

Supplementary Materials

The gelatin gel samples, which were irradiated for a designated time, were immersed in an artificial saliva solution (pH 7), and weighted every 24 h.

Figure S1: Effect of irradiation time on gelatin gel weight. Data are presented as the mean \pm SD ($n=9$) and were analyzed using the nonparametric Kruskal–Wallis H-test. Differences of $p < 0.05$ were considered statistically significant. (*) denotes a significant difference ($p < 0.05$)
