

Bryophytes can recognize their neighbours through volatile organic compounds

Eliška Vicherová, Robert Glinwood, Tomáš Hájek, Petr Šmilauer and Velemir Ninkovic

Supplemental Figure S7. The biomass production of *S. flexuosum* shoots grown in cultivation units (Fig. 1) for 30 days under artificial light without FR light addition (FR-) and added FR light (FR+; L1 and L2 FR+ treatments pooled together). The light treatment has no effect on biomass production of *S. flexuosum* ($F_{1,4}=4.0$, $p=0.12$; experimental design included in the test). The box and whiskers depict \pm s.e. and minimum/maximum values.
