

Supplementary Fig. S1. Pie chart showing the ratio of HAE overlaps with DHSs with many different origins.

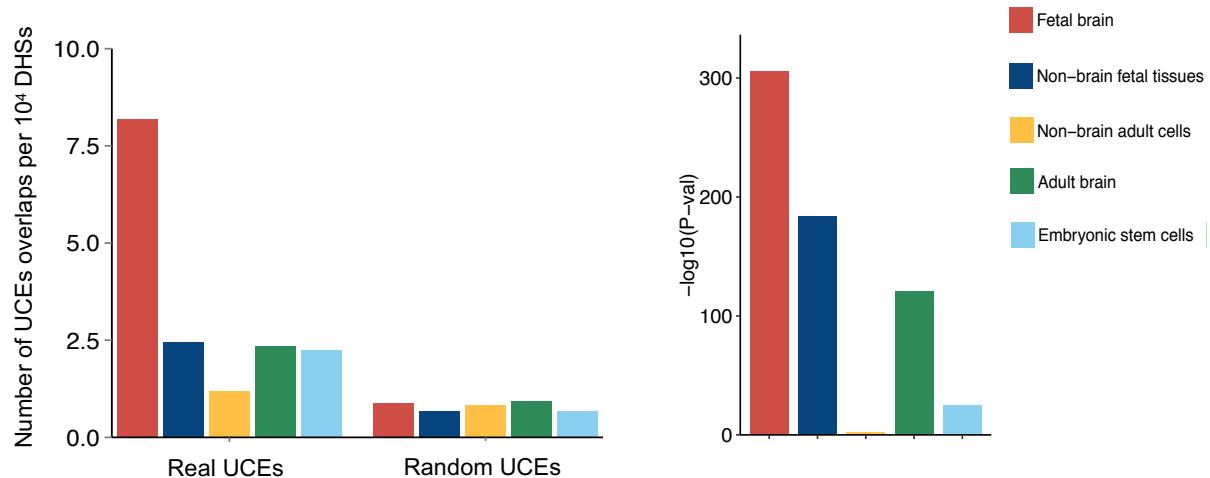

Supplementary Fig. S2. The number of HAE overlaps per 10⁴ DHSs combined according to cell- or tissue-origin. The same number of DNA segments with the same size distribution as the HAEs was randomly captured from each chromosome to generate a false set of HAEs. The frequency of DHS overlapping was obtained repeatedly for a set of 1000 random HAEs in the same manner. Odds ratios (ORs) were obtained for each cell type using the Fisher's exact test (right bar plot).

Supplementary Fig. S3. Statistical enrichment test of HAE overlaps per 10⁴ DHSs in each tissue or cell type. The same number of DNA segments with the same size distribution as the DHSs was randomly captured from each chromosome to generate a false set of DHSs. The number of DHS overlaps was obtained repeatedly for a set of 1000 random DHSs. P values calculated with Fisher's exact test.

Supplementary Fig. S4. The mean frequency of the number of HAE overlaps per 10^4 peaks for each histone modification in developing brains (Fetal Brain, Germinal Matrix, Neurosphere Cultured Cells Ganglionic Eminence Derived, Neurosphere Cultured Cells Cortex Derived) and adult brains (Substantia Nigra, Mid Frontal Lobe, Inferior Temporal Lobe, Hippocampus Middle, Cingulate Gyrus, Anterior Caudate, Angular Gyrus).

Supplementary Fig. S5. The number of UCE overlaps per 10⁴ DHSs combined according to cell- or tissue-origin. The same number of DNA segments with the same size distribution as the UCEs was randomly captured from each chromosome to generate a false set of UCEs. The frequency of DHS overlapping was obtained repeatedly for a set of 1000 random UCEs in the same manner. Odds ratios (ORs) were obtained for each cell type using the Fisher's exact test (right bar plot).

Supplementary Table S1. The number of overlapped HAEs with DHSs

Tissue types	Samples-age	# of overlapped HAEs	# of total DHSs	Frequency
