**Supplementary**

Figure S1. Taste responses of Scnn1[++/++] and Scnn1[aa/bb] mice to control stimuli after dietary intervention. After 4 weeks fed with sodium-adequate, low, or high salt diet, Scnn1[++/++] and Scnn1[aa/bb] mice were subjected to short-term preference tests using an automated gustometer. To do so, animals were either restricted for 22.5 h with access to 2.0 mL water and 1 g food (attractive restriction conditions, (**A**)) or water-deprived for 22.5 h (aversive restriction conditions, (**B**)). Taste solutions and concentrations were presented in random order. Each data point represents a mean ± STE of 5 s presentations from 10 to 11 animals tested. Statistical testing was based on UNIANOVA and post-hoc analysis using Bonferroni´s multiple comparison test. Statistical differences were indicated by different letters between individual groups.
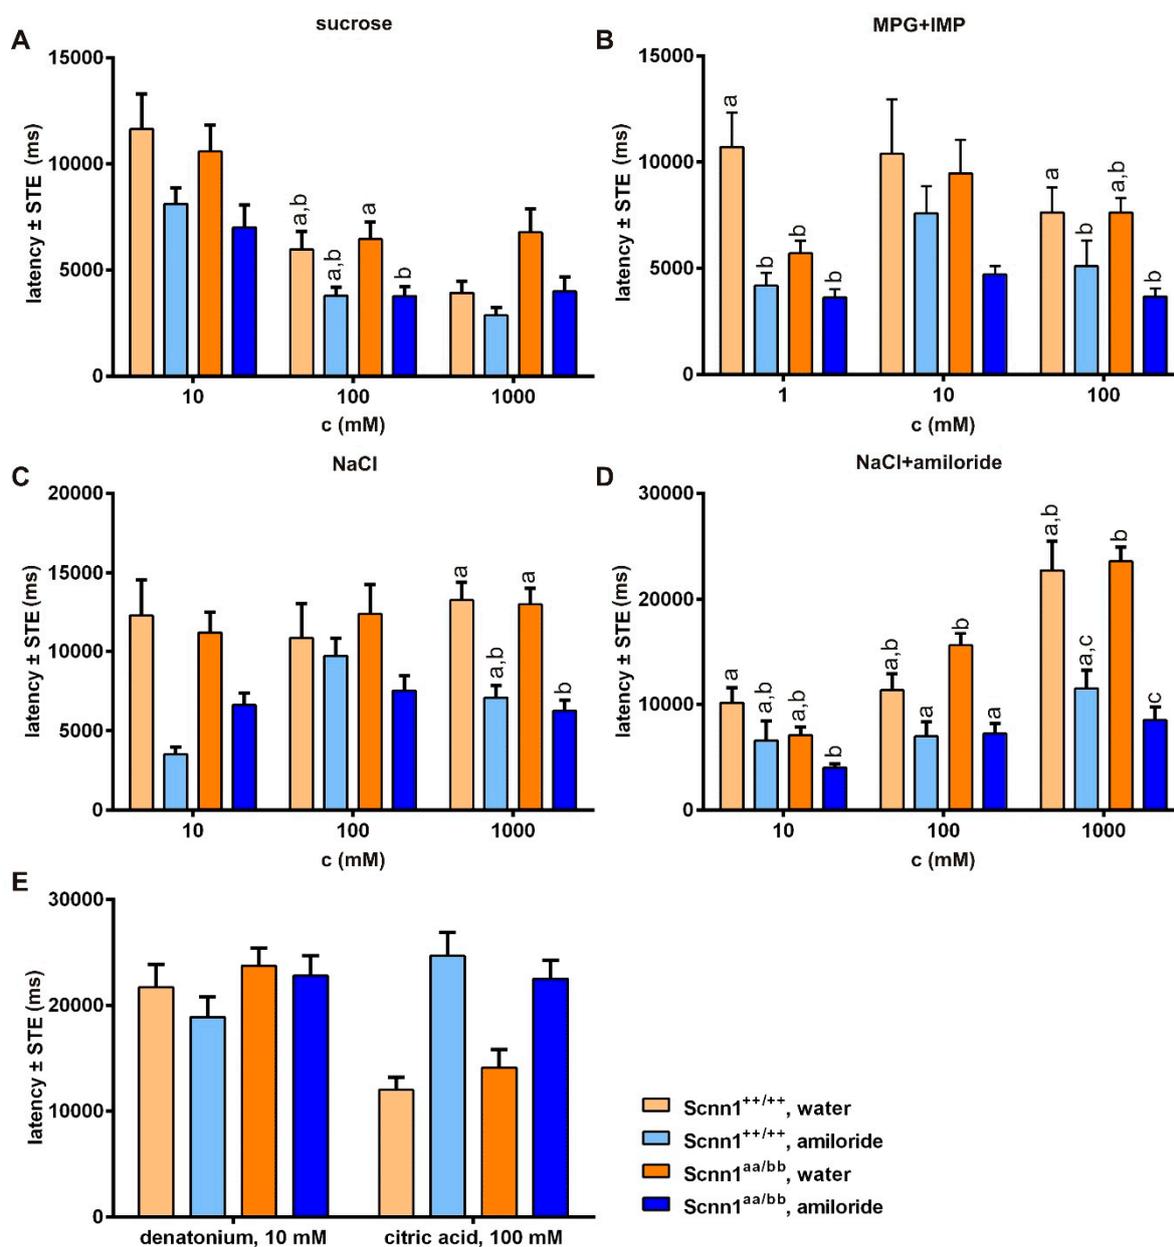

Figure S2. Latency to initiate the first lick for different taste stimuli after access to amiloride-containing water. Scnn1[++/++] and Scnn1[aa/bb] mice receiving sodium-adequate diet had either access to 300 µM amiloride-containing water 13 h prior to restriction starting or received water without amiloride. The restriction phase lasted for 22.5 h with access to 2.0 mL water ± 300 µM amiloride and 1 g food. Mean latency to the first lick for each stimulus concentration was determined by an automated gustometer presenting different concentrated solutions of sucrose (**A**), monopotassium glutamate with inosine 5´monophosphate (MPG+IMP; **B**), sodium chloride (NaCl; **C**), NaCl with amiloride (NaCl+amiloride; **D**), or bitter and sour stimuli (**E**). Each bar represents the mean ± STE from 10 to 16 animals tested. Statistical testing was based on UNIANOVA and post-hoc analysis using Bonferroni´s multiple comparison test. Different letters indicate statistical significance.

Table S1. Relative expression of ENaC subunits in Scnn1[++/++] and Scnn1[aa/bb] mice. Data represent the relative expression of ENaC subunits normalized to β-actin and eEf2 in isolated taste buds and non-gustatory tissue of Scnn1[++/++] (n = 4) and Scnn1[aa/bb] (n = 6) mice fed with a sodium-adequate diet. Mean variances between Scnn1[++/++] and Scnn1[aa/bb] animals are indicated in %. Statistical testing was based on Student´s *t*-test. Differences were considered to be significant if $p < 0.05$, as indicated in bold.

	ENaC subunit	Scnn1[++/++] [33] (mean ± STABW)	Scnn1[aa/bb] (mean ± STABW)	Scnn1[aa/bb] / Scnn1[++/++] (%)	*p*-Value

Table S2. Statistical significance of different factors on the short-term preference tests of Scnn1[++/++] and Scnn1[aa/bb] animals after dietary intervention. After 4 weeks fed with sodium-adequate, low, or high salt diet, 10 to 11 Scnn1[++/++] and Scnn1[aa/bb] mice were subjected to short-term preference tests using an automated gustometer. To do so, animals were either restricted for 22.5 h with access to 2.0 mL water and 1 g food (attractive restriction conditions) or water-deprived for 22.5 h (aversive restriction conditions). Statistical significance (*p*-value) of lick responses to different concentrations of taste solutions based on diet (sodium-adequate, low, or high), genotype (Scnn1[++/++] versus Scnn1[aa/bb]), and diet X genotype interactions are shown. Statistical testing was based on UNIANOVA and post-hoc analysis using Bonferroni´s multiple comparison test. Differences were considered to be statistically significant if *p* < 0.05, as indicated in bold.

Table S4. Statistical significance of different factors on the short-term preference tests of Scnn1$^{++/++}$ and Scnn1$^{aa/bb}$ animals after amiloride intervention for 36 h. After receiving sodium-adequate diet, animals either had access to water or amiloride-containing water (300 μM), following short-term preference testing in an automated gustometer. Data represent the statistical significance (*p*-value) of an intervention (water with or without amiloride), genotype (Scnn1$^{++/++}$ versus Scnn1$^{aa/bb}$), and intervention X genotype on different taste solutions and their concentrations. Statistical testing was based on UNIANOVA and post-hoc analysis using Bonferroni´s multiple comparison test for data points of 10 to 16 animals. Differences were considered to be statistically significant if *p* < 0.05, as indicated in bold.

Table S5. Statistical significance of different factors on the short-term preference tests of Scnn1$^{++/++}$ and Scnn1$^{aa/bb}$ animals after access to amiloride-containing drinking water for 36 h. After receiving sodium-adequate diet, animals either had access to water or amiloride-containing water (300 μM), following short-term preference testing in an automated gustometer. Data represent the statistical significance (*p*-value) of intervention (water with or without amiloride), genotype, concentration, and different combination/interaction of them based on all 5 concentrations tested for 1 stimulus/substance (for denatonium and citric acid only 1 concentration was tested). Test was based on UNIANOVA and post-hoc analysis using Bonferroni´s multiple comparison test relying on data of 10 to 16 animals. Differences were considered to be statistically significant if *p* < 0.05, as indicated in bold.
