Figure S1 Comparison of peripheral circadian phase between non-PD and PD subjects

The estimated peak time of *Per3* expression in hair follicles was compared between 10 non-PD elderly subjects (black squares; age, 71.4 ± 7.4 ; sex, male 40%) and 18 PD patients (red squares; age, 66.2 ± 7.5 ; sex, male 33.3%). Error bars indicate 95% confidence intervals. n.s. represents no statistical significance between the two groups.
