

CONSORT-EHEALTH (V 1.6.1) - Submission/Publication Form

The CONSORT-EHEALTH checklist is intended for authors of randomized trials evaluating web-based and Internet-based applications/interventions, including mobile interventions, electronic games (incl multiplayer games), social media, certain telehealth applications, and other interactive and/or networked electronic applications. Some of the items (e.g. all subitems under item 5 - description of the intervention) may also be applicable for other study designs.

The goal of the CONSORT EHEALTH checklist and guideline is to be

- a) a guide for reporting for authors of RCTs,
- b) to form a basis for appraisal of an ehealth trial (in terms of validity)

CONSORT-EHEALTH items/subitems are MANDATORY reporting items for studies published in the Journal of Medical Internet Research and other journals / scientific societies endorsing the checklist.

Items numbered 1., 2., 3., 4a., 4b etc are original CONSORT or CONSORT-NPT (non-pharmacologic treatment) items.

Items with Roman numerals (i., ii, iii, iv etc.) are CONSORT-EHEALTH extensions/clarifications.

As the CONSORT-EHEALTH checklist is still considered in a formative stage, we would ask that you also RATE ON A SCALE OF 1-5 how important/useful you feel each item is FOR THE PURPOSE OF THE CHECKLIST and reporting guideline (optional).

Mandatory reporting items are marked with a red *.

In the textboxes, either copy & paste the relevant sections from your manuscript into this form - please include any quotes from your manuscript in QUOTATION MARKS, or answer directly by providing additional information not in the manuscript, or elaborating on why the item was not relevant for this study.

YOUR ANSWERS WILL BE PUBLISHED AS A SUPPLEMENTARY FILE TO YOUR PUBLICATION IN JMIR AND ARE CONSIDERED PART OF YOUR PUBLICATION (IF ACCEPTED).

Please fill in these questions diligently. Information will not be copyedited, so please use proper spelling and grammar, use correct capitalization, and avoid abbreviations.

DO NOT FORGET TO SAVE AS PDF _AND_ CLICK THE SUBMIT BUTTON SO YOUR ANSWERS ARE IN OUR DATABASE !!!

Citation Suggestion (if you append the pdf as Appendix we suggest to cite this paper in the caption):

*Obligatorio

Your name *

First Last

Juan Francisco Lisón

Primary Affiliation (short), City, Country *

University of Toronto, Toronto, Canada

Department of Medicine, Universidad Ca

Your e-mail address *abc@gmail.com

juanfran@uchceu.es

Title of your manuscript *

Provide the (draft) title of your manuscript.

Impact of a web-based exercise and nutritional educational intervention in obese patients with hypertension: a randomised waitlist-controlled trial

Name of your App/Software/Intervention *

If there is a short and a long/alternate name, write the short name first and add the long name in brackets.

Vivir mejor (Live better)

Evaluated Version (if any)

e.g. "V1", "Release 2017-03-01", "Version 2.0.27913"

Tu respuesta

Language(s) *

What language is the intervention/app in? If multiple languages are available, separate by comma (e.g. "English, French")

Spanish

URL of your Intervention Website or App

e.g. a direct link to the mobile app on app in appstore (itunes, Google Play), or URL of the website. If the intervention is a DVD or hardware, you can also link to an Amazon page.

Tu respuesta

URL of an image/screenshot (optional)

Tu respuesta

Accessibility *

Can an enduser access the intervention presently?

- access is free and open
- access only for special usergroups, not open
- access is open to everyone, but requires payment/subscription/in-app purchases
- app/intervention no longer accessible
- Otro:

Primary Medical Indication/Disease/Condition *

e.g. "Stress", "Diabetes", or define the target group in brackets after the condition, e.g. "Autism (Parents of children with)", "Alzheimers (Informal Caregivers of)"

Hypertension, Obesity

Primary Outcomes measured in trial *

comma-separated list of primary outcomes reported in the trial

Body mass index

Secondary/other outcomes

Are there any other outcomes the intervention is expected to affect?

Body fat mass, Systolic and diastolic blood pressure, plasma glucose, insulin, habitual level of physical activity, aerobic capacity

Recommended "Dose" *

What do the instructions for users say on how often the app should be used?

- Approximately Daily
- Approximately Weekly
- Approximately Monthly
- Approximately Yearly
- "as needed"
- Otro:

Approx. Percentage of Users (starters) still using the app as recommended after 3 months *

unknown / not evaluated

0-10%

11-20%

21-30%

31-40%

41-50%

51-60%

61-70%

71%-80%

81-90%

91-100%

Otro:

Overall, was the app/intervention effective? *

- yes: all primary outcomes were significantly better in intervention group vs control
- partly: SOME primary outcomes were significantly better in intervention group vs control
- no statistically significant difference between control and intervention
- potentially harmful: control was significantly better than intervention in one or more outcomes
- inconclusive: more research is needed
- Otro:

Article Preparation Status/Stage *

At which stage in your article preparation are you currently (at the time you fill in this form)

- not submitted yet - in early draft status
- not submitted yet - in late draft status, just before submission
- submitted to a journal but not reviewed yet
- submitted to a journal and after receiving initial reviewer comments
- submitted to a journal and accepted, but not published yet
- published
- Otro:

Journal *

If you already know where you will submit this paper (or if it is already submitted), please provide the journal name (if it is not JMIR, provide the journal name under "other")

- not submitted yet / unclear where I will submit this
- Journal of Medical Internet Research (JMIR)
- JMIR mHealth and UHealth
- JMIR Serious Games
- JMIR Mental Health
- JMIR Public Health
- JMIR Formative Research
- Other JMIR sister journal
- Otro:

Is this a full powered effectiveness trial or a pilot/feasibility trial?

*

- Pilot/feasibility
- Fully powered

Manuscript tracking number *

If this is a JMIR submission, please provide the manuscript tracking number under "other" (The ms tracking number can be found in the submission acknowledgement email, or when you login as author in JMIR. If the paper is already published in JMIR, then the ms tracking number is the four-digit number at the end of the DOI, to be found at the bottom of each published article in JMIR)

- no ms number (yet) / not (yet) submitted to / published in JMIR
- Otro:

TITLE AND ABSTRACT 

1a) TITLE: Identification as a randomized trial in the title

1a) Does your paper address CONSORT item 1a? *

I.e does the title contain the phrase "Randomized Controlled Trial"? (if not, explain the reason under "other")

yes

Otro:

1a-i) Identify the mode of delivery in the title

Identify the mode of delivery. Preferably use "web-based" and/or "mobile" and/or "electronic game" in the title. Avoid ambiguous terms like "online", "virtual", "interactive". Use "Internet-based" only if Intervention includes non-web-based Internet components (e.g. email), use "computer-based" or "electronic" only if offline products are used. Use "virtual" only in the context of "virtual reality" (3-D worlds). Use "online" only in the context of "online support groups". Complement or substitute product names with broader terms for the class of products (such as "mobile" or "smart phone" instead of "iphone"), especially if the application runs on different platforms.

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	essential

Does your paper address subitem 1a-i? *

Copy and paste relevant sections from manuscript title (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Impact of a web-based exercise and nutritional educational intervention in obese patients with hypertension: a randomised waitlist-controlled trial"

1a-ii) Non-web-based components or important co-interventions in title

Mention non-web-based components or important co-interventions in title, if any (e.g., "with telephone support").

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	essential

Does your paper address subitem 1a-ii?

Tu respuesta

1a-iii) Primary condition or target group in the title

Mention primary condition or target group in the title, if any (e.g., "for children with Type I Diabetes")
Example: A Web-based and Mobile Intervention with Telephone Support for Children with Type I Diabetes: Randomized Controlled Trial

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	essential

Does your paper address subitem 1a-iii? *

Copy and paste relevant sections from manuscript title (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"in obese patients with hypertension"

1b) ABSTRACT: Structured summary of trial design, methods, results, and conclusions

NPT extension: Description of experimental treatment, comparator, care providers, centers, and blinding status.

1b-i) Key features/functionalities/components of the intervention and comparator in the METHODS section of the ABSTRACT

Mention key features/functionalities/components of the intervention and comparator in the abstract. If possible, also mention theories and principles used for designing the site. Keep in mind the needs of systematic reviewers and indexers by including important synonyms. (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	essential

Does your paper address subitem 1b-i? *

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"completely self-administered internet-based intervention involving different modules and learning techniques, aimed at promoting lifestyle changes (both physical activity and healthy eating) "

1b-ii) Level of human involvement in the METHODS section of the ABSTRACT

Clarify the level of human involvement in the abstract, e.g., use phrases like "fully automated" vs. "therapist/nurse/care provider/physician-assisted" (mention number and expertise of providers involved, if any). (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5

Copy and paste relevant sections from the manuscript abstract (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Tu respuesta

1b-iii) Open vs. closed, web-based (self-assessment) vs. face-to-face assessments in the METHODS section of the ABSTRACT

Mention how participants were recruited (online vs. offline), e.g., from an open access website or from a clinic or a closed online user group (closed usergroup trial), and clarify if this was a purely web-based trial, or there were face-to-face components (as part of the intervention or for assessment). Clearly say if outcomes were self-assessed through questionnaires (as common in web-based trials). Note: In traditional offline trials, an open trial (open-label trial) is a type of clinical trial in which both the researchers and participants know which treatment is being administered. To avoid confusion, use "blinded" or "unblinded" to indicated the level of blinding instead of "open", as "open" in web-based trials usually refers to "open access" (i.e. participants can self-enrol). (Note: Only report in the abstract what the main paper is reporting. If this information is missing from the main body of text, consider adding it)

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	essential

INTRODUCTION

2a) In INTRODUCTION: Scientific background and explanation of rationale

2a-i) Problem and the type of system/solution

Describe the problem and the type of system/solution that is object of the study: intended as stand-alone intervention vs. incorporated in broader health care program? Intended for a particular patient population? Goals of the intervention, e.g., being more cost-effective to other interventions, replace or complement other solutions? (Note: Details about the intervention are provided in "Methods" under 5)

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	essential

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Promoting healthy lifestyles (physical activity and healthy eating) through lifestyle counselling is recommended as the first-line therapy for the treatment of these patients and may be an effective tool for treating obesity and preventing obesity-related health burdens [6,8,9]. However, frequent visits to outpatient clinics are costly and time-consuming for patients as well as for physicians and nurse practitioners. These patients need to develop specific self-management skills so that they can make long-lasting lifestyle changes and adhere to their treatments, however, clinics may not be ideal environment for them because these surroundings can be perceived as intrusive and threatening [10,11]. Furthermore, in many cases physicians and nurses do not have the proper background training to be able to provide patients with the best possible counselling about nutrition or physical activity. Therefore, an approach is needed that can be offered without imposing additional burdens on our healthcare workers or budget. "

2a-ii) Scientific background, rationale: What is known about the (type of) system

Scientific background, rationale: What is known about the (type of) system that is the object of the study (be sure to discuss the use of similar systems for other conditions/diagnoses, if appropriate), motivation for the study, i.e. what are the reasons for and what is the context for this specific study, from which stakeholder viewpoint is the study performed, potential impact of findings [2]. Briefly justify the choice of the comparator.

"So far, very few studies have investigated the effects of internet-based programs on obese patients with HTN [27-29]. Furthermore, to the best of our knowledge, no study has assessed the efficacy of a completely self-administered internet-based intervention entailing the completion of different modules and which incorporates several learning techniques aimed at promoting lifestyle changes in obese patients with HTN."

2b) In INTRODUCTION: Specific objectives or hypotheses

Does your paper address CONSORT subitem 2b? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"This study aimed to examine the short- and long-term efficacy in terms of body composition and BP parameters of a completely self-administered internet-based intervention involving different modules and learning techniques, aimed at promoting lifestyle changes (both physical activity and healthy eating) in obese patients with HTN.

Compared with the wait-list control group receiving standard medical care, we hypothesized that the internet-based intervention group will have significantly better improvements for body composition, BP, blood glucose and insulin levels, physical activity levels, and aerobic exercise capacity from baseline to post-intervention."

METHODS

3a) Description of trial design (such as parallel, factorial) including allocation ratio

Does your paper address CONSORT subitem 3a? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"This prospective, single-centre, waitlist-controlled trial (Trial Registration: ClinicalTrials.gov NCT03396302) with balanced randomisation [1:1], was approved by the Hospital of Sagunto Human Ethics Committee and followed the ethical guidelines set out in the Declaration of Helsinki."

3b) Important changes to methods after trial commencement (such as eligibility criteria), with reasons

Does your paper address CONSORT subitem 3b? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

There were no important changes after trial commencement

3b-i) Bug fixes, Downtimes, Content Changes

Bug fixes, Downtimes, Content Changes: ehealth systems are often dynamic systems. A description of changes to methods therefore also includes important changes made on the intervention or comparator during the trial (e.g., major bug fixes or changes in the functionality or content) (5-iii) and other "unexpected events" that may have influenced study design such as staff changes, system failures/downtimes, etc. [2].

4a) Eligibility criteria for participants

Does your paper address CONSORT subitem 4a? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"Eligible participants were all adults aged between 18 and 65 years with HTN and who were overweight or had type-I obesity (a body mass indices [BMIs] > 25 kg/m2 and < 35 kg/m2, respectively). Exclusion criteria were a diagnosis of diabetes, previous ischemic heart disease, cerebrovascular disease or a severe psychiatric disorder, taking more than three antihypertensive drugs, physical impairments precluding participation in physical activity, receiving any treatment for weight loss elsewhere, or no internet access."

4a-i) Computer / Internet literacy

Computer / Internet literacy is often an implicit "de facto" eligibility criterion - this should be explicitly clarified.

Tu respuesta

4a-ii) Open vs. closed, web-based vs. face-to-face assessments:

Open vs. closed, web-based vs. face-to-face assessments: Mention how participants were recruited (online vs. offline), e.g., from an open access website or from a clinic, and clarify if this was a purely web-based trial, or there were face-to-face components (as part of the intervention or for assessment), i.e., to what degree got the study team to know the participant. In online-only trials, clarify if participants were quasi-anonymous and whether having multiple identities was possible or whether technical or logistical measures (e.g., cookies, email confirmation, phone calls) were used to detect/prevent these.

	1	2	3	4	5	
subitem not at all important	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	<input type="radio"/>	essential

Does your paper address subitem 4a-ii? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"The intervention programme we used is called Vivir mejor (translated from Spanish as 'Live better'; [27,30]. In this intervention, in addition to their usual medical care, participants received a three-month multimedia, interactive, and self-administered online intervention program comprising nine modules. "

4a-iii) Information giving during recruitment

Information given during recruitment. Specify how participants were briefed for recruitment and in the informed consent procedures (e.g., publish the informed consent documentation as appendix, see also item X26), as this information may have an effect on user self-selection, user expectation and may also bias results.

	1	2	3	4	5

5-vii) Access

Access: Describe how participants accessed the application, in what setting/context, if they had to pay (or were paid) or not, whether they had to be a member of specific group. If known, describe how participants obtained "access to the platform and Internet" [1]. To ensure access for editors/reviewers/readers, consider to provide a "backdoor" login account or demo mode for reviewers/readers to explore the application (also important for archiving purposes, see vi).

"This internet-based intervention was delivered using a web-based platform called Wix. Wix is a self-hosted website builder and content management system with more than 90 million users (<http://www.wix.com>). This cloud-based website development platform is customisable with drag-and-drop features and includes apps, graphics, image galleries, fonts, and a responsive design which adjusts the site for viewing with mobile devices. We purchased a unique website domain URL to avoid pop-up advertising from Wix. To prevent the general public from accessing the site, a password-login was added to secure the proprietary information and participant responses [34]."

The application was free.

5-viii) Mode of delivery, features/functionality/components of the intervention and comparator, and the theoretical framework

Describe mode of delivery, features/functionality/components of the intervention and comparator, and the theoretical framework [6] used to design them (instructional strategy [1], behaviour change techniques, persuasive features, etc., see e.g., [7, 8] for terminology). This includes an in-depth description of the content (including where it is coming from and who developed it) [1], "whether [and how] it is tailored to individual circumstances and allows users to track their progress and receive feedback" [6]. This also includes a description of communication delivery channels and – if computer-mediated communication is a component – whether communication was synchronous or asynchronous [6]. It also includes information on presentation strategies [1], including page design principles, average amount of text on pages, presence of hyperlinks to other resources, etc. [1].

"The program was delivered in the participants' native language (Spanish) and included psychoeducation about what a healthy lifestyle involves and teaches techniques for how this can be achieved on a day-to-day basis. Some of the techniques used were self-monitoring, self-instruction, behavioural recording, stimulus control, self-reinforcement, problem-solving techniques, and homework. In addition, the web page offered useful tools, such as downloadable documents and videos. This program is described in more detail in Baños et al. [30]"

5-ix) Describe use parameters

Describe use parameters (e.g., intended "doses" and optimal timing for use). Clarify what instructions or recommendations were given to the user, e.g., regarding timing, frequency, heaviness of use, if any, or was the intervention used ad libitum.

6a) Completely defined pre-specified primary and secondary outcome measures, including how and when they were assessed

Does your paper address CONSORT subitem 6a? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"The primary outcome (BMI) and secondary outcomes (body fat mass, systolic and diastolic BP, plasma glucose, insulin, habitual level of physical activity and aerobic capacity) were measured using validated and reliable tests. "

"As shown in the participant flow chart (Figure 1), all the outcome measures were assessed at baseline (Time 0), 3-months post-baseline (Time 1), and at a 12-month follow-up (Time 2) in the IBI group. WLC group participants took part in an initial baseline assessment (Time 0) followed by a second assessment 3-months post-baseline (Time 1). After the Time 1 assessment, WLC participants received the intervention, which was offered in order to comply with the instructions of the Hospital's Human Ethics Committee, and the patients were subsequently assessed at a 12-month follow-up (Time 2). Thus, all the participants underwent a pre-intervention, post-intervention (3-months), and 12-month follow-up assessment, and the WLC participants were assessed twice before the intervention. "

6a-i) Online questionnaires: describe if they were validated for online use and apply CHERRIES items to describe how the questionnaires were designed/deployed

If outcomes were obtained through online questionnaires, describe if they were validated for online use and apply CHERRIES items to describe how the questionnaires were designed/deployed [9].

11b) If relevant, description of the similarity of interventions

(this item is usually not relevant for ehealth trials as it refers to similarity of a placebo or sham intervention to a active medication/intervention)

Does your paper address CONSORT subitem 11b? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

Not relevant.

12a) Statistical methods used to compare groups for primary and secondary outcomes

NPT: When applicable, details of whether and how the clustering by care providers or centers was addressed

Does your paper address CONSORT subitem 12a? *

Copy and paste relevant sections from the manuscript (include quotes in quotation marks "like this" to indicate direct quotes from your manuscript), or elaborate on this item by providing additional information not in the ms, or briefly explain why the item is not applicable/relevant for your study

"To compare the success of the randomisation, a chi-squared test was used to determine differences in gender distribution between the groups. Independent-sample t-tests and the Mann–Whitney U test were also performed as preliminary tests to detect potential gender differences among all the variables. The study used both a between-subjects and a within-subjects design, with measurements recorded at 3 time points (baseline, post-intervention, and 12-months follow-up). The between-group comparison (IBI vs. WLC) assessed the effect of IBI on outcomes; the within-subject analyses assessed the effect of IBI over time at the individual level. This approach was selected because all the WLC participants also subsequently received the IBI intervention. The statistical analysis was performed according to intention-to-treat. Statistical analyses were performed using SPSS version 19.0 for Windows (SPSS Inc., Chicago, IL, USA) and the statistical significance was set at $P < .05$ for all our analyses. The data in this study are presented as the mean \pm SD.

Analysis at 3 months

Two-way mixed ANOVA tests were used to compare the study effects on the BMI, BFM, SBP, DBP, blood glucose and insulin levels, physical activity levels, and aerobic exercise capacity, using time (baseline vs. post-intervention) as the within-group factor and group (IBI vs. WLC) as the between-group factor. Effect sizes were estimated using partial eta squared (η^2_p) and interpreted following the Cohen guidelines [37] for small effect sizes ($\eta^2_p = .01$), moderate effect sizes ($\eta^2_p = .06$), and large effect sizes ($\eta^2_p = .14$).

Analysis at 12 months

After testing the normality (using the Shapiro–Wilk test) of the pooled data from both groups ($N = 105$), the following statistical tests were carried out as follows: (1) t-tests on related samples to compare the baseline versus 12-month follow-up values for the anthropometric variables (BMI and BFM), SBP, DPB, and blood glucose; and (2) Wilcoxon tests to compare the pre- versus 12-month follow-up values for insulin. Program engagement was analysed by calculating the percentage of participants who completed the entire program. We did not record the patients' level of physical activity or their aerobic exercise capacity at 12 months because of the implied complexity of asking participants to record these measurements for one year."

12a-i) Imputation techniques to deal with attrition / missing values

Imputation techniques to deal with attrition / missing values: Not all participants will use the intervention/comparator as intended and attrition is typically high in ehealth trials. Specify how participants who did not use the application or dropped out from the trial were treated in the statistical analysis (a complete case analysis is strongly discouraged, and simple imputation techniques such as LOCF may also be problematic [4]).

17a-i) Presentation of process outcomes such as metrics of use and intensity of use

In addition to primary/secondary (clinical) outcomes, the presentation of process outcomes such as metrics of use and intensity of use (dose, exposure) and their operational definitions is critical. This does not only refer to metrics of attrition (13-b) (often a binary variable), but also to more continuous exposure metrics such as "average session length". These must be accompanied by a technical description how a metric like a "session" is defined (e.g., timeout after idle time) [1] (report under item 6a).

"The present study evaluated the efficacy of a 3-month completely self-administered internet-based intervention called Live better which aims to promote lifestyle changes in obese patients with HTN. Our results showed a significant decrease in the BMI, BFM, and blood glucose levels at 3 months in the IBI group, with a moderate to large effect size for BMI and BFM, and also highlighted a trend toward significance for DBP and insulin levels. Moreover, these improvements in BMI, BFM, and BP were sustained and reached statistical significance for DBP at the 12-month follow-up. When evaluating specific internet-based interventions, several attributes may be associated with increased e-counselling efficacy. These include its duration [22,38], the range of behaviour-change techniques offered [22,39], target behaviours to be modified [22], whether specific disease entities are targeted or not [38], and program engagement [34,40]. Duration

For any intervention to have a significant and sustained effect, a minimum follow-up time of 6 months is required [38]. Indeed, in a recent meta-analysis, Sam Liu et al. [22] showed that internet-based interventions lasting at least 6 months were associated with greater BP reductions. These authors argued that the influence of lifestyle interventions on BP may require a critical period for therapeutic changes to appear and that longer interventions might be required to facilitate comprehensive physical changes such as weight reduction. Three months after beginning our study we found a significant BMI reduction (0.4 kg/m²) that was sustained after 12 months. Moreover, the mean decrease in BFM (by 1 kg) achieved after three months had doubled 12 months later (to 2.4 kg). Although this parameter is less frequently used because of its lower feasibility, BFM may be a better marker of cardiovascular risk compared to BMI, which has been criticised because the latter does not always reflect true body fat content [41,42]. Indeed, BMI has some limitations in assessing the risk of obesity-related diseases in subjects with low muscle and high body fat content [43] and in individuals with increased body fat and a normal BMI.

Consistent with our results, a Cochrane meta-analysis concluded that interactive computer-based interventions, compared to no intervention or minimal interventions (e.g., pamphlets or usual care), are an effective tool for enhancing weight loss and weight maintenance [12]. In addition, providing support oriented towards self-management while patients change their lifestyle leads to improved health outcomes [24,44] and better long-term effects [45].

Concerning BP values, we found a non-significant decrease in systolic (-2.6 mmHg) and diastolic (-2.0 mmHg) BP after 3 months, which was sustained and even reached statistical significance after 12 months in the case of DBP (-1.8 mmHg). These results are slightly lower than those reported in the Internet

Lifestyle Counselling metanalysis (-3.8 mmHg for SBP and -2.1 mmHg for DBP) by Liu et al. [22] and are also lower than the BP reductions reported by other metanalyses that considered face-to-face lifestyle-counselling [9,46]. The lack of a stronger significant effect in our study may be because the BP at baseline was already well controlled by antihypertensive medications [47-49] by a specialised HTN Unit.

Range of behaviour-change techniques

Two recent meta-analyses which evaluated the BP lowering [22] and weight-loss [39] achieved by e-counselling lifestyle interventions reported that their efficacy depended on the number of intervention components they included. The meta-analysis by Liu et al. [22] found that BP was preferentially (and significantly) reduced by interventions providing a wider range of behavioural-change techniques and suggested that "a critical number of techniques (at least 5) may be required to build a flexible repertoire of skills that are necessary to overcome situational stressors that might otherwise impede therapeutic lifestyle change". These authors reported that the behavioural change techniques present in more than 50% of the successful internet-based interventions shared the following features: provision of general information about the consequences of the patient's behaviour (86% of studies), incorporation of feedback on performance (86%), prompting behavioural self-monitoring (71%), and giving instructions on how to perform targeted behavioural changes (71%). Likewise, Khaylis et al. [50] also conducted a systematic review of efficacious technology-based weight-loss interventions and to identify several similar components (self-monitoring, counsellor feedback and communication, social support, structured programs, and individually tailored programs) that were key to their success. Other effective components identified in the technology-based weight-loss literature as potential factors that increase intervention effectiveness are goal setting, motivational interviewing, and incentives [30,51,52].

All the behavioural-change techniques mentioned by Liu et al. [22] and Khaylis et al. [50] were present in our intervention, except for feedback incorporation, motivational interviewing, and social support, because these were not possible given the self-administered nature of our intervention (which maintained its low monetary and time cost). Moreover, this trial was distinct insofar as it also incorporated problem-solving techniques focussed on the regulation of emotional eating (module 5) and the difficulties associated with body image and assertiveness (module 7). As Katan [53] suggested, cognitions and feelings have a big impact on behaviour during dieting and thus, may strengthen or disrupt treatment engagement and compliance with clinical prescriptions. Indeed, psychological factors and processes mediate every behaviour change and differently affect both the initiation and maintenance phases of change [54].

Target behaviours to be modified

Exercise and diet are two major target behaviours for modification by internet-based e-counselling interventions designed to prevent or treat cardiovascular disease risk-factors such as obesity and HTN. Numerous studies suggest that

automated, self-guided, internet-based lifestyle counselling (e-counselling) programs can evoke meaningful improvements in daily physical activity [55,56] and dietary behaviours [56,57]. Moreover, meta-analysis reviews indicate that exercise and diet, provided by conventional programs or by internet-based interventions, significantly decrease cardiovascular risk factors [9,16,46,58,59]. Our Live better intervention focused on modifying both of these target behaviours because it has been shown that tackling them simultaneously is more effective at promoting weight loss than targeting either alone [60].

After three months, our results showed improvements in the patients' aerobic exercise capacity with a large effect size in both sexes ($\eta^2p > 0.2$) in the IBI group. Nevertheless, caution must be shown in interpreting these results because this variable also increases in men in the WCL group and there was a non-significant trend towards improvement in women. It is worth considering that a learning effect over a 2-month period has been documented with repeated administration of the 6MWT [61]. However, in contrast to subjective physical activity estimations like questionnaires, in our study we used an accelerometer to obtain precise and objective measurements of activity levels in overweight and obese individuals [62]. We did not find significant inter-group or intra-group differences after three months and so this period may represent too short a time for any physical activity behaviour changes to have been noted among our participants. Unfortunately, the use of accelerometers was associated with difficulties that prevented the participants from repeating the measurements after 12 months. However, the fact that the reduction in BFM doubled in the time between the end of the intervention (3 months) and the end of the study (12 months), while simultaneously maintaining a constant BMI, may indicate that the patients had increased muscle mass secondary to higher levels of physical activity during this period. Thus, future studies will be required to measure muscle mass in order to test this hypothesis.

Targeting specific disease entities

Live better was specifically designed to treat HTN in overweight patients or those with type-I obesity, and its implementation resulted in modest but positive measurable results in body composition and BP. In general, internet-based programs are more successful if they are targeted at specific disease entities such as HTN [38]. Although our study listed diabetes as an exclusion criterion, and our intervention did not specifically focus on this disease, improved glucose metabolism was also relevant in our study because we detected a significant and sustained decrease in glucose levels among our patients. The close relationship between glucose metabolism variables and healthy living through physical activity and healthy eating is well known. In line with this, a recent high-quality randomised lifestyle-intervention trial conducted over 12 and 24 months in individuals with type 2 diabetes mellitus or impaired fasting glucose levels showed the internet-based intervention to be useful in reducing fasting plasma glucose [21].

Program engagement

Lastly, in terms of program engagement, the percentage of participants who completed our entire program was high (73%) and was similar to the levels reported in related eHealth interventions [34,63]. Increasing knowledge about healthy lifestyles and making tailor-made prevention programmes possible can empower individuals and improve their adherence to interventions [64]. In this sense, the wide and still-growing access and use of the internet has become a major resource in the assessment of health information [65]. This is especially true for adults with chronic conditions who are more likely to seek health information on the internet than their counterparts with acute ailments [66-68]. Using modern information and communication technologies to deliver physical activity and diet interventions is particularly promising considering the increased proliferation of such technologies in many developing countries.

The internet is an efficient way to prevent and treat chronic conditions by promoting healthy lifestyles because: (1) it can reach more individuals (including those with limited access to health services or with low levels of social support), and can provide more intensive contact at potentially lower costs than conventional face-to-face programs [69-72]; (2) it can provide immediate, easy-access, individually-tailored (one-to-one), and 'permanent' (accessible at any time) behavioural-change support by delivering care to patients in the comfort of their own homes with self-paced delivery [34,39,71]; and (3) it is less intrusive than traditional methods and can more easily be implemented in an environment that is less threatening than a hospital [10].

However, despite the encouraging results of this study and other studies on internet-based programs, the goal of web-based interventions is not to replace in-person care but rather, to maximise care. Of note, internet interventions also have potential disadvantages, such as their inability to recognise comorbidities that would not have become apparent without the patient implementing lifestyle changes. Furthermore, internet-use depends on age, income, education levels, and digital skills, and there may be participation bias and lower response rates because of technical problems or different levels of computer experience among participants [5]. In addition, ironically, internet use is a sedentary behaviour, which is known to be an independent risk factor for cardiovascular disease, so caution should be exercised when designing these programs so that they prevent rather than encourage further sedentary attitudes and behaviours."

"The main limitation of this study was its lack of a control group for the analysis carried out at 12 months. Although the positive results at 3-months remained at the 12-month follow-up visit, the follow-up analyses were based on uncontrolled data and thus, should be interpreted with caution. Controls eliminate possible alternate explanations of experimental results, especially those of confounding variables and experimental bias, allowing investigators to control for threats to validity.

Furthermore, the participants we enrolled had demonstrated an initial level of motivation to engage in an eHealth program. Therefore, our findings may only be generalisable to individuals with internet access who are similarly interested in such eHealth interventions [73]. In addition, our participants were recruited from a public hospital (rather than a private one) which may have influenced our results because sociodemographic status (which could correlate with the use of public hospitals) has been related to treatment adherence for chronic conditions [74,75]. Another possible limitation of the study was the inclusion of BMI as the primary outcome. Although the waist circumference or waist-hip ratio are considered better anthropometric parameters to reflect the risk of cardiovascular disease associated with obesity, the BMI clinical tool has been shown to have the least bias during assessment [71]. Furthermore, BMI measurements in our study were complemented with segmental body-fat distribution analysis measured with bioelectrical impedance. Finally, even though intervention acceptability is related to its eventual effectiveness [76], we did not assess this data in our study, and thus we do not know how well the participants accepted this internet-based intervention."

21) Generalisability (external validity, applicability) of the trial findings

NPT: External validity of the trial findings according to the intervention, comparators, patients, and care providers or centers involved in the trial

21-i) Generalizability to other populations

Generalizability to other populations: In particular, discuss generalizability to a general Internet population, outside of a RCT setting, and general patient population, including applicability of the study results for other organizations
