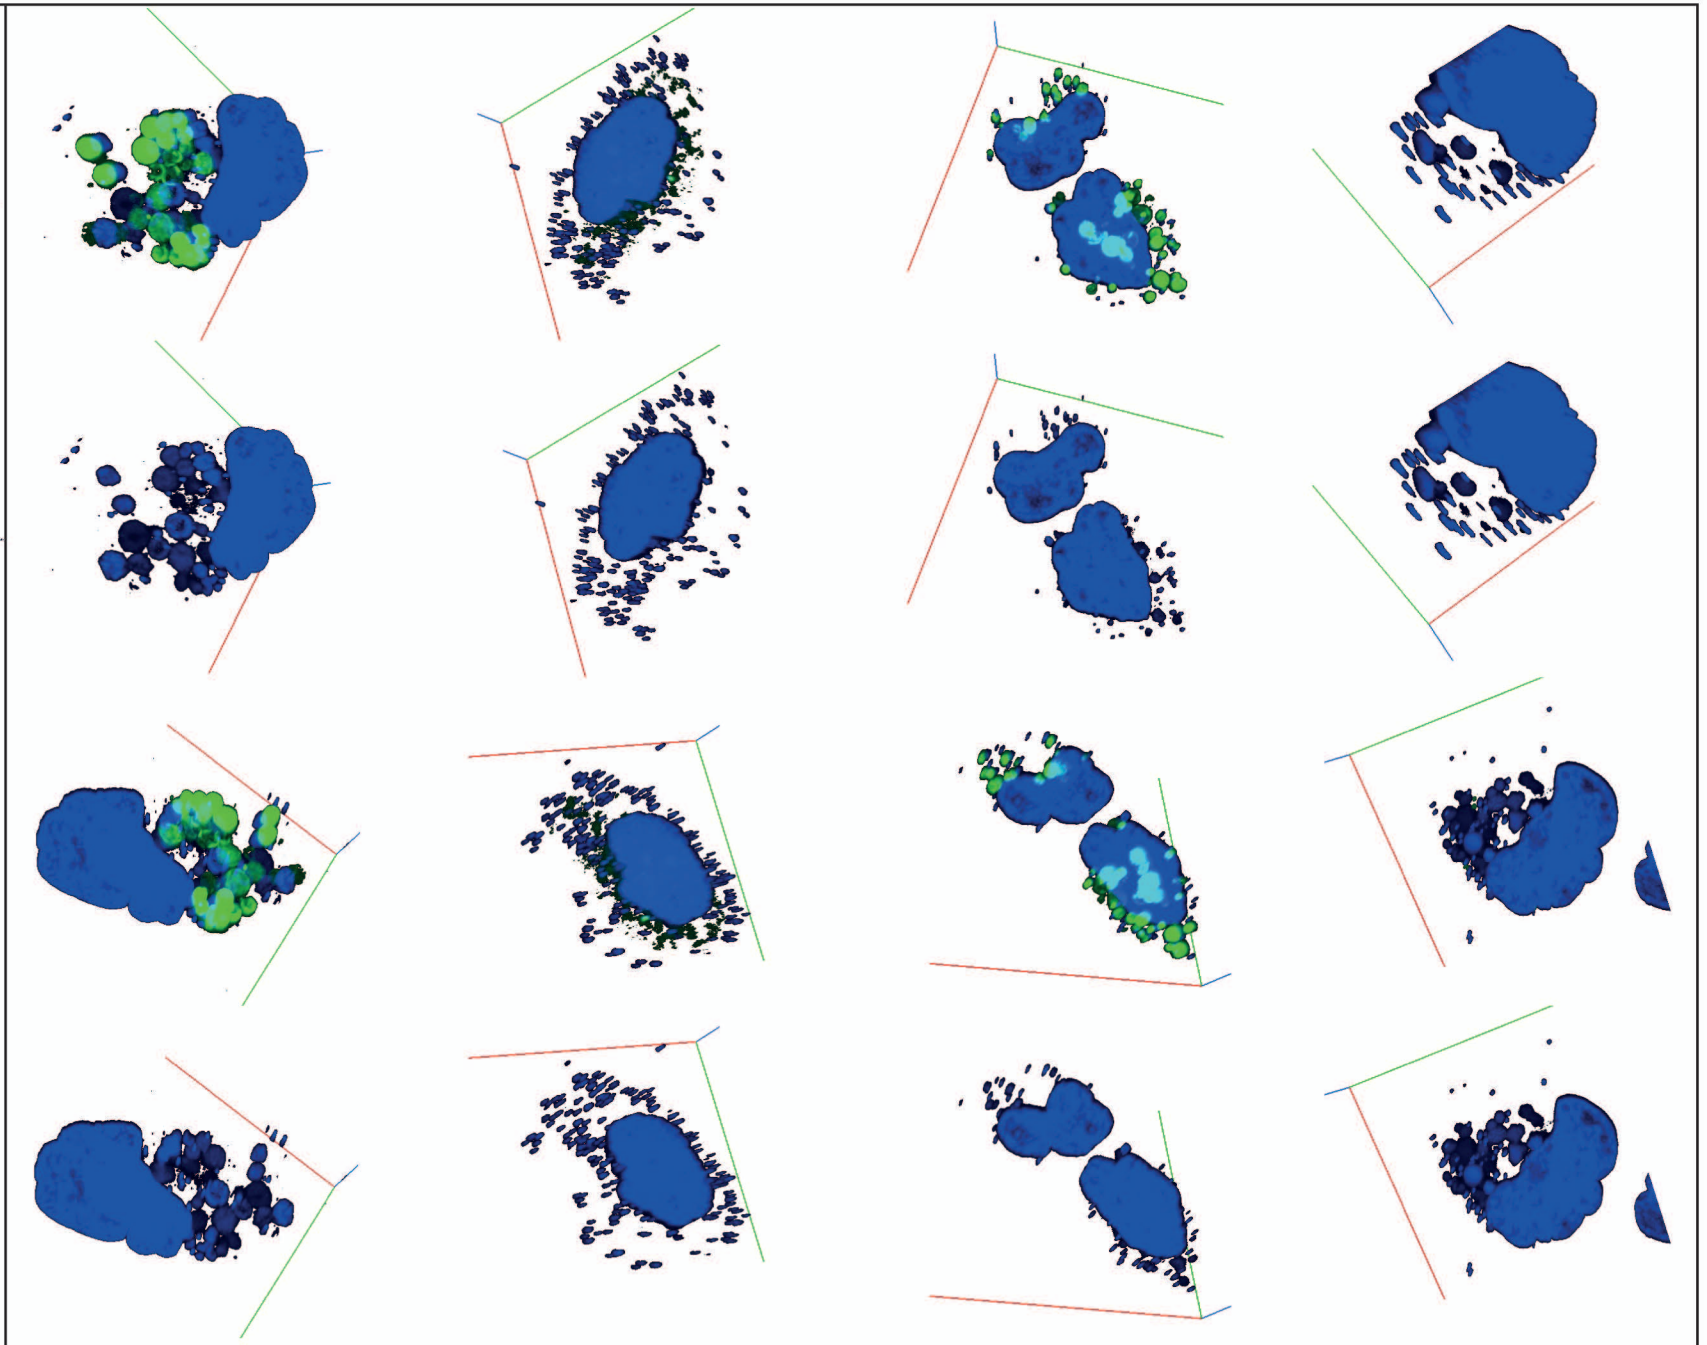

Fig. S7 *Protein synthesis in Pac-infected Bax/Bak-deficient HeLa cells in presence and absence of rifampicin and cycloheximide*

Pac-infected and Click-iT stained Bax/Bak-deficient HeLa cells treated with rifampicin and/or cycloheximide (already shown in Fig. 3) were visualized by confocal microscopy. Z-stack pictures of the cell were taken to generate 3D images. The Click-iT-reaction products are shown in green, blue gives a Hoechst-33342 counter-stain to visualize bacterial and host DNA.
