13.2 Gene contexts

Each L31-Corynebacteriaceae RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one L31-Corynebacteriaceae RNA are assigned a color; other domains are gray. Information about these conserved

domains is given in Section 13.3. The accession of the sequence containing each L31-Corynebacteriaceae RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each L31-Corynebacteriaceae RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 13.1.

13.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 13.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one L31-

Corynebacteriaceae RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 13.2.

cd00886 (2) MogA_MoaB family.
COG0265 (4) Periplasmic serine protease, S1-C subfamily, contain C-terminal PDZ domain [Posttranslational modification, protein turnover, chaperones]
COG0642 (2) Signal transduction histidine kinase [Signal transduction mechanisms]
COG0745 (5) DNA-binding response regulator, OmpR family, contains REC and winged-helix (wHTH) domain [Signal transduction mechanisms, Transcription]
COG2965 (2) Primosomal replication protein N [Replication, recombination and repair]
pfam01197 (353) Ribosomal protein L31.
pfam01783 (313) Ribosomal L32p protein family.
pfam13026 (1) Protein of unknown function (DUF3887).
pfam13180 (4) PDZ domain.

pfam13365 (4) Trypsin-like peptidase domain.
PRK00019 (1) 50S ribosomal protein L31; Reviewed
PRK01110 (316) 50S ribosomal protein L32; Validated
PRK01678 (353) 50S ribosomal protein L31 type B; Reviewed
smart00304 (2) HAMP (Histidine kinases, Adenylyl cyclases, Methyl binding proteins, Phosphatases) domain.
smart00357 (2) Histidine kinase-like ATPases.
smart00383 (2) His Kinase A (phosphoacceptor) domain.
smart00448 (4) cheY-homologous receiver domain.
smart00852 (2) Probable molybdopterin binding domain.
smart00862 (5) Transcriptional regulatory protein, C terminal.

13.4 Multiple-sequence alignment

Each L31-Corynebacteriaceae RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 13.1. The alignment may include sequences containing the RNA motif, as well as flanking sequence. The L31-Corynebacteriaceae RNA itself is denoted by the line underneath marked 5’ and 3’ on either end. Nucleotides in flanking sequences (i.e., not part of the motif) are written in gray letters. Stems of predicted rho-independent transcription terminators, if any, are shaded yellow. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNIE software.) Nucleotides predicted to function (as DNA) as transcription-factor binding sites, if any, are shaded in green. (But note: these predictions are manually annotated, so they might be under-predicted.) Annotated start codons, if any, are shaded green. (Note: start codons are frequently misannotated, especially in environmental samples.) Nucleotides proposed to basepair as part of the consensus structure are shaded in color when they comprise Watson-

Crick or G-U pairs. Otherwise they are shaded gray. Conserved stems are also indicated at the bottom of the alignment by angle brackets, where matching < and > denote base-paired columns. Below these angle brackets, the symbol “2” denotes base pairs exhibiting covariation according to the statistically well-founded R-scape method. “1” denotes base pairs exhibiting covariation according to R2R’s simplistic method. “0” denotes base pairs that are not observed to mutate and “?” denotes base pairs that have a significant frequency of non-canonical nucleotides for Watson-Crick or G-U pairs (> 5%). Below these base pair annotation is the consensus sequence: “R” = “A” or “G”, “Y” = “C” or “U”, red nucleotides: nucleotide identity conserved more than 97% of the time, black nucleotides: 90%, gray nucleotides: 75%, red circle (◉): nucleotide is present 97% of the time, black circle (◐): 90%, gray circle (◑): 75%, white circle (◒): 50%. All percentages of sequences just described (e.g. 97% conserved) assume that sequences have been weighted by the GSC algorithm implemented by the Infernal software package.

Duplicate sequences: the following putative homologs are not shown in the alignment because their sequences are identical to a homolog already shown: Cac-1-1, Cac-2-1, Cau-2-4, Cca-1-2, Ccr-1-1, Ccr-2-1, Cdi-1-1, Cdi-10-1, Cdi-11-1, Cdi-12-1, Cdi-13-1, Cdi-14-1, Cdi-16-1, Cdi-17-1, Cdi-18-2, Cdi-19-1, Cdi-2-1, Cdi-21-1, Cdi-22-1, Cdi-3-1, Cdi-4-1, Cdi-5-1, Cdi-6-1, Cdi-7-1, Cdi-8-1, Cdi-9-1, Cdo-1-1, Cgl-10-1, Cgl-11-1, Cgl-11-2, Cgl-11-3, Cgl-12-1, Cgl-3-2, Cgl-4-1, Cgl-5-1, Cgl-6-1, Cgl-7-1, Cgl-8-1, Cgl-9-1, Cha-1-2, Cje-4-1, Cje-4-10, Cje-4-12, Cje-4-14, Cje-4-17, Cje-4-18, Cje-4-2, Cje-4-7, Cje-4-9, Cma-4-1, Cma-5-1, Cpi-1-1, Cpr-1-1, Cpr-2-1, Cpr-2-3, Cps-1-1, Cps-11-1, Cps-13-1, Cps-14-1, Cps-15-1, Cps-17-2, Cps-17-3, Cps-17-4, Cps-17-5, Cps-17-6, Cps-17-7, Cps-17-8, Cps-17-9, Cps-18-1, Cps-19-1, Cps-2-1, Cps-3-1, Cps-4-1, Cps-5-1, Cps-6-1, Cps-7-1, Cps-8-1, Cps-9-1, Csp-1-1, Csp-10-1, Csp-11-1, Csp-12-1, Csp-13-1, Csp-15-1, Csp-16-1, Csp-17-1, Csp-18-1, Csp-2-1, Csp-3-1, Csp-4-1, Csp-5-1, Csp-9-1, Cst-1-1, Cst-2-2, Cst-2-3, Cst-2-4, Cst-2-5, Cst-2-6, Cst-2-7, Cul-1-1, Cul-4-1, Cul-6-3, Cul-8-1, Cvi-3-1, Tot-1-1, [fl-1-1, env-10, env-100, env-101, env-102, env-103, env-104, env-105, env-106, env-107, env-108, env-109, env-11, env-110, env-111, env-112, env-113, env-114, env-115, env-116, env-117, env-118, env-119, env-120, env-121, env-122, env-123, env-124, env-125, env-126, env-127, env-128, env-129, env-130, env-131, env-132, env-133, env-134, env-135, env-136, env-137, env-138, env-139, env-140, env-141, env-143, env-145, env-146, env-147, env-148, env-149, env-15, env-150, env-151, env-152, env-153, env-155, env-158, env-16, env-20, env-21, env-22, env-23, env-26, env-28, env-34, env-36, env-37, env-38, env-39, env-40, env-41, env-42, env-43, env-44, env-45, env-46, env-47, env-48, env-49, env-50, env-51, env-52, env-53, env-54, env-55, env-56, env-57, env-58, env-59, env-60, env-61, env-62, env-63, env-64, env-65, env-66, env-67, env-68, env-69, env-7, env-70, env-71, env-72, env-73, env-74, env-75, env-76, env-77, env-78, env-79, env-80, env-81, env-82, env-83, env-84, env-85, env-86, env-87, env-88, env-89, env-90, env-91, env-92, env-93, env-94, env-95, env-96, env-97, env-98, env-99

14.2 Gene contexts

Each S4-Bacteroidia RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S4-Bacteroidia RNA are assigned a color; other domains are gray. Information about these conserved

domains is given in Section 14.3. The accession of the sequence containing each S4-Bacteroidia RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S4-Bacteroidia RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 14.1.

14.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 14.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S4-

cd00156 (1) Signal receiver domain; originally thought to be unique to bacteria (CheY, OmpR, NtrC, and PhoB), now recently identified in eukaryotes ETR1 *Arabidopsis thaliana*; this domain receives the signal from the sensor partner in a two-component systems; contains a phosphoacceptor site that is phosphorylated by histidine kinase homologs; usually found N-terminal to a DNA binding effector domain; forms homodimers

cd00165 (1) S4/Hsp/ tRNA synthetase RNA-binding domain; The domain surface is populated by conserved, charged residues that define a likely RNA-binding site; Found in stress proteins, ribosomal proteins and tRNA synthetases; This may imply a hitherto unrecognized functional similarity between these three protein classes.

cd06928 (96) N-terminal domain of the Alpha subunit of Bacterial RNA polymerase.

COG0100 (2) Ribosomal protein S11 [Translation, ribosomal structure and biogenesis]

COG0202 (94) DNA-directed RNA polymerase, alpha subunit/40 kD subunit [Transcription]

COG0203 (132) Ribosomal protein L17 [Translation, ribosomal structure and biogenesis]

COG0522 (341) Ribosomal protein S4 or related protein [Translation, ribosomal structure and biogenesis]

COG4185 (1) Predicted ABC-type ATPase [General function prediction only]

pfam00163 (100) Ribosomal protein S4/S9 N-terminal domain.

pfam01000 (1) RNA polymerase Rpb3/RpoA insert domain.

Bacteroidia RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 14.2.

pfam01193 (26) RNA polymerase Rpb3/Rpb11 dimerisation domain.

pfam01196 (33) Ribosomal protein L17.

pfam01479 (1) S4 domain.

pfam03118 (79) Bacterial RNA polymerase, alpha chain C terminal domain.

pfam07877 (1) Protein of unknown function (DUF1661).

PLN02967 (1) kinase

PRK05182 (218) DNA-directed RNA polymerase subunit alpha; Provisional

PRK05309 (2) 30S ribosomal protein S11; Validated

PRK05327 (423) 30S ribosomal protein S4; Validated

PRK05591 (165) 50S ribosomal protein L17; Validated

PRK10905 (1) cell division protein DamX; Validated

PRK13108 (1) prolipoprotein diacylglycerol transferase; Reviewed

PRK14521 (2) 30S ribosomal protein S16; Provisional

smart00363 (21) S4 RNA-binding domain.

smart00382 (1) ATPases associated with a variety of cellular activities.

smart00448 (1) cheY-homologous receiver domain.

TIGR02027 (1) DNA-directed RNA polymerase, alpha subunit, bacterial and chloroplast-type. [Transcription, DNA-dependent RNA polymerase]

14.4 Multiple-sequence alignment

Each S4-Bacteroidia RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 14.1. The alignment may include sequences containing the RNA motif, as well as flanking sequence. The S4-Bacteroidia RNA itself is denoted by the line underneath marked 5’ and 3’ on either end. Nucleotides in flanking sequences (i.e., not part of the motif) are written in gray letters. Stems of predicted rho-independent transcription terminators, if any, are shaded yellow. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNI software.) Nucleotides predicted to function (as DNA) as transcription-factor binding sites, if any, are shaded in green. (But note: these predictions are manually an-

notated, so they might be under-predicted.) Annotated start codons, if any, are shaded green. (Note: start codons are frequently misannotated, especially in environmental samples.) Nucleotides proposed to basepair as part of the consensus structure are shaded in color when they comprise Watson-Crick or G-U pairs. Otherwise they are shaded gray. Conserved stems are also indicated at the bottom of the alignment by angle brackets, where matching < and > denote base-paired columns. Below these angle brackets, the symbol “2” denotes base pairs exhibiting covariation according to the statistically well-founded R-scape method. “1” denotes base pairs exhibiting covariation according to R2R’s simplistic method. “0” denotes base pairs that are not observed to mutate and “?” denotes base pairs that

15.2 Gene contexts

Each S4-Flavobacteria RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S4-Flavobacteria RNA are assigned a color; other domains are gray. Information about these conserved

domains is given in Section 15.3. The accession of the sequence containing each S4-Flavobacteria RNA is given in the column named “Seq. accession”. Accessions beginning with “NC.”, “NS.”, “NW.” or “NZ.” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S4-Flavobacteria RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 15.1.

15.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 15.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S4-

Flavobacteria RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 15.2.

- cd00599** (2) Endo-N-acetylmuramidases (muramidases) are lysozymes (also referred to as peptidoglycan hydrolases) that degrade bacterial cell walls by catalyzing the hydrolysis of 1,4-beta-linkages between N-acetylmuramic acid and N-acetyl-D-glucosamine residues.
- cd01744** (5) Small chain of the glutamine-dependent form of carbamoyl phosphate synthase, CPSase II.
- cd03313** (29) Enolase: Enolases are homodimeric enzymes that catalyse the reversible dehydration of 2-phospho-D-glycerate to phosphoenolpyruvate as part of the glycolytic and gluconeogenesis pathways.
- cd06114** (8) Escherichia coli (Ec) citrate synthase (CS) GltA-like.
- cd06928** (183) N-terminal domain of the Alpha subunit of Bacterial RNA polymerase.
- cd11313** (1) Alpha amylase catalytic domain found in archaeal and bacterial Alpha-amylases (also called 1,4-alpha-D-glucan-4-glucanohydrolase).
- CHL00013** (7) RNA polymerase alpha subunit
- CHL00113** (1) ribosomal protein S4; Reviewed
- COG0202** (115) DNA-directed RNA polymerase, alpha subunit/40 kD subunit [Transcription]
- COG0203** (224) Ribosomal protein L17 [Translation, ribosomal structure and biogenesis]
- COG0505** (80) Carbamoylphosphate synthase small subunit [Amino acid transport and metabolism, Nucleotide transport and metabolism]
- COG0522** (578) Ribosomal protein S4 or related protein [Translation, ribosomal structure and biogenesis]
- COG1834** (2) N-Dimethylarginine dimethylaminohydrolase [Amino acid transport and metabolism]
- pfam00117** (3) Glutamine amidotransferase class-I.
- pfam00163** (226) Ribosomal protein S4/S9 N-terminal domain.
- pfam00285** (1) Citrate synthase, C-terminal domain.
- pfam00988** (15) Carbamoyl-phosphate synthase small chain, CPSase domain.
- pfam01193** (34) RNA polymerase Rpb3/Rpb11 dimerisation domain.
- pfam01196** (9) Ribosomal protein L17.
- pfam02274** (2) Amidotransferase.
- pfam03118** (157) Bacterial RNA polymerase, alpha chain C terminal domain.
- pfam03485** (1) Arginyl tRNA synthetase N terminal domain.
- pfam03486** (2) HI0933-like protein.
- pfam03952** (2) Enolase, N-terminal domain.
- pfam03971** (2) Monomeric isocitrate dehydrogenase.
- pfam10310** (2) Maintenance of telomere capping protein 1.
- pfam13489** (1) Methyltransferase domain.
- PLN02967** (1) kinase
- PRK00077** (31) enolase; Provisional
- PRK05182** (345) DNA-directed RNA polymerase subunit alpha; Provisional
- PRK05327** (783) 30S ribosomal protein S4; Validated
- PRK05591** (233) 50S ribosomal protein L17; Validated
- PRK05614** (9) type II citrate synthase; Reviewed
- PRK10811** (1) ribonuclease E; Reviewed
- PRK12564** (90) carbamoyl phosphate synthase small subunit; Reviewed
- PRK14521** (2) 30S ribosomal protein S16; Provisional
- smart00363** (26) S4 RNA-binding domain.
- smart00621** (2) Glycosyl hydrolases family 25.
- smart01016** (1) Arginyl tRNA synthetase N terminal dom.
- smart01097** (6) Carbamoyl-phosphate synthase small chain, CPSase domain.
- TIGR00178** (2) isocitrate dehydrogenase, NADP-dependent, monomeric type. [Energy metabolism, TCA cycle]
- TIGR00275** (2) flavoprotein, HI0933 family. [Unknown function, Enzymes of unknown specificity]
- TIGR01078** (1) arginine deiminase. [Energy metabolism, Amino acids and amines]
- TIGR02456** (1) trehalose synthase. [Energy metabolism, Biosynthesis and degradation of polysaccharides]

15.4 Multiple-sequence alignment

Each S4-Flavobacteria RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 15.1. The alignment may include sequences containing the RNA motif, as well as flanking sequence. The S4-Flavobacteria RNA itself is denoted by the line underneath marked 5’ and 3’ on either end. Nucleotides in flanking sequences (i.e., not part of the motif) are written in **gray letters**. Stems of predicted rho-independent transcription terminators, if any, are shaded **yellow**. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNIE software.) Nucleotides predicted to function (as DNA) as transcription-factor binding sites, if any, are shaded in **green**. (But note: these predictions are manually annotated, so they might be under-predicted.) Annotated start codons, if any, are shaded **green**. (Note: start codons are frequently misannotated, especially in environmental samples.) Nucleotides proposed to basepair as part of the consensus structure are shaded in color when they comprise Watson-Crick or G-U

pairs. Otherwise they are shaded gray. Conserved stems are also indicated at the bottom of the alignment by angle brackets, where matching < and > denote base-paired columns. Below these angle brackets, the symbol “2” denotes base pairs exhibiting covariation according to the statistically well-founded R-scape method. “1” denotes base pairs exhibiting covariation according to R2R’s simplistic method. “0” denotes base pairs that are not observed to mutate and “?” denotes base pairs that have a significant frequency of non-canonical nucleotides for Watson-Crick or G-U pairs (> 5%). Below these base pair annotation is the consensus sequence: “R” = “A” or “G”, “Y” = “C” or “U”, **red nucleotides**: nucleotide identity conserved more than 97% of the time, **black nucleotides**: 90%, **gray nucleotides**: 75%, **red circle** (◉): nucleotide is present 97% of the time, **black circle** (◐): 90%, **gray circle** (◑): 75%, **white circle** (◒): 50%. All percentages of sequences just described (e.g. 97% conserved) assume that sequences have been weighted by the GSC algorithm implemented by the Infernal software package.

16.2 Gene contexts

Each S4-Clostridia RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S4-Clostridia RNA are assigned a color; other domains are gray. Information about these conserved domains is given

in Section 16.3. The accession of the sequence containing each S4-Clostridia RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5’ and 3’ boundaries of each S4-Clostridia RNA. If the 5’ coordinate is greater than the 3’ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 16.1.

16.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 16.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S4-

cd00207 (5) 2Fe-2S iron-sulfur cluster binding domain.
cd06928 (3) N-terminal domain of the Alpha subunit of Bacterial RNA polymerase.
CHL00041 (2) ribosomal protein S11
CHL00137 (46) ribosomal protein S13; Validated
COG0099 (345) Ribosomal protein S13 [Translation, ribosomal structure and biogenesis]
COG0100 (189) Ribosomal protein S11 [Translation, ribosomal structure and biogenesis]
COG0202 (99) DNA-directed RNA polymerase, alpha subunit/40 kD subunit [Transcription]
COG0493 (5) NADPH-dependent glutamate synthase beta chain or related oxidoreductase [Amino acid transport and metabolism, General function prediction only]
COG0522 (132) Ribosomal protein S4 or related protein [Translation, ribosomal structure and biogenesis]

Clostridia RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 16.2.

COG1576 (5) NAD-dependent dihydropyrimidine dehydrogenase, PreA subunit [Nucleotide transport and metabolism]
COG1597 (4) Diacylglycerol kinase family enzyme [Lipid transport and metabolism, General function prediction only]
COG1891 (5) NADH:ubiquinone oxidoreductase, NADH-binding 51 kD subunit (chain F) [Energy production and conversion]
COG1971 (4) Putative Mn2+ efflux pump MntP [Inorganic ion transport and metabolism]
pfam00163 (1) Ribosomal protein S4/S9 N-terminal domain.
pfam01193 (2) RNA polymerase Rpb3/Rpb11 dimerisation domain.
pfam01196 (44) Ribosomal protein L17.
pfam02256 (5) Iron hydrogenase small subunit.

17 S4-Fusobacteriales

17.1 Taxa

The taxonomy of each organism containing a putative S4-Fusobacteriales RNA is listed, with abbreviations identifying each hit (e.g., “Eco-1-1” and “Eco-1-2” might hypothetically represent two distinct RNAs in *E. coli*). The abbreviations will be used to identify each individual S4-Fusobacteriales RNA in Sections 17.2 and 17.4:

abbrev. of hits	taxonomy of species
Cso-1-1	Bacteria Fusobacteria Fusobacteriales Fusobacteriaceae <i>Cetobacterium somerae</i> ATCC BAA-474

17.2 Gene contexts

Each S4-Fusobacteriales RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S4-Fusobacteriales RNA are assigned a color; other domains are gray. Information about these con-

served domains is given in Section 17.3. The accession of the sequence containing each S4-Fusobacteriales RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S4-Fusobacteriales RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 17.1.

17.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 17.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S4-

Fusobacteriales RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 17.2.

cd06928 (15) N-terminal domain of the Alpha subunit of Bacterial RNA polymerase.
cd16320 (1) N-terminal subdomain of transcriptional regulator MraZ.
cd16321 (1) C-terminal subdomain of transcriptional regulator MraZ.
CHL00041 (11) ribosomal protein S11
CHL00137 (11) ribosomal protein S13; Validated
COG0099 (522) Ribosomal protein S13 [Translation, ribosomal structure and biogenesis]
COG0100 (308) Ribosomal protein S11 [Translation, ribosomal structure and biogenesis]
COG0202 (175) DNA-directed RNA polymerase, alpha subunit/40 kD subunit [Transcription]
COG0203 (145) Ribosomal protein L17 [Translation, ribosomal structure and biogenesis]
COG0275 (1) 16S rRNA C1402 N4-methylase RsmH [Translation, ribosomal structure and biogenesis]
COG0522 (199) Ribosomal protein S4 or related protein [Translation, ribosomal structure and biogenesis]
COG0642 (1) Signal transduction histidine kinase [Signal transduction mechanisms]
COG0657 (1) Acetyl esterase/lipase [Lipid transport and metabolism]
pfam00163 (9) Ribosomal protein S4/S9 N-terminal domain.
pfam00411 (1) Ribosomal protein S11.
pfam00583 (3) Acetyltransferase (GNAT) family.
pfam01193 (7) RNA polymerase Rpb3/Rpb11 dimerisation domain.
pfam01196 (7) Ribosomal protein L17.
pfam03118 (2) Bacterial RNA polymerase, alpha chain C terminal domain.
pfam13508 (3) Acetyltransferase (GNAT) domain.
pfam14520 (1) Helix-hairpin-helix domain.

PRK00050 (1) 16S rRNA m(4)C1402 methyltransferase; Provisional
PRK00326 (1) cell division protein MraZ; Reviewed
PRK05179 (528) 30S ribosomal protein S13; Validated
PRK05182 (110) DNA-directed RNA polymerase subunit alpha; Provisional
PRK05309 (321) 30S ribosomal protein S11; Validated
PRK05327 (201) 30S ribosomal protein S4; Validated
PRK05591 (152) 50S ribosomal protein L17; Validated
PRK09607 (1) 30S ribosomal protein S11P; Reviewed
smart00304 (1) HAMP (Histidine kinases, Adenylyl cyclases, Methyl binding proteins, Phosphatases) domain.
smart00363 (11) S4 RNA-binding domain.
smart00387 (1) Histidine kinase-like ATPases.
smart00388 (1) His Kinase A (phosphoacceptor) domain.
TIGR02027 (87) DNA-directed RNA polymerase, alpha subunit, bacterial and chloroplast-type. [Transcription, DNA-dependent RNA polymerase]
TIGR03628 (1) ribosomal protein uS11P, archaeal form. [Protein synthesis, Ribosomal proteins: synthesis and modification]
TIGR03631 (5) ribosomal protein uS13, bacterial form. [Protein synthesis, Ribosomal proteins: synthesis and modification]
TIGR03632 (1) ribosomal protein uS11, bacterial form. [Protein synthesis, Ribosomal proteins: synthesis and modification]

18.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 18.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S6-S18-

cd00473 (36) Bacterial ribosomal protein S6.

cd03789 (1) Lipopolysaccharide heptosyltransferase is involved in the biosynthesis of lipooligosaccharide (LOS).

cd04496 (5) SSB_OBF: A subfamily of OB folds similar to the OB fold of ssDNA-binding protein (SSB).

COG0359 (24) Ribosomal protein L9 [Translation, ribosomal structure and biogenesis]

Chlorobi RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 18.2.

COG0629 (1) Single-stranded DNA-binding protein [Replication, recombination and repair]

pfam00436 (25) Single-strand binding protein family.

pfam01084 (25) Ribosomal protein S18.

pfam01250 (15) Ribosomal protein S6.

pfam01281 (1) Ribosomal protein L9, N-terminal domain.

PRK00137 (25) 50S ribosomal protein L9; Reviewed

The taxonomy of each organism containing a putative S10-Clostridia RNA is listed, with abbreviations identifying each hit (e.g., “Eco-1-1” and “Eco-1-2” might hypothetically represent two distinct RNAs in *E. coli*). The abbreviations will be used to identify each individual S10-Clostridia RNA in Sections 19.2 and 19.4.

env-1 to env-1176	environmental samples	

19.2 Gene contexts

Each S10-Clostridia RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S10-Clostridia RNA are assigned a color; other domains are gray. Information about these conserved domains is given in

Section 19.3. The accession of the sequence containing each S10-Clostridia RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S10-Clostridia RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 19.1.

19.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 19.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S10-

- cd00432** (1) Ribosomal L18/L5e: L18 (L5e) is a ribosomal protein found in the central protuberance (CP) of the large subunit.
cd01086 (5) Methionine Aminopeptidase 1.
cd01428 (2) Adenylate kinase (ADK) catalyzes the reversible phosphoryl transfer from adenosine triphosphates (ATP) to adenosine monophosphates (AMP) and to yield adenosine diphosphates (ADP).
cd01658 (25) Ribosomal protein L30, which is found in eukaryotes and prokaryotes but not in

Clostridia RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 19.2.

- archaea, is one of the smallest ribosomal proteins with a molecular mass of about 7kDa.
cd02412 (2) K homology RNA-binding (KH) domain of the prokaryotic 30S small ribosomal subunit protein S3.
cd04451 (4) S1_IF1: Translation Initiation Factor IF1, S1-like RNA-binding domain.
cd06088 (1) KOW motif of Ribosomal Protein L14.
cd06089 (3) KOW motif of Ribosomal Protein L26.
CHL00022 (135) ribosomal protein L16
CHL00050 (2) ribosomal protein S19

TIGR03918 (1) [FeFe] hydrogenase H-cluster maturation GTPase HydF. [FeFe] hydrogenase H-cluster maturation GTPase HydF. This model describes the family of the [Fe] hydrogenase maturation protein HypF as characterized in *Chlamydomonas reinhardtii* and found, in an operon with radical SAM proteins HydE and HydG, in numerous bacteria. It has GTPase activity, can bind an 4Fe-4S cluster, and is essential for hydrogenase activity. [Protein fate, Protein modification and repair]

19.4 Multiple-sequence alignment

Each S10-Clostridia RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 19.1. The alignment may include sequences containing the RNA motif, as well as flanking sequence. The S10-Clostridia RNA itself is denoted by the line underneath marked 5' and 3' on either end. Nucleotides in flanking sequences (i.e., not part of the motif) are written in gray letters. Stems

of predicted rho-independent transcription terminators, if any, are shaded yellow. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNIE software.) Nucleotides predicted to function (as DNA) as transcription-factor binding sites, if any, are shaded in green. (But note: these predictions are manually an-

notated, so they might be under-predicted.) Annotated start codons, if any, are shaded **green**. (Note: start codons are frequently misannotated, especially in environmental samples.) Nucleotides proposed to basepair as part of the consensus structure are shaded in color when they comprise Watson-Crick or G-U pairs. Otherwise they are shaded gray. Conserved stems are also indicated at the bottom of the alignment by angle brackets, where matching < and > denote base-paired columns. Below these angle brackets, the symbol “2” denotes base pairs exhibiting covariation according to the statistically well-founded R-scape method. “1” denotes base pairs exhibiting covariation according to R2R’s simplistic method. “0”

denotes base pairs that are not observed to mutate and “?” denotes base pairs that have a significant frequency of non-canonical nucleotides for Watson-Crick or G-U pairs (> 5%). Below these base pair annotation is the consensus sequence: “R” = “A” or “G”, “Y” = “C” or “U”, **red nucleotides**: nucleotide identity conserved more than 97% of the time, black nucleotides: 90%, gray nucleotides: 75%, red circle (◐): nucleotide is present 97% of the time, black circle (◑): 90%, gray circle (◒): 75%, white circle (◓): 50%. All percentages of sequences just described (e.g. 97% conserved) assume that sequences have been weighted by the GSC algorithm implemented by the Infernal software package.

Duplicate sequences: the following putative homologs are not shown in the alignment because their sequences are identical to a homolog already shown: Bfi-3-1, Bfi-4-1, Bsp-8-1, Cba-4-1, Cba-5-1, env-1 to env-185						environmental samples

20.2 Gene contexts

Each S15-Halobacteria RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S15-Halobacteria RNA are assigned a color; other domains are gray. Information about these conserved

domains is given in Section 20.3. The accession of the sequence containing each S15-Halobacteria RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S15-Halobacteria RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 20.1.

20.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 20.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S15-

cd00353 (98) Ribosomal protein S15 (prokaryotic)_S13 (eukaryotic) binds the central domain of 16S rRNA and is required for assembly of the small ribosomal subunit and for intersubunit association, thus representing a key element in the assembly of the whole ribosome.
cd00677 (2) S15/NS1/EPRS_RNA-binding domain.
cd06927 (1) L subunit of Archaeal RNA polymerase.
cd11255 (1) The Sema domain, a protein interacting module, of semaphorin 3G (Sema3G).
cd13704 (1) The periplasmic sensor domain of histidine kinase receptors; the type 2 periplasmic binding fold protein.
COG0184 (44) Ribosomal protein S15P/S13E [Translation, ribosomal structure and biogenesis]
COG0608 (1) Single-stranded DNA-specific exonuclease, DHH superfamily, may be involved in

Halobacteria RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 20.2.

archaeal DNA replication initiation [Replication, recombination and repair]
COG0642 (1) Signal transduction histidine kinase [Signal transduction mechanisms]
COG1413 (1) HEAT repeat [General function prediction only]
COG1846 (1) DNA-binding transcriptional regulator, MarR family [Transcription]
COG1890 (69) Ribosomal protein S3AE [Translation, ribosomal structure and biogenesis]
COG2892 (1) tRNA threonylcarbamoyladenine modification (KEOPS) complex, Pcc1 subunit [Translation, ribosomal structure and biogenesis]
COG4300 (1) Cadmium resistance protein CadD, predicted permease [Inorganic ion transport and metabolism]
pfam00312 (18) Ribosomal protein S15.

21.2 Gene contexts

Each S15-Methanobacteria RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S15-Methanobacteria RNA are assigned a color; other domains are gray. Information about these conserved do-

mains is given in Section 21.3. The accession of the sequence containing each S15-Methanobacteria RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S15-Methanobacteria RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 21.1.

21.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 21.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S15-

cd00353 (67) Ribosomal protein S15 (prokaryotic)_S13 (eukaryotic) binds the central domain of 16S rRNA and is required for assembly of the small ribosomal subunit and for intersubunit association, thus representing a key element in the assembly of the whole ribosome.

cd00670 (5) Gly_His_Pro_Ser_Thr_tRNA synthetase class II core domain.

cd01942 (4) Ribokinase-like subgroup A.

cd06174 (1) The Major Facilitator Superfamily (MFS) is a large and diverse group of secondary transporters that includes uniporters, symporters, and antiporters.

cd15178 (1) CXC chemokine receptor types 1 and 2, member of the class A family of seven-transmembrane G protein-coupled receptors.

cd16011 (6) uncharacterized subfamily of alkaline phosphatase, homologous to 2 3 bisphosphoglycerate independent phosphoglycerate mutase (iPGM) and bacterial phosphopentomutases.

COG0184 (31) Ribosomal protein S15P/S13E [Translation, ribosomal structure and biogenesis]

COG0608 (107) Single-stranded DNA-specific exonuclease, DHH superfamily, may be involved in archaeal DNA replication initiation [Replication, recombination and repair]

COG3221 (1) ABC-type phosphate/phosphonate transport system, periplasmic component [Inorganic ion transport and metabolism]

COG3356 (2) Predicted membrane-associated lipid hydrolase, neutral ceramidase superfamily [Lipid transport and metabolism]

COG3635 (1) 2,3-bisphosphoglycerate-independent phosphoglycerate mutase, archeal type [Carbohydrate transport and metabolism]

COG4801 (1) Predicted acyltransferase, contains DUF342 domain [General function prediction only]

pfam00312 (27) Ribosomal protein S15.

pfam00881 (4) Nitroreductase family.

pfam01015 (68) Ribosomal S3Ae family.

pfam01561 (1) Hantavirus glycoprotein G2.

pfam02272 (6) DHHA1 domain.

pfam04475 (4) Protein of unknown function (DUF555).

pfam04519 (3) Polymer-forming cytoskeletal.

pfam08069 (25) Ribosomal S13/S15 N-terminal domain.

pfam09843 (2) Predicted membrane protein (DUF2070).

pfam10143 (1) 2,3-bisphosphoglycerate-independent phosphoglycerate mutase. [2-phospho-D-glycerate + 2,3-diphosphoglycerate = 3-phospho-D-glycerate + 2,3-diphosphoglycerate]

PRK00960 (5) seryl-tRNA synthetase; Provisional

21.4 Multiple-sequence alignment

Each S15-Methanobacteria RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 21.1. The alignment may include sequences containing the RNA motif, as well as flanking sequence. The S15-Methanobacteria RNA itself is denoted by the line underneath marked 5’ and 3’ on either end. Nucleotides in flanking sequences (i.e., not part of the motif)

Methanobacteria RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 21.2.

PRK03922 (4) hypothetical protein; Provisional

PRK04024 (1) cofactor-independent phosphoglycerate mutase; Provisional

PRK04057 (68) 30S ribosomal protein S3Ae; Validated

PRK08561 (137) 30S ribosomal protein S15P; Reviewed

PRK10765 (2) nitroreductase A; Provisional

PRK11160 (1) cysteine/glutathione ABC transporter membrane/ATP-binding component; Reviewed

PRK14888 (76) KEOPS complex Pcc1-like subunit; Provisional

PRK15319 (1) AIDA autotransporter-like protein ShdA; Provisional

PTZ00247 (3) adenosine kinase; Provisional

TCR00306 (5) phosphoglycerate mutase (2,3-diphosphoglycerate-independent), archaeal form. [Energy metabolism, Glycolysis/gluconeogenesis]

TIGR00644 (87) single-stranded-DNA-specific exonuclease RecJ. [DNA metabolism, DNA replication, recombination, and repair]

TIGR00711 (1) drug resistance transporter, EmrB/QacA subfamily. [Cellular processes, Toxin production and resistance, Transport and binding proteins, Other]

TIGR01173 (1) UDP-N-acetylglucosamine diphosphorylase/glucosamine-1-phosphate N-acetyltransferase. [Cell envelope, Biosynthesis and degradation of murein sacculus and peptidoglycan, Cell envelope, Biosynthesis and degradation of surface polysaccharides and lipopolysaccharides, Central intermediary metabolism, Amino sugars]

TIGR01853 (2) UDP-3-O-[3-hydroxymyristoyl] glucosamine N-acyltransferase LpxD. [3-hydroxymyristoyl] glucosamine N-acyltransferase LpxD. This model describes LpxD, an enzyme for the biosynthesis of lipid A, a component of lipopolysaccharide (LPS) in the outer membrane outer leaflet of most Gram-negative bacteria. Some differences are found between lipid A of different species. This protein represents the third step from UDP-N-acetyl-D-glucosamine. The group added at this step generally is 14:0(3-OH) (myristate) but may vary; in Aquifex it appears to be 16:0(3-OH) (palmitate). [Cell envelope, Biosynthesis and degradation of surface polysaccharides and lipopolysaccharides]

TIGR02152 (1) ribokinase. [Energy metabolism, Sugars]

TIGR02476 (2) 5,6-dimethylbenzimidazole synthase. [Biosynthesis of cofactors, prosthetic groups, and carriers, Heme, porphyrin, and cobalamin]

TIGR03683 (1) alanyl-tRNA synthetase.

are written in gray letters. Stems of predicted rho-independent transcription terminators, if any, are shaded yellow. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNIE software.) Nucleotides predicted to function (as DNA) as transcription-factor binding sites, if any, are shaded in green. (But note: these

22.2 Notes

Superscript numbers are used to annotate any S15-Flavobacteria RNA that has special characteristics (described below). These numeric annotations will be

¹ No UAnnUUUG is apparent in the 100 nucleotides upstream of this motif in-

22.3 Gene contexts

Each S15-Flavobacteria RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S15-Flavobacteria RNA are assigned a color; other domains are gray. Information about these conserved

used in Sections 22.3 and 22.5. The meaning of the numbers are as follows.

stance.

domains is given in Section 22.4. The accession of the sequence containing each S15-Flavobacteria RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S15-Flavobacteria RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 22.1. (Superscript numbers refer to annotations listed in Section 22.2)

22.4 Conserved domains

Conserved domains found in protein-coding genes listed in Section 22.3 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S15-Flavobacteria RNA are assigned a color, while others are shown in gray. The symbols ‘d’ and ‘u’ (if any) to the left of the colored domain name indicate whether the domain occurs upstream or downstream of the RNA motif. Domains marked with lower-case ‘d’ occur (at least once) present downstream of some S15-Flavobacteria

RNA in the opposite orientation. Domains marked with capital ‘D’ occur downstream and in the same orientation (i.e., a potential *cis*-regulatory arrangement). Domains marked with a ‘u’ occur upstream of the RNA in either orientation. If the ‘d’/‘u’ symbols are missing, then the domain is downstream and in the same strand. (This mode is used for motifs predicted as *cis*-regulatory.) The number in parentheses after the colored domain name is the number of occurrences in Section 22.3.

- bSCRAP106** (26) Self-Cleaving Ribozyme Associated Protein number 106 (gi=2031276512 by jackhmmer)
- bSCRAP40** (26) Self-Cleaving Ribozyme Associated Protein number 40 (gi=10605909721 by jackhmmer)
- cd00353** (2) Ribosomal protein S15 (prokaryotic)_S13 (eukaryotic) binds the central domain of 16S rRNA and is required for assembly of the small ribosomal subunit and for intersubunit association, thus representing a key element in the assembly of the whole ribosome.
- cd00429** (50) Ribulose-5-phosphate 3-epimerase (RPE).
- cd11363** (45) Polyribonucleotide nucleotidyltransferase, repeat 1.
- COG0184** (344) Ribosomal protein S15P/S13E [Translation, ribosomal structure and biogenesis]
- COG0405** (1) Gamma-glutamyltranspeptidase [Amino acid transport and metabolism]
- COG0568** (54) DNA-directed RNA polymerase, sigma subunit (sigma70/sigma32) [Transcription]
- COG0810** (1) Periplasmic protein TonB, links inner and outer membranes [Cell wall/membrane/envelope biogenesis]
- COG1185** (118) Polyribonucleotide nucleotidyltransferase (polynucleotide phosphorylase) [Translation, ribosomal structure and biogenesis]
- COG1770** (1) Protease II [Amino acid transport and metabolism]
- COG2377** (2) 1,6-Anhydro-N-acetylmuramate kinase [Cell wall/membrane/envelope biogenesis]
- pfam00140** (5) Sigma-70 factor, region 1.
- pfam00312** (1729) Ribosomal protein S15.
- pfam01138** (150) 3' exoribonuclease family, domain 1.
- pfam03702** (14) Anhydro-N-acetylmuramic acid kinase.
- pfam03725** (39) 3' exoribonuclease family, domain 2.
- pfam03726** (4) Polyribonucleotide nucleotidyltransferase, RNA binding domain.
- pfam04542** (3) Sigma-70 region 2.
- pfam06210** (18) Protein of unknown function (DUF1003).
- PLN02198** (1) glutathione gamma-glutamylcysteinytransferase
- PRK05581** (50) ribulose-phosphate 3-epimerase; Validated
- PRK05626** (2112) 30S ribosomal protein S15; Reviewed
- PRK09210** (2) RNA polymerase sigma factor RpoD; Validated
- PRK09585** (16) anhydro-N-acetylmuramic acid kinase; Reviewed
- PRK10115** (1) protease 2; Provisional
- PRK11824** (313) polynucleotide phosphorylase/polyadenylase; Provisional
- smart00316** (1) Ribosomal protein S1-like RNA-binding domain.
- smart00322** (1) K homology RNA-binding domain.
- TIGR01352** (1) TonB family C-terminal domain. [Transport and binding proteins, Cations and iron carrying compounds]
- TIGR02169** (18) chromosome segregation protein SMC, primarily archaeal type. [Cellular processes, Cell division, DNA metabolism, Chromosome-associated proteins]
- TIGR02937** (57) RNA polymerase sigma factor, sigma-70 family.

22.5 Multiple-sequence alignment

Each S15-Flavobacteria RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 22.1. (Superscript numbers refer to annotations listed in Section 22.2) The alignment may include sequences containing the RNA motif, as well as flanking sequence. The S15-Flavobacteria RNA itself is denoted by the line underneath marked 5' and 3' on either end. Nucleotides in flanking sequences (i.e., not part of the motif) are written in *gray letters*. Stems of predicted rho-independent transcription terminators, if any, are shaded **yellow**. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNIE software.) Nucleotides predicted to function (as DNA) as transcription-factor binding sites, if any, are shaded in **green**. (But note: these predictions are manually annotated, so they might be under-predicted.) Annotated start codons, if any, are shaded **green**. (Note: start codons are frequently misannotated, especially in environmental samples.) Nucleotides proposed to basepair as part of the consensus structure are shaded in color when they comprise Watson-Crick or G-U pairs. Oth-

erwise they are shaded gray. Conserved stems are also indicated at the bottom of the alignment by angle brackets, where matching < and > denote base-paired columns. Below these angle brackets, the symbol “2” denotes base pairs exhibiting covariation according to the statistically well-founded R-scape method. “1” denotes base pairs exhibiting covariation according to R2R’s simplistic method. “0” denotes base pairs that are not observed to mutate and “?” denotes base pairs that have a significant frequency of non-canonical nucleotides for Watson-Crick or G-U pairs (> 5%). Below these base pair annotation is the consensus sequence: “R” = “A” or “G”, “Y” = “C” or “U”, **red nucleotides**: nucleotide identity conserved more than 97% of the time, black nucleotides: 90%, **gray nucleotides**: 75%, red circle (◉): nucleotide is present 97% of the time, black circle (◐): 90%, gray circle (◑): 75%, white circle (◒): 50%. All percentages of sequences just described (e.g. 97% conserved) assume that sequences have been weighted by the GSC algorithm implemented by the Infernal software package.

Duplicate sequences: the following putative homologs are not shown in the alignment because their sequences are identical to a homolog already shown: Aal-1-1, Cba-1-1, Cba-3-1, Cca-2-3, Cca-3-1, Ccy-1-2, Ccy-2-1, Cin-2-1, Coc-4-1, Cor-1-2, Csp-4-1, Ean-1-1, Ean-1-2, Ean-1-4, Ean-10-1, Ean-11-1, Ean-12-1, Ean-2-1, Ean-4-1, Ean-5-1, Ean-6-1, Ean-7-1, Ean-8-1, Ean-9-1, Eme-1-1, Eme-2-2, Fca-1-2, Fen-1-2, Fps-1-10, Fps-1-2, Fps-1-3, Fps-1-4, Fps-1-5, Fps-1-6, Fps-1-7, Fps-1-8, Fps-1-9, Fps-2-1, Fps-3-1, Fri-2-1, Fsp-14-1, Fsu-1-2, Fsu-3-2, Jpa-1-2, Jpa-1-3, Lbl-1-1, M[o-1-1, Mod-2-1, Mod-5-1, Msp-3-1, Orh-2-1, Orh-3-1, Psp-1-1, Ran-1-1, Ran-1-2, Ran-2-2, Ran-3-1, Ran-5-1, Ran-6-1, Ran-7-1, Zpr-1-1, env-10, env-1000, env-1014, env-1020, env-1031, env-104, env-1043, env-105, env-1050, env-1052, env-1054,

Each S16-Flavobacteria RNA (indicated by “RNA→”) is listed. For each hit, the downstream genes predicted to reside in a regulated operon are listed. If the nearest downstream gene is encoding in the opposite strand (and therefore presumed to not be a part of a regulated operon), then that gene is still depicted. Some environmental sequences and some RefSeq entries lack gene annotations, and so no genes are available for such sequences. The direction of each gene is indicated with an arrow (→), and each predicted conserved domain in the gene is named. Conserved domains associated with more than one S16-Flavobacteria RNA are assigned a color; other domains are gray. Information about these con-

served domains is given in Section 23.3. The accession of the sequence containing each S16-Flavobacteria RNA is given in the column named “Seq. accession”. Accessions beginning with “NC_”, “NS_”, “NW_” or “NZ_” are contained in RefSeq. Other accession refer to environmental samples. Nucleotide coordinates are given for the 5′ and 3′ boundaries of each S16-Flavobacteria RNA. If the 5′ coordinate is greater than the 3′ coordinate, the RNA is present on the reverse-complement strand of the containing genomic DNA sequence. Each hit is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 23.1.

23.3 Conserved domains

Conserved domains found in protein-coding genes listed in Section 23.2 are shown below, with the first sentence in their description from the Conserved Domain Database (if any). Conserved domains associated with more than one S16-

cd01569 (1) pre-B-cell colony-enhancing factor (PBEF)-like.
cd01832 (4) Members of the SGNH-hydrolase superfamily, a diverse family of lipases and esterases.
cd02165 (3) Nicotinamide/nicotinate mononucleotide adenyltransferase.
cd02440 (23) S-adenosylmethionine-dependent methyltransferases (SAM or AdoMet-MTase), class I; AdoMet-MTases are enzymes that use S-adenosyl-L-methionine (SAM or AdoMet) as a substrate for methyltransfer, creating the product S-adenosyl-L-homocysteine (AdoHcy).
cd16026 (1) galactosamine-6-sulfatase; also known as N-acetylgalactosamine-6-sulfatase (GALNS).
cd16343 (3) Low molecular weight protein tyrosine phosphatase.
COG0194 (3) Guanylate kinase [Nucleotide transport and metabolism]
COG0228 (100) Ribosomal protein S16 [Translation, ribosomal structure and biogenesis]
COG0353 (2) Recombinational DNA repair protein RecR [Replication, recombination and repair]
COG0462 (1) Phosphoribosylpyrophosphate synthetase [Nucleotide transport and metabolism, Amino acid transport and metabolism]
COG0806 (25) Ribosomal 30S subunit maturation factor RimM, required for 16S rRNA processing [Translation, ribosomal structure and biogenesis]
COG0807 (1) GTP cyclohydrolase II [Coenzyme transport and metabolism]
COG1051 (1) ADP-ribose pyrophosphatase YjhB, NUDIX family [Nucleotide transport and metabolism]
COG1561 (3) Uncharacterized conserved protein YicC, UPF0701 family [Function unknown]
COG1960 (13) Acyl-CoA dehydrogenase related to the alkylation response protein AidB [Lipid transport and metabolism]
COG1990 (1) Peptidyl-tRNA hydrolase [Translation, ribosomal structure and biogenesis]
COG3064 (1) Membrane protein involved in colicin uptake [Cell wall/membrane/envelope biogenesis]

23.4 Multiple-sequence alignment

Each S16-Flavobacteria RNA is denoted by an abbreviation (like “Eco-1-1”) that refers to a taxonomy given in Section 23.1. The alignment may include sequences containing the RNA motif, as well as flanking sequence. The S16-Flavobacteria RNA itself is denoted by the line underneath marked 5' and 3' on either end. Nucleotides in flanking sequences (i.e., not part of the motif) are written in gray letters. Stems of predicted rho-independent transcription terminators, if any, are shaded yellow. (Note: terminator predictions have not been analyzed manually, and many are likely to be false positives. Terminator predictions are those of the RNE software.) Nucleotides predicted to function (as DNA) as transcription-

Flavobacteria RNA are assigned a color, while others are shown in gray. The number in parentheses after the colored domain name is the number of occurrences in Section 23.2.

COG3958 (3) Transketolase, C-terminal subunit [Carbohydrate transport and metabolism]
pfam00886 (35) Ribosomal protein S16.
pfam01782 (23) RimM N-terminal domain.
pfam04111 (2) Autophagy protein Apg6.
pfam05239 (9) PRC-barrel domain.
pfam06459 (1) Ryanodine Receptor TM 4-6.
pfam13472 (4) GDSL-like Lipase/Acylhydrolase family.
pfam13649 (23) Methyltransferase domain.
PLN02526 (13) acyl-coenzyme A oxidase
PRK00040 (32) 30S ribosomal protein S16; Reviewed
PRK00071 (3) nicotinic acid mononucleotide adenyltransferase; Provisional
PRK00076 (2) recombination protein RecR; Reviewed
PRK00122 (52) 16S rRNA-processing protein RimM; Provisional
PRK00300 (3) guanylate kinase; Provisional
PRK00393 (1) GTP cyclohydrolase II; Reviewed
PRK05379 (1) bifunctional nicotinamide mononucleotide adenyltransferase/ADP-ribose pyrophosphatase; Provisional
PRK09198 (1) putative nicotinate phosphoribosyltransferase; Provisional
PRK11820 (3) hypothetical protein; Provisional
PRK13759 (1) arylsulfatase; Provisional
PRK14521 (95) 30S ribosomal protein S16; Provisional
smart00226 (3) Low molecular weight phosphatase family.
smart00861 (3) Transketolase, pyrimidine binding domain.
TIGR00002 (12) ribosomal protein S16. [Protein synthesis, Ribosomal proteins: synthesis and modification]
TIGR01251 (1) ribose-phosphate pyrophosphokinase. [Purines, pyrimidines, nucleosides, and nucleotides, Purine ribonucleotide biosynthesis]

factor binding sites, if any, are shaded in green. (But note: these predictions are manually annotated, so they might be under-predicted.) Annotated start codons, if any, are shaded green. (Note: start codons are frequently misannotated, especially in environmental samples.) Nucleotides proposed to basepair as part of the consensus structure are shaded in color when they comprise Watson-Crick or G-U pairs. Otherwise they are shaded gray. Conserved stems are also indicated at the bottom of the alignment by angle brackets, where matching < and > denote base-paired columns. Below these angle brackets, the symbol “2” denotes base pairs exhibiting covariation according to the statistically well-founded R-scape method.

“1” denotes base pairs exhibiting covariation according to R2R’s simplistic method. “0” denotes base pairs that are not observed to mutate and “?” denotes base pairs that have a significant frequency of non-canonical nucleotides for Watson-Crick or G-U pairs (> 5%). Below these base pair annotation is the consensus sequence: “R” = “A” or “G”, “Y” = “C” or “U”, **red nucleotides**: nucleotide identity con-

served more than 97% of the time, black nucleotides: 90%, gray nucleotides: 75%, red circle (●): nucleotide is present 97% of the time, black circle (●): 90%, gray circle (●): 75%, white circle (○): 50%. All percentages of sequences just described (e.g. 97% conserved) assume that sequences have been weighted by the GSC algorithm implemented by the Infernal software package.
