

Supplementary Figure S5

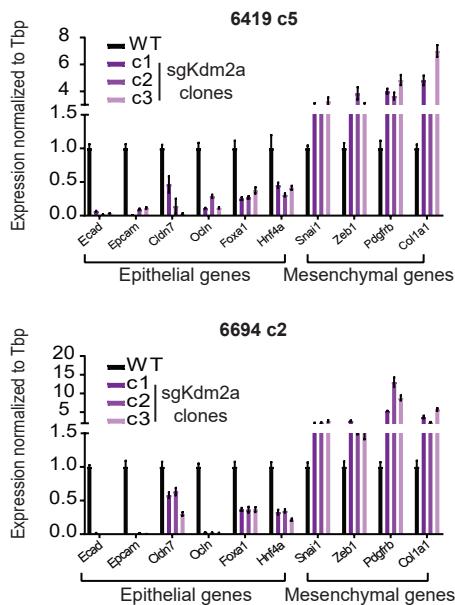

A

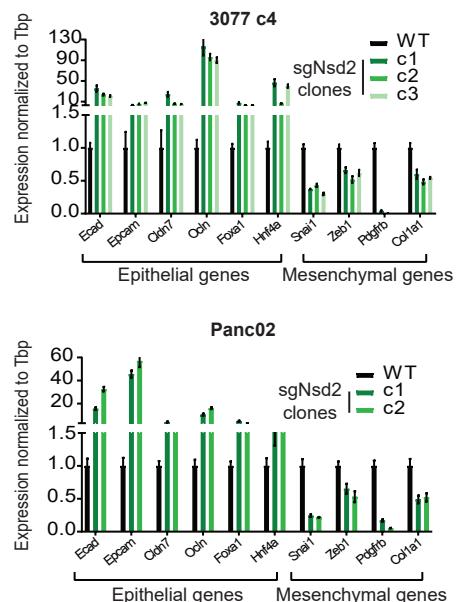

B

C

D

Supplementary Figure S5. EMT-related genes are reciprocally regulated by *Nsd2* and *Kdm2a*.

(A-B) Boxplots of expressions of various epithelial (top) and mesenchymal (bottom) genes in transcripts per million (TPM) in WT versus sgKdm2a cells (**A**), as well as in WT versus sgNsd2 cells (**B**).

(C-D) Relative mRNA expression of epithelial and mesenchymal genes (qPCR) in WT versus sgKdm2 cells (**C**) and WT versus sgNsd2 cells (**D**). For all experiments, n=2 cell lines/genotype, n=2-3 sgRNA clones/cell line. For triplicate qPCR analyses, bars represent mean \pm SEM.
