

## Results Supplement 4

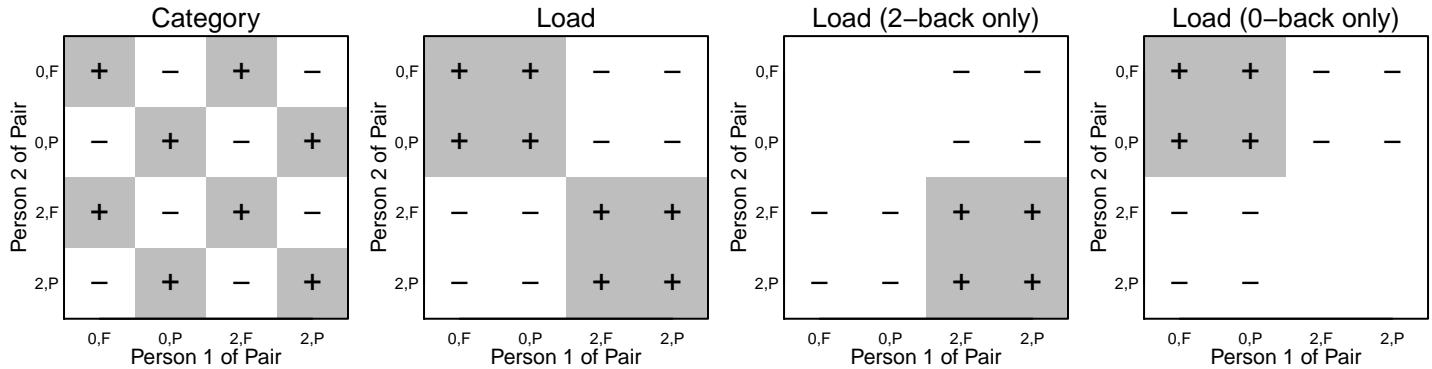

source and input files available at <https://osf.io/p6msu/>

compiled September 6, 2019

Results Supplement 4 for “Pattern similarity analyses of frontoparietal task coding: Individual variation and genetic influences” by Joset A. Etzel, Ya’el Courtney, Caitlin E. Carey, Maria Z. Gehred, Arpana Agrawal, and Todd S. Braver.

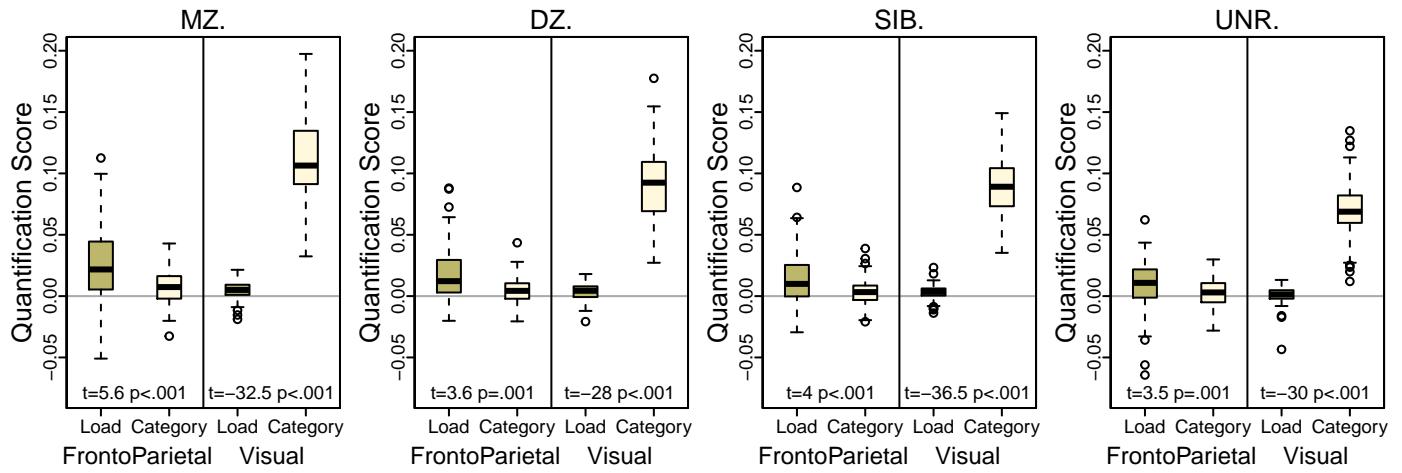

This is a `knitr` file (<https://yihui.name/knitr/>); see the `.rnw` file with the same name as this `.pdf` for the R code to generate all figures and results. To compile, change the `in.path` variable to the location of the `input` directory downloaded from <https://osf.io/p6msu/>.

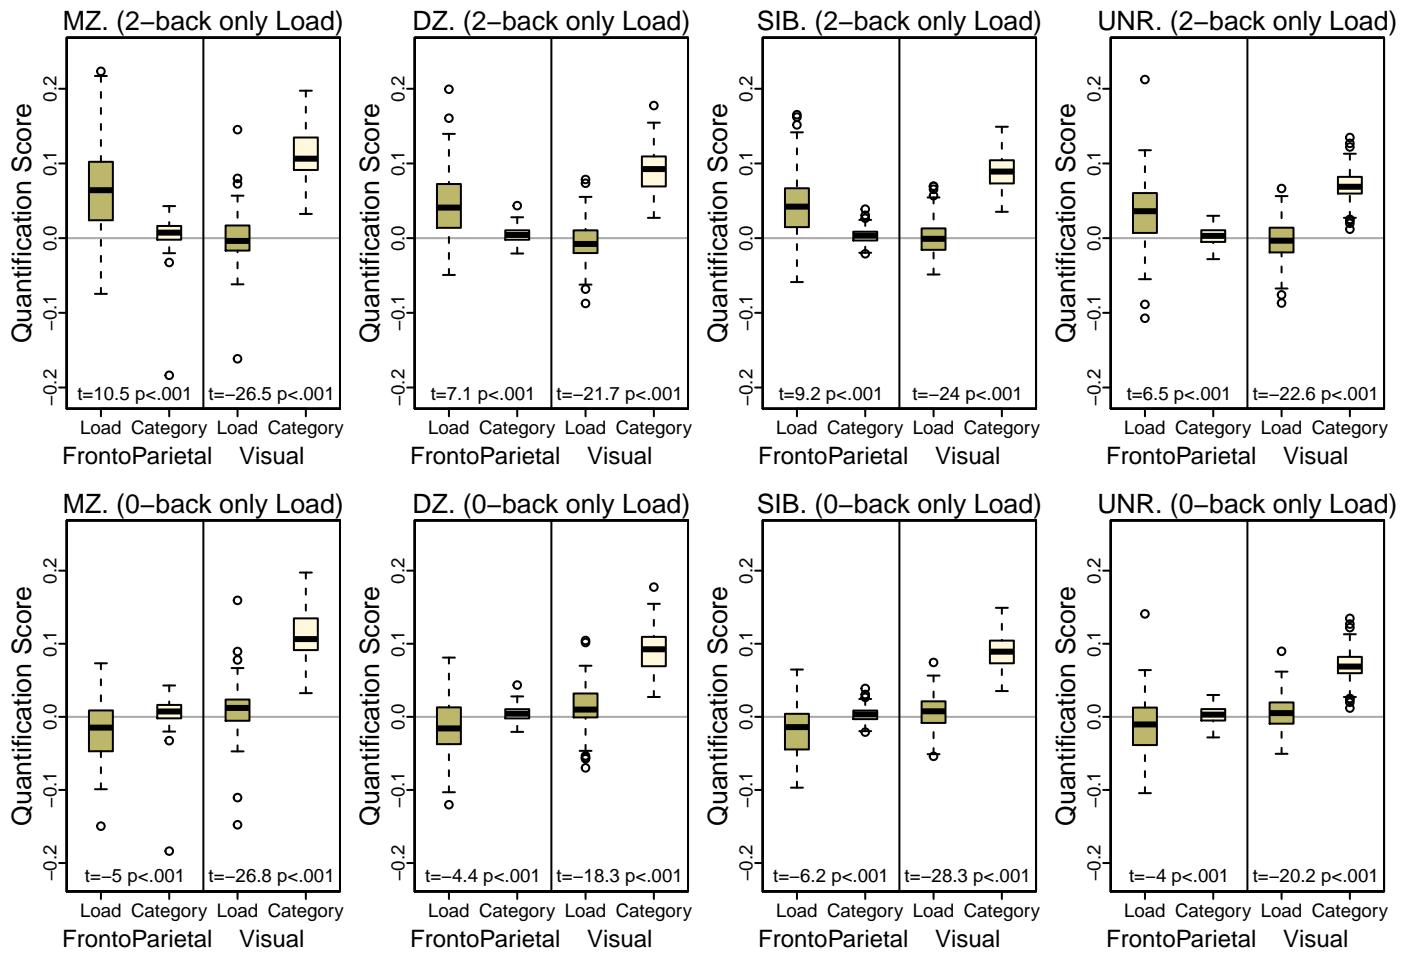

The four pairwise reference matrices; see Figure 2 on the main paper. The average of the white cells (-) is subtracted from the average of the grey cells (+) for quantification, and blank cells are not included.

### S4.1a Pairwise quantification scores: Load and Category comparisons

Pairwise quantification scores, by subject group, and with different ways of quantifying Load. One MZ FrontoParietal Category outlier at -0.18 not shown for the 0 and 2-back Load quantification. Numbers printed on boxplots are for a paired robust t-test for Load != Category within each community and subject group. Note that y-axis scaling varies between the first row of plots and the others.

Robust t-tests for the mean of each set of quantification scores != 0. p-values uncorrected for multiple comparisons.

<b>Category</b>		
	FrontoParietal	Visual
MZ	5.44 (<.001)	33.33 (<.001)
DZ	4.28 (<.001)	28.16 (<.001)
SIB	3.44 (.001)	36.59 (<.001)
UNR	2.28 (.025)	30.92 (<.001)

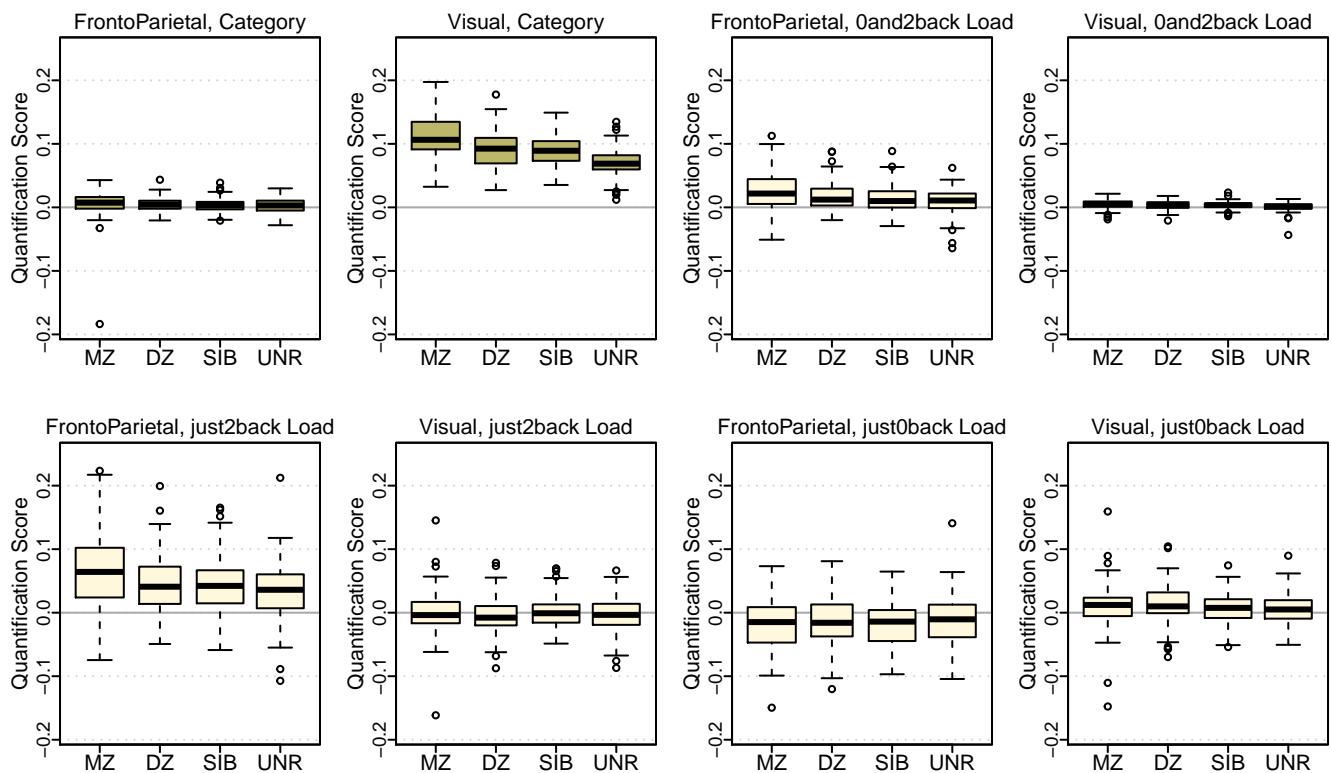

<b>Load</b>		
	FrontoParietal	Visual
MZ	8.27 (<.001)	7.96 (<.001)
DZ	5.95 (<.001)	5.32 (<.001)
SIB	5.83 (<.001)	6.59 (<.001)
UNR	5.45 (<.001)	2.46 (.016)

<b>Load (2-back only)</b>		
	FrontoParietal	Visual
MZ	11.37 (<.001)	-.59 (.557)
DZ	8.07 (<.001)	-1.59 (.116)
SIB	9.84 (<.001)	-.33 (.739)
UNR	7.21 (<.001)	-1.79 (.077)

<b>Load (0-back only)</b>		
	FrontoParietal	Visual
MZ	-3.93 (<.001)	4.67 (<.001)
DZ	-3.11 (.003)	3.52 (.001)
SIB	-5.3 (<.001)	2.58 (.012)
UNR	-3.36 (.001)	2.28 (.026)

## S4.1b Pairwise quantification scores: group comparisons

These are rearranged versions of the boxplots shown in S4.1a to make the group comparisons more visually obvious. The group comparisons are then tested with robust ANOVAs; posthoc tests only shown when model  $p < 0.05$ .

## S4.2 Pairwise quantification scores: full dataset

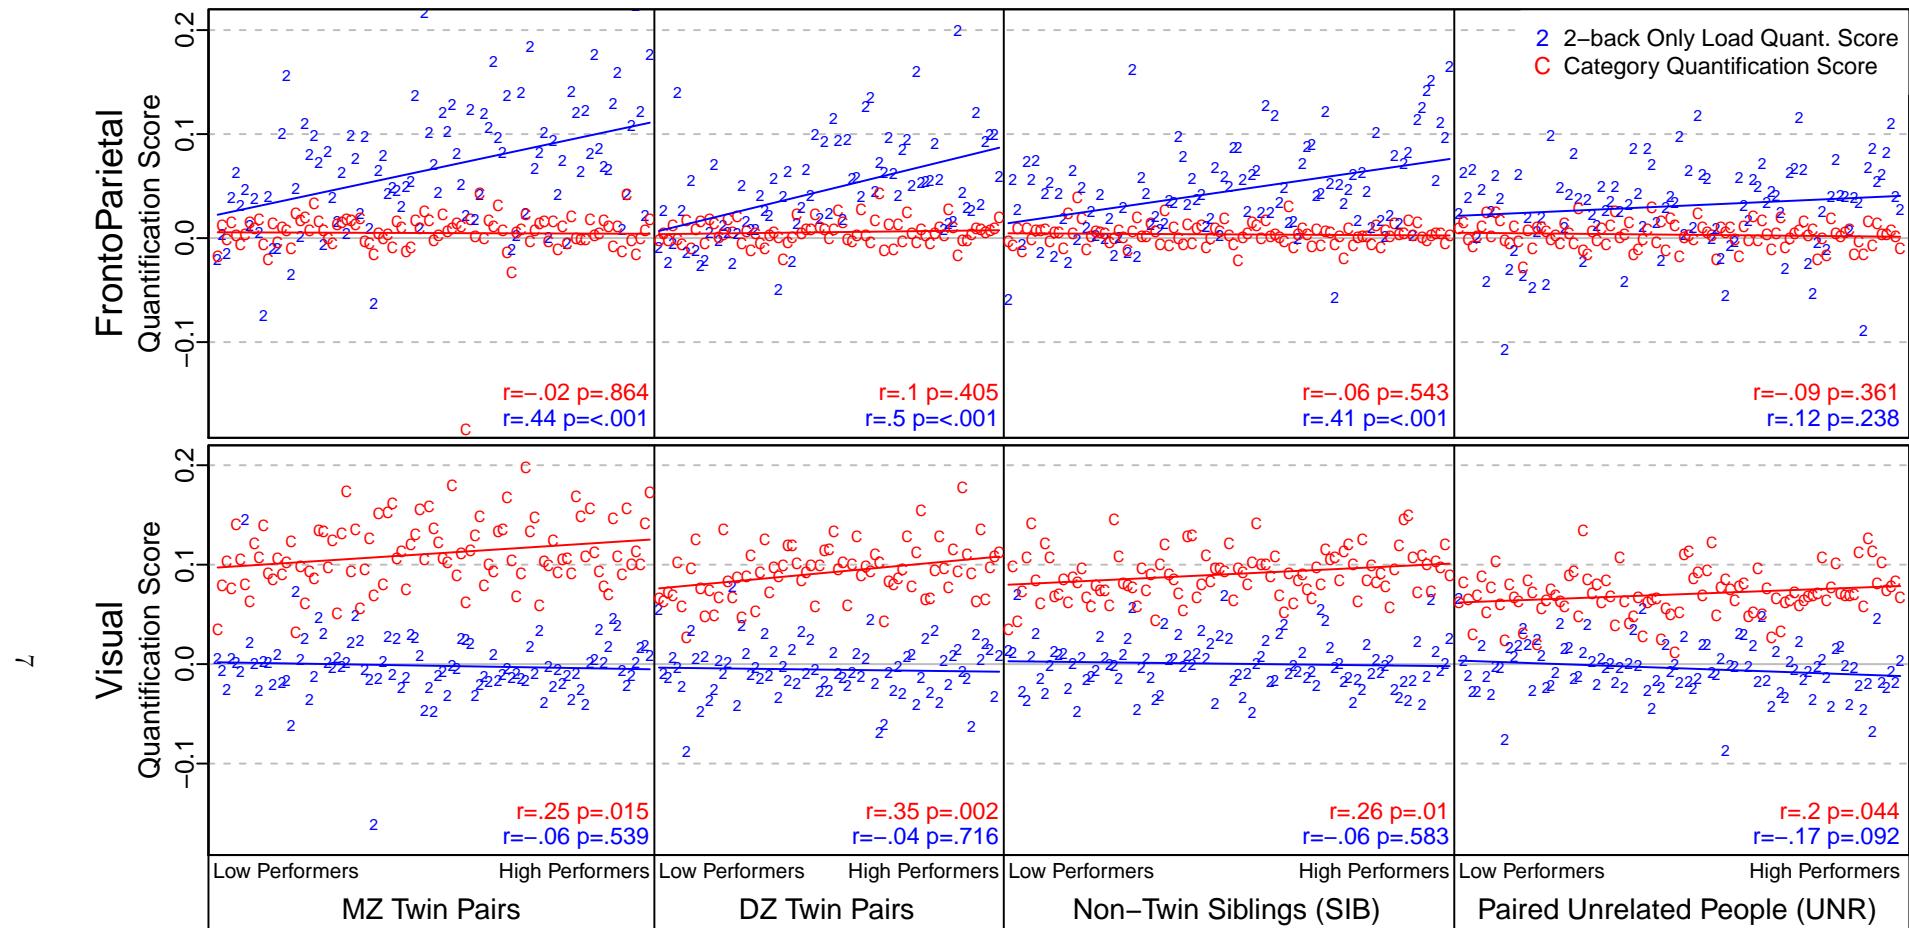

Quantification of each set of paired participants' similarity matrix to the Load (blue, L, with both 0 and 2-back) and Category (red, C). The paired participants are arrayed along the x-axis **in arbitrary order within each type** (MZ, DZ, SIB, UNR), with the two quantifications for each pair of participants in each column. The participants are shown in arbitrary order here to provide a contrast for the appearance when participants are sorted by behavioral performance in the next figure. Also, several participants are missing behavioral performance data, so are included here, but omitted from the next graph.

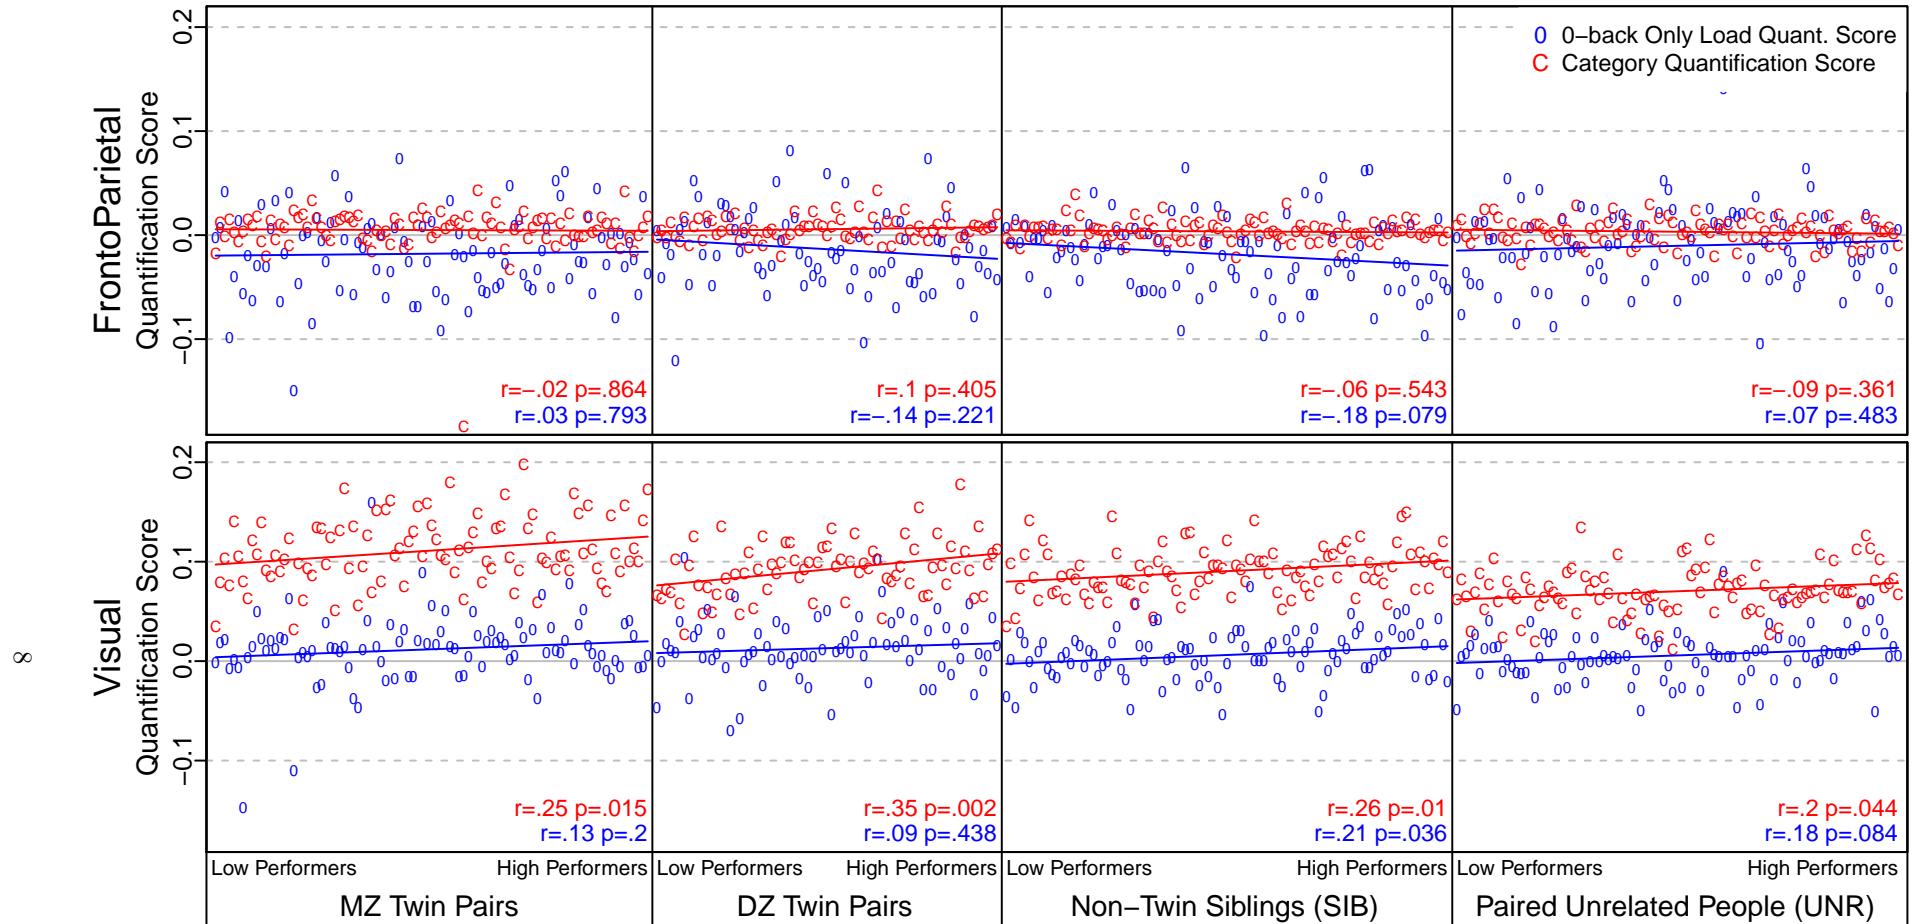

Quantification of each set of paired participants' similarity matrix to the Load (blue, L, with both 0 and 2-back) and Category (red, S) The paired participants are arrayed along the x-axis in **order of increasing mean behavioral performance** within each type (MZ, DZ, SIB, UNR), with the two quantification scores in each column. Displayed correlation and regression lines are between the quantification score and subject order (1:n), not the actual mean pairwise behavior. Figure 9 in the main manuscript.

Same, but Load quantified using **2-back** only.

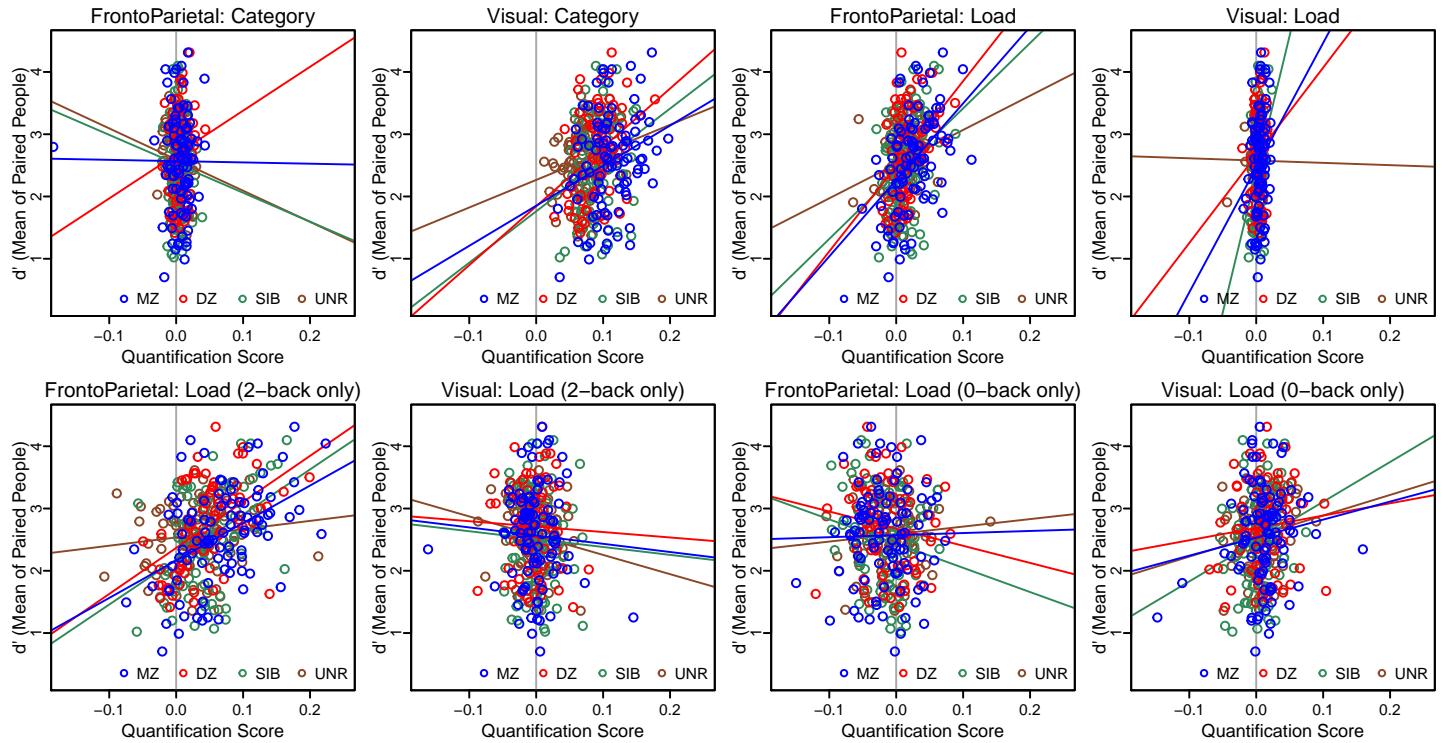

Same, but Load quantified using **0-back only**.

### S4.3 Pairwise quantification scores: correlation with behavior

The correlation between the average of pair's behavioral performance ( $d'$ ) and the pairwise quantification as specified by the Load and Category references. The correlations are listed below the graphs; p-values for each in parentheses, from `hc4wttest`, and uncorrected for multiple comparisons. Tests for pairwise correlation differences follow.

	MZ	DZ	SIB	UNR
FrontoParietal, Category	-.01 (.904)	.11 (.24)	-.06 (.536)	-.12 (.25)

## S4.4 Pairwise quantification scores: multiple regression

These models have pairwise quantification score as the outcome variable, predicted by the d' of person 1 of each pair (`dprime.1`), d' of person 2 of the pair (`dprime.2`), single-subject quantification score of person 1 (`q.1`), or single-subject quantification score of person 2 (`q.2`).

**Load, FrontoParietal, MZ twins.**

```
mreg.tbl <- get.tbl("MZ", "load", "FrontoParietal", "0and2back"); # Load quantified with 0 & 2-back trials
lm.full <- lm(mreg.tbl$q.pairwise ~ mreg.tbl$dprime.1 + mreg.tbl$dprime.2 + mreg.tbl$q.1 + mreg.tbl$q.2);
