

Figure S4

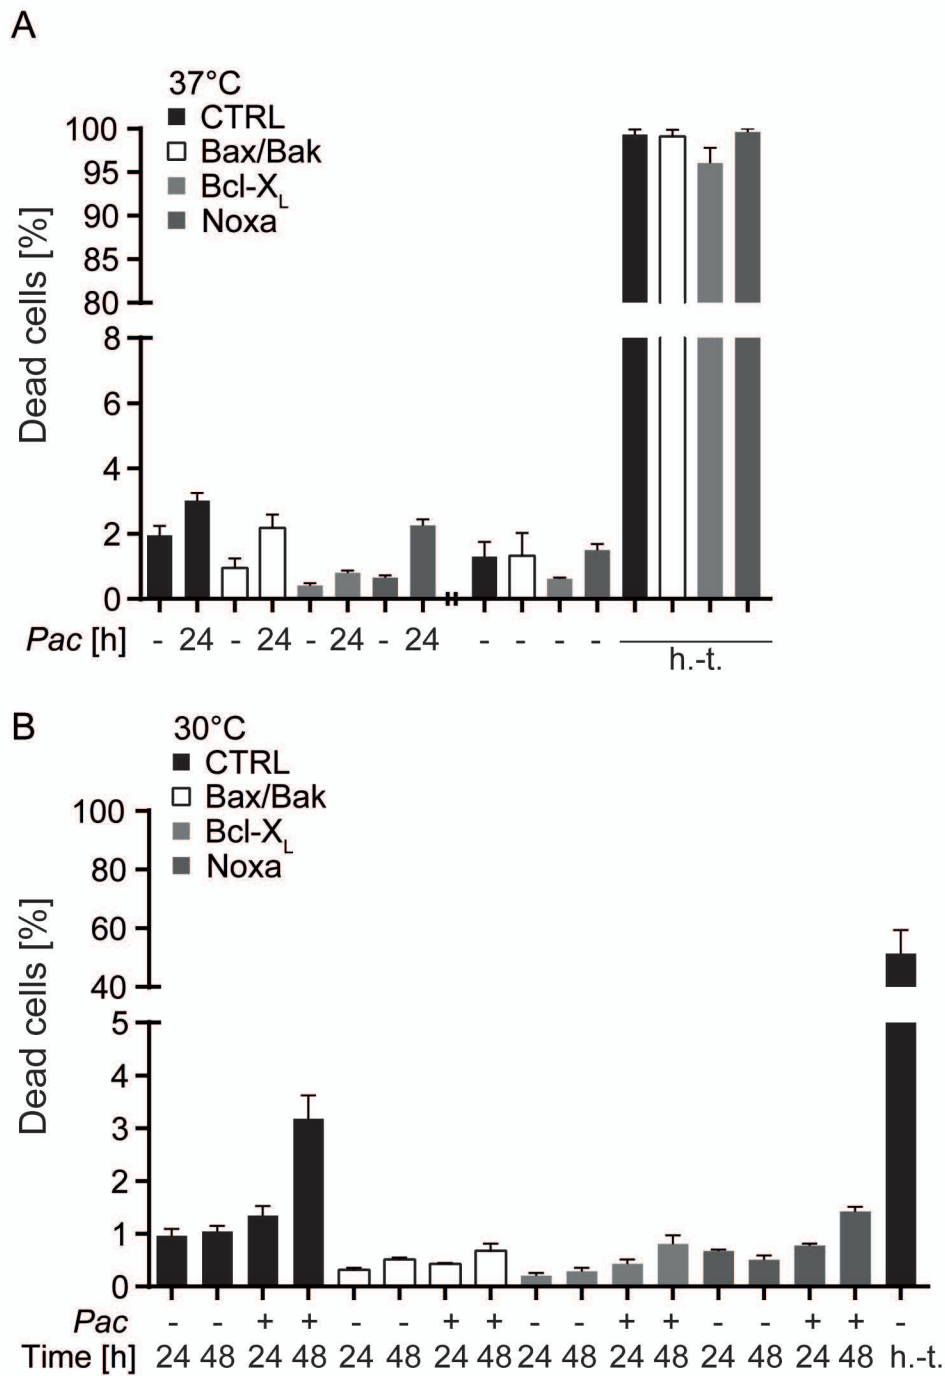

Fig. S4 Cell death during Pac infection.

CTRL and mutant cell lines (Bax/Bak- or Noxa-deficient, Bcl-X_L-overexpressing) were infected with *Pac* (24 or 48 at 37°C (A) or 30°C (B)) and stained with a Live/Dead stain to determine percentage of dead cells in the population. MOI was in all experiments 25. h.-t., heat-treated (1 min at 95°C).

Data are means/SEM of at least three independent experiments.
