

### Tumor bearing mice succumb with less metastatic burden

BALB/c mice were implanted with  $3 \times 10^5$  cells in the left tibia (n=13-15 mice/group). Mice treated as described in Fig 4. and sacrificed upon meeting euthanasia criteria as previously described. Metastatic burden calculated by measuring the total area of metastatic foci divided by the total area of the lung section from lung on H&E stained lung sections. Data compared by one-way ANOVA with post-hoc Dunnett's multiple comparison test,  $p=0.26$ . # $p=0.058$ , \* $p<0.05$
