Mimicry diversification in *Papilio dardanus* via a genomic inversion in the regulatory region of
engrailed-inverted. Proceedings of the Royal Society B. DOI: 10.1098/rspb.2020.0443

Electronic supplementary material

Figure S1-S8

Table S1-4

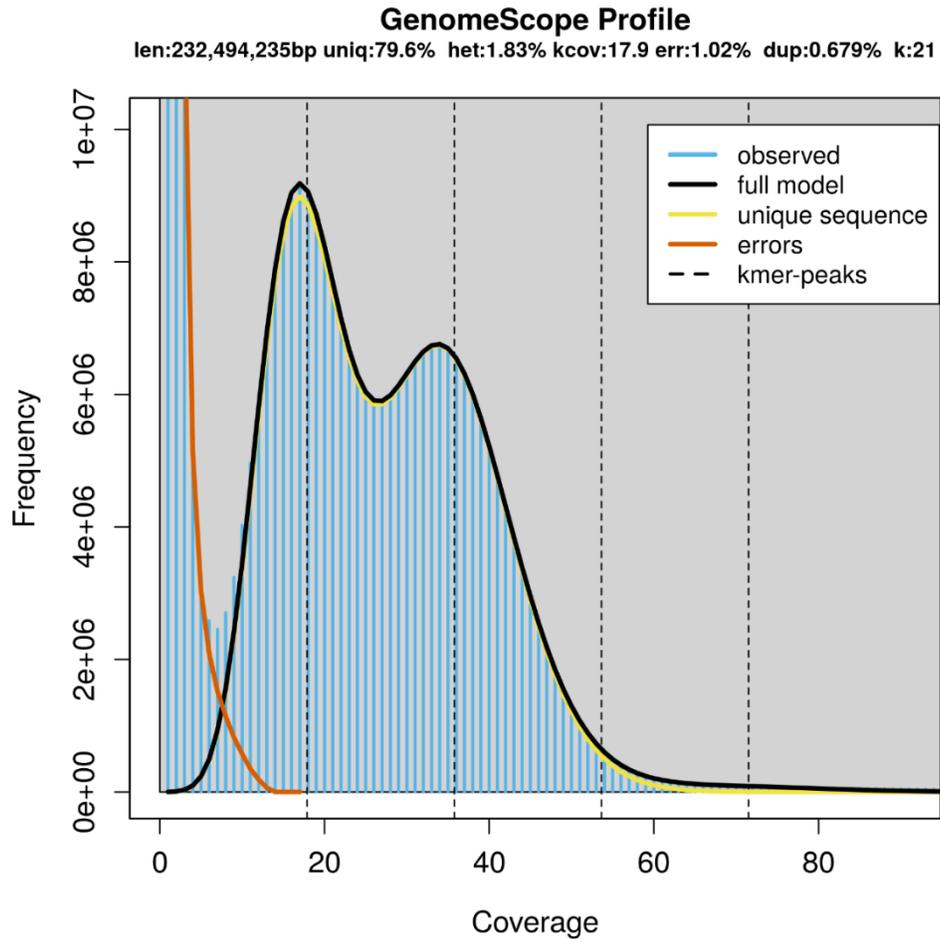

Figure S1: Estimate of genome size using K-mer count. Profile was obtained using GenomeScope.

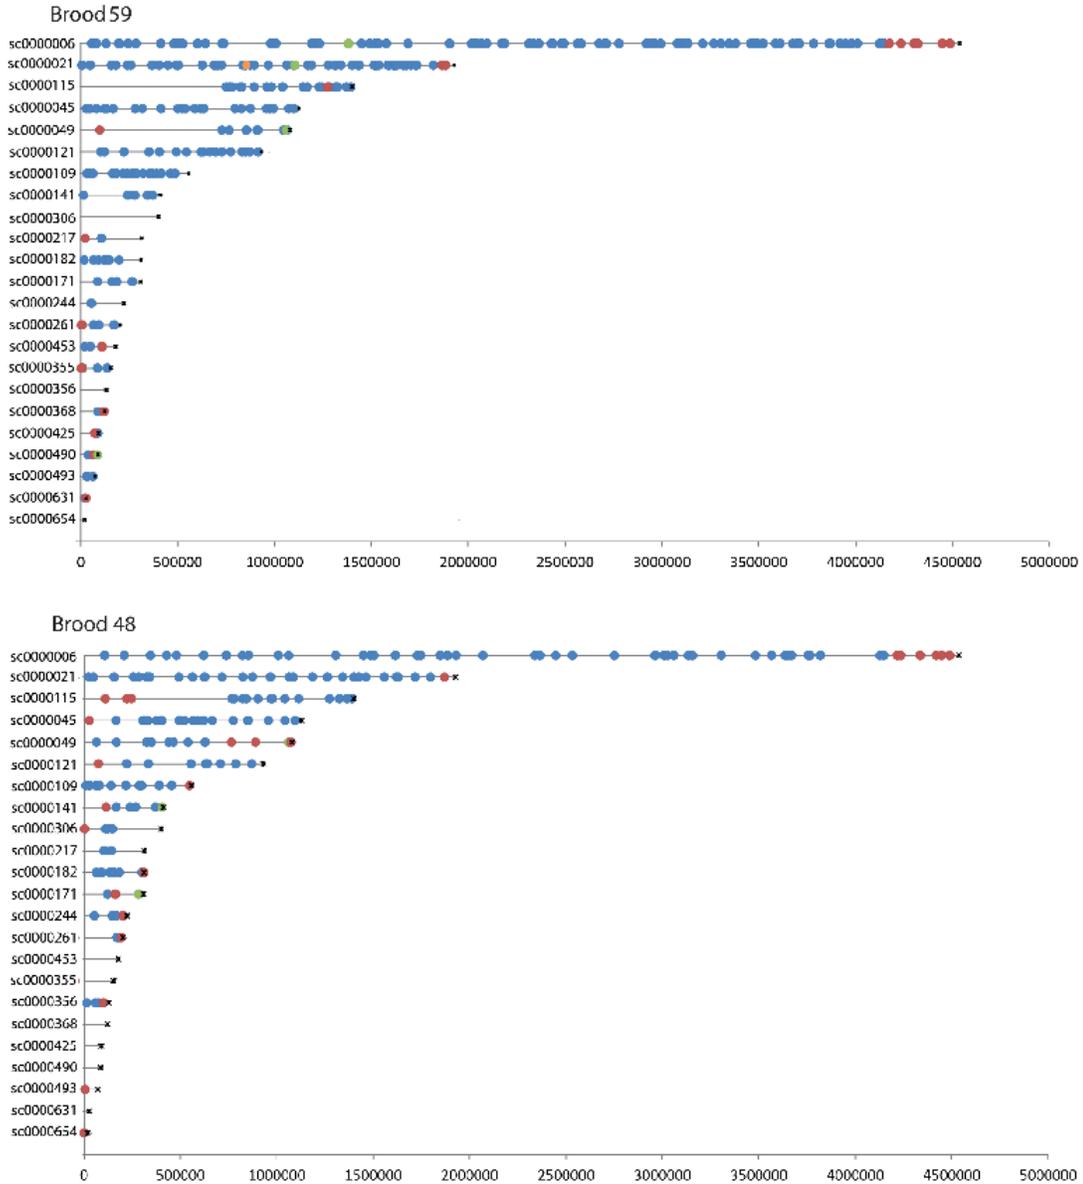

Figure S2: Scaffolds with deviating SNP patterns for the two pedigree broods. Top: Brood 59, Bottom: Brood 48. Vertical axis: scaffolds flagged up as being misassembled. Horizontal axis: scaffold length (bp). Colored dots represent SNPs. Blue dots: SNPs showing most frequent pattern. Other colors: SNPs deviating from the most frequent pattern.

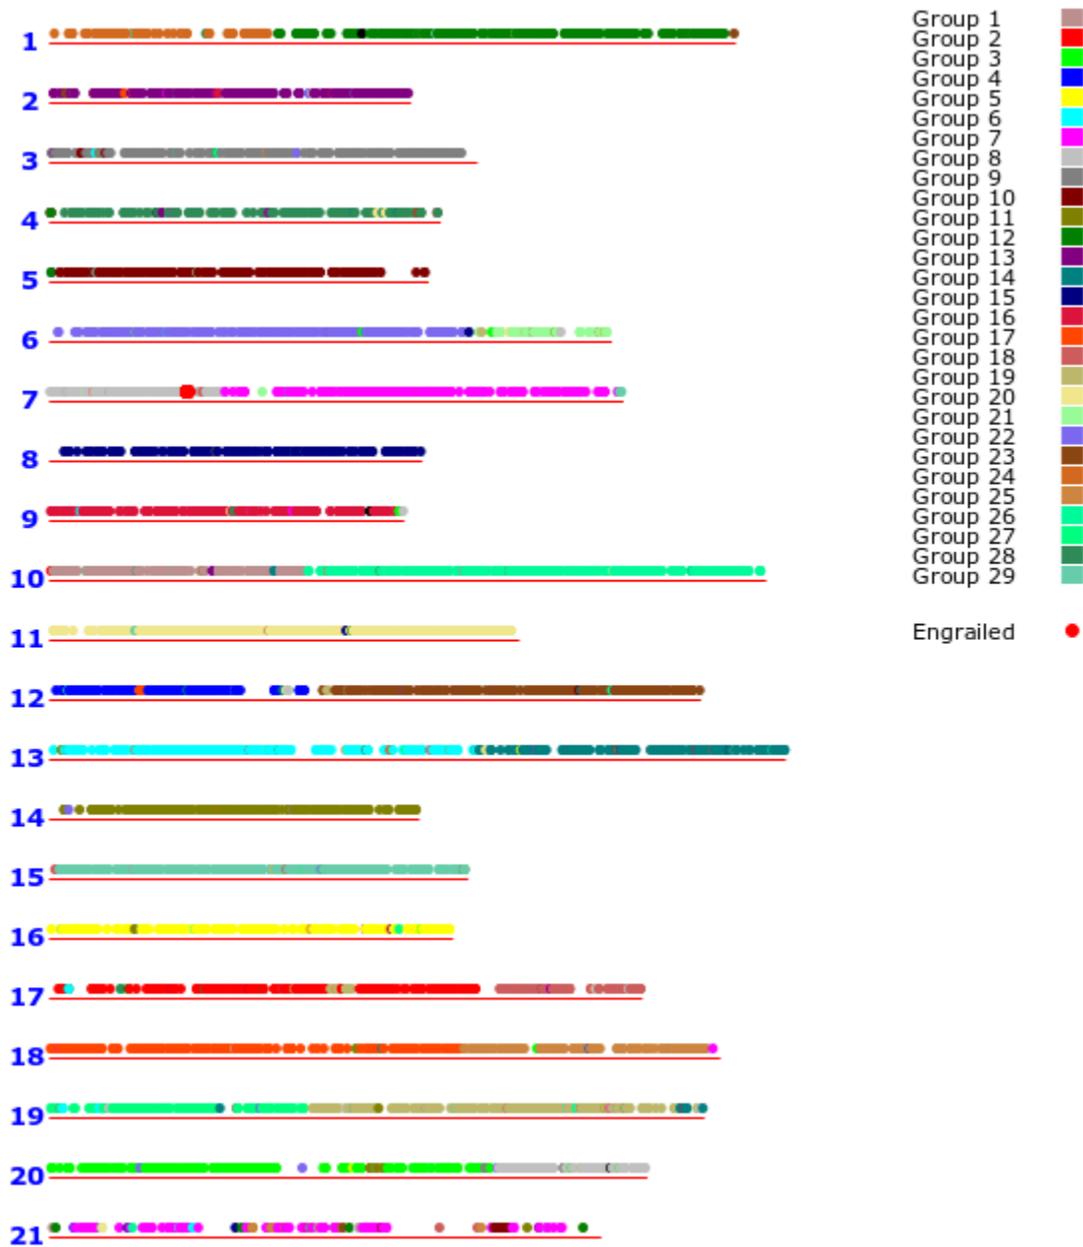

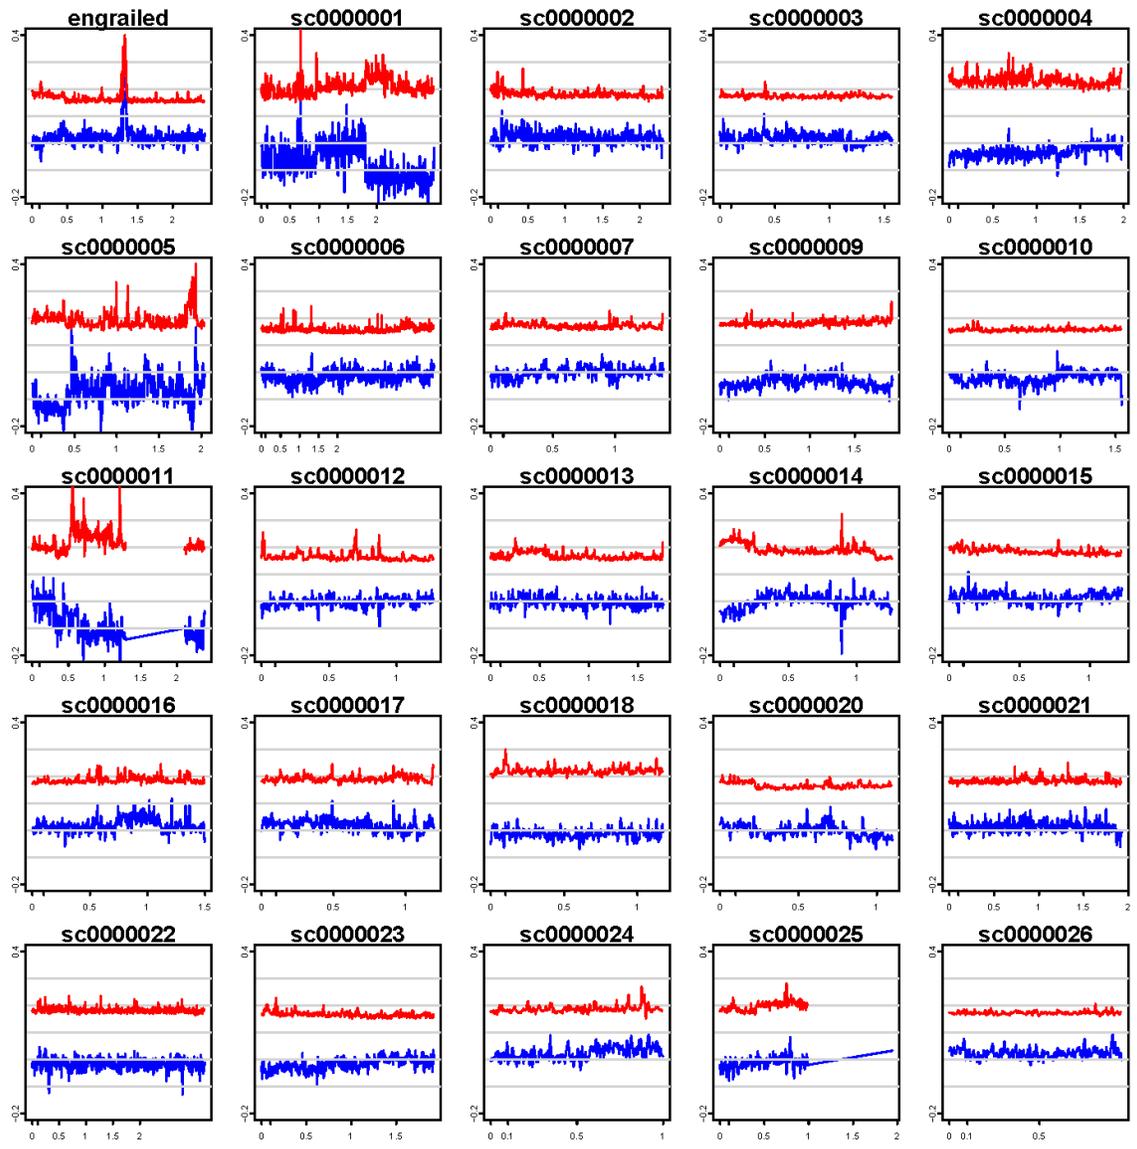

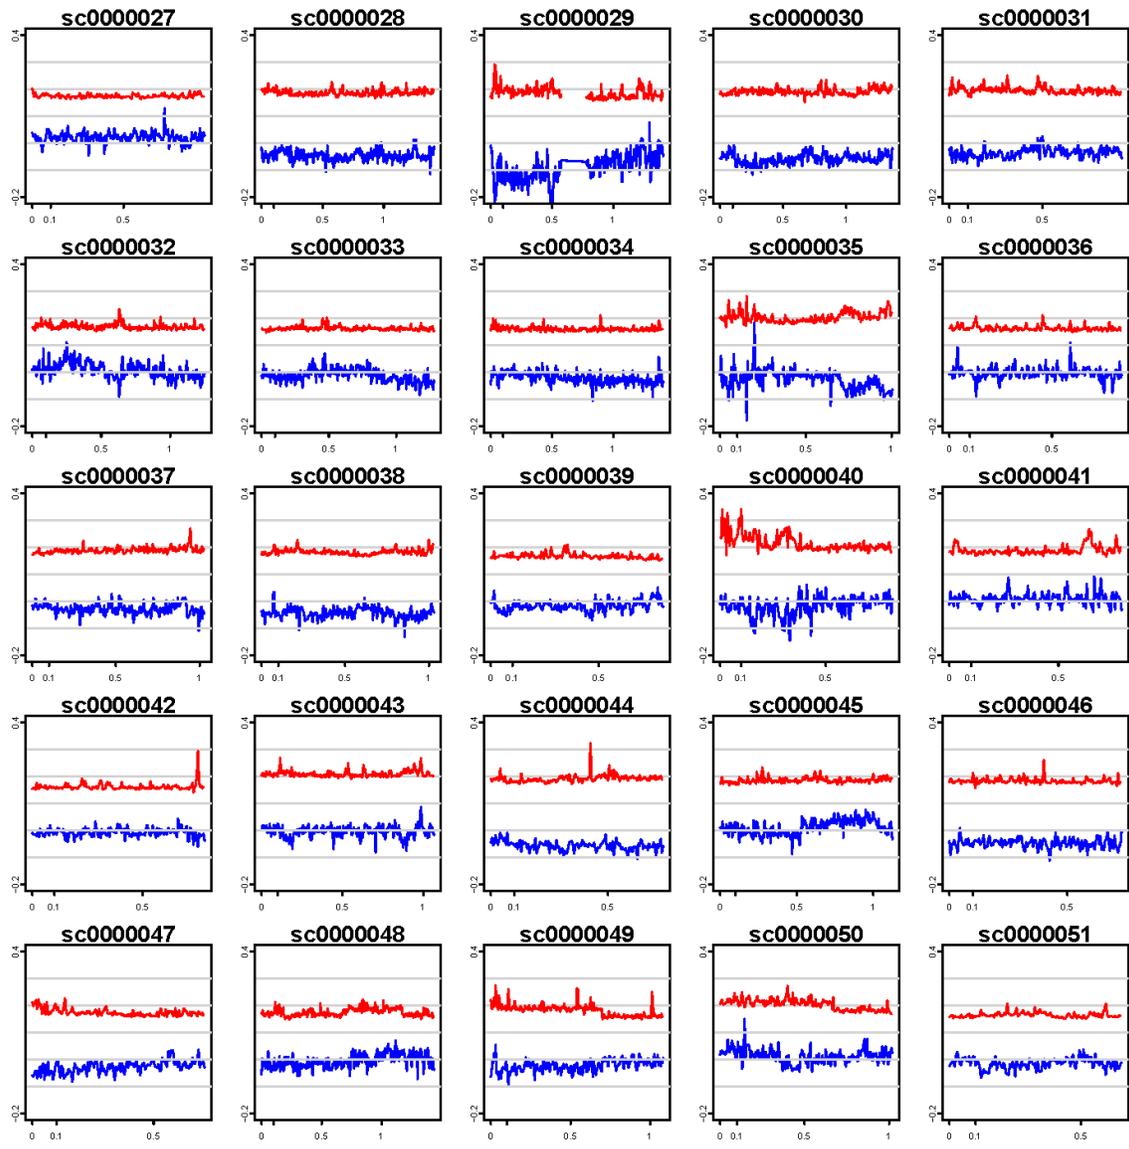

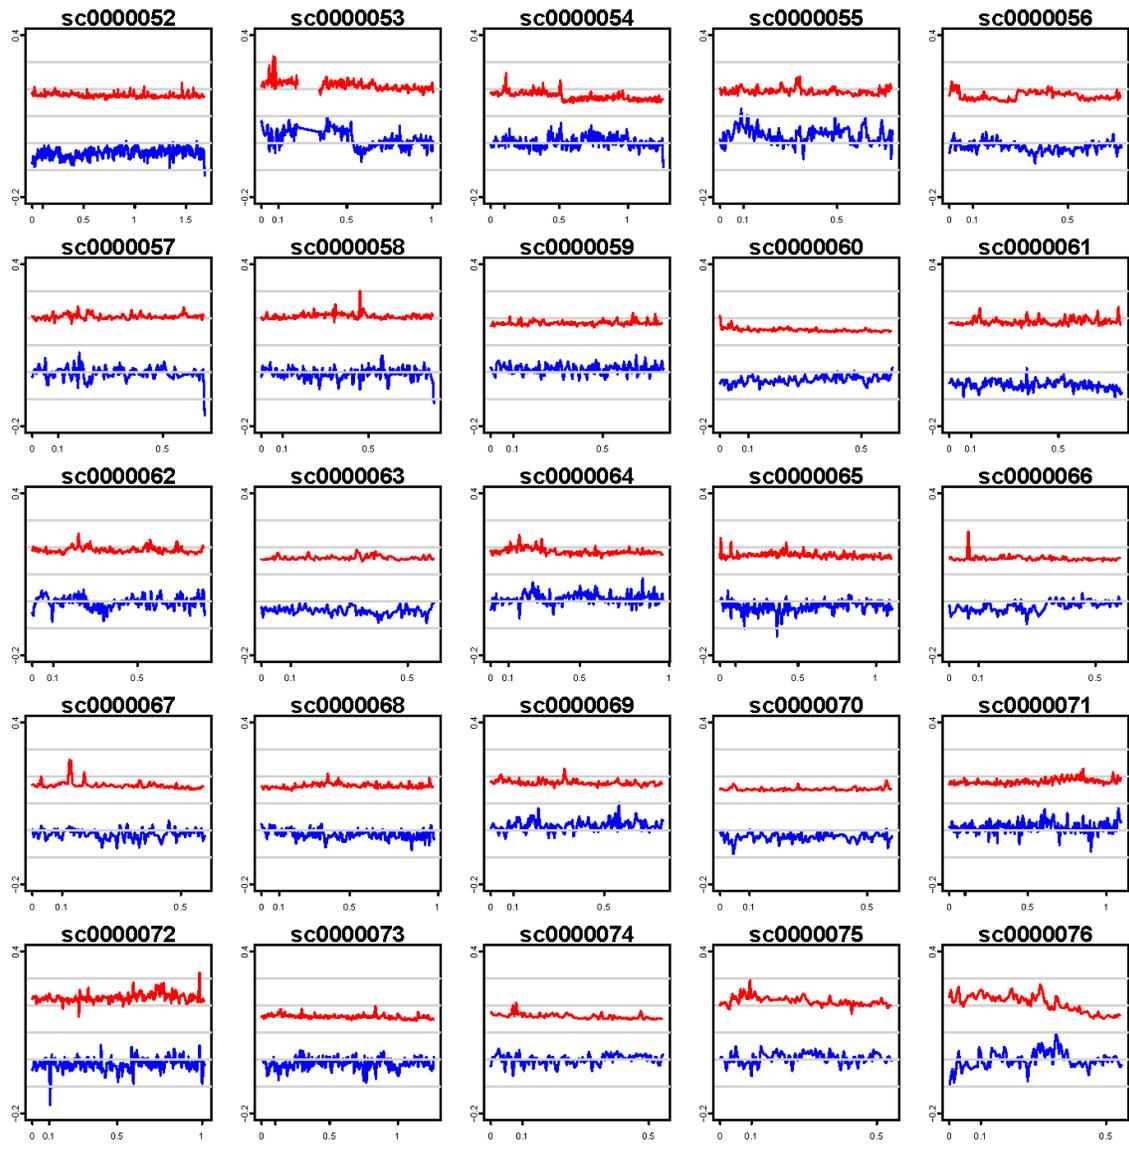

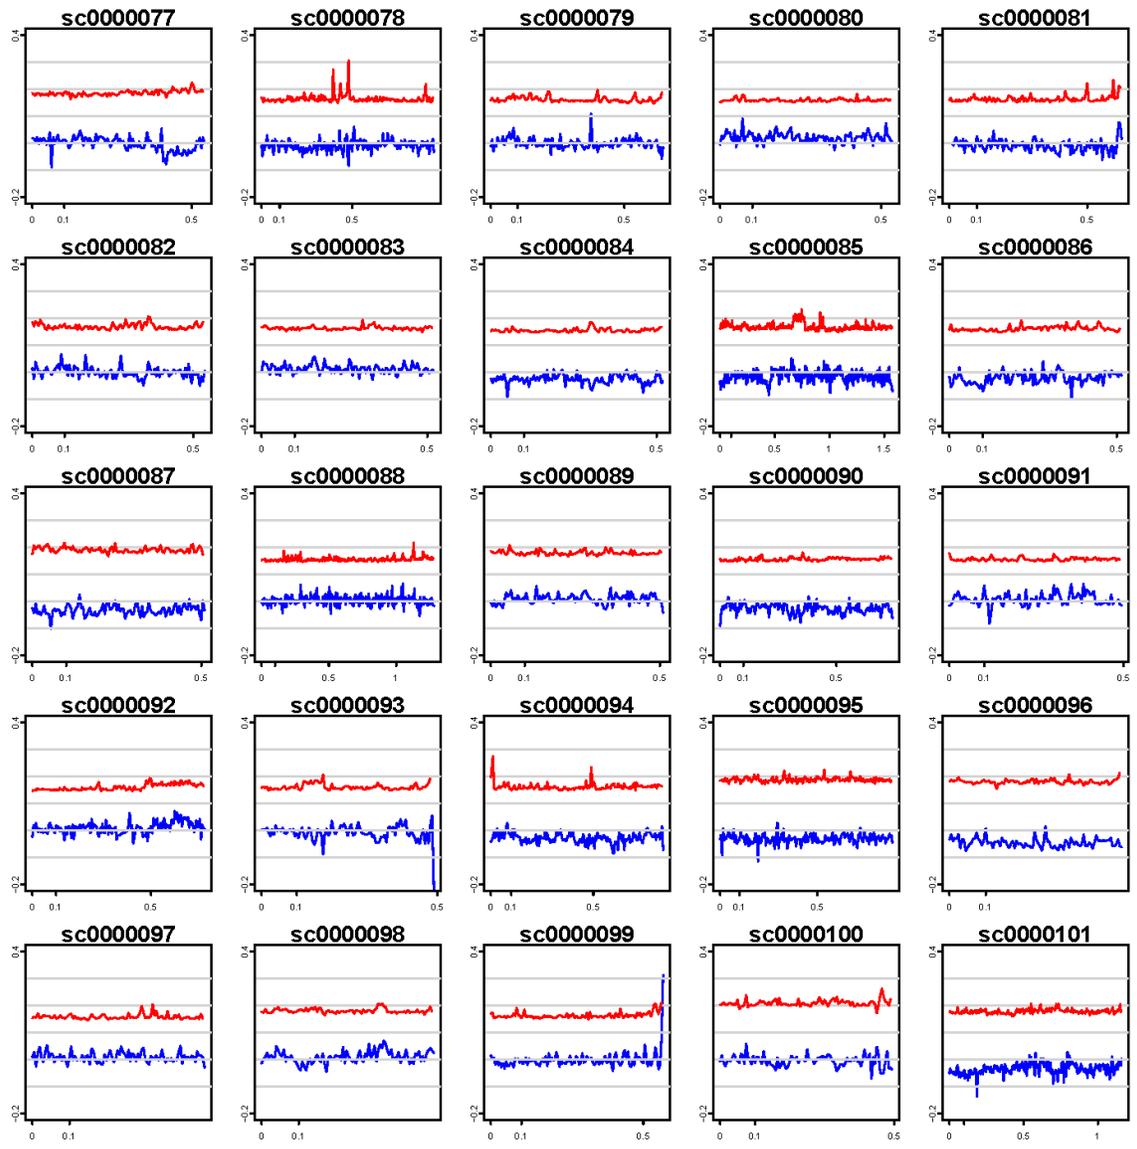

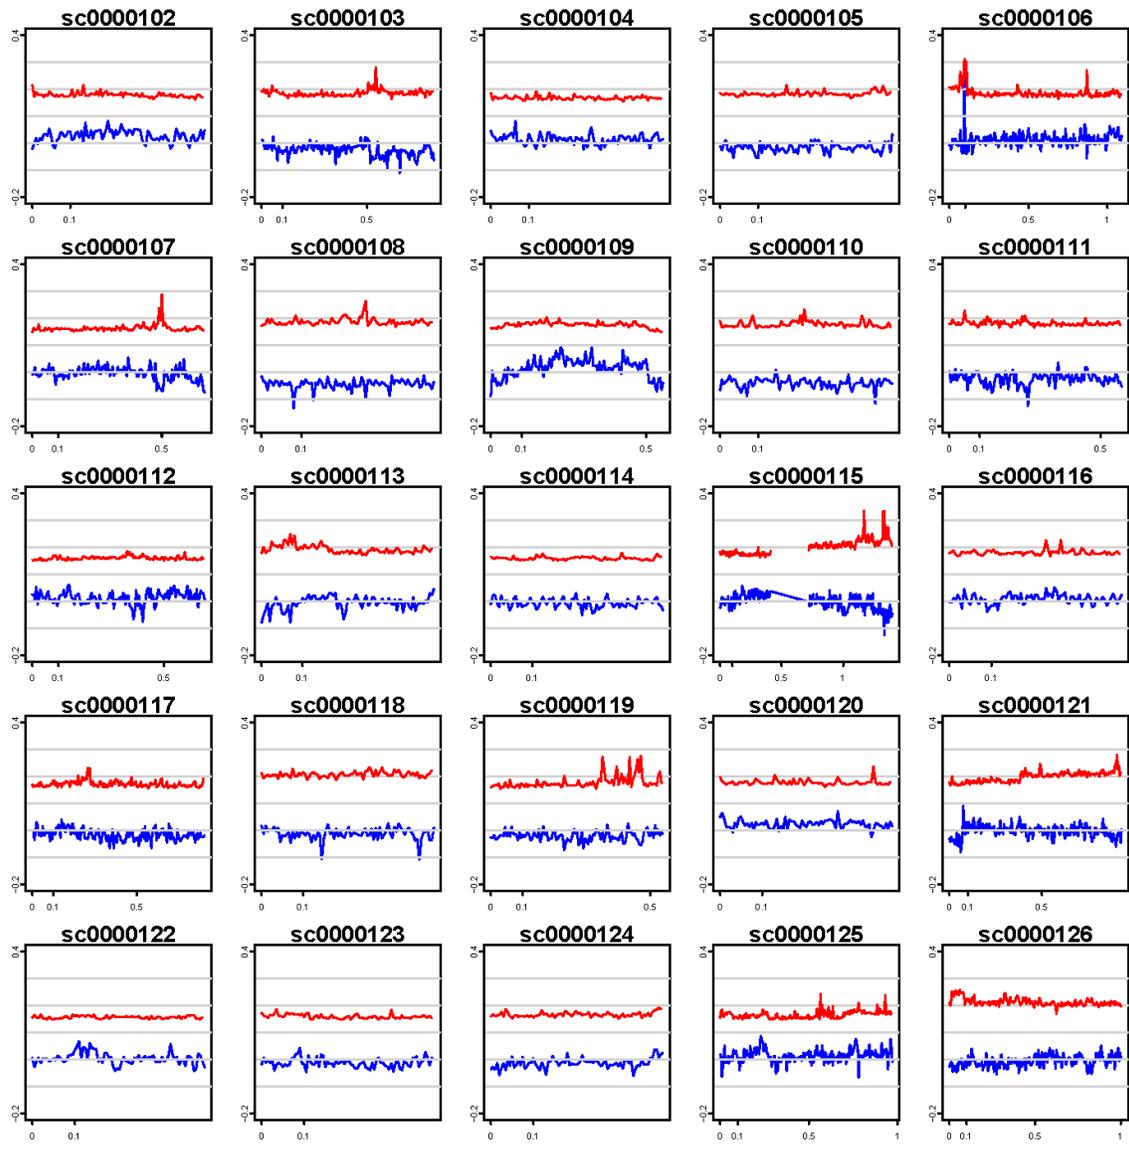

Figure S3: Comparison between *P. dardanus* draft assembly and *Heliconius melpomene* genome. BLAST matches between *P. dardanus* and *H. melpomene* are visualised on the *H. melpomene* genome map. *H. melpomene* 21 chromosomes are indicated with red lines. Colored circles indicate positions of *P. dardanus* predicted proteins that show homology to a *H. melpomene* gene. Predicted proteins from similar linkage groups (‘chromosome bins’) are given identical colors. The transcription factor *engrailed* is part of linkage group 8. In most cases the *P. dardanus* scaffolds within a chromosome bin also mapped to a single chromosome in *H. melpomene*. One exception is *P. dardanus* linkage group 7, which showed similarity to *H. melpomene* chromosome 7 and its Z chromosome (= *H. melpomene* chromosome 21).

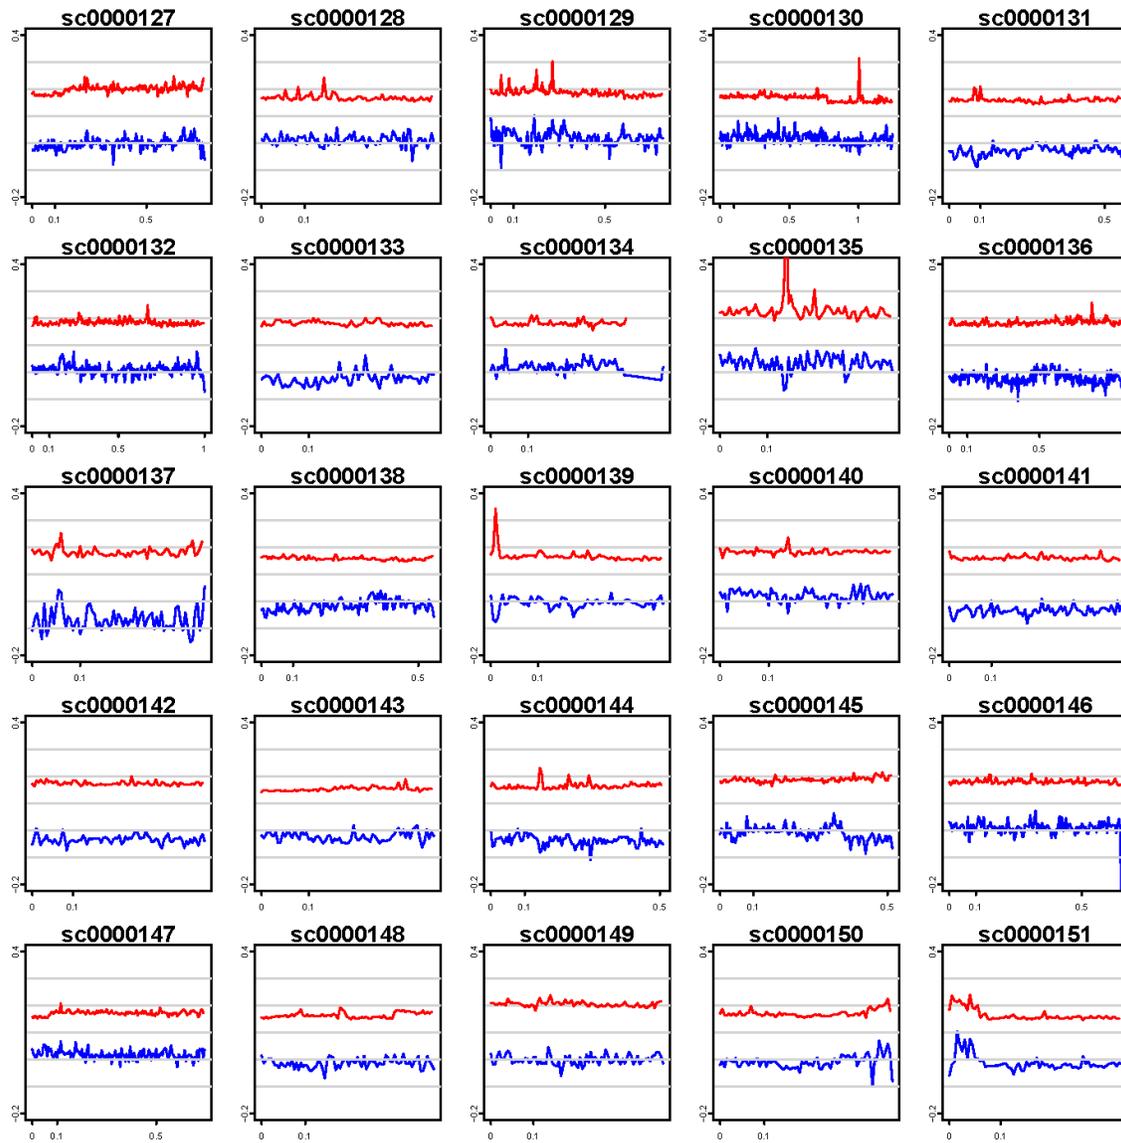

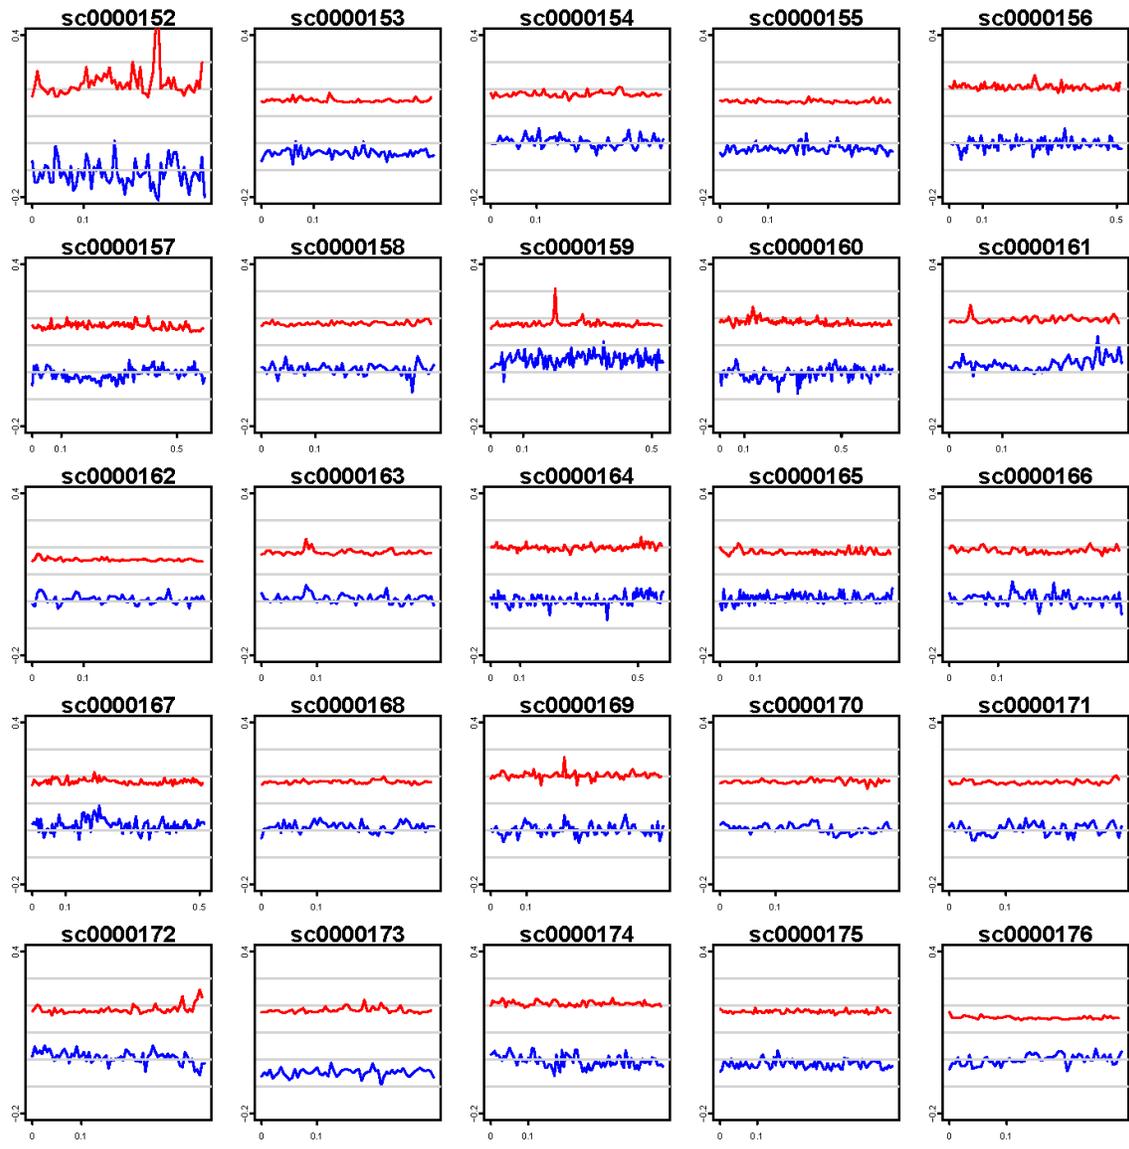

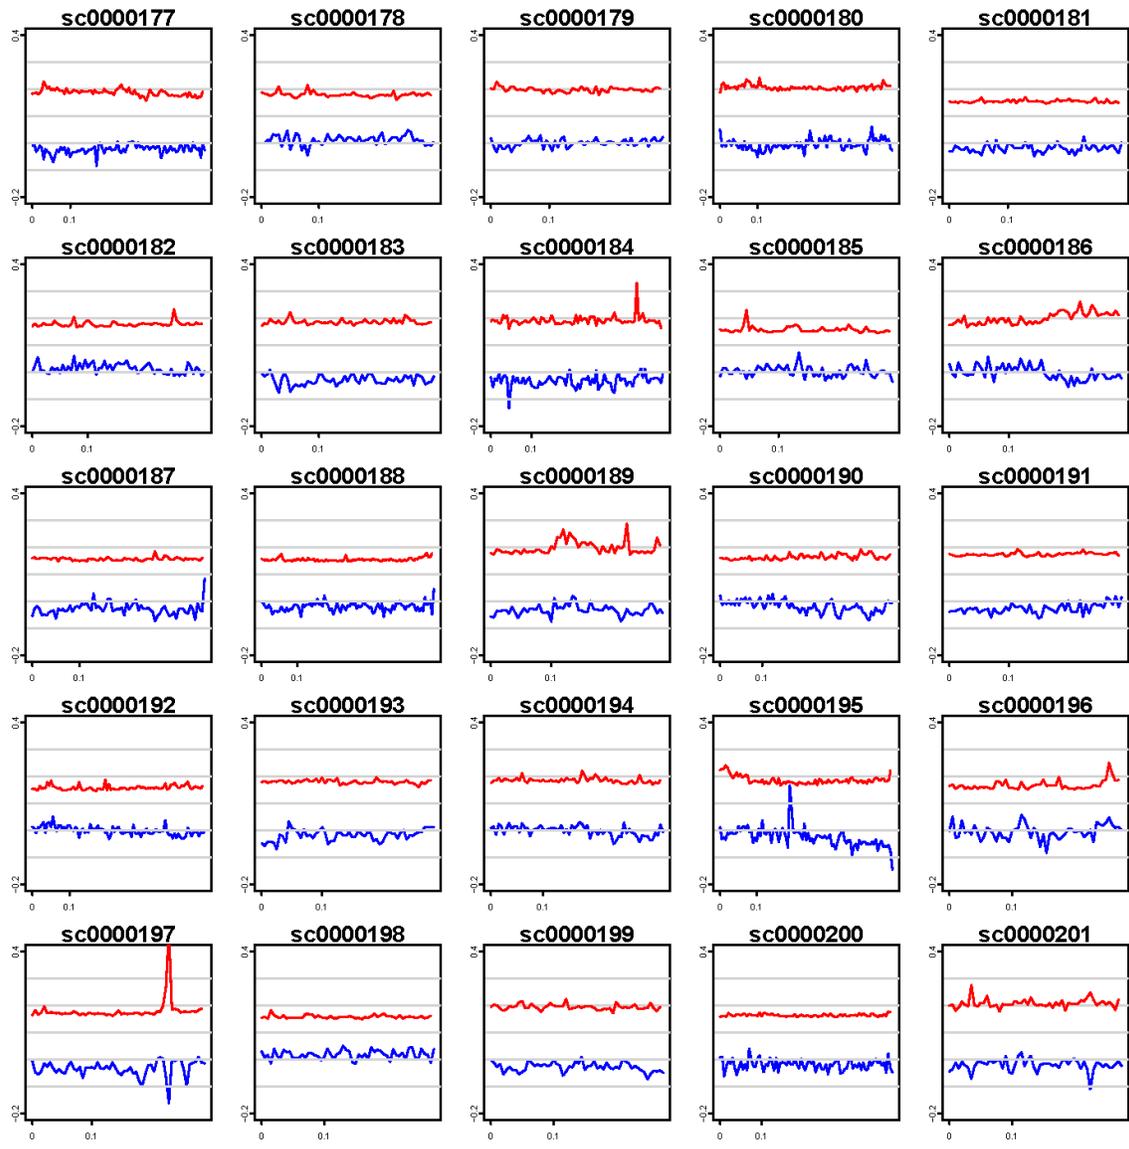

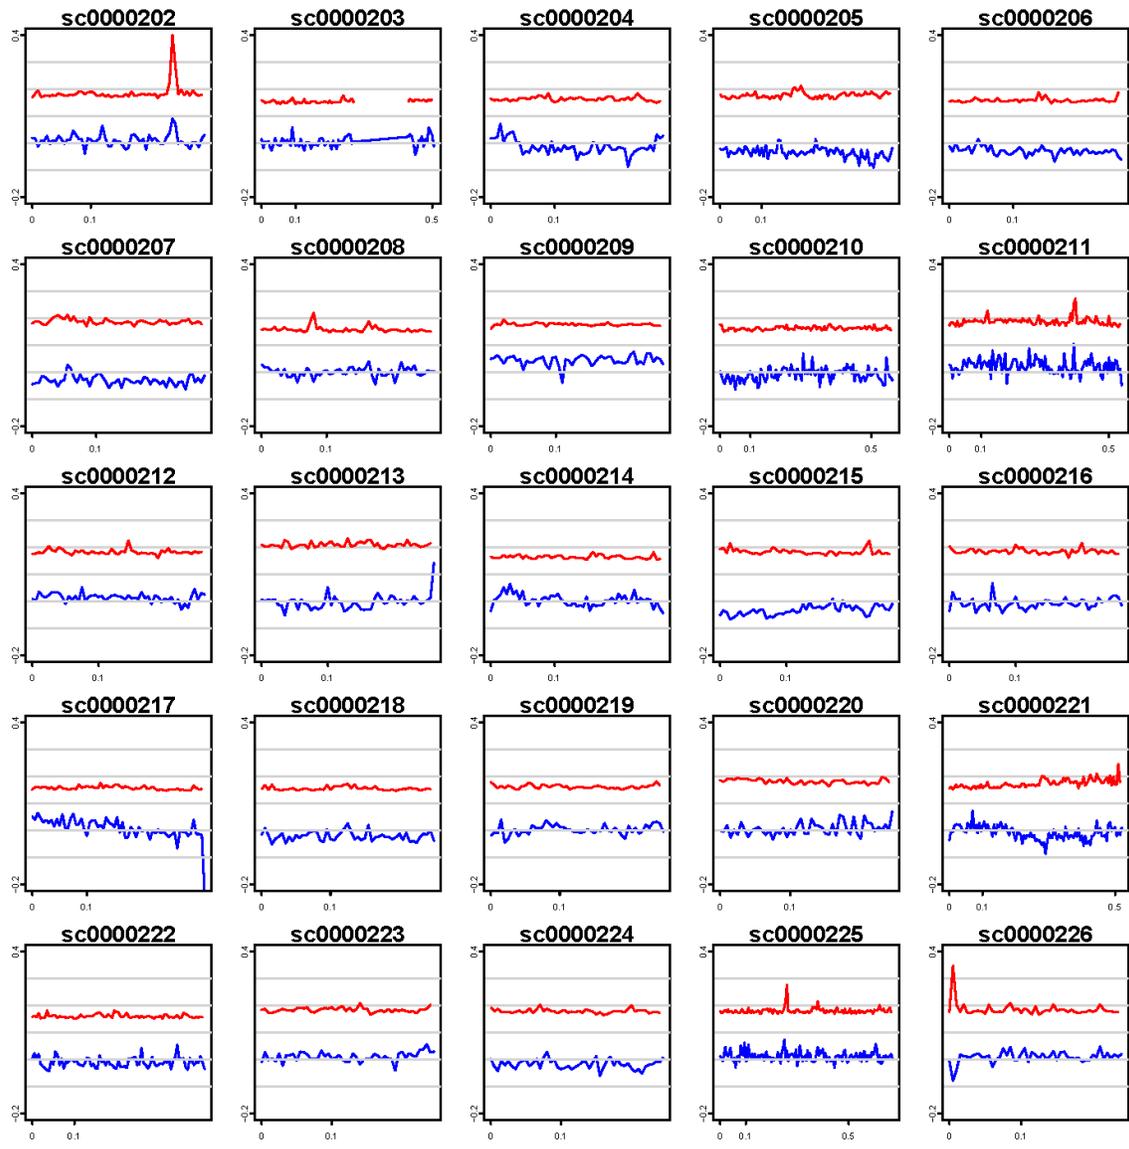

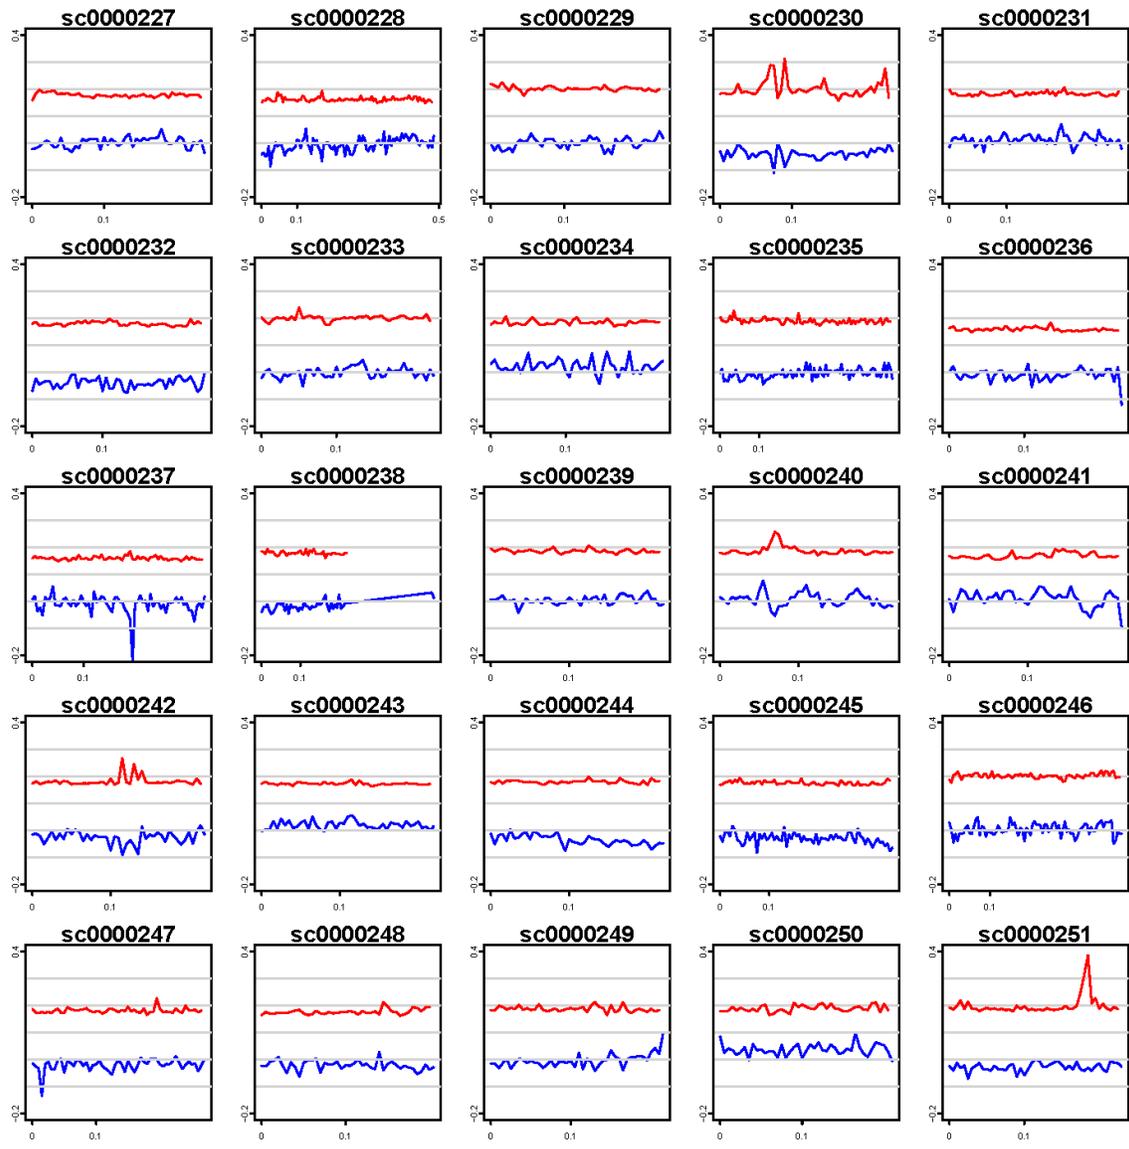

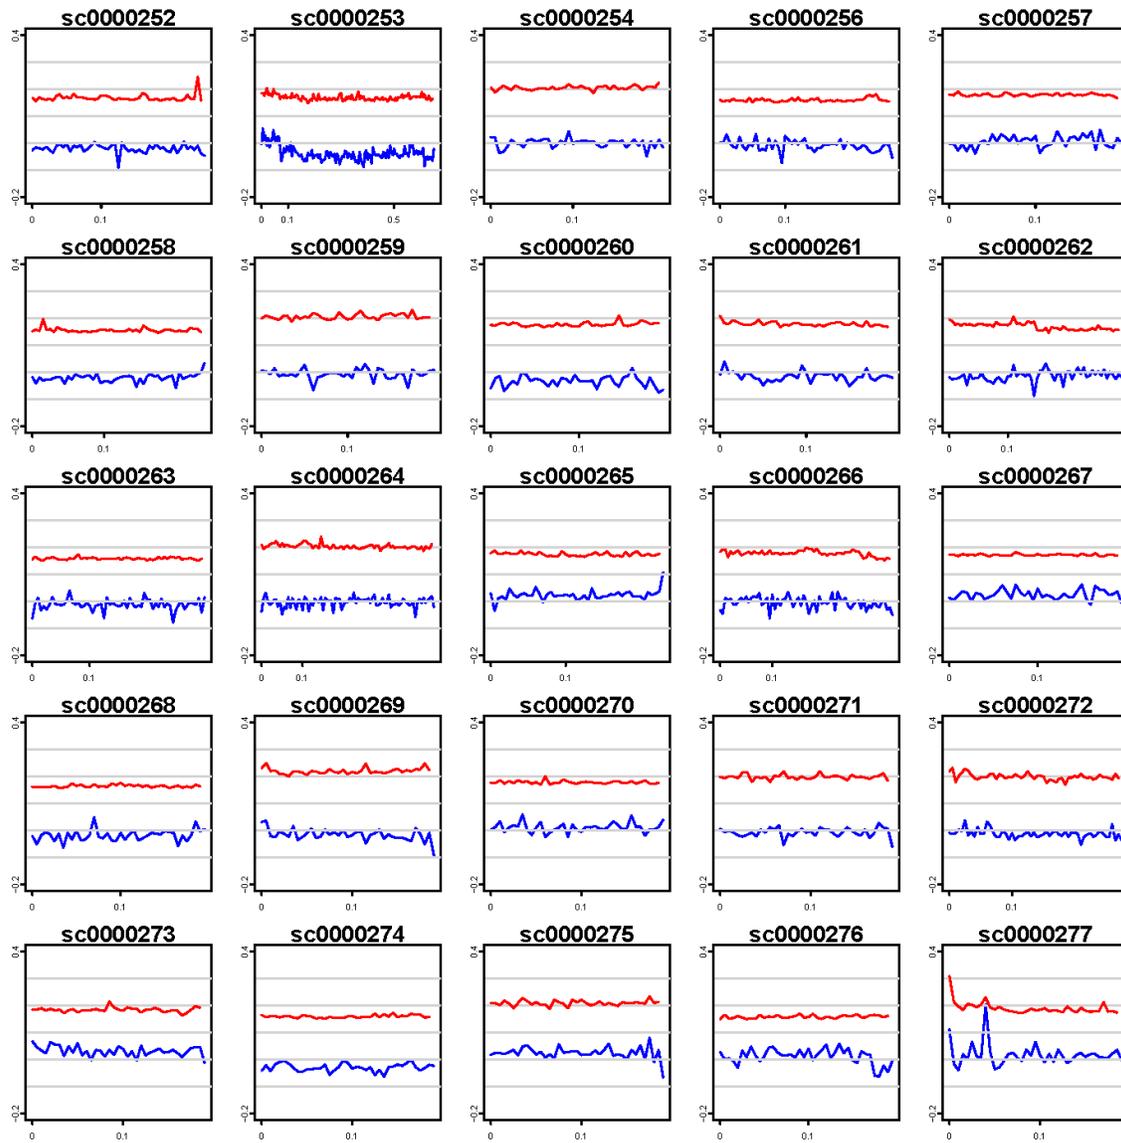

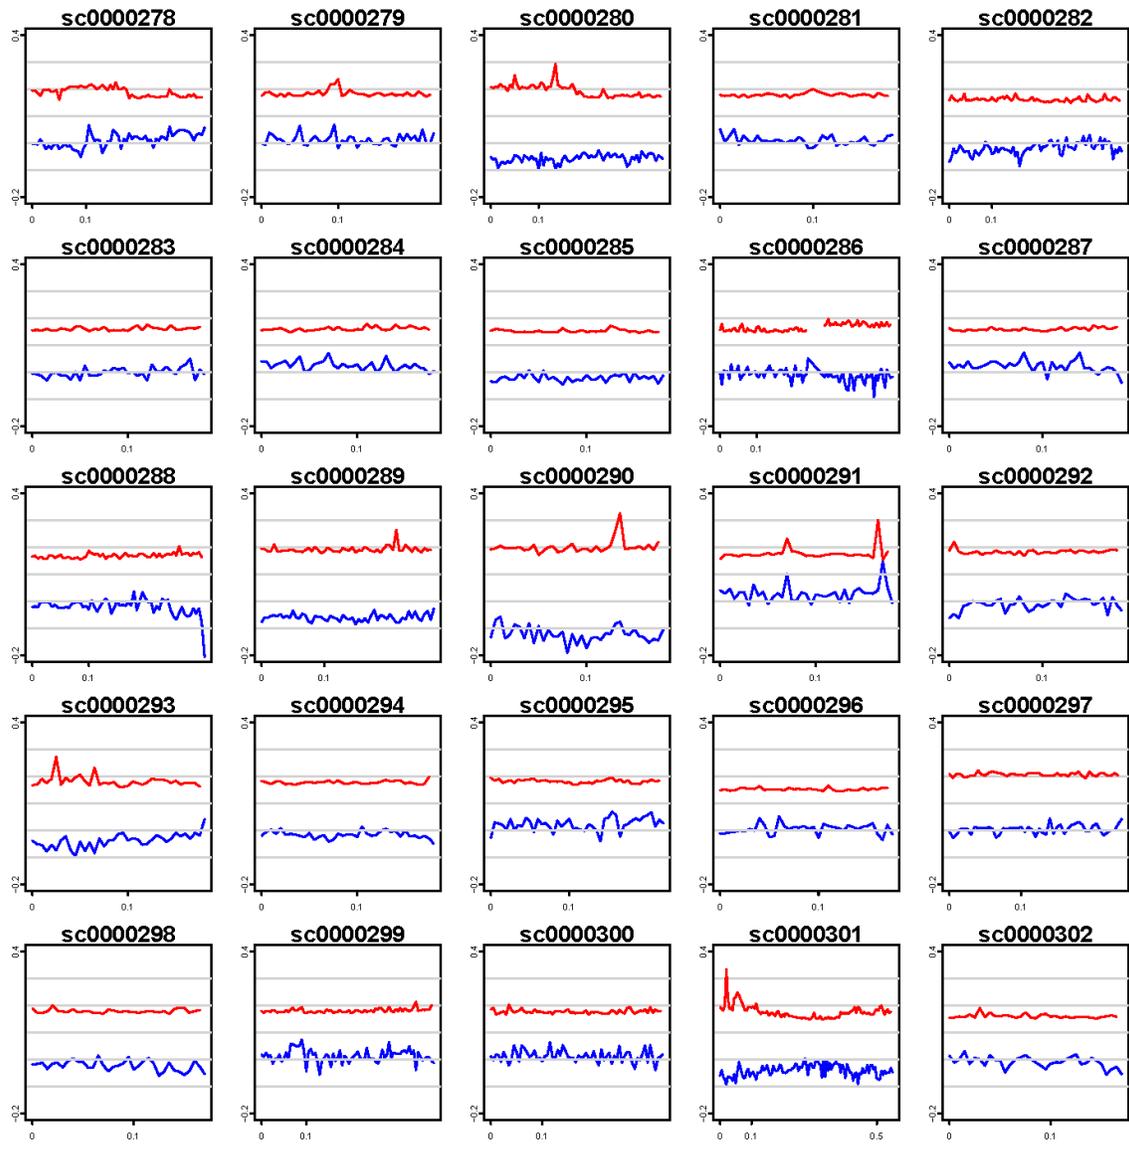

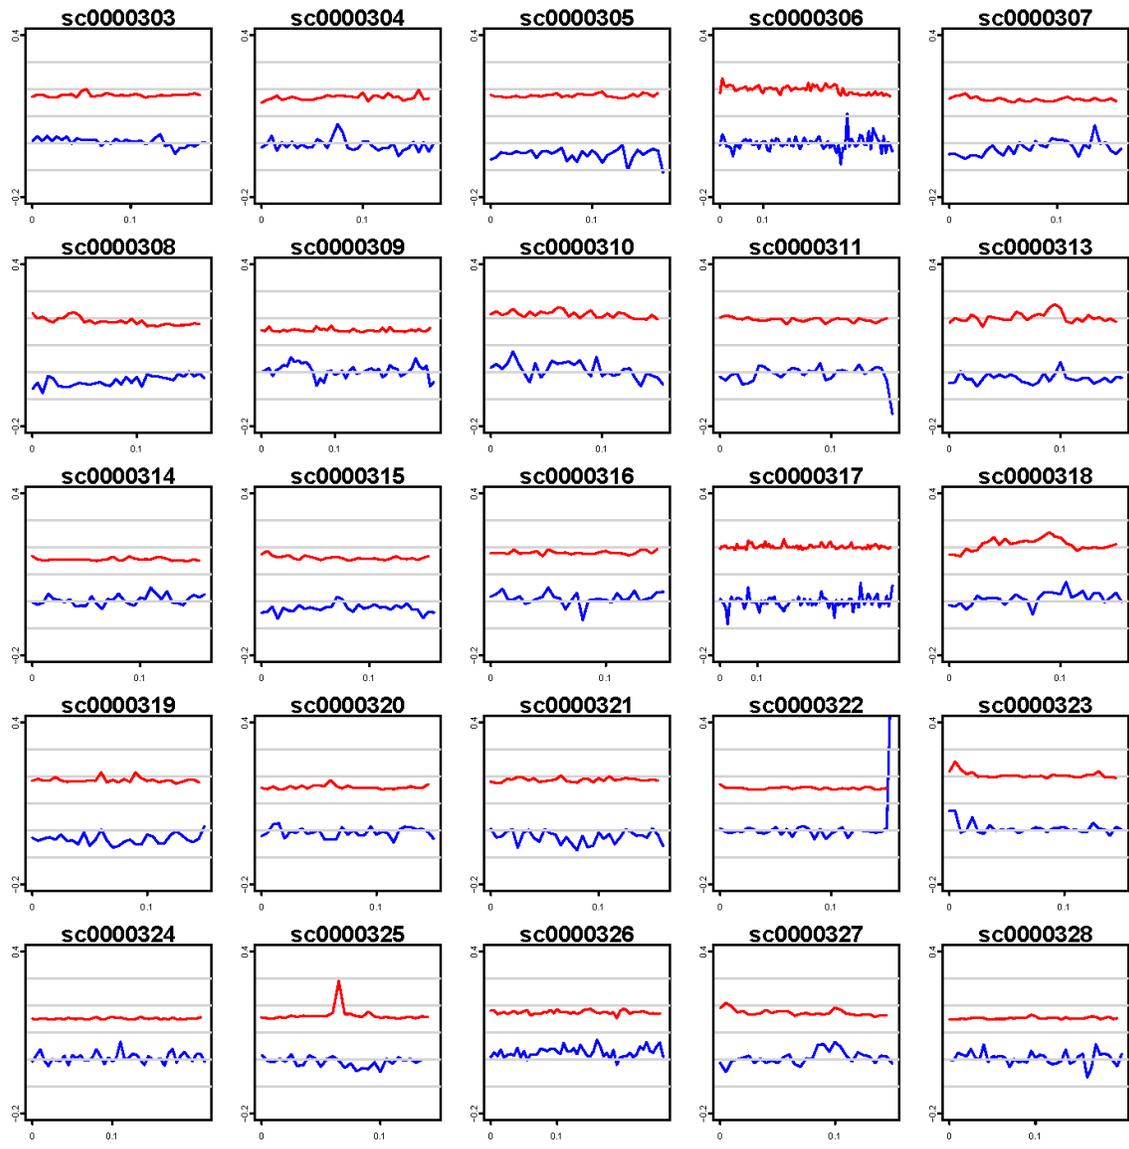

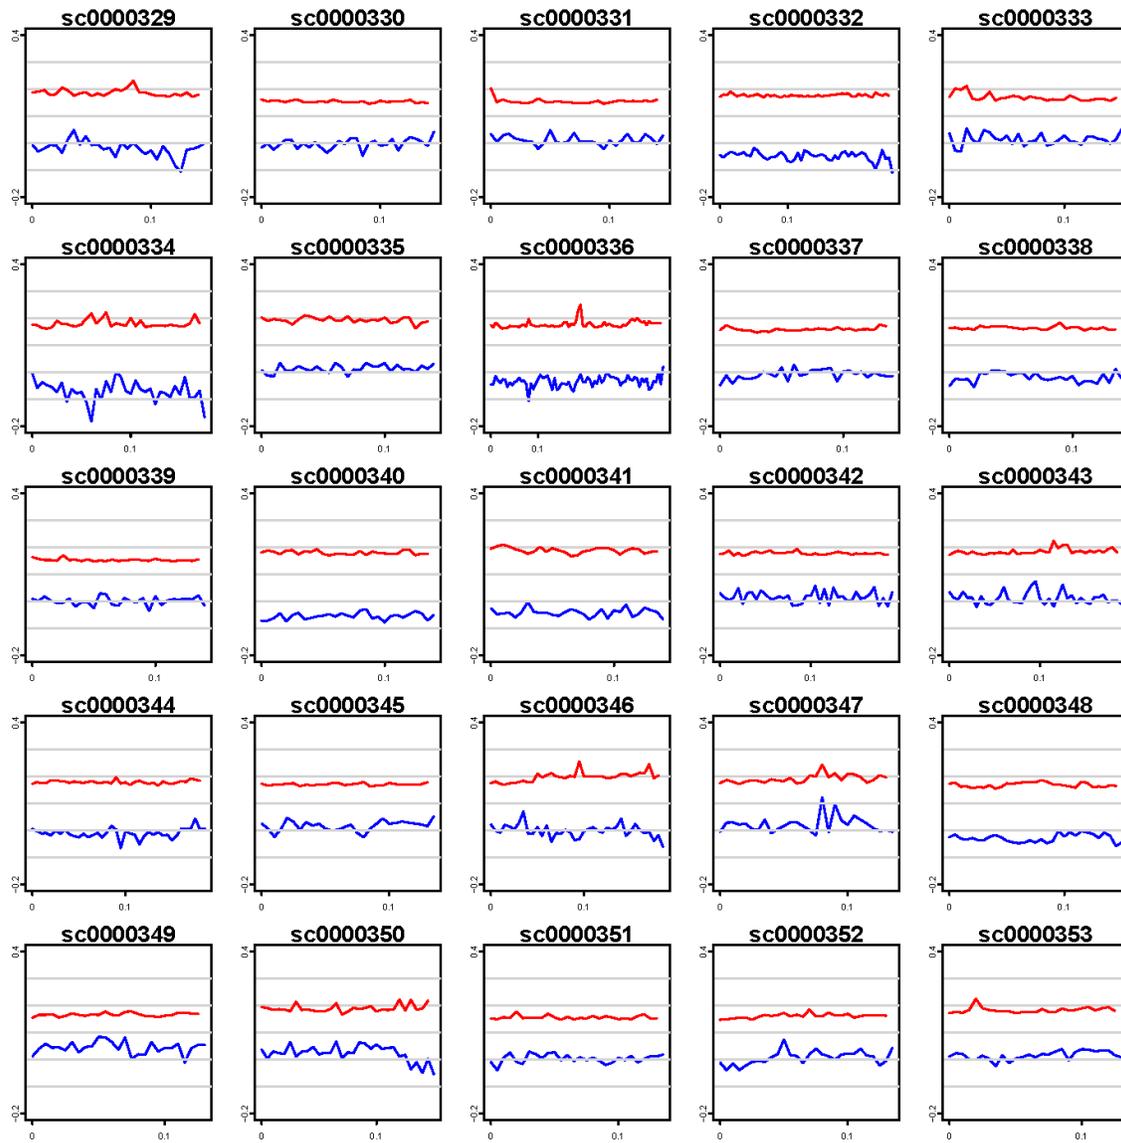

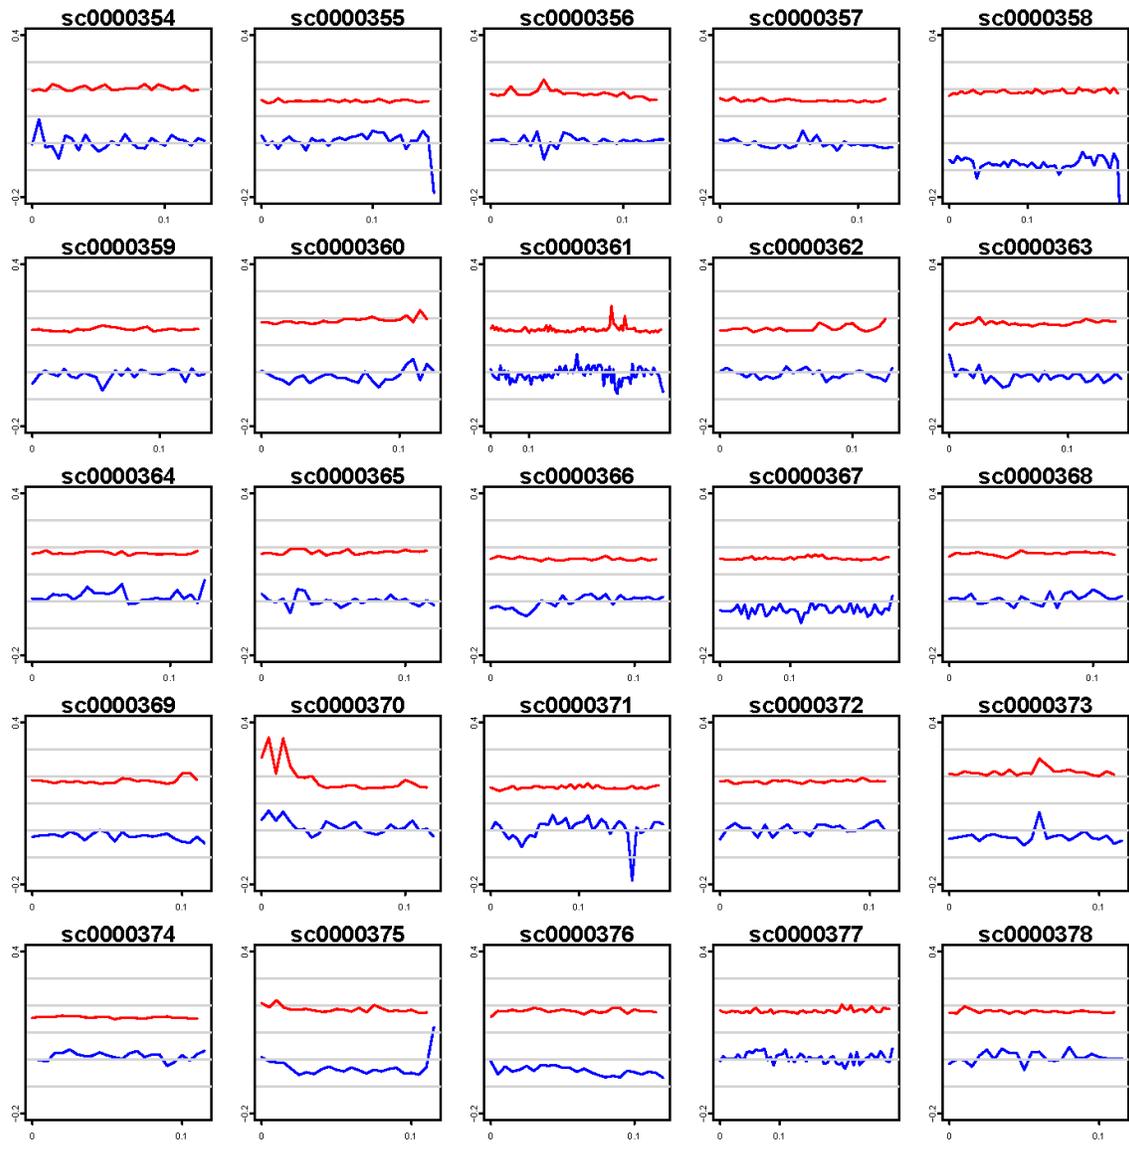

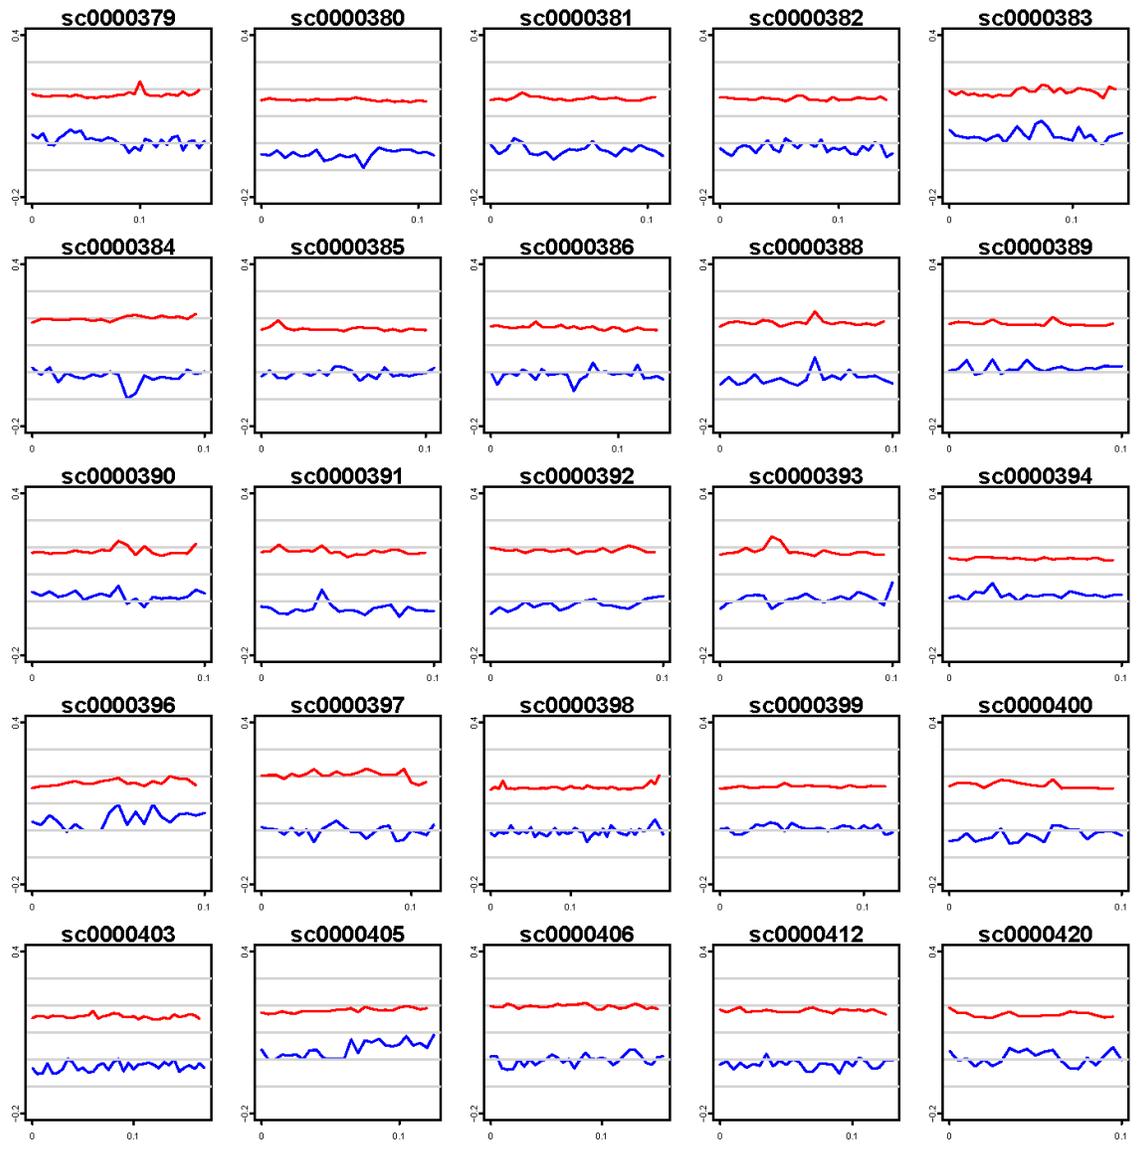

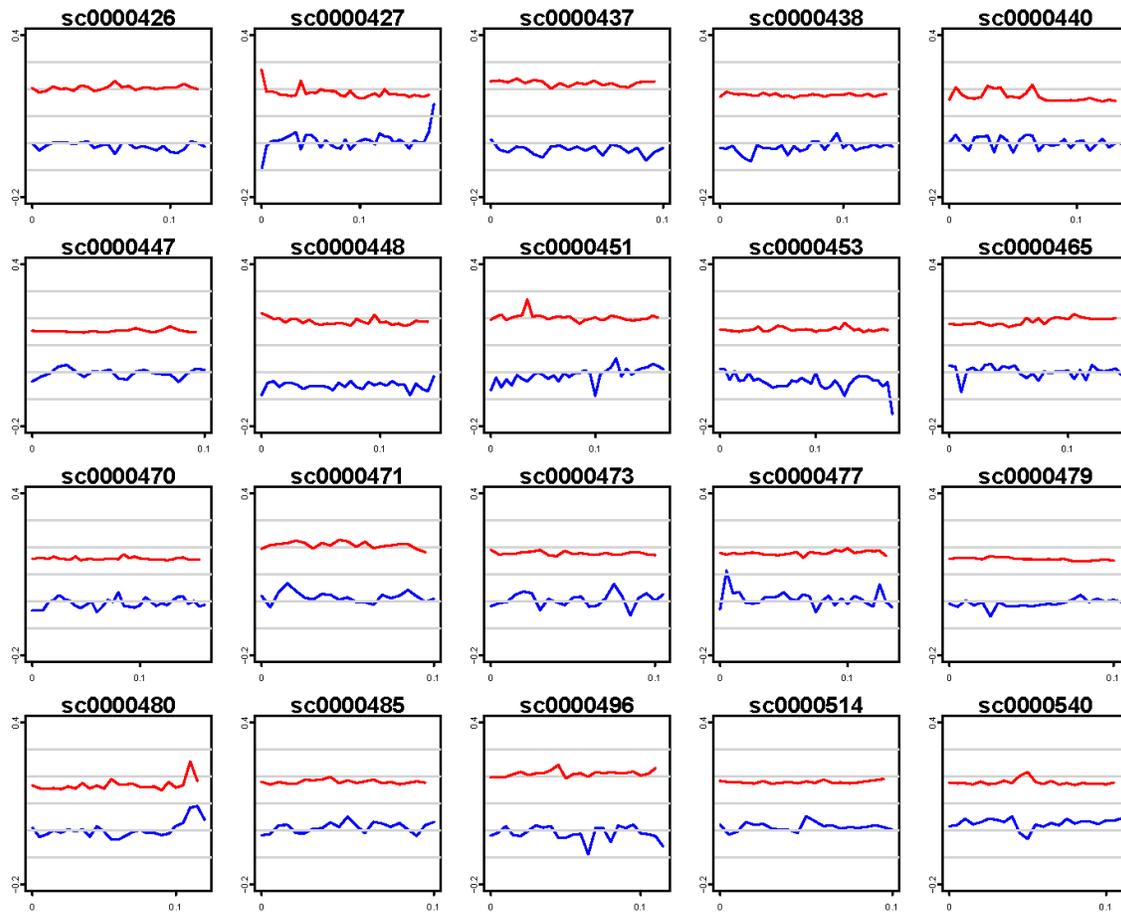

Figure S4: Linkage disequilibrium (blue) and F_{st} (red) for the 420 scaffolds > 100 kb. The first graph (“engrailed”) represents the scaffold containing the engrailed locus. engrailed: LD and F_{st} for the scaffold containing the *engrailed-inverted* locus. Horizontal scale is in million base pair.

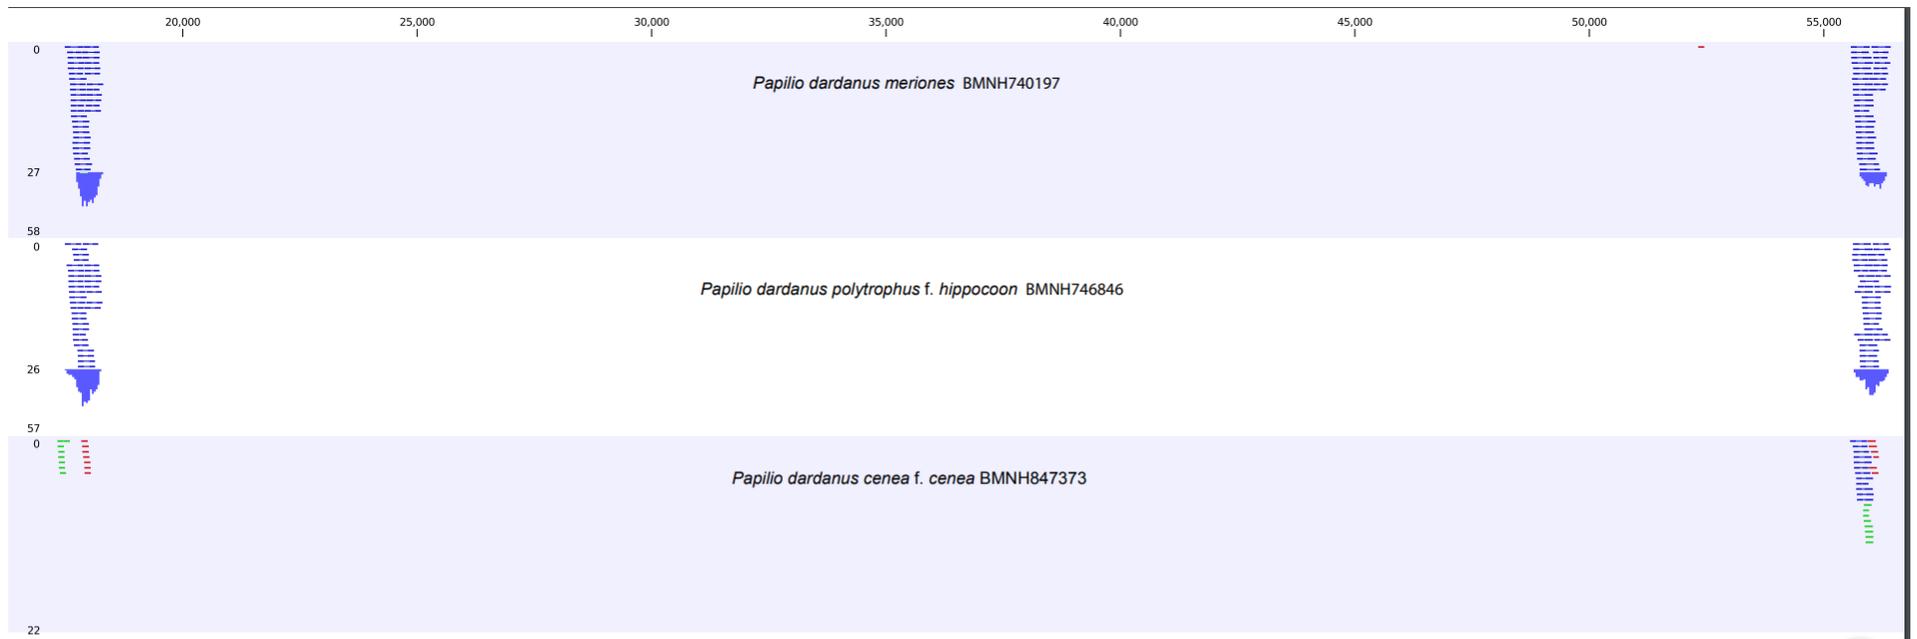

Figure S5: Reads mapping near the inversion breakpoint. Top: *Papilio dardanus meriones* ('male-like'), Middle: *Papilio dardanus* f. *hippococonides*, Bottom: *Papilio dardanus* f. *cenea*. Reads are mapped to the f. *hippococonides* based draft genome sequence. Correctly placed reads ($\rightarrow \leftarrow$) are indicated in blue. Distant and oppositely-oriented placed paired reads ($\rightarrow \rightarrow$ or $\leftarrow \leftarrow$) are indicated in green and red. Numbers at the left indicate coverage.

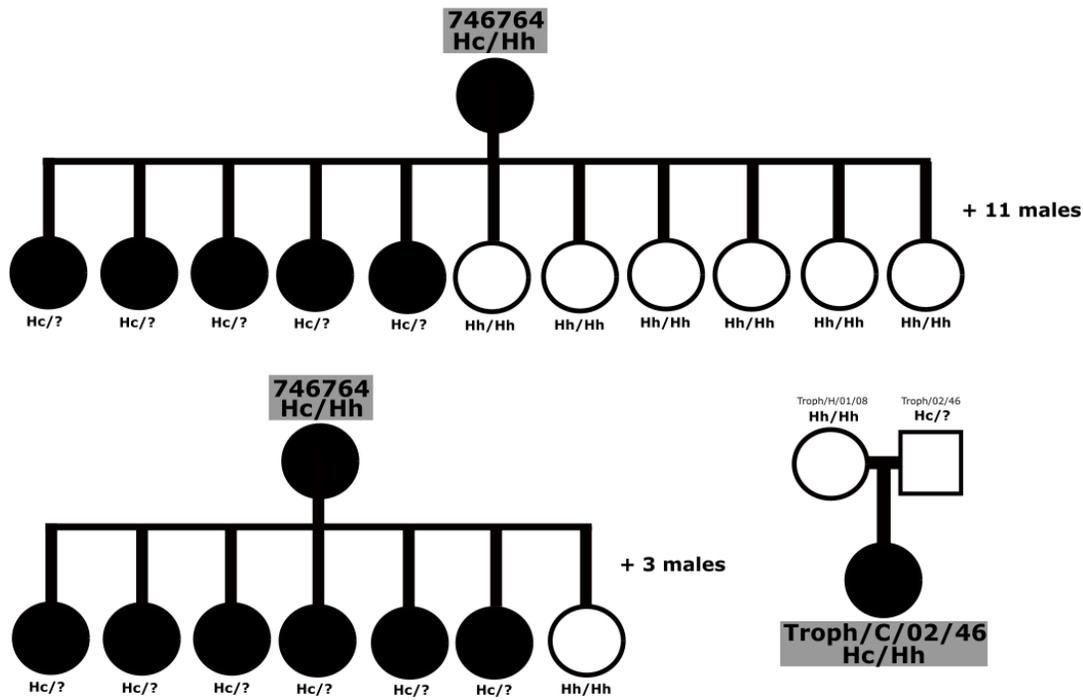

Figure S6: Laboratory cross details on the three heterozygous (H_c/H_h) *P. dardanus polytrophus f. cenea* used for whole genome shotgun sequencing.

Figure S7: PCR validation of inversions using females of two forms (*f. hippocooides* and *f. cenea*). The *P. dardanus meriones* specimen used for whole genome shotgun sequencing is also included (“mer”). Primer combinations are given on the right.

microRNA 2768 (miR-2768)

Papilio dardanus ATCAGGCGCCGGTGCAATATTTGACCAATTTTATAGCA---AACAATCGCTATAGCAAATGTGAATTGGTTAAGATAATGCATCGCCCGCTTGACT
Bombyx mori (NR_107338) GTCGGCGACCGGTGAATATATTTGACCAATTTTATAATCGCTCGATCG--TCAATCAAAGTGAATTGGTTAAGATAATGCATCGTCTCTGATC

Figure S8: Sequence of microRNA 2768 located in the intronic region of *invected*. miR-2768 is Lepidoptera specific and has been shown to interact with *cubitus interruptus*. Top: Sequence of *Papilio dardanus*, Bottom: Sequence of *Bombyx mori* (Genbank accession number: NR_107338).

Table S1. Completeness of the assembly as estimated using BUSCO version 3 compared to various recently published genomes.

Species	Number of scaffolds	N50	Total Length	BUSCO summary (%)	BUSCO summary (absolute)
<i>Papilio dardanus</i>	7,365	596,599	231,123,043	C:89.3%[D:0.7%],F:7.0%,M:3.7%,n:2442	C: 2180 [D:16], F:172, M: 90, n:2,442
