

Table S3. Reasons for Exclusion of Articles During Full-Text Article Screening

Reasons for Exclusion	No. of Articles Excluded ^a
IBDQ-32 results were reported for a mixed-IBD sample only	10
Study administered variant of the IBDQ other than the IBDQ-32 ^b	4
Study did not administer IBDQ	5
Study did not report usable IBDQ-32 data ^c	8
Study included an active control	1
Study sample did not include patients with IBD	1
Study sample had nonactive ulcerative colitis at baseline	1
Total no. of articles excluded	30

IBD, inflammatory bowel disease; IBDQ, Inflammatory Bowel Disease Questionnaire

^aEach excluded article may have met several exclusion criteria; however, for screening purposes, only the initially reported reason for exclusion was recorded.

^bVariants of the IBDQ administered in these studies included the 9-item IBDQ (n=2) and the United Kingdom version of the IBDQ (n=2).

^cData were considered nonusable if they did not provide enough information to calculate an effect size statistic representing the magnitude of mean difference between change-from-baseline scores for treatment arm(s) and control arm at the final assessment of the primary efficacy endpoint.
