General Information

The reagents and solvents were obtained from commercial suppliers and used without further purification. TLC was performed on silica gel plates (GF254) with visualization of components by UV light (254 nm). ¹H and ¹³C NMR spectra were recorded on Varian 400 or 500 MHz NMR spectrometer with DMSO-*d*₆ as a solvent. Chemical shifts are referenced to the residual solvent peak and reported in ppm (δ scale) and all coupling constant (*J*) values are given in Hz. The following multiplicity abbreviations are used: (s) singlet, (d) doublet, (t) triplet, (q) quartet, (m) multiplet, and (br) broad. ESI-HRMS data were measured on Thermo Exactive Orbitrap plus spectrometer. Melting points were determined on Yanaco MP-J3 microscope melting point apparatus. All microwave reactions were carried out in single-mode CEM Explorer SP 48.
