Text S2: Details on the missing SDs imputation for each outcome

Methods for imputation of missing standard deviations

We used published standard deviations (SDs), where available. When standard errors instead of SDs were presented, the former was converted to SDs.¹ If both were missing, we estimated SDs from P values or confidence interval (CIs) according to the recommendations of the Cochrane Handbook for Systematic Reviews.¹ We also estimated SDs from graphs when they were missing in tables or in text. If studies reported medians and interquartile ranges (IQRs), we used median to impute the missing mean and calculated SDs by dividing IQRs by 1.35.¹ If none of these options are viable, we imputed the missing SDs using pooled SDs from other studies included in our NMA following the formula below:²

$$SD_{pooled} = \sqrt{\frac{\sum(n_i - 1)SD_i^2}{\sum(n_i - 1)}}$$

Weight loss at 12 months

Eight studies did not report the SDs in their report. Six studies (Bazzano, 2014; Foster GD, 2010; Aldana, 2007; Gardner, 2007; Rock, 2010; Jolly, 2011) reported 95% Confidence Intervals (CIs) of mean, we estimated the SDs from 95% CIs. One study (Iqbal, 2010) provided the error bars of mean change in Figure 2 of their report, we estimated the SD from graph. One study (Green, 2015) reported P value between experimental and control groups ($P=0.03$), we estimated the SD between groups from P value and used this to impute the missing SDs for both groups (degrees of freedom=87+81-2=166, obtained SD=2.19 by entering =tinv(0.03, 166) into a cell in a Microsoft Excel spreadsheet).

Weight loss at 6 months

Twenty-one studies did not report the SDs. Fifteen studies (Ijzelenberg, 2012; Konstantinidou, 2010 ; Wardle, 2000; Bazzano, 2014; Foster GD, 2010; Yancy, 2004; Aldana, 2007; Gardner, 2007; Rock, 2010; Jolly, 2011; Jenkins, 2014; Liu, 2013; Veum, 2017; Ramprasath, 2014; Jenkins, 2017) reported 95% CIs of mean, we estimated the SDs from 95% CIs. One study (Iqbal, 2010) provided the error bars of mean change in Figure 2 of their report, we estimated SD from graph. One study (Green, 2015) reported P value between experimental and control groups ($P=0.001$), we estimated the SD between groups from P value and used to impute the missing SDs for both groups (degrees of freedom=93+85-2=178, obtained SD=3.35 by entering =tinv(0.001, 178) into a cell in a Microsoft Excel spreadsheet). We imputed the missing SDs of 4 studies (Blumenthal, 2010a; Dyson, 2007; Johnston, 2013; Lima, 2013) using the pooled SDs.

SBP reduction at 12 months

Four studies did not report the SDs. Four of them (Bazzano, 2014; Foster GD, 2010; Aldana, 2007) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 1 studies (Green, 2015) using the pooled SDs.

SBP reduction at 6 months

Thirteen studies did not report the SDs. Nine of them (Konstantinidou, 2010; Blumenthal, 2010a; Bazzano, 2014; Foster GD, 2010; Yancy, 2004; Aldana, 2007; Liu, 2013; Ramprasath, 2014; Davis, 2017) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 4 studies (Blumenthal, 2000; Lima, 2013; Samaha 03; Green, 2015) using the pooled SDs.

DBP reduction at 12 months

Four studies did not report the SDs. Four of them (Bazzano, 2014; Foster GD, 2010; Aldana, 2007) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 1 studies (Green, 2015) using the pooled SDs.

DBP reduction at 6 months

Fourteen studies did not report the SDs. Ten of them (Konstantinidou, 2010; Blumenthal, 2010a; Bazzano, 2014; Foster GD, 2010; Yancy, 2004; Aldana, 2007; Jenkins, 2014; Liu, 2013; Ramprasath, 2014; Davis, 2017) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 4 studies (Blumenthal, 2000; Lima, 2013; Samaha 03; Green, 2015) using the pooled SDs.

LDL reduction at 12 months

Three studies did not report the SDs. Two of them (Foster GD, 2010; Aldana, 2007) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 1 studies (Green, 2015) using the pooled SDs.

LDL reduction at 6 months

Fifteen studies did not report the SDs. Nine of them (Wardle, 2000; Konstantinidou, 2010; Blumenthal, 2010a; Bazzano, 2014; Foster GD, 2010; Aldana, 2007; Rock, 2010; Jenkins, 2014; Ramprasath, 2014) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 6 studies (Austel, 2015; Dyson, 2007; Lasker, 2008; Yancy, 2004; Yang, 2016; Green, 2015) using the pooled SDs.

HDL increase at 12 months

Four studies (Bazzano, 2014; Foster GD, 2010; Aldana, 2007; Rock, 2010) reported 95% CIs of mean, we estimated the SDs from 95% CIs. We imputed the missing SDs for 1 studies (Green, 2015) using the pooled SDs.

HDL increase at 6 months

Seventeen studies did not report the SDs. 12 of them (Wardle, 2000; Konstantinidou, 2010; Blumenthal, 2010a; Bazzano, 2014; Foster GD, 2010; Aldana, 2007; Rock, 2010; Jenkins, 2014; Liu, 2013; Veum, 2017; Ramprasath, 2014; Yang, 2016) reported 95% CIs of mean, we estimated the

SDs from 95% CIs. We imputed the missing SDs for 5 studies (Austel, 2015; Dyson, 2007; Lasker, 2008; Yancy, 2004; Green, 2015) using the pooled SDs.

CRP reduction at 12 months

One studies (Bazzano, 2014) reported 95% CIs of mean, we estimated the SDs from 95% CIs. One reported IQR of median (Rock, 2010), we estimated the SDs from IQR.

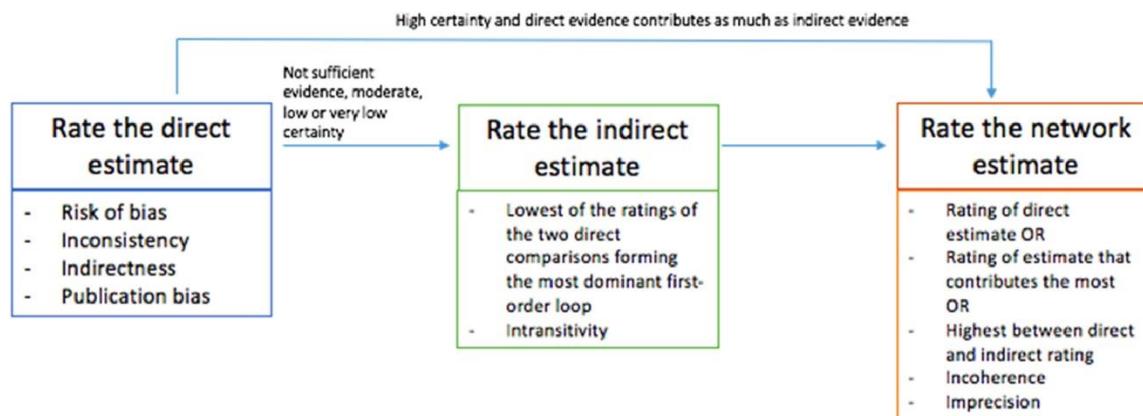

CRP reduction at 6 months

Five studies (Konstantinidou, 2010; Bazzano, 2014; McAuley, 2005; Jenkins, 2014; Ramprasath, 2014) reported 95% CIs of mean, we estimated the SDs from 95% CIs. One reported IQR of median (Rock, 2010), we estimated the SDs from IQR.

Text S3: Instructions for GRADE assessment

Our certainty of assessments addressed the following categories: risk of bias, imprecision, inconsistency, and indirectness. We did not assess for publication bias given the most popular diets were usually compared to an active control (low fat diet or another popular diet) and a limited number of popular diets were compared to usual diet as a control. In particular, only 2 of 136 comparison groups (Atkins versus Control-low fat, and Zone versus Control-low fat) had more than 10 studies. For both direct and indirect comparisons, the starting point for certainty in estimates was ‘high’. The certainty in indirect estimates was inferred from examination of the dominant lowest order loop. We identified the dominant lowest order loop by per comparison contribution matrix which could show the contribution percentage of each direct comparison to each indirect comparison. If more than one loop contributed similar power to the indirect estimate, we assumed that the grade of the indirect evidence started at the lowest grade within all similarly contributing loops. The certainty rating chosen was the lowest of the direct estimates contributing to the indirect comparison. For instance, consider a comparison of A versus B that is informed by A versus C and B versus C. If A versus C was rated as high certainty and B versus C as moderate certainty, the overall indirect certainty rating was moderate (moderate from the B versus C comparison). We considered further rating down each indirect comparison for intransitivity if the interventions or populations were dissimilar between the direct comparisons informing the dominant loop with respect to exercise, behavioral support (i.e. the loop that contributed most to the indirect estimate).

Network estimate certainty started with the certainty of evidence from the direct or indirect evidence that dominated the comparison. We considered rating down the certainty in the network estimate if there was incoherence between the indirect and direct estimates or if there was imprecision (wide credible intervals) around the treatment effect. When there was serious inconsistency, we used the estimates with the higher certainty of the direct and indirect evidence.

Instruction for each domain:

Risk of Bias – For each direct estimate, we rated down for risk of bias if studies with high risk of bias had contributed more to the overall effect estimate. If half the studies were at high risk and half at low risk, we assigned risk of bias based on the total number of patients randomized within

each risk of bias category. For example, if 2 studies are high risk with a total of 500 patients, while 2 studies are at low risk with a total of 300 patients, the risk of bias was high.

Inconsistency/heterogeneity – We assessed the inconsistency for each direct estimate by visually inspecting the distribution of point estimates and corresponding 95% credible intervals. We looked to see if the point estimates were in the same direction, similar in magnitude and we assessed if the estimates all fell within the widest 95% credible intervals.

Publication bias: not detectable.

Indirectness – for weight-loss comparisons, if the majority of participants enrolled included clinical populations, we rated down for indirectness. If we concluded that an active popular diet (Mediterranean) was of higher certainty evidence than another active diet (Atkins, DASH, Jenny Craig, Zone) and there was no direct comparison, we also rated down. For lipid markers, blood pressure and CRP comparisons, if the majority of studies enrolled patients with clinical conditions respective to the outcome of interest (e.g. high lipids, blood pressure), we rated down for indirectness.

Intransitivity – we assessed the intransitivity (the distribution of effect modifiers [exercise, behavioral support]) between comparisons that informed the direct comparisons for the indirect estimates. To do so, we looked at the league tables for adjusted and unadjusted estimates. If the point estimates were relatively the same, and the point estimates for each fell within the largest 95%CrI, we did not rate down.

Imprecision – Among all outcomes, we rated down for imprecision among direct estimates if there was a small sample size (less than 400 among continuous outcomes).

Weight loss: Among Indirect and network estimates, for active popular diets versus control or active versus active popular diet groups, we rated down for imprecision if the confidence interval crossed 1 kg.

For remaining CV risk outcomes: For active popular diets versus active diets or control groups, we rated down for imprecision if the confidence interval crossed our minimal important difference (MID). Based on consultation with cardiovascular experts and the literature, the MIDs were determined to be 2.5% for SBP and DBP, and 5% for LDL, HDL and CRP (Chaivaroli L et al. 2018).

	Normal	20%	15%	10%	5%	2.5%
SBP	120 mm Hg	24	18	12	6	3 (MID)
DBP	80 mm Hg	16	12	8	4	2 (MID)
LDL	100 mg/dL	20	15	10	5 (MID)	2.5
HDL ↑	40 mg/dL	8	6	4	2 (MID)	1
CRP	10 mg/dL	2	1.5	1.0	0.5 (MID)	0.25

SBP/DBP: 2mmHg - based on epidemiology in relation to stroke, MI, etc.

LDL and HDL: 5% or 0.1mmol/L - based on FDA/Health Canada cholesterol-lowering health claims for foods

CRP: 0.5mg/L - based on Reynolds Risk score 0.5mg/L = 1% change in 10y CVD risk

GRADE certainty in estimates

High certainty - Further research is very unlikely to change our certainty in the estimate of effect;

Moderate certainty - Further research is likely to have an important impact on our certainty in the estimate of effect and may change the estimate;

Low certainty - Further research is very likely to have an important impact on our certainty in the estimate of effect and is likely to change the estimate;

Very low certainty - Any estimate of effect is very uncertain.

Table S1: The characteristics of eligible dietary program study interventions

Dietary program*	Calorie & macronutrient recommendations	Exercise recommendations	Behavioral supports	Other co-interventions
Atkins	Though several studies incorporating this diet program did not recommend a specific caloric intake, among those that did the daily intake ranged from 1400-2200 and 1200-1600 calories for males and females, respectively. This program was often based on an Atkins manual, and typically involved an initial induction phase in which carbohydrates (CHO), proteins and fats were, respectively, 4-5%, 35% and 60% of the daily caloric intake. This was followed by a gradual increase in carbohydrate intake until a goal weight was achieved.	Several studies encouraged exercise, consisting of at least 30 minutes per day, 3 days of the week.	Participants were offered supports such as individualized daily calorie targets; weekly calorie controlled, low-fat menu plans, grocery lists, and exercise plans; access to a web-based food and exercise diary and community forums; and group meetings and dietitian-led education sessions.	Among studies providing additional co-interventions, this typically consisted of multivitamin supplements or prepared foods to aid with adherence.
DASH	DASH focuses on reduction of daily sodium intake (2,300 mg/day; 1,500 mg/day for some groups), with advice to consume the appropriate amount of calories to maintain a healthy weight or lose weight if needed. Daily Nutrient Goals Used in the DASH Studies (for a 2,000-Calorie Eating Plan) (Total fat: 27% of calories; Saturated fat: 6% of calories; Protein: 18% of calories; Carbohydrate: 55% of calories; Cholesterol: 150mg; Sodium: 2300mg; Potassium: 4700mg; Calcium: 1250mg; Magnesium: 500mg; Fiber: 30g). A minority of studies recommended calorie restrictions of about 500 kcal/d. Most provided no caloric guidelines.	Exercise is not typically part of the DASH eating plan. Studies in this review advised high, moderate, low or no exercise.	Participants were provided with moderate to high support in these studies, including menu plans and dietitian support in group or individual settings. Some studies included psychological strategies such as Cognitive Behavioural Therapy.	No additional co-interventions.
Jenny Craig**	This program typically suggested a daily caloric intake between 1200-2000 calories. Though macronutrient recommendations were not clearly provided, in general the Jenny Craig program encourages a macronutrient intake of 50-60% CHO, 20-30% protein and 20-30% fats. ¹	Recommendations of 30 minutes of exercise on 5 or more days of the week were provided.	Participants in this program were provided with personalized meal and exercise plans, and one-to-one counseling sessions with a Jenny Craig certified consultant.	Participants were provided with prepackaged, prepared foods.
Mediterranean	Participants were encouraged to increase intake of vegetables, legumes, whole grains and bread, to eat fish regularly, and to choose poultry rather than other meats. Olive oil was usually recommended. A few studies recommended moderate consumption of red wine with meals.	In half of the studies, this program included exercise (typically walking or moderate aerobic activity).	Mediterranean diet intervention arms almost always included moderate to high support, including nutritional counselling, menus, and shopping lists. Several studies demonstrated support using shared meals as part of the support.	A minority of studies provided supplements (olive oil, nuts or fish oil capsules). There were no additional co-interventions.
Ornish	A daily caloric recommendation was not clearly provided in this program. However, participants were encouraged to follow a macronutrient intake of 75% CHO, 15% protein, and 10% fats.	Participants engaged in twice-weekly supervised exercise sessions. Independent, daily exercise of at least 30 minutes per day was encouraged.	Participants were provided with sessions that included supervised exercise, stress management, a meal, lifestyle-related lecture and group support.	Participants were offered to supplement their diet with a multivitamin and omega-3 fatty acids.

<i>Paleolithic</i>	The paleolithic diet aims to mimic hunter-gatherer diet by excluding added sugars and grains and emphasizing protein (typically meat), seeds, nuts and vegetables. Paleolithic programs did not restrict caloric intake.	Exercise is not typically part of the paleolithic program. Studies either recommended increased exercise without specific guidelines or did not address exercise.	Participants were provided with low to moderate support, from written materials to formal cooking classes and recipes.	No additional co-interventions.
<i>Portfolio</i>	This program encouraged consumption of a low-weight maintaining vegetarian diet high in cholesterol-lowering foods. The goal of the dietary portfolio was to increase plant sterols, viscous fiber (oats, barley, and psyllium), soy protein and nuts, with encouragement to consume peas, beans and lentils.	Exercise is not part of the dietary portfolio program.	Participants were provided with moderate support. Dietitians counselled participants regularly and modified pre-intervention 7-day intake records to incorporate study foods. Participants received a 7-day study food checklist and an illustrated study booklet.	Participants used a plant sterol ester-enriched margarine.
<i>Rosemary Conley</i>	Caloric and macronutrient recommendations were not clearly provided. Rosemary Conley's 'Eat Yourself Slim' manual suggests 60% CHO, 15% protein, and selection of foods containing <4% fats. ²	Weekly, group exercise classes were offered to participants.	Group meetings; one-on-one support; additional supports via e-mail and telephone; and exercise sessions were offered to participants.	No additional co-interventions.
<i>Slimming World</i>	Weight loss goals in this program were individualized, and macronutrient recommendations were not clearly indicated. The approach of this program, however, is in accordance with the British Nutrition Foundation, which recommends a diet consisting of 60% CHO and 35% fats. ^{3,4}	Participants were encouraged to gradually build up to 30 minutes of intense physical activity 5 days a week.	Participants were offered group meetings and group support; one-to-one phone support from a consultant or group members; and access to program websites and magazines.	No additional co-interventions.
<i>South Beach</i>	Specific caloric and macronutrient recommendations were not clearly specified in this program. Participants followed the initial phase of the diet for 2 weeks and consumed small quantities of low glycemic-index carbohydrates, high intake of protein, and moderate intake of mono- and polyunsaturated fats. Following this phase participants gradually added carbohydrates back to their diet.	Exercise and physical activity were assessed, but not clearly recommended to participants in this program.	Individual counseling and support from a bariatric nutritionist were provided to participants in this diet program. In addition, participants were provided with sample meal plans and written instructions about the diet	No additional co-interventions.
<i>The Biggest Loser</i>	Daily caloric intake targets were individualized in this program. Though specific macronutrient recommendations were not clearly provided, this program generally suggests no more than 30% daily caloric intake from fats.	Weekly physical activity was encouraged and based on exercise preferences.	Participants were provided with access to online calorie-controlled, low-fat menu plans and grocery lists; weekly physical activity plans based on exercise preferences; and web-based community forums and newsletters.	No additional co-interventions.
<i>Volumetrics</i>	The key component of the program involves consumption of foods with low energy density (foods that contain a small number of calories relative to their size). Specific macronutrient recommendations were not clearly provided in this program, though Volumetrics generally	Participants were encouraged to exercise daily for 30 minutes, 5 days a week.	Participants were provided with written materials and instructions from a dietitian in an effort to help them achieve a reduced fat diet	No additional co-interventions.

	suggests a daily macronutrient intake of 55% carbohydrates, 15-25% protein and 20- 30% fats. ⁵			
<i>Weight Watchers</i>	In general, this program consists of tracking daily points (each point is about 50 kcal) based on a participant's current weight and weight loss goals. Though a recommended macronutrient intake was not clearly specified, this program is generally consistent with the National Academy of Sciences acceptable macronutrient distribution ranges for adults, which are 45-65% carbohydrates, 10-35% protein and 20-35% fats. ⁶	Thirty minutes of exercise on most days of the week was encouraged.	Participants were typically provided with access to weekly group meetings and support, behavioral counseling, individual contact with the dietitian and educational resources such as recipes and meal ideas, as well as community discussion boards.	No additional co-interventions.
<i>Zone</i>	This program typically consisted of an active weight loss-phase in which the daily caloric intake was reduced to 1500 and 1200 calories for males and females respectively, followed by a weight maintenance phase. The recommended macronutrient intake during both phases was 40% carbohydrates, 30% protein and 30% fats.	Thirty minutes of exercise on most days of the week was encouraged.	Participants were typically offered meal planning and nutritional counseling from a dietitian and group support.	Among studies providing additional co-interventions, this typically consisted of prepared foods to aid with adherence.

*This table was derived from data provided in the studies. If this information was not reported, then the data was taken from the dietary program website or other available resources; please note there is often considerable variability between branded diets within included studies. **Only female participants were enrolled in the 2 eligible and included Jenny Craig trials.

Most of RCTs (90.98%) received funding support, in which 34.7% were funded in-part or in-whole by diet company. 57.8% reported that none of the authors declared a conflict of interest. 52.0% studies did not specify the primary outcome. 7.4% studies specified the primary outcomes that were not our targeted outcomes. 53.7% studies did not specify the secondary outcome. 21.5% studies specified the primary outcomes that were not our targeted outcomes.

Notes:

NR = not reported

NS = not specified (the outcomes didn't subdivided into the primary outcomes or secondary outcomes.)

"Not relevant" means that the primary/secondary outcomes reported in RCTs were not our targeted outcomes (our targeted outcomes include weight loss, SBP, DBP, LDL, HDL, and CRP).

* means acronym undefined

Note 1: Bibus has received consulting fees from companies that make fish oil, Coromega Co., Vista, CA, and Enreco, Inc., Newton, WI. He also has equity ownership in Lipid Technologies, LLC, Austin, MN, the company that performed the plasma fatty acid analysis. Bibus owns patents related to lipid therapy. He has served as an expert witness regarding lipids and fatty acids.

Note 2: Ruth, Shah, Port, Bourland, Istfan, Nelson and Gokce have no competing interests. Apovian has served on the advisory boards for Allergan, Amylin, Orexigen, Merck, Johnson and Johnson, Abbott, Arena, Zafgen, Novo Nordisk and SanofiAventis and has received research funding from Lilly, Amylin, Pfizer, Sanofi-Aventis, Orexigen, MetaProteomics, and the Dr. Robert C. and Veronica Atkins Foundation.

Note 3: DRM and PAD have received research funding from the Sugar Bureau. SB has no competing interests to declare.

Note 4: DKL received grant/research support from the funding agencies for this research: the National Cattleman's Beef Association, The Beef Board and Kraft Foods.

Note 5: Dr. Foster reports having received consulting fees from Abbott Laboratories and HealtheTech and lecture fees from Abbott Laboratories and Roche Laboratories. Dr. Wyatt reports having received consulting fees from Ortho-McNeil, USANA, and GlaxoSmithKline and lecture fees from Roche Laboratories, Abbott Laboratories, Slim-Fast, and Ortho-McNeil. Dr. Hill reports having received consulting fees from HealtheTech, Johnson & Johnson, Procter & Gamble, Coca-Cola, and the International Life Sciences Institute; lecture fees from Abbott Laboratories, Roche Laboratories, and Kraft Foods; and grant support from M&M Mars, Procter & Gamble, and Abbott Laboratories. Dr. Szapary reports having received lecture fees from AstraZeneca and Kos Pharmaceuticals and grant support from AstraZeneca. Dr. Klein reports having received consulting fees from Roche Laboratories and HealtheTech, lecture fees from Ortho-McNeil, and grants from GlaxoSmithKline and Regeneron.

Note 6: The General Clinical Research Center scientific staff provided consultation in the design of the study. The General Clinical Research Center nursing staff provided assistance with the data collection. No sponsor participated in the analysis or interpretation of the data, manuscript preparation, review, or approval, or the decision to publish.

Note 7: Grants received: E.C. Westman (Robert C. Atkins Foundation); Grants pending: E.C. Westman and W.S. Yancy Jr. (Robert C. Atkins Foundation).

Note 8: CEC is a dietetic consultant to SP Health Co. M Neve received a PhD scholarship supplement from SP Health Co, and P Jones is employed as an Accredited Practising Dietitian by SP health Co. All other authors declare that they have no competing interests.

Note 9: Dr Anderson has received grants/research support from Abbott, AstraZeneca, Aventis, Bristol-Myers Squibb, GlaxoSmithKline, Health Management Resources, Johnson & Johnson, Kos, Merck, NutriPharma, Protein Technologies International, Procter&Gamble, Regeneron,

Roche, Schering- Plough, Tishcon, Weight Watchers, and Wyeth- Ayerst, has served as a consultant to GlaxoSmithKline, Health Management Resources, Johnson & Johnson, Knoll, NutriPharma, and Protein Technologies International, and has received honoraria from Abbott, Bristol- Myers Squibb, GlaxoSmithKline, NutriPharma, and Protein Technologies International; Dr Greenway is a consultant to Jenny Craig; and Dr Pi-Sunyer serves on the scientific advisory board for Weight Watchers

Note 10: DJAJ has served on the Scientific Advisory Board of Sanitarium Company, Agri-Culture and Agri-Food Canada (AAFC), Canadian Agriculture Policy Institute (CAPI), California Strawberry Commission, Loblaws Supermarket, Herbal Life International, Nutritional Fundamental for Health, Pacific Health Laboratories, Metagenics, Bayer Consumer Care, Orafti, Dean Foods, Kellogg's, Quaker Oats, Procter & Gamble, Coca-Cola, NuVal Griffin Hospital, Abbott, Pulse Canada, Saskatchewan Pulse Growers, and Canola Council of Canada; received honoraria for scientific advice from Sanitarium Company, Orafti, the Almond Board of California, the American Peanut Council, International Tree Nut Council Nutrition Research and Education Foundation and the Peanut Institute, Herbal Life International, Pacific Health Laboratories, Nutritional Fundamental for Health, Barilla, Metagenics, Bayer Consumer Care, Unilever Canada and Netherlands, Solae LLC, Oldways, Kellogg's, Quaker Oats, Procter & Gamble, Coca-Cola, NuVal Griffin Hospital, Abbott, Canola Council of Canada, Dean Foods, California Strawberry Commission, Haine Celestial, Pepsi, and Alpro Foundation; has been on the speakers panel for the Almond Board of California; received research grants from Saskatchewan Pulse Growers, the Agricultural Bioproducts Innovation Program (ABIP) through the Pulse Research Network (PURENet), Advanced Food Materials Network (AFMNet), Loblaws, Unilever, Barilla, Almond Board of California, Coca-Cola, Solae LLC, Haine Celestial, Sanitarium Company, Orafti, International Tree Nut Council Nutrition Research and Education Foundation and the Peanut Institute, the Canola and Flax Councils of Canada, Calorie Control Council, Canadian Institutes of Health Research (CIHR), Canada Foundation for Innovation, and the Ontario Research Fund; and received travel support to meetings from the Solae LLC, Sanitarium Company, Orafti, AFMNet, Coca-Cola, The Canola and Flax Councils of Canada, Oldways Preservation Trust, Kellogg's, Quaker Oats, Griffin Hospital, Abbott Laboratories, Dean Foods, the California Strawberry Commission, American Peanut Council, Herbal Life International, Nutritional Fundamental for Health, Metagenics, Bayer Consumer Care, AAFC, CAPI, Pepsi, Almond Board of California, Unilever, Alpro Foundation, International Tree Nut Council, Barilla, Pulse Canada, and the Saskatchewan Pulse Growers. CWCK reported being on speakers bureaus for Almond Board of California, Solae LLC, and Unilever; and receiving research grants from CIHR, Unilever, Solae LLC, Loblaws Brands Ltd, International Tree Nut Council, and Almond Board of California. EV has received partial salary funding from research grants provided by Unilever, Loblaws, and the Almond Board of California. GP, RM and ESK are employees of Solae, LLC. JMWW was a recipient of a Canadian Institutes of Health Research (CIHR) Doctoral Research Award and is now a holder of a CIHR randomised controlled trials—mentoring program Training Grant.

Note 11: By contractual agreement, scientists at UCSD and the University of Minnesota have responsibility and independence regarding data management, analysis, and publication. The sponsor contributed to the development of the design and protocol through discussions with the investigators during the development phase of the study. The funding sponsor had no role in

the conduct of the study; collection, management, analysis, and interpretation of the data; preparation, review, or approval of the manuscript (except for verifying the specific weight loss program activities that comprised the intervention); and decision to submit the manuscript for publication. No other potential conflicts of interest relevant to this article were reported.

Note 12: Dr. Ramprasath reported receiving grants from CRCE of the Federal Government of Canada, CIHR, AFM Net, Loblaw Brands Ltd, Solae, and Unilever. Dr. Jenkins reported serving on the Scientific Advisory Board of Unilever, Sanitarium Company, California Strawberry Commission, Loblaw Supermarket, Herbal Life International, Nutritional Fundamental for Health, Pacific Health Laboratories, Metagenics, Bayer Consumer Care, Orafti, Dean Foods, Kellogg's, Quaker Oats, Procter & Gamble, Coca-Cola, NuVal Griffin Hospital, Abbott, Pulse Canada, Saskatchewan Pulse Growers, and Canola Council of Canada; receiving honoraria for scientific advice from the Almond

Board of California, International Tree Nut Council Nutrition Research and Education Foundation, Barilla, Unilever Canada, Solae, Oldways, Kellogg's, Quaker Oats, Procter & Gamble, Coca-Cola, NuVal Griffin Hospital, Abbott, Canola Council of Canada, Dean Foods, California Strawberry Commission, Haine Celestial, and Alpro Foundation; being on the speakers panel for the Almond Board of California; receiving research grants from Loblaw Brands Ltd, Unilever, Barilla, Almond Board of California, Solae, Haine Celestial, Sanitarium Company, Orafti, International Tree Nut Council, and Peanut Institute; and receiving travel support to meetings from the Almond Board of California, Unilever, Alpro Foundation, and International Tree Nut Council. Dr. Jenkins' wife is a director of Glycemic Index Laboratories, Toronto, Ontario, Canada, and his sister, Caroline Brydson, contributed to the diet booklet used in the study, which may in the future be expanded to book form for the general public. Dr. Jones reported receiving grants from the Canadian Institutes of Health Research (CIHR), Canada Research Chair Endowment (CRCE) of the Federal Government of Canada, Advanced Foods and Materials Network (AFM Net), Danone, Enzymotec, and Unilever. Dr. Jones also serves as president of Nutritional Fundamentals for Health Inc, which markets plant sterols among other nutraceuticals. Dr. Lamarche reported receiving grants from CIHR and AFM Net, being a consultant and on speakers bureaus for Danone, and receiving royalties from Atrium Innovations. Dr. Kendall reported being on speakers bureaus for Almond Board of California, Solae, and Unilever; and receiving research grants from CIHR, Unilever, Solae, Loblaw Brands Ltd, International Tree Nut Council, and Almond Board of California. Dr. Faulkner reported receiving grants from CRCE of the Federal Government of Canada, CIHR, AFM Net, Loblaw Brands Ltd, Unilever, and Solae. Ms. Cermakova reported receiving grants from CRCE of the Federal Government of Canada, CIHR, AFM Net, Loblaw Brands Ltd, Unilever, Solae, and Viterra Food Processing-Oat and Specialty Grain Milling. Dr. de Souza reported receiving grants from Coca-Cola, Calorie Control Council, and CIHR. Mr. Ireland reported receiving grants from CRCE of the Federal Government of Canada, CIHR, AFM Net, Loblaw Brands Ltd, Solae, and Unilever. Ms. Patel reported receiving grants from CRCE of the Federal Government of Canada, CIHR, AFM Net, Loblaw Brands Ltd, Solae, and Unilever. Dr. Bashyam reported receiving grants from CIHR, CRCE of the Federal Government of Canada, AFM Net, Loblaw Brands Ltd, Solae, and Unilever. No other authors reported any conflict of interest.

Note 13: Dr. Green has received grant support from AHRQ, the Kaiser Permanente Center for Safety and Effectiveness Research, the Kaiser Permanente Community Benefit Initiative, NIDA,

NIDDK, NIH, NIMH, and Purdue Pharma; she has also provided research consultation for The Industry PMR (the Industry PMR consortium is comprised of Actavis, Endo Pharmaceuticals, Janssen Pharmaceuticals, Mallinckrodt, Pfizer, Purdue Pharma, Rhodes Pharmaceuticals, Roxane Laboratories, and Zogenix). Dr. Yarborough has received grant support from AHRQ, the Kaiser Permanente Center for Safety and Effectiveness Research, the Kaiser Permanente Community Benefit Initiative, NCCAM, NIDA, NIDDK, NIMH, and Purdue Pharma. Dr. Leo has received funding from GenomeDX Biosciences and Pfizer. Mr. Yarborough has received grant support from the Kaiser Permanente Community Benefit Initiative, NIDDK, NIMH, and Purdue Pharma. Mr. Stumbo has received grant support from AHRQ, the Health Resources and Services Administration, the Kaiser Permanente Community Benefit Initiative, the Lucile Packard Foundation for Children's Health, Maternal and Child Health Bureau, NCCAM, NIDDK, NIMH, and Purdue Pharma. Ms. Janoff has received grant support from AHRQ, the Kaiser Permanente Center for Safety and Effectiveness Research, NIDA, NIDDK, NIMH, and Purdue Pharma. Dr. Perrin has received grant support from AHRQ, the Centers for Disease Control and Prevention, the Kaiser Permanente Community Benefit Initiative, Kaiser Permanente Northwest, Merck, NCCAM, NCI, NCMHD, NHLBI, NIA, NICHD, NIDA, NIDDK, NIMH, NINR, NIOSH, Purdue Pharma, and the Veterans Administration. Dr. Nichols has received grant support from AHRQ, AstraZeneca, Bristol-Myers Squibb, GlaxoSmithKline, NHLBI, NIDDK, NIH, Novartis Pharmaceuticals, and Merck. Dr. Stevens has received grant support from AHRQ, NCCAM, NCI, NCRR, NHLBI, NICHD, NIDDK, NIH, and Kaiser Permanente Northwest.

Note 14: K. Miller-Kovach and G. D. Foster are both employed by Weight Watchers International

Note 15: Food items for the food basket were contributed by Loblaw Cos. Ltd., Alberta Barley Commission, Almond Board of CA, Barilla, ConAgra Foods, Earth's Own Food Co. Inc., International Nut Council, Kellogg Co., Mars Canada, Pepsi-QTG Canada, Puresource Natural Products, and So Soyab Inc. Dr. Jenkins has received research grants from Saskatchewan Pulse Growers, Agricultural Bioproducts Innovation Program through the Pulse Research Network, Advanced Foods and Material Network, Loblaw Cos. Ltd., Unilever, Barilla, Almond Board of CA, Agriculture and Agri-food Canada, Pulse Canada, Kellogg's Co., Canada, Quaker Oats, Canada, Procter & Gamble Technical Centre Ltd., Bayer Consumer Care, Pepsi/Quaker, International Nut & Dried Fruit, Soy Foods Association of North America, Coca-Cola Co. (investigator-initiated, unrestricted grant), Solae, Haine Celestial, Sanitarium Co., Orafti, International Tree Nut Council Nutrition Research and Education Foundation, Peanut Institute, Canola and Flax Councils of Canada, Canola Council of Canada, Canadian Institutes of Health Research, Canada Foundation for Innovation and Ontario Research Fund; and has served on the speaker's panel and scientific advisory board and has received travel support and honoraria from Almond Board of California, Canadian Agriculture Policy Institute, Loblaw Cos. Ltd., Griffin Hospital, Coca-Cola Co., Epicure, Danone, Saskatchewan Pulse Growers, Sanitarium Co., Orafti, American Peanut Council, International Tree Nut Council Nutrition Research and Education Foundation, Peanut Institute, Herbalife International, Pacific Health Laboratories, Nutritional Fundamental for Health, Metagenics, Bayer Consumer Care, Unilever Canada and Netherlands, Solae, Kellogg, Quaker Oats, Griffin Hospital, Abbott Laboratories, Dean Foods, California Strawberry Commission, Haine Celestial, PepsiCo, Alpro Foundation, Pioneer Hi-Bred International, DuPont Nutrition and Health, Spherix Consulting and WhiteWave Foods, Advanced Foods and Material Network,

Canola and Flax Councils of Canada, Nutritional Fundamentals for Health, Agri-Culture and Agri-Food Canada, the Canadian Agri-Food Policy Institute, Pulse Canada, Saskatchewan Pulse Growers, Soy Foods Association of North America, Nutrition Foundation of Italy, Nutra-Source Diagnostics, McDougall Program, Toronto Knowledge Translation Group (St. Michael's Hospital), Canadian College of Naturopathic Medicine, Hospital for Sick Children, Canadian Nutrition Society, American Society of Nutrition, Arizona State University, Paolo Sorbini Foundation and Institute of Nutrition, Metabolism, and Diabetes; and has received honoraria from U.S. Department of Agriculture; and has received the 2013 Award for Excellence in Research from the International Nut and Dried Fruit Council; and has received funding and travel support from Canadian Society of Endocrinology and Metabolism. Dr. de Souza has received personal fees from World Health Organization, Canadian Institutes for Health Research/Health Canada; and grants from Dietitians of Canada and Canadian Institutes for Health Research. Amy Jenkins is an employee of Vineland Research and Innovation Centre, a not-for-profit organization.

Note 16: PMO received grants from Orexigen Therapeutics, WWI, and Novo Nordisk; served on advisory groups for Novo Nordisk, Medscape/WebMD, Pfizer, and Janssen; and received honoraria from Novo Nordisk, Vindico CME, and Medscape/WebMD. TAW, KF, PLH, RFK, WTG, DMR, RJM, DW, WJR, and JLS received funding from MUSC to conduct this research at their sites. TAW received grants from Novo Nordisk and Nutrisystem; served on advisory boards for Orexigen.

High certainty Moderate certainty Low certainty Very low certainty

The values above the popular diets correspond to the difference in median weight loss between the column and row at 6 months, for positive values the diet indicated in the column is favored (e.g., the difference in median weight loss between the Jenny Craig and usual diet at 6 months is 7.77 kg). Diets in bold indicate a significant treatment effect. * Estimates were informed by direct evidence because of serious inconsistency in these comparisons.

The NMA included 97 RCTs enrolling 12,727 participants involving 14 popular diets and 3 control diets and reported weight loss at 6 months (\pm 3 months); of 136 paired comparisons 31 had direct and indirect evidence, 10 had only direct evidence, and 95 had only indirect evidence (Appendix table S27). Although the heterogeneity of the network was low ($\tau^2=0.38$), 7 of 18 direct comparisons with more than one RCT had $I^2 > 50\%$. In 4 of 31 comparisons, we identified serious incoherence between direct and indirect evidence; in our evidence summaries, we used the estimates with higher certainty of direct and indirect for these comparisons (Appendix table S27). On the basis of substantial differences between unadjusted and adjusted network estimates, we identified serious intransitivity in 38 of 136 comparisons (Appendix table S27). Appendix table S34 presents the league table with the NMA estimates and GRADE assessments. Much of the evidence was judged as moderate or low certainty, most often because of serious inconsistency and imprecision.

The values correspond to the difference in mean weight lost between the row and column at 12 months (e.g., the difference in average weight lost between the Jenny Craig diet and usual diet at 12 months is 7.18 kg).

44 RCTs with 8,811 participants involving 14 network nodes reported 12-month weight loss. Portfolio, South Beach, and The Biggest Loser diets were not assessed at 12-month because there were no relevant RCTs. All other popular diets except Paleolithic slightly decreased in their estimated effects at 12-month follow-up compared with 6-month follow-up. The Jenny Craig kept the largest weight loss at this time point compared to usual diet.

Table S38 Individual popular diets NMA results with GRADE certainty of evidence for both DBP reduction (above right) and SBP reduction (below left) at 6 months (mm Hg)

High certainty Moderate certainty Low certainty Very low certainty

The values correspond to the difference in median DBP reduction (above right) and SBP reduction (below left) between the column and row at 6 months, for positive values the diet indicated in the column is favored (e.g., the difference in median DBP reduction between Jenny Craig and usual diet at 6 months is 7.81 mm Hg; the difference in median SBP reduction between DASH and usual diet at 6 months is 4.68

mm Hg). Diets in bold indicate a significant treatment effect. * Estimate was informed by indirect evidence because of serious inconsistency in these comparisons.

SBP - The NMA included 71 RCTs enrolling 10,118 participants involving 12 popular diets and 3 control diets reported SBP at 6 months (\pm 3 months); of 105 paired comparisons, 24 had direct and indirect evidence, 8 had only direct evidence, and 73 had only indirect evidence (Appendix table S28). The heterogeneity of the network was low ($\tau^2=0.27$); 2 of 14 direct comparisons with more than one RCT had $I^2 > 50\%$.

The comparison of low fat and dietary advice was the only comparison in which we identified serious incoherence between direct and indirect evidence (Appendix table S28). We identified serious intransitivity in 26 of 105 comparisons (Appendix table S28). Much of the evidence was judged to be moderate or low certainty, most often because of serious risk of bias and imprecision (Appendix table S35-below left, Appendix table S28).

DBP - The NMA for DBP was almost identical to SBP with, again, much of the evidence judged as moderate or low certainty, most often rated down for risk of bias and imprecision (Table 35-above right, Appendix table S29).

Table S39: DBP reduction (above right) and SBP reduction (below left) at 12 months across individual popular diets with 95% credible intervals

High certainty	Moderate certainty	Low certainty	Very low certainty
----------------	--------------------	---------------	--------------------

The values correspond to the difference in median HDL increase (above right) and LDL reduction (below left) between the column and row at 6 months, for positive values the diet indicated in the column is favored (e.g., the difference in median HDL increase between Atkins and usual diet at 6 months is 1.78 mg/dL; the difference in median LDL reduction between Mediterranean and usual diet at 6 months is 4.42 mg/dL). Diets in bold indicate a significant treatment effect.

LDL – The NMA included 73 RCTs enrolling 8,368 participants involving 13 popular diets and 3 control diets reported LDL at 6 months (± 3 months); of 120 paired comparisons, 27 had direct and indirect evidence, 8 had only direct evidence, and 85 had only indirect evidence (Appendix table S30). The heterogeneity of the network was low ($\tau^2=0.05$); 5 of 15 direct comparisons with more than one RCT had $I^2 > 50\%$. No serious incoherence was found (Appendix table S30). We identified serious intransitivity in 18 of 120 comparisons (Appendix table S30). Much of the evidence was judged as low or very low certainty, most often because of serious risk of bias and very serious imprecision (Appendix table S33, table S36-below left).

HDL – The NMA for HDL was almost identical to LDL with, again, much of the evidence judged as low or very low certainty, most often rated down for serious risk of bias and imprecision (Appendix table S31).

Table S41: HDL increase (above right) and LDL reduction (below left) at 12 months across individual popular diets with 95% credible intervals

The values correspond to the difference in median HDL increase (above right) and LDL reduction (below left) between the column and row at 6 months (eg, the difference in median HDL increase between Atkins and usual diet at 12 months is -0.25 mg/dL; the difference in median LDL reduction between Mediterranean and usual diet at 12 months is 6.17 mg/dL).

35 RCTs with 6,070 participants involving 11 network nodes reported 12-months LDL. There were no relevant RCTs that focused on Paleolithic, Portfolio, Rosemary Conley, South Beach, and The Biggest Loser diets. Mediterranean diet demonstrated significant larger LDL reduction than usual diet. The difference between Mediterranean and Atkins was larger at 12-months than at 6-months follow up.

36 RCTs with 6,265 participants involving 11 network nodes reported 12-month HDL increase. The median HDL increase between the 8 popular diets ranged from 0.20 mg/dL and 5.03 mg/dL. None of popular diets showed significant HDL increase compared with usual diet.

The values correspond to the difference in median CRP reduction between the column and row at 6 months, for positive values the diet indicated in the column is favored (e.g., the difference in median CRP reduction between Ornish and usual diet at 6 months is 1.11).

CRP – The NMA included 27 RCTs enrolling 3,238 participants involving 8 popular diets and 3 control diets reported CRP at 6 months (\pm 3 months) (Appendix table S31).

Table S43: 6-month weight loss across all individual popular diets when restricted to overweight/obese yet otherwise healthy populations (below left) and restricted to low risk of bias studies (above right)

The values correspond to the difference in median weight loss between the row and column at 6 months (e.g., the difference in median weight loss between the Atkins diet and Usual diet at 6 months is 4.68 kg when restricting to low risk of bias studies). Diets with underline indicate statistical significance change compared with the primary analysis between diets and usual diet.

Table S44: 6-month weight loss across all individual popular diets when restricted to studies without diet company support (β -coefficient =1.65, 95%CrI: -0.60 to 3.81)
