*Supplementary Table S1 - Derived traits description*

Description of direct glycan peaks and derived traits measured in this study(5). Structure abbreviations are as follows: F,  $\alpha$ -1,6-linked core fucose; A, number of antenna's; B, bisecting GlcNAc  $\beta$ 1-4 linked to  $\beta$ 1-3 mannose; M, number of mannose residues; Gx, number of  $\beta$ 1-4 linked galactoses; [3]G1, galactose on the antenna of the  $\alpha$ 1-3 linked mannose; [6]G1, galactose on the antenna of the  $\alpha$ 1-6 linked mannose; Sx, number of sialic acids linked to galactose.

Supplementary Table S2 – associations eGFR percentage change per year

Associations between 58 IgG glycans and eGFR change per year. Glycan values are centered and scaled. Shown are the regression coefficient beta and p-value per association. The p-values that remained significant after correction for multiple comparisons (Bonferroni) are highlighted in green. Red represents a positive association and blue a negative association. The basic model was adjusted for age and sex and their interaction. Additionally, the full model was adjusted for smoking, MAP, BMI, Hba1c, duration of type 2 diabetes, nonHDL and HDL.

Supplementary Table S4 – associations ACR percentage change per year

Associations between 58 IgG glycans and ACR change per year. Glycan values are centered and scaled. Shown are the regression coefficient beta and p-value per association. The p-values that remained significant after correction for multiple comparisons (Bonferroni) are highlighted in green. Red represents a positive association and blue a negative association. The basic model was adjusted for age and sex and their interaction. Additionally, the full model was adjusted for smoking, MAP, BMI, Hba1c, duration of type 2 diabetes, ACE-inhibitor, nonHDL and HDL.
