, CDCl₃) δ 140.2, 134.3 (q, *J* = 32.9 Hz), 128.2, 128.0, 126.2 (q, *J* = 3.6 Hz), 123.4 (d, *J* = 272.6 Hz), 47.0, 25.2, 23.5.

¹⁹F NMR (282 MHz, CDCl₃) δ -63.12.

1-(Methylsulfonyl)piperidine (**1e**)

It was done in 30 mmol scale of methanesulfonyl chloride. Purification was carried out with 8-15% ethyl acetate in hexane to give **1e** as white solid in 82% yield (24.5 mmol, 4.0 g). The NMR data are consistent with literature values.¹⁵

¹H NMR (500 MHz, CDCl₃) δ 3.18 (t, *J* = 5.6 Hz, 4H), 2.77 (s, 3H), 1.72 – 1.64 (m, 4H), 1.61 – 1.53 (m, 2H).

¹³C NMR (126 MHz, CDCl₃) δ 46.6, 34.1, 25.2, 23.5.

1-((4-(*tert*-Butyl)phenyl)sulfonyl)piperidine (**1g**)

Purification was carried out with 10-12% ethyl acetate in hexane to give **1g** as white solid in 98% yield (49 mmol, 13.8 g). The NMR data are consistent with literature values.¹⁴

¹H NMR (600 MHz, CDCl₃) δ 7.67 (d, *J* = 8.2 Hz, 2H), 7.52 (d, *J* = 8.5 Hz, 2H), 2.99 (t, *J* = 5.5 Hz, 4H), 1.68 – 1.61 (m, 4H), 1.47 – 1.39 (m, 2H), 1.35 (s, 9H).

^{13}C NMR (151 MHz, CDCl_3) δ 156.2, 133.3, 127.6, 125.9, 46.9, 35.1, 31.1, 25.2, 23.5.

1-((4-Nitrophenyl)sulfonyl)piperidine (1h)

It was done in 30 mmol scale of 4-nitrobenzenesulfonyl chloride. Purification was carried out with 8-15% ethyl acetate in hexane to give **1h** as white solid in 83% yield (25 mmol, 6.7 g). The NMR data are consistent with literature values.¹⁶

^1H NMR (500 MHz, CDCl_3) δ 8.39 (d, $J = 8.9$ Hz, 2H), 7.96 (d, $J = 8.9$ Hz, 2H), 3.06 (t, $J = 5.5$ Hz, 4H), 1.67 (p, $J = 5.9$ Hz, 4H), 1.47 (tt, $J = 8.3, 4.6$ Hz, 2H).

^{13}C NMR (126 MHz, CDCl_3) δ 150.1, 142.6, 128.8, 124.3, 47.0, 25.2, 23.4.

Other diazoacetate compounds were prepared using procedures in literatures from corresponding starting materials.^{1,6-7}

Methyl 2-diazo-2-(3,4-dibromophenyl)acetate (2e)

The synthesis is adapted from literatures:³ In a 250 mL round-bottom flask with argon atmosphere inside, 2-(3,4-dibromophenyl)acetic acid (4.6 g, 15.6 mmol, 1.0 equiv) was dissolved in 100 mL of methanol and cooled to 0 °C via ice bath. Acetyl chloride (2 mL, 18.8 mmol, 1.2 equiv) was added via a syringe. The reaction mixture was stirred for 15 hours, at which point it was warmed up to room temperature (23 °C). The reacted mixture was diluted with 100 mL of ethyl acetate and washed with NaHCO₃. The organic layer was concentrated under reduced pressure and purified by flash column chromatography (10% ethyl acetate in hexane) to afford the orange solid in 93% yield (4.5 g). It was used immediately in the next step.

Methyl 2-(3,4-dibromophenyl)acetate (3.0 g, 9.7 mmol) was added in a flame-dried round-bottom flask, together with *p*-ABSA (*p*-acetamidobenzenesulfonyl azide) (3.03 g, 12.6 mmol, 1.3 equiv.). After the flask was flushed with argon gas (3 times), 50 mL of dry acetonitrile was added to the mixture for dissolving. Then, the reaction mixture was cooled to 0 °C via ice bath. DBU (1,8-diazabicyclo[5.4.0]undec-7-ene) (2.0 mL, 12.6 mmol, 1.3 equiv.) was added drop-wise at 0 °C. The mixture was allowed to stir at 0 °C for an additional 15 min, followed by 24 hours at room temperature (23 °C) after removing the ice bath. The resulting orange solution was quenched with 60 mL of saturated aqueous NH₄Cl. The aqueous layer was extracted with diethyl ether (50 mL X 3) and the combined organic layer was washed with brine. Then, it was concentrated under reduced pressure and purified by flash column chromatography (5-8% diethyl ether in hexane) to provide orange solid in 95% yield (3.1 g).

Rf = 0.20 (5% diethyl ether in hexane);

¹H NMR (500 MHz, CDCl₃) δ 7.77 (d, *J* = 2.3 Hz, 1H), 7.57 (d, *J* = 8.5 Hz, 1H), 7.25 (dd, *J* = 8.6, 2.3 Hz, 1H), 3.87 (s, 3H);

¹³C NMR (126 MHz, CDCl₃) δ 164.8, 133.9, 128.3, 126.9, 125.6, 123.5, 121.4, 52.4 (The resonance resulting from the diazo carbon was not observed);

IR (neat) 3091, 3005, 2952, 2092, 1702, 1470, 1358, 1238, 1196, 1160, 1049, 806, 737 cm⁻¹;

HRMS (+p ESI) calcd for C₉H₇Br₂N₂O₂ (M+H)⁺ 332.8869 found 332.88715.

2,2,2-Trichloroethyl 2-([1,1'-biphenyl]-4-yl)-2-diazoacetate (3c)

The synthesis is adapted from literatures:¹ A dry 100 mL round-bottom flask was charged with 2-([1,1'-biphenyl]-4-yl)acetic acid (2.12g, 10 mmol, 1.0 equiv), DMAP (4-dimethylaminopyridine) (122.2 mg, 1 mmol, 0.1 equiv.) and 2,2,2-trichloroethanol (1.2 mL, 12 mmol, 1.2 equiv.). After the flask was flushed with argon gas (3 times), 20 mL of dry dichloromethane was added to the mixture. Then, the reaction mixture was cooled to 0 °C via ice bath. The solution of DCC (N,N'-dicyclohexylcarbodiimide) (2.27 g, 11 mmol, 1.1 equiv) in 20 mL of dry dichloromethane was then added slowly at 0 °C. The reaction mixture was stirred for 15 hours, at which point it was warmed up to room temperature (23 °C). The reacted mixture was filtered through Celite under reduced pressure and washed with dichloromethane. The filtrate was collected and concentrated under reduced pressure. The crude compound was purified by silica plug (3.8 cm diameter, 6 cm height, 5% ethyl acetate in hexane) to afford the white solid in 99% yield (9.9 mmol, 3.4 g). The product was used immediately in the next step.

The 2,2,2-trichloroethyl 2-([1,1'-biphenyl]-4-yl)acetate (3.4 g, 9.9 mmol, 1.0 equiv.) was added in a flame-dried round-bottom flask, together with *o*-NBSA (*o*-nitrobenzenesulfonyl azide) (3.39 g, 14.85 mmol, 1.5 equiv.). After the flask was flushed with argon gas (3 times), 30 mL of dry acetonitrile was added to the mixture for dissolving. Then, the reaction mixture was cooled to 0 °C via ice bath. DBU (1,8-diazabicyclo[5.4.0]undec-7-ene) (3.3 mL, 21.78 mmol, 2.2 equiv.) was added drop-wise at 0 °C. The mixture was allowed to stir for 1 hour at 0 °C, followed by pouring into a separation funnel with 40 mL of saturated aqueous NH₄Cl for quenching. The aqueous layer was extracted with diethyl ether (30 mL X 2) and the combined organic layer was washed with brine. Then, it was concentrated under reduced pressure and purified by flash column chromatography (5-8% dichloromethane in hexane) to provide orange solid in 82% yield.

Rf = 0.50 (20% dichloromethane in hexane);

¹H NMR (500 MHz, CDCl₃) δ 7.62 (d, *J* = 8.5 Hz, 2H), 7.57 (d, *J* = 7.9 Hz, 2H), 7.54 (d, *J* = 8.5 Hz, 2H), 7.42 (t, *J* = 7.7 Hz, 2H), 7.33 (t, *J* = 7.4 Hz, 1H), 4.90 (s, 2H);

HRMS (+p ESI) calcd for C₁₀H₆Br₂Cl₃N₂O₂ (M+H)⁺ 448.7856 found 448.78616.

4. C–H Insertion Reactions

4.1 General Procedures

GP-I: A 16-mL reaction vial (21x70mm) with screw cap (open top with PTFE faced silicone septum) was charged with Rh₂L₄ (0.0025 mmol, 0.5 mol%) and corresponding substrate (0.75 mmol, 1.5 equiv.). The reaction vessel was then evacuated and back filled with argon (3 times), followed by the addition of dry degassed CH₂Cl₂ (2 mL). Corresponding donor/acceptor diazo compounds (0.5 mmol, 1.0 equiv.) was weighed in a 20-mL scintillation vial and dissolved in 4 mL of dry degassed CH₂Cl₂ under argon atmosphere. Then, under room temperature (23 °C) and argon atmosphere, the diazo solution was added to the reaction vessel dropwise via syringe pump over 2 h. The reaction mixture was stirred at room temperature (23 °C) for another 4 h, and crude ¹H NMR was obtained after the resulted mixture was concentrated under vacuum. Finally, the desired product was obtained after purification using flash column chromatography with indicated eluting gradient.

GP-II: Similar to GP-I, but an additional step was added after the completion of the reaction, before the concentration for crude ¹H NMR: After the reaction mixture was stirred at room temperature (23 °C) for another 4 h, 1 mL of TFA (trichloroacetic acid) was added to the reaction mixture slowly and stirred at room temperature (23 °C) for 15 h. The resulted mixture was concentrated under reduce pressure and dissolved in 4 mL of dichloromethane, followed by addition of aqueous saturated NaHCO₃ drop-wise until no more bubble generated (~4 mL). The aqueous layer was extracted by 10 mL dichloromethane (3 times). The combined organic layer was concentrated for crude ¹H NMR and purified using flash column chromatography with indicated eluting gradient.

GP-III: In a round bottom flask, *tert*-butyl pyridine-1(4H)-carboxylate (91 mg, 0.5 mmol, 1.5 equiv.) and 2.5 mol% rhodium catalyst were dissolved in 5 mL dry solvent. Methyl 2-diazo-2-phenylacetate (59 mg, 0.333 mmol, 1 equiv.) was dissolved in 4 mL of the corresponding dry solvent and added within 2 h using a syringe pump. After addition, the reaction mixture was stirred for 30 min and the solvent was evaporated under reduced pressure.

GP-IV: In a round bottom flask, *tert*-butyl pyridine-1(4H)-carboxylate (91 mg, 0.5 mmol, 1.5 equiv.) and 2.5 mol% rhodium catalyst were dissolved in 5 mL dry pentane and stirred for 1 min. Methyl 2-diazo-2-phenylacetate (59 mg, 0.333 mmol, 1 equiv.) dissolved in 5 mL dry pentane was added to the mixture. The solvent was removed under reduced pressure and high vacuum was applied under stirring. After complete removal of the solvent the reaction starts under high vacuum conditions. With progressive conversion, the viscosity of the mixture increased. For better homogeneity solvent was added, the mixture was stirred for 1 min and the solvent was removed again before applying high vacuum. This was repeated for 2 times. The reaction is completed when gas formation stops. The crude product was purified by FC (EA/HEX: 2-10% EA gradient). As the product is decomposing under normal conditions complete analysis of the compound was not carried out. Enantiomeric excess was measured after hydrogenation of the 1,4-dihydropyridine.

4.2. Regioisomer and Diastereomer Ratios Determination

The crude ¹H NMR spectra in general procedures were utilized for regioisomer and diastereomer ratios determination, and it was obtained using Bruker-600 MHz spectrometer with a Prodigy probe, and the acquisition was done with 16 times of scans and 1 seconds of relaxation time.

4.3. Characterization Data of C–H Functionalization Products

Methyl (*R*)-2-(4-bromophenyl)-2-((*S*)-piperidin-2-yl)acetate (*4a-erythro*)

Following *GP-II* (*tert*-butyl piperidine-1-carboxylate as substrate, reacting with methyl 2-(4-bromophenyl)-2-diazoacetate), the desired C2-product (mixture of both diastereomers) was obtained using 0-4% methanol in dichloromethane as eluting gradient in flash column chromatography.

Characterization data for the *erythro*-diastereomer was conducted on sample obtained in $\text{Rh}_2(\text{S-2-Cl-5-BrTPCP})_4$ -catalyzed reaction (83% ee).

5. Cyclopropanation and Ring-Opening Reactions for C3-Analogs

5.1 General Procedures

General Procedure for Cyclopropanation Reactions:

In a 25 mL round bottom flask under argon atmosphere, Boc-1,2,3,4-tetrahydropyridine (137 mg, 0.75 mmol, 1.5 equiv.) and 0.5 mol% Rh₂L₄ were dissolved in 2 mL dry solvent under indicated temperature. Corresponding donor/acceptor diazo compounds (0.5 mmol, 1.0 equiv.) was dissolved in 12 mL dry solvent under argon atmosphere and added over 2 h via a syringe pump under indicated temperature. After addition, the reaction mixture was stirred for another 30 min, and crude ¹H NMR was obtained after the resulted mixture was concentrated under vacuum. Finally, the desired product was obtained after purification using flash column chromatography with 1-15% ethyl acetate in hexane as eluting gradient.

General Procedure for Ring-opening Reactions:

In a flame-dried 10-mL round bottom flask, corresponding cyclopropanation product from last step (1 equiv.) was dissolved in dry dichloromethane (5 mL). BF₃-OEt₂ (2 equiv.) and triethylsilane (10 equiv.) were added. The mixture was stirred for 3 days at 23 °C. The crude product was purified by flash column chromatography (20% ethyl acetate in hexane to remove byproducts, then the product was eluted with 2% triethylamine in ethyl acetate). Further purification was done by a 2nd flash column chromatography (10% methanol in dichloromethane).

5.2. Diastereomer and Enantiomer Ratios Determination

Diastereomer ratio was determined from crude ¹H NMR spectra.

Enantiomer ratio were determined by chiral HPLC on purified samples without derivatization (cyclopropanation products), or after derivatizing the secondary amine to 2,2,2-trifluoroacetamide (ring-opening products).

General Procedure for Derivatizing the Secondary Amine to 2,2,2-Trifluoroacetamide:

Triethylamine (1 equiv.) and corresponding amine from ring-opening reactions (1 equiv.) were dissolved in 2 mL dichloromethane and cooled to 0 °C. Trifluoroacetic acid anhydride (1.2 equiv.) was added dropwise. The mixture was stirred at 0 °C for 1 h and was allowed to warm up to 23 °C. At 23 °C, the mixture was stirred overnight. The solvent was evaporated under reduced pressure and the crude product was purified by flash column chromatography (5-10% ethyl acetate in hexane as eluting gradient).

5.3. Characterization Data for Cyclopropanation and Ring-Opening Products

2-(*tert*-Butyl) 7-methyl (1*R*,6*R*,7*S*)-7-(4-bromophenyl)-2-azabicyclo[4.1.0]heptane-2,7-dicarboxylate (8a)

Following *General Procedure for Cyclopropanation Reactions* (methyl 2-(4-bromophenyl)-2-diazoacetate (128 mg), Rh₂(*S*-DOSP)₄ as catalyst, pentane as solvent, at 0 °C), the desired cyclopropanation product was obtained for characterization (92% ee).

10. X-Ray Crystallographic Data of the Products for Absolute Stereochemistry

10.1. X-Ray Crystallographic Data for 6a

Crystal Data and Experimental

Experimental. Single colourless needle-shaped crystals of **WL-ELN09-38R-d1** were recrystallised from DCM by slow evaporation. A suitable crystal $0.49 \times 0.10 \times 0.05$ mm³ was selected and mounted on a loop with paratone oil on an XtaLAB Synergy, Dualflex, HyPix diffractometer. The crystal was kept at a steady $T = 111.4(2)$ K during data collection. The structure was solved with the **ShelXT** (Sheldrick, 2015) structure solution program using the Intrinsic Phasing solution method and by using **Olex2** (Dolomanov et al., 2009) as the graphical interface. The model was refined with version 2018/3 of **ShelXL** (Sheldrick, 2015) using Least Squares minimisation.

Crystal Data. C₂₁H₂₀Br₂Cl₃NO₄S, $M_r = 648.61$, orthorhombic, $P2_12_12_1$ (No. 19), $a = 6.15074(9)$ Å, $b = 26.3980(4)$ Å, $c = 30.1139(5)$ Å, $a = b = c = 90^\circ$, $V = 4889.51(13)$ Å³, $T = 111.4(2)$ K, $Z = 8$, $Z' = 2$, $m(\text{CuK}\alpha) = 8.276$ mm⁻¹, 53908 reflections measured, 9424 unique ($R_{int} = 0.0555$) which were used in all calculations. The final wR_2 was 0.0645 (all data) and R_1 was 0.0262 ($I > 2\sigma(I)$).

A colourless needle-shaped crystal with dimensions $0.49 \times 0.10 \times 0.05 \text{ mm}^3$ was mounted on a loop with paratone oil. Data were collected using an XtaLAB Synergy, Dualflex, HyPix diffractometer equipped with an Oxford Cryosystems low-temperature device operating at $T = 111.4(2) \text{ K}$.

Data were measured using ω scans using $\text{CuK}\alpha$ radiation. The total number of runs and images was based on the strategy calculation from the program **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The maximum resolution that was achieved was $Q = 72.944^\circ$ (0.81 \AA).

The diffraction pattern was indexed and the total number of runs and images was based on the strategy calculation from the program **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019) and the unit cell was refined using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019) on 38372 reflections, 71% of the observed reflections.

Data reduction, scaling and absorption corrections were performed using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The final completeness is 99.90 % out to 72.944° in Q . A numerical absorption correction based on a Gaussian integration over a multifaceted crystal model was performed using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). An empirical absorption correction using spherical harmonics as implemented in SCALE3 ABSPACK was also applied. The absorption coefficient m of this material is 8.276 mm^{-1} at this wavelength ($\lambda = 1.542 \text{ \AA}$) and the minimum and maximum transmissions are 0.687 and 1.000.

The structure was solved and the space group $P2_12_12_1$ (# 19) determined by the **ShelXT** (Sheldrick, 2015) structure solution program using Intrinsic Phasing and refined by Least Squares using version 2018/3 of **ShelXL** (Sheldrick, 2015). All non-hydrogen atoms were refined anisotropically. Hydrogen atom positions were calculated geometrically and refined using the riding model.

The value of Z' is 2. This means that there are two independent molecules in the asymmetric unit.

The Flack parameter was refined to $-0.003(6)$. Determination of absolute structure using Bayesian statistics on Bijvoet differences using the Olex2 results in $-0.007(6)$. Note: The Flack parameter is used to determine chirality of the crystal studied, the value should be near 0, a value of 1 means that the stereochemistry is wrong and the model should be inverted. A value of 0.5 means that the crystal consists of a racemic mixture of the two enantiomers.

Images of the Crystal on the Diffractometer

Figure 1: Plot of the asymmetric unit. There are two independent molecules in the asymmetric unit with the same chirality.

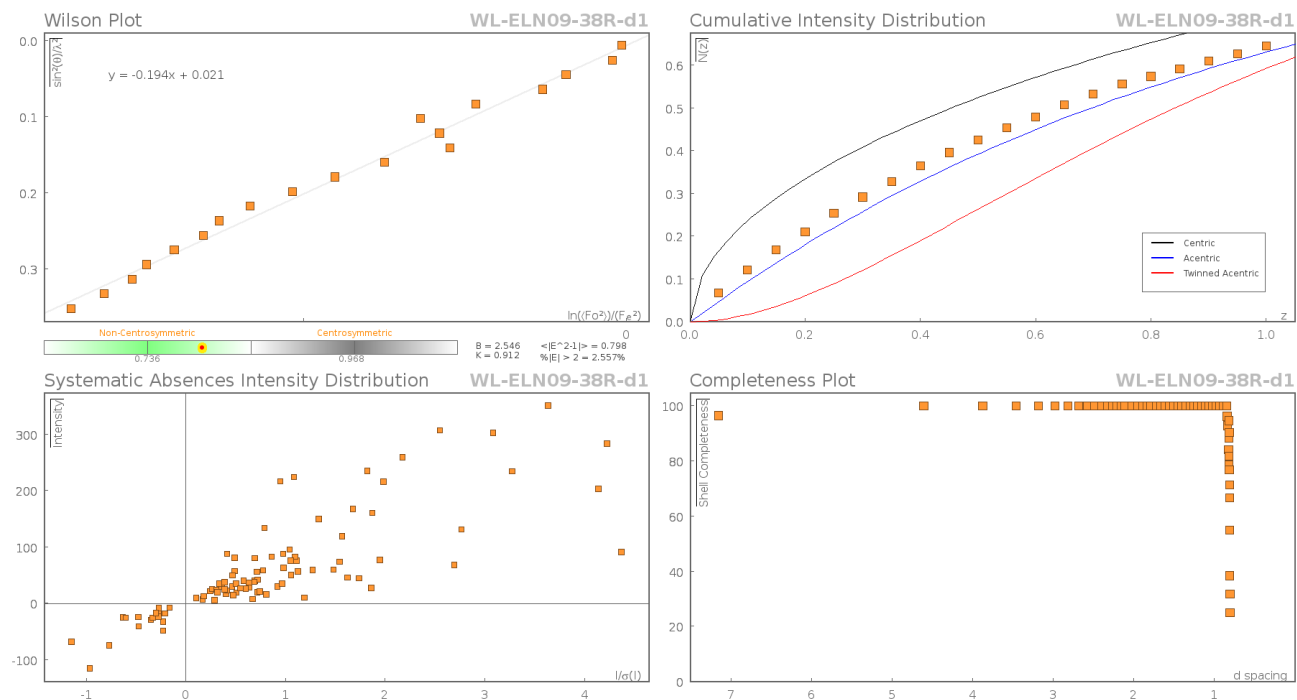

Figure 2: Plot of one of the two independent molecules in the asymmetric unit.

10.2. X-Ray Crystallographic Data for 8b

Table 1 Crystal data and structure refinement for US8.

Identification code	US8
Empirical formula	C ₁₉ H ₂₅ NO ₄
Formula weight	331.40
Temperature/K	106(7)
Crystal system	orthorhombic
Space group	P2 ₁ 2 ₁ 2 ₁
a/Å	8.28903(12)
b/Å	11.79462(19)
c/Å	18.8010(3)
α/°	90
β/°	90
γ/°	90
Volume/Å ³	1838.10(5)
Z	4
ρ _{calc} /cm ³	1.198
μ/mm ⁻¹	0.678
F(000)	712.0

Crystal size/mm ³	0.334 × 0.227 × 0.128
Radiation	CuKα (λ = 1.54184)
2θ range for data collection/°	8.85 to 144.684
Index ranges	-9 ≤ h ≤ 9, -14 ≤ k ≤ 14, -21 ≤ l ≤ 23
Reflections collected	17416
Independent reflections	3508 [R _{int} = 0.0424, R _{sigma} = 0.0275]
Data/restraints/parameters	3508/65/307
Goodness-of-fit on F ²	1.064
Final R indexes [I ≥ 2σ (I)]	R ₁ = 0.0264, wR ₂ = 0.0654
Final R indexes [all data]	R ₁ = 0.0272, wR ₂ = 0.0660
Largest diff. peak/hole / e Å ⁻³	0.19/-0.15
Flack parameter	-0.11(6)

Experimental

Single crystals of C₁₉H₂₅NO₄ [US8] were []. A suitable crystal was selected and [The crystal was mounted on a None] on a XtaLAB Synergy, Dualflex, HyPix diffractometer. The crystal was kept at 106(7) K during data collection. Using Olex2 [1], the structure was solved with the ShelXT [2] structure solution program using Intrinsic Phasing and refined with the ShelXL [3] refinement package using Least Squares minimisation.

10.3. X-Ray Crystallographic Data for *N*-COCF₃-9a

Crystal Data and Experimental

Experimental. Single colourless needle-shaped crystals of **US96** were chosen from the sample as supplied. A suitable crystal 0.39×0.12×0.10 mm³ was selected and mounted on a loop with paratone oil on an XtaLAB Synergy, Dualflex, HyPix diffractometer. The crystal was kept at a steady $T = 100.01(10)$ K during data collection. The structure was solved with the **ShelXT** (Sheldrick, 2015) structure solution program using the Intrinsic Phasing solution method and by using **Olex2** (Dolomanov et al., 2009) as the graphical interface. The model was refined with version 2018/3 of **ShelXL** (Sheldrick, 2015) using Least Squares minimisation.

Crystal Data. C₁₆H₁₇BrF₃NO₃, $M_r = 408.21$, monoclinic, $P2_1$ (No. 4), $a = 8.8333(2)$ Å, $b = 8.6844(2)$ Å, $c = 11.4854(3)$ Å, $\beta = 107.078(3)^\circ$, $a = \gamma = 90^\circ$, $V = 842.22(4)$ Å³, $T = 100.01(10)$ K, $Z = 2$, $Z' = 1$, $m(\text{MoK}\alpha) = 2.485$ mm⁻¹, 20214 reflections measured, 7976 unique ($R_{int} = 0.0321$) which were used in all calculations. The final wR_2 was 0.0993 (all data) and R_1 was 0.0406 ($I > 2\sigma(I)$).

A colourless needle-shaped crystal with dimensions 0.39×0.12×0.10 mm³ was mounted on a loop with paratone oil. Data were collected using an XtaLAB Synergy, Dualflex, HyPix diffractometer equipped with an Oxford Cryosystems low-temperature device operating at $T = 100.01(10)$ K.

Data were measured using ω scans using MoK α radiation. The total number of runs and images was based on the strategy calculation from the program **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The maximum resolution that was achieved was $Q = 36.317^\circ$ (0.60 Å).

The diffraction pattern was indexed using the program **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019) and the unit cell was refined using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019) on 9810 reflections, 49% of the observed reflections. Data reduction, scaling and absorption corrections were performed using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The final completeness is 99.80 % out to 36.317° in Q . A numerical absorption correction based on Gaussian integration over a multifaceted crystal model was performed using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). An empirical absorption correction using spherical harmonics as implemented in SCALE3 ABSPACK (Rigaku, V1.171.40.37a, 2019) was also used. The absorption coefficient m of this material is 2.485 mm⁻¹ at this wavelength ($\lambda = 0.711\text{Å}$) and the minimum and maximum transmissions are 0.448 and 1.000.

The structure was solved and the space group $P2_1$ (# 4) determined by the **ShelXT** (Sheldrick, 2015) structure solution program using Intrinsic Phasing and refined by Least Squares using version 2018/3 of **ShelXL** (Sheldrick, 2015). All non-hydrogen atoms were refined anisotropically. Hydrogen atom positions were located from the difference maps and refined using restraints.

There is a single molecule in the asymmetric unit, which is represented by the reported sum formula. In other words: Z is 2 and Z' is 1.

The Flack parameter was refined to -0.003(3). Determination of absolute structure using Bayesian statistics on Bijvoet differences using the Olex2 results in 0.017(2). Note: The Flack parameter is used to determine chirality of the crystal studied, the value should be near 0, a value of 1 means that the stereochemistry is wrong and the model should be inverted. A value of 0.5 means that the crystal consists of a racemic mixture of the two enantiomers.

10.4. X-Ray Crystallographic Data for 13b

Crystal Data and Experimental

Experimental. Single colourless prism-shaped crystals of **WL-N9-80-f34** were chosen from the sample as supplied. A suitable crystal $0.35 \times 0.21 \times 0.11 \text{ mm}^3$ was selected and mounted on a loop with paratone oil on an XtaLAB Synergy-S diffractometer. The crystal was kept at a steady $T = 100.01(10) \text{ K}$ during data collection. The structure was solved with the **ShelXT** (Sheldrick, 2015) structure solution program using the Intrinsic Phasing solution method and by using **Olex2** (Dolomanov et al., 2009) as the graphical interface. The model was refined with version 2018/3 of **ShelXL** (Sheldrick, 2015) using Least Squares minimisation.

Crystal Data. $\text{C}_{22}\text{H}_{23}\text{BrCl}_3\text{NO}_4\text{S}$, $M_r = 583.73$, orthorhombic, $P2_12_12_1$ (No. 19), $a = 5.60602(6) \text{ \AA}$, $b = 20.3318(2) \text{ \AA}$, $c = 21.4309(2) \text{ \AA}$, $a = b = g = 90^\circ$, $V = 2442.71(4) \text{ \AA}^3$, $T = 100.01(10) \text{ K}$, $Z = 4$, $Z' = 1$, $m(\text{CuK}\alpha) = 6.365 \text{ mm}^{-1}$, 24631 reflections measured, 4842 unique ($R_{int} = 0.0422$) which were used in all calculations. The final wR_2 was 0.0855 (all data) and R_1 was 0.0326 ($I > 2\sigma(I)$).

Refinement:	Shift -0.004	Max Peak 0.7	Min Peak -0.7	Goof 1.057	Flack .001(8)

A colourless prism-shaped crystal with dimensions 0.35×0.21×0.11 mm³ was mounted on a loop with paratone oil. Data were collected using an XtaLAB Synergy, Dualflex, HyPix diffractometer equipped with an Oxford Cryosystems low-temperature device operating at $T = 100.01(10)$ K.

Data were measured using ω scans using CuK α radiation. The total number of runs and images was based on the strategy calculation from the program **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The maximum resolution that was achieved was $Q = 77.056^\circ$ (0.79 Å).

The diffraction pattern was indexed and then the total number of runs and images was calculated from the program **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The unit cell was refined using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019) on 20665 reflections, 84% of the observed reflections.

Data reduction, scaling and absorption corrections were performed using **CrysAlisPro** (Rigaku, V1.171.40.37a, 2019). The final completeness is 100.00 % out to 77.056° in Q . A numerical absorption correction based on Gaussian integration over a multifaceted crystal model was performed using (Rigaku Oxford Diffraction, 2019). An empirical absorption correction using spherical harmonics as implemented in SCALE3 ABSPACK was also performed. The absorption coefficient m of this material is 6.365 mm⁻¹ at this wavelength ($\lambda = 1.542\text{Å}$) and the minimum and maximum transmissions are 0.158 and 0.975.

The structure was solved and the space group $P2_12_12_1$ (# 19) determined by the **ShelXT** (Sheldrick, 2015) structure solution program using Intrinsic Phasing and refined by Least Squares using version 2018/3 of **ShelXL** (Sheldrick, 2015). All non-hydrogen atoms were refined anisotropically. Hydrogen atom positions were calculated geometrically and refined using the riding model. Hydrogen atom positions were calculated geometrically and refined using the riding model.

There is a single molecule in the asymmetric unit, which is represented by the reported sum formula. In other words: Z is 4 and Z' is 1.

The Flack parameter was refined to -0.001(8). Determination of absolute structure using Bayesian statistics on Bijvoet differences using the Olex2 results in -0.007(6). Note: The Flack parameter is used to determine chirality of the crystal studied, the value should be near 0, a value of 1 means that the stereochemistry is wrong and the model should be inverted. A value of 0.5 means that the crystal consists of a racemic mixture of the two enantiomers.

>>> The Following Improvement and Query ALERTS were generated - (Acta-Mode) <<<
#=====
Format: alert-number_ALERT_alert-type_alert-level text

```

```

090_ALERT_3_C Poor Data / Parameter Ratio (Zmax > 18) ..... 9.88 Note
761_ALERT_1_C CIF Contains no X-H Bonds ..... Please Check
762_ALERT_1_C CIF Contains no X-Y-H or H-Y-H Angles ..... Please Check
#=====
003_ALERT_2_G Number of Uiso or Uij Restrained non-H Atoms ... 7 Why ?
142_ALERT_4_G su on b - Axis Small or Missing ..... 0.00020 Ang.
143_ALERT_4_G su on c - Axis Small or Missing ..... 0.00020 Ang.
434_ALERT_2_G Short Inter HL..HL Contact Cl1 .. Cl3 . 3.32 Ang.
791_ALERT_4_G The Model has Chirality at C6 ..... S Verify
860_ALERT_3_G Number of Least-Squares Restraints ..... 12 Note
912_ALERT_4_G Missing # of FCF Reflections Above STh/L= 0.600 99 Note
#=====

```

ALERT_Level and ALERT_Type Summary

```

=====
3 ALERT_Level_C = Check. Ensure it is Not caused by an Omission or Oversight
7 ALERT_Level_G = General Info/Check that it is not Something Unexpected

2 ALERT_Type_1 CIF Construction/Syntax Error, Inconsistent or Missing Data.

```

2 ALERT_Type_2 Indicator that the Structure Model may be Wrong or Deficient.
2 ALERT_Type_3 Indicator that the Structure Quality may be Low.
4 ALERT_Type_4 Improvement, Methodology, Query or Suggestion.

#=====

2 Missing Experimental Info Issue(s) (Out of 54 Tests) - 96 % Satisfied
0 Experimental Data Related Issue(s) (Out of 28 Tests) - 100 % Satisfied
4 Structural Model Related Issue(s) (Out of 117 Tests) - 97 % Satisfied
4 Unresolved or to be Checked Issue(s) (Out of 223 Tests) - 98 % Satisfied
