

Supplemental Table S2

Correlation at baseline between osteoclast parameters, demographics, RA characteristics and bone phenotype

Osteoclastic parameters included the number of osteoclast precursors (PBMC-CD14+ cells), and characteristics of PBMC-derived osteoclasts (osteoclast generated in vitro, osteoclast apoptosis and bone resorption). Correlations with these osteoclastic parameters and demographics or RA activity (DAS28 for tender or swollen joints, HAQ), as well as RA phenotype (seropositivity, erosions), and bone parameters (serum 25-OH vitamin D, lumbar or femoral T-score or BMD)

	PBMC- CD14+ cells			Osteoclasts/well			in vitro bone resorption			Osteoclast apoptosis

Erosion SHS

Erosion score from the Sharp/van der Heijde modified method (SHS)

Total SHS

Total score from the Sharp/van der Heijde modified method (SHS)

Osteoclasts/well: number of multinucleated TRAP positive cells formed in cultures of PBMC-derived precursors
