

Supplementary Figure 1. Flow chart of the study population.

Supplementary Figure 2. Standardised incidence rates of bone fractures by attained age in male and female offspring exposed and unexposed to maternal smoking during pregnancy.

Incidence rates (per 1000 person-years) are standardised by calendar year of birth and stratified by attained age in males (black circles) and females (grey circles) separately. Incidence rates (95% confidence intervals) of fractures in offspring are for those whose mothers did smoke (filled circles) and did not smoke (open circles) during pregnancy.

Supplementary Methods

Description of Swedish registers used in this study

For this study, the data are from national Swedish registers. Each resident in Sweden is assigned a unique personal identification number which allows data linkage across the registers used here. The Medical Birth Register includes maternal, obstetric and neonatal data for > 98% of all births in Sweden since 1973.¹ The Multi-Generation Register includes information on familial relationships for all individuals born since 1932, such that siblings, parents and offspring can be identified.² The Total Population Register includes dates of birth, death, and migration since 1915.³ The Cause of Death Register is a virtually complete register of all deaths in Sweden since 1961.⁴ The National Patient Register was established in 1964 and has covered all inpatient hospital admissions since 1987 and outpatient physician visits since 2001.⁵ Diagnoses in the National Patient Register are coded according to Swedish versions of the International Classification of Diseases (ICD-8 from 1969 to 1986, ICD-9 from 1987 to 1996 and ICD-10 since 1997) and have been demonstrated to be of high validity with the reported positive predictive value for most diagnoses of 85-95%.⁵ Socioeconomic variables are registered in LISA (the Swedish acronym for the Longitudinal Integration Database for Health Insurance and Labour Market Studies),⁶ which is managed by Statistics Sweden. Using these data sources, we identified 1 680 307 singleton live births in Sweden between 1 January 1987 and 31 December 2000 with complete data on maternal smoking during pregnancy. For the sibling comparison analysis, we used a subset of the cohort comprising 1 234 992 individuals born to 531 884 mothers identified through the Multi-Generation Register. Follow-up in this cohort was up until 31 December 2014.

Analyses

The following variables were included as potential confounders in whole cohort analyses: year of birth (1983, 1984, 1985, 1986, 1987, 1988, 1989, 1990, 1991, 1992, 1993, 1994, 1995, 1996, 1997, 1998, 1999, 2000), sex, maternal age at birth (< 20, 20-24, 25-29, 30-34, ≥ 35 years), maternal height (< 155, 155-164, 165-174, ≥ 175 cm), maternal body mass index (< 18.5, 18.5-24.9, 25.0-29.9, ≥ 30.0 kg/m²), maternal parity (at the time of the index pregnancy, nulliparous, 1, 2, ≥ 3), maternal educational level (compulsory up to 9 years, secondary, post-secondary), maternal occupational classification (low, intermediate, high), parental marital status (unmarried, married, divorced/widow), paternal educational level (compulsory up to 9 years, secondary, post-secondary), paternal occupational classification (low, intermediate, high). We used stratified Cox models with a separate stratum for each family identifier to obtain within-sibship estimates. These within-sibship analyses were adjusted for the same covariates as the multivariable analysis in the whole cohort but excluding maternal height, a variable that is unlikely to vary among siblings in the same family.

To explore the extent to which associations were explained by small size at birth, models were additionally adjusted for gestational age at birth (in weeks) and birth weight for gestational age (in percentiles).

Handling of missing covariate data

In total, 569 526 offspring (34%) had missing data on one or more covariates, which was mainly due to missing information on early pregnancy maternal BMI and height (31%). This is because maternal weight and height were not routinely recorded in women who were pregnant before 1992. Primary analyses were based on complete case data, but we also conducted sensitivity analyses with multiple imputation of missing covariate data. Missing covariate data were imputed under the ‘missing at random assumption’ using multivariate multiple imputation with chained equations ⁷, and 10 imputed datasets were generated. The imputation model included the exposure (no daily smoking, < 10 cigarettes/day, ≥ 10 cigarettes/day), the outcome (i.e. Nelson-Aalen estimator of the baseline cumulative hazard and event indicator), all covariates included in the multivariable adjusted model (i.e. birth year, offspring sex, maternal age, parity,

height, body mass index, parental education, occupation and marital status) and other predictors that were not included in the main analysis model but were associated with some missing data (gestational age at birth and birth weight for gestational age).

Supplementary Table 1. International classification of diseases (ICD) codes for bone fractures.

ICD-8 and 9	Description
800-804	Fracture of skull and facial bones
805-806	Fracture of vertebral column
807	Fracture of rib(s), sternum, larynx, and trachea
808	Fracture of pelvis
809	Ill-defined fractures of bones of trunk
810	Fracture of clavicle
811	Fracture of scapula
812	Fracture of humerus
813	Fracture of radius and ulna
814	Fracture of carpal bone(s)
815	Fracture of metacarpal bone(s)
816	Fracture of one or more phalanges of the hand
817	Multiple fractures of hand bones
818	Ill-defined fractures of upper limb
819	Multiple fractures involving both upper limbs, and upper limb with rib(s) and sternum
820-821	Fracture of femur
822	Fracture of patella
823	Fracture of tibia and fibula
824	Fracture of ankle
825	Fracture of one or more tarsal and metatarsal bones
826	Fracture of one or more phalanges of foot
827	Other, multiple, and ill-defined fractures of lower limb
828	Multiple fractures involving both lower limbs, lower with upper limb, and lower limb(s) with rib(s) and sternum
829	Fracture of unspecified bones
ICD-10	Description
S02	Fracture of skull and facial bones
S12	Fracture of neck
S22	Fracture of rib(s), sternum and thoracic spine
S32	Fracture of lumbar spine and pelvis
S42	Fracture of shoulder and upper arm including humerus
S52	Fracture of forearm including radius and ulna

S62	Fracture at wrist and hand level
S72	Fracture of femur
S82	Fracture of lower leg including ankle (including tibia and fibula)
S92	Fracture of foot, except ankle
T02	Fractures involving multiple body regions
T08	Fracture of spine, level unspecified
T10	Fracture of upper limb, level unspecified
T12	Fracture of lower limb, level unspecified

Supplementary Table 2. Diagnostic codes for bone fractures by anatomical site and mechanism of injury.

Fractures	ICD-8-9	ICD-10
Anatomical site		
Skull and face	800-804	S02
Neck and trunk	805-809	S12, S22, S32, T08
Upper extremity	810-818	S42, S52, S62, T10
-shoulder and upper arm	810-812	S42
-forearm	813	S52
-wrist and hand	814-817	S62
-unspecified	818	T10
Lower extremity	820-827	S72, S82, S92, T12
-femur	820-821	S72
-lower leg and ankle	822-824	S82
-foot	825-826	S92
-unspecified	827	T12
Other	819, 828, 829	T02
Mechanism of injury *		
Non-intentional	E80-E92	V01-V99, W00-X59
Assault	E96	X85-X99, Y00-Y09
Other	Any external cause code except those listed under non-intentional and assault	Any external cause code except those listed under non-intentional and assault

*External cause codes for defining the mechanism of injury are not available for fractures recorded in the Medical Birth Register.

Supplementary Table 3. Bone fractures by anatomical site and mechanism of injury in all offspring and those with and without siblings, overall and stratified by attained age.

Hazard ratios (with 95% confidence intervals) for bone fractures comparing offspring exposed to maternal smoking during pregnancy (any, 1-9 cigarettes/day, \geq 10 cigarettes day) to those unexposed (= reference group). Hazard ratios are presented by attained age (0 to < 1 year, 1 to < 5 years, 5 to < 15 years, ≥ 15 years) and for the different analysis models: model 1: whole cohort analysis adjusted for birth year; model 2: whole cohort analysis with adjustment for birth year, offspring sex, maternal age, parity, height, body mass index, parental education, occupation and marital status; and model 3: within-sibship analysis including all covariates included in model 2 except for maternal height, a variable which is unlikely to vary among siblings in the same family. * The within-sibship analysis model includes all offspring with siblings, but only families who are discordant on both the exposure and outcome contribute to the estimation of the hazard ratio. The numbers presented in the table therefore refer to the total number of offspring with siblings discordant on bone fractures and maternal smoking during pregnancy.

Abbreviations: HR = hazard ratio; CI = confidence interval.

Supplementary Table 8. Maternal smoking during pregnancy and risk of bone fractures in offspring by attained age in months up to one year of age.

Hazard ratios (with 95% confidence intervals) for infant bone fractures comparing offspring exposed to maternal smoking during pregnancy (any, 1-9 cigarettes/day, ≥ 10 cigarettes day) to those unexposed (= reference group). Hazard ratios are presented by attained age (0 to < 3 months, 3 months to < 1 year) and for the different analysis models: model 1: whole cohort analysis adjusted for birth year; model 2: whole cohort analysis adjusted for birth year, offspring sex, maternal age, parity, height, body mass index, parental education, occupation and marital status; and model 3: within-sibship analysis including all covariates included in model 2 except for maternal height, a variable which is unlikely to vary among siblings in the same family. * The within-sibship analysis model includes all offspring with siblings, but only families who are discordant on both the exposure and outcome contribute to the estimation of the hazard ratio. The numbers presented in the table therefore refer to the total number of offspring with siblings discordant on bone fractures and maternal smoking during pregnancy. Abbreviations: HR = hazard ratio; CI = confidence interval.

Supplementary Table 9. Maternal smoking during pregnancy and risk of bone fractures in offspring by attained age – analyses with additional adjustment for gestational age at birth and birth weight for gestational age.

Hazard ratios (with 95% confidence intervals) for bone fractures comparing offspring exposed to maternal smoking during pregnancy (any, 1-9 cigarettes/day, \geq 10 cigarettes day) to those unexposed (= reference group) – analyses in offspring with and without siblings. Hazard ratios are presented by attained age (0 to < 1 year, 1 to < 5 years, 5 to < 15 years, \geq 15 years) for model 2: whole cohort analysis adjusted for birth year, offspring sex, maternal age, parity, height, body mass index, parental education, occupation and marital status. Abbreviations: HR = hazard ratio; CI = confidence interval.

Supplementary Table 15. Maternal smoking during pregnancy and risk of bone fractures in offspring by attained age – within-sibship analyses including full siblings only.

Hazard ratios (with 95% confidence intervals) for bone fractures comparing offspring exposed to maternal smoking during pregnancy (any, 1-9 cigarettes/day, ≥ 10 cigarettes day) to those unexposed (= reference group) – analyses after multiple imputation of missing covariate data. Hazard ratios are presented by attained age (0 to < 1 year, 1 to < 5 years, 5 to < 15 years, ≥ 15 years) and for the different analysis models: model 2: whole cohort analysis adjusted for birth year, offspring sex, maternal age, parity, height, body mass index, parental education, occupation and marital status; and model 3: within-sibship analysis including all covariates included in model 2 except for maternal height, a variable which is unlikely to vary among siblings in the same family. * The within-sibship analysis model includes all offspring with siblings, but only families who are also discordant on both the exposure and outcome contribute to the estimation of the hazard ratio. The numbers presented in the table therefore refer to the total number of offspring with siblings discordant on bone fractures and maternal smoking during pregnancy.

Abbreviations: HR = hazard ratio; CI = confidence interval.
