

**Supplement for “Excess Out-Of-Hospital Mortality and Declining Oxygen Saturation: The Sentinel Role of EMS Data in the COVID-19 Crisis in Tijuana, Mexico”**

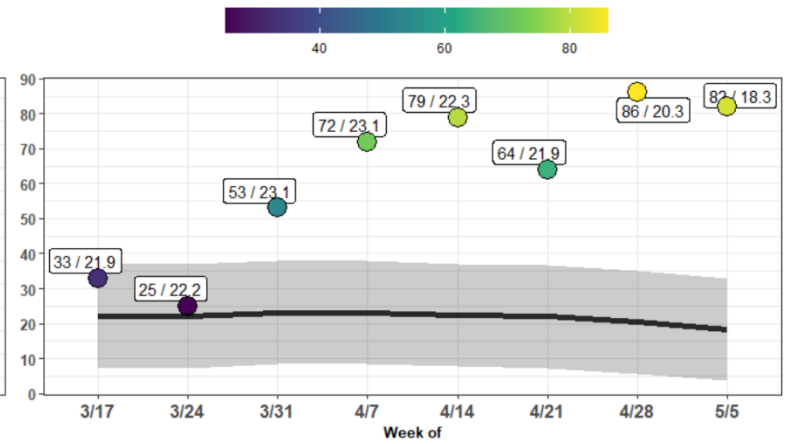

**Supplemental Figure 1. Number of CPR Administrations by Triage Priority Code, 2019-2020**

The number of CPR administrations among non-trauma patients was visualized by triage priority code for 2019 through May 2020. The vertical black line marks the week of March 10<sup>th</sup> through March 16<sup>th</sup>. The 2019 average number of CPR administrations is shown with a horizontal black line for each category. Overall, a very low number of CPR applications was observed in this population, with no substantial differences noted during the observed peak COVID-19 period.

A) EMS-Documented Out-Of-Hospital Mortality (observed / expected)

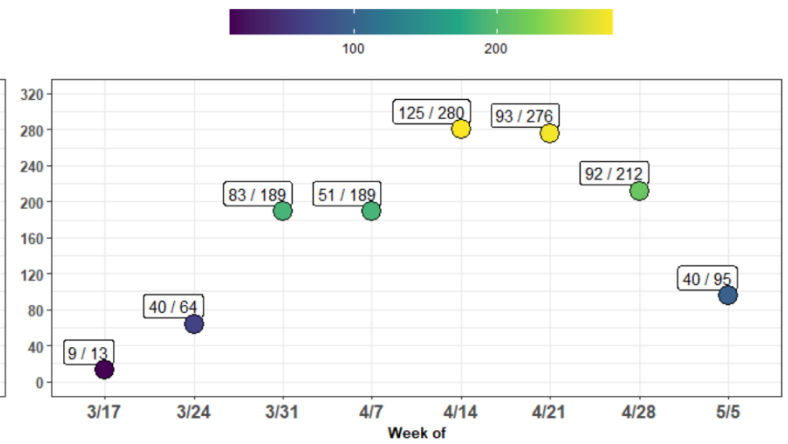

B) EMS-Documented Respiratory Cases (observed / expected)

C) Official COVID-19 Deaths (reported as outpatient / total)

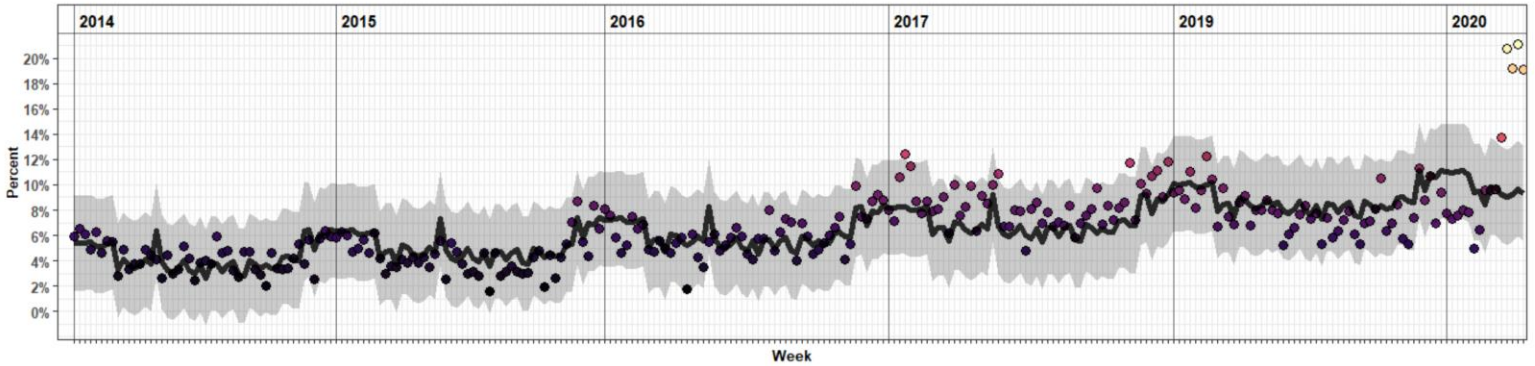

D) Official COVID-19 Cases (reported as outpatient / total)

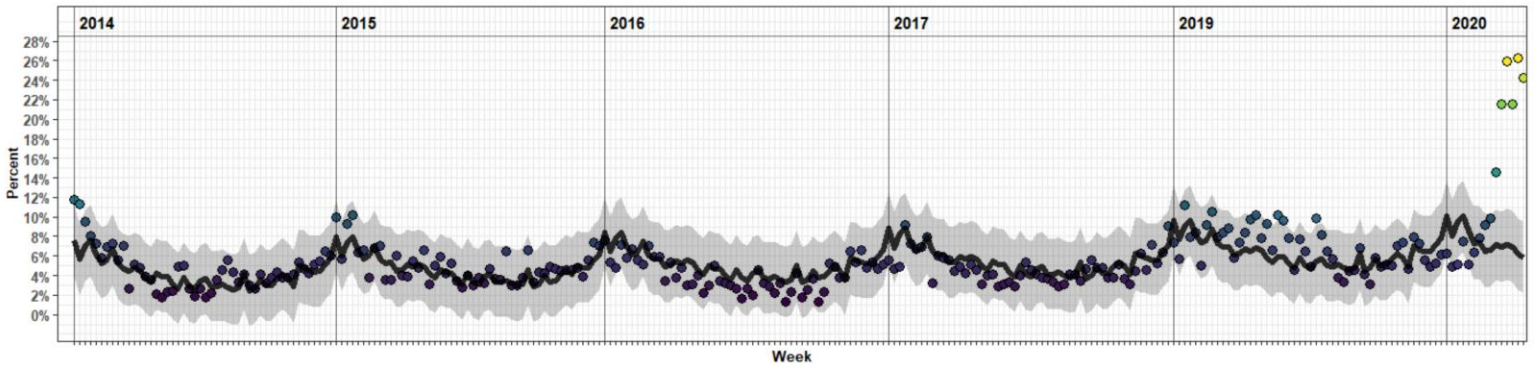

**Supplemental Figure 2. EMS-Documented Dead-On-Arrival Mortality and Respiratory Cases Compared to Official COVID-19 Case and Mortality Numbers, March 17<sup>th</sup> – May 11<sup>th</sup>**

A supplemental version of figure 3 in the main text, using only dead-on-arrival mortality. Shown as a sensitivity analysis. The results in the main text use all pre-hospital mortality, including dead-on-arrival (which are the majority) and individuals who died in transit.

A) EMS-Documented Out-Of-Hospital Mortality

B) EMS-Documented Respiratory Cases

**Supplemental Figure 3. Long-Run EMS-Documented Out-Of-Hospital Mortality and Respiratory Percent of Cases, 2014-2020**  
A supplemental version of figure 2 in the main text using % of non-trauma caseload instead of total number of cases, to control for possible differences in overall volume. A) EMS-documented out-of-hospital mortality. B) EMS-documented respiratory cases. Parts A and B include expected values (black line) and 95% prediction intervals (grey band) based on model fit on data from 2014-2019, with forecasts through April of 2020. Both series exclude trauma-patients.

### Supplemental Table 1. Characteristics of Respiratory Patients by Categorical SpO2

Numbers exclude trauma-related patients and pre-hospital deaths. Data are shown for the peak observed respiratory case period, from March 31<sup>st</sup> to May 11<sup>th</sup>.
