

## Cork oak and climate change: Disentangling drought effects on cork chemical composition

Carla Leite, Vanda Oliveira, Isabel Miranda and Helena Pereira

### Supplementary material

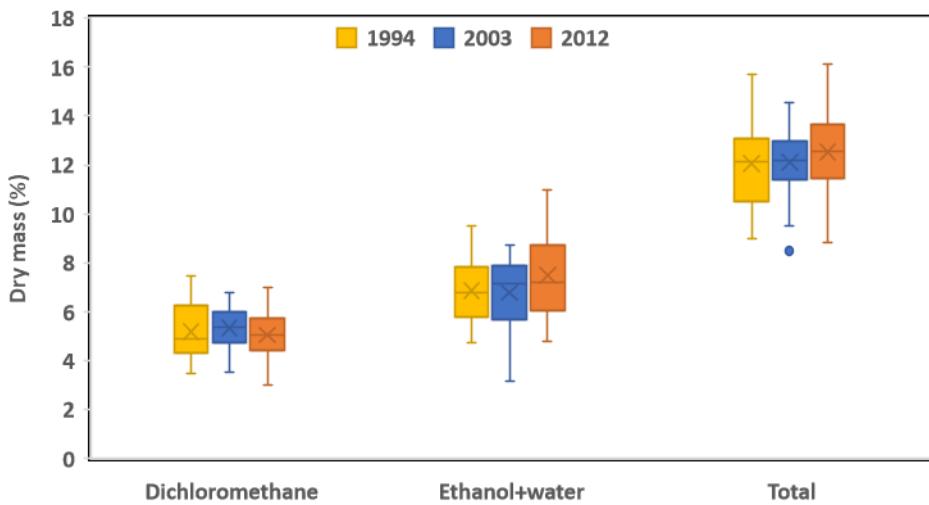

Figure S1 – Extractives content (in % of dry mass) of the samples grown without any drought (1994), with two drought events (2003) and one drought event (2012).

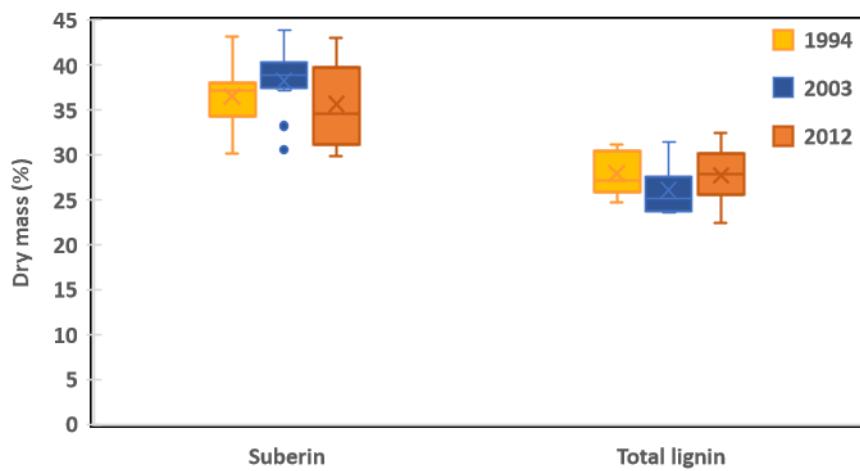

Figure S2 – Suberin and total lignin contents (in % of dry mass) of the samples grown without any drought (1994), with two drought events (2003) and one drought event (2012).

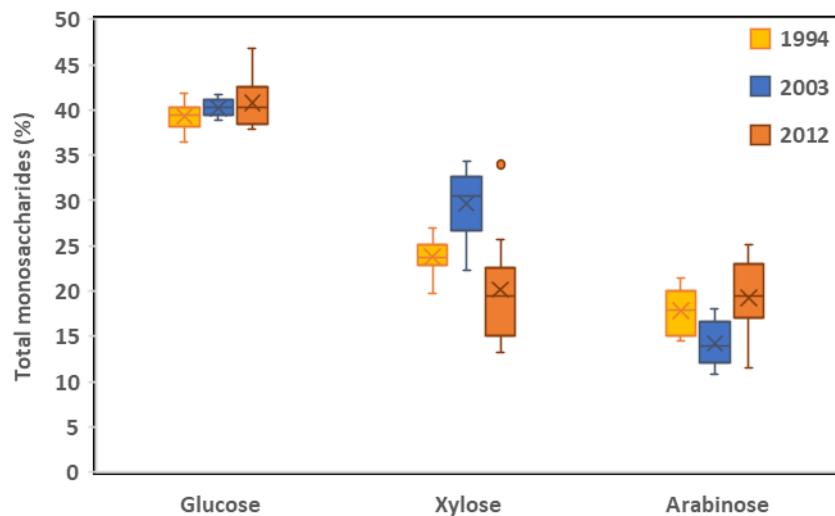

Figure S3 – Glucose, xylose and arabinose proportion (in % of total monosaccharides) of the samples grown without any drought (1994), with two drought events (2003) and one drought event (2012).

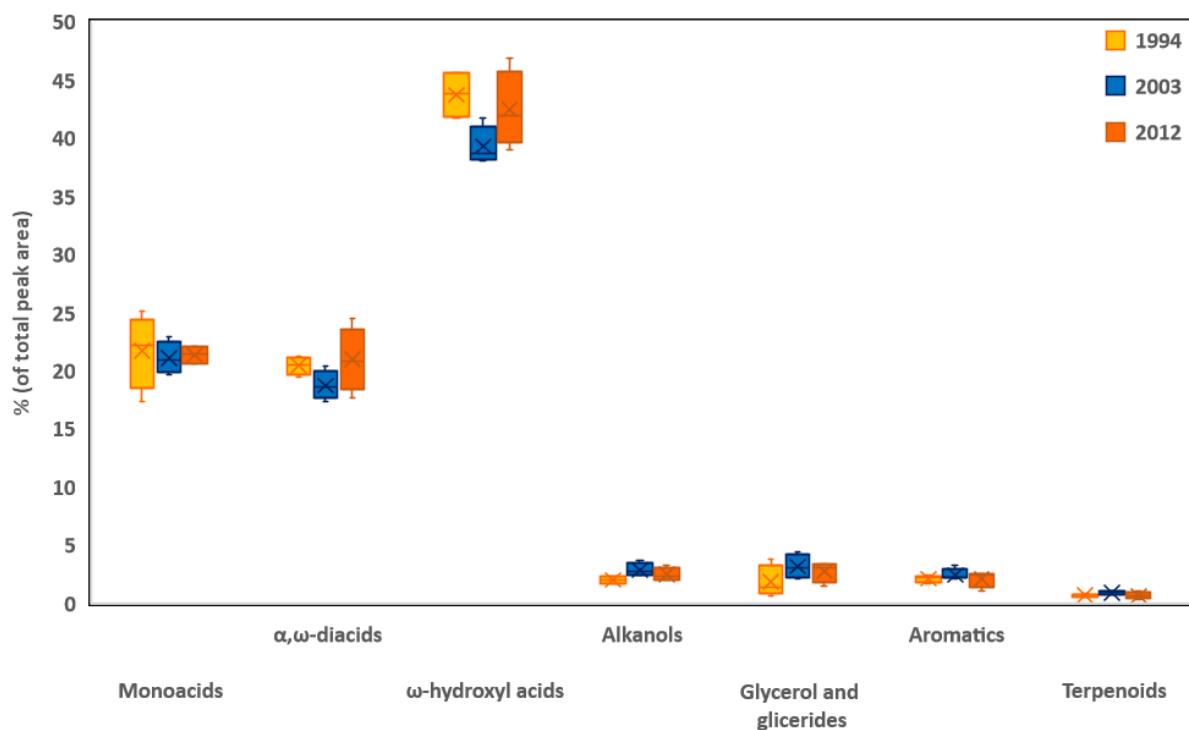

Figure S4 – Monomeric composition of suberin from cork produced without any drought (1994), with two drought events (2003) and one drought event (2012), determined in the GC–MS chromatograms of the depolymerization extracts (% of total peak area).

**Table S1 – Composition of suberin from cork produced without any drought (1994), with two drought events (2003) and one drought event (2012), determined in the GC–MS chromatograms of the depolymerization extracts (percentual peak area).**
