Supplementary Figures

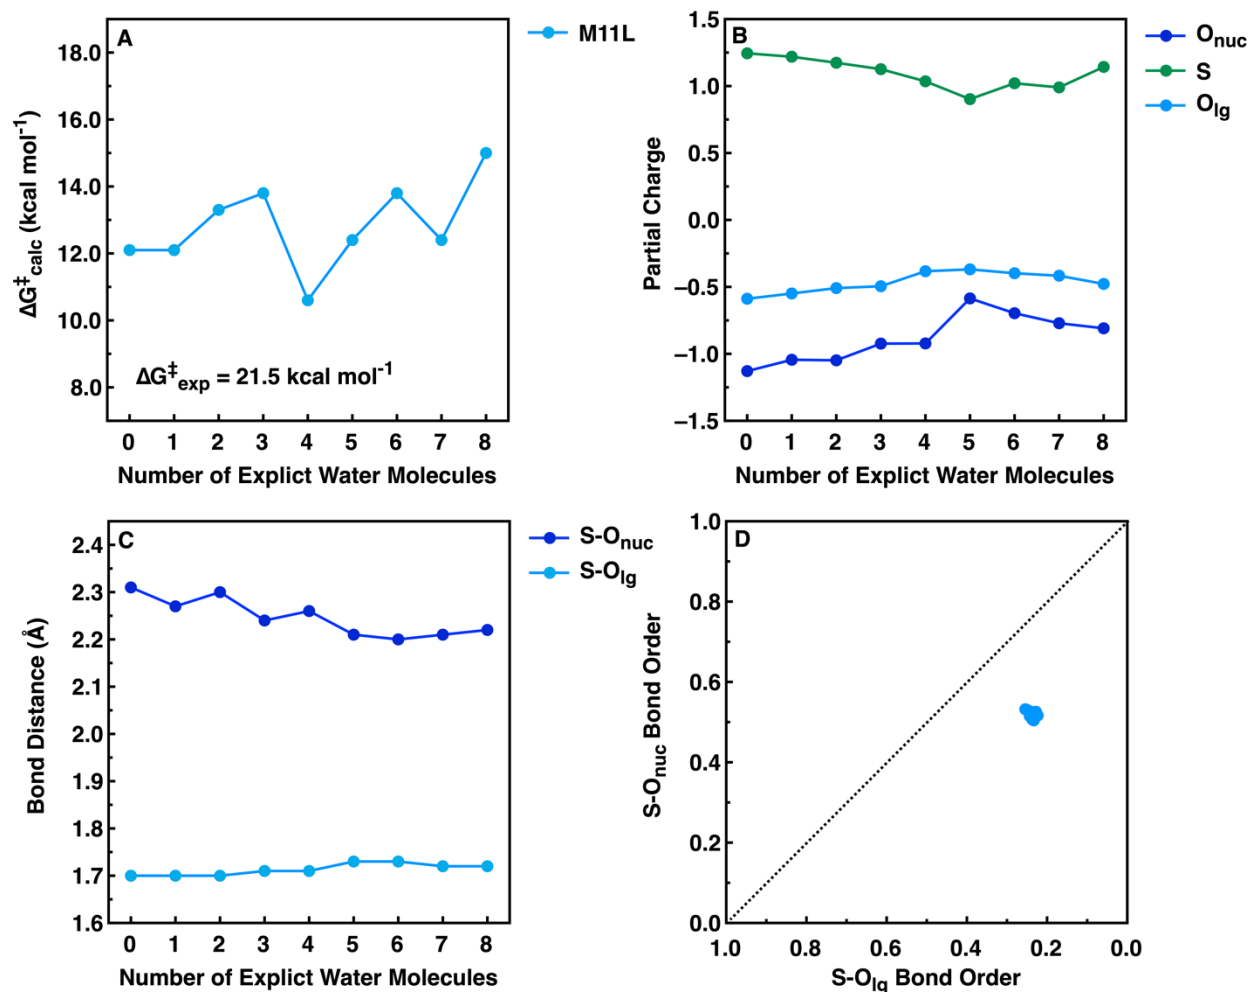

Figure S1. Overview of the (A) activation free energies, (B) partial charges at the transition state, (C) S-O_{nuc} and S-O_{Ig} distances at the transition state and (D) S-O_{nuc} and S-O_{Ig} bond orders at the transition state for the alkaline hydrolysis of 4-nitrophenyl sulfate with varying numbers of water molecules, obtained using the M11L¹ functional, as described in the **Methodology** section. The calculated activation free energy was obtained using transition state theory at 313.15 K, based on kinetic data provided in ref. ². For the corresponding data obtained using the ω B97X-D³ and M062X⁴ functionals, see **Figures 3** and **S2**, and for the corresponding raw data see **Tables S1** to **S21**.

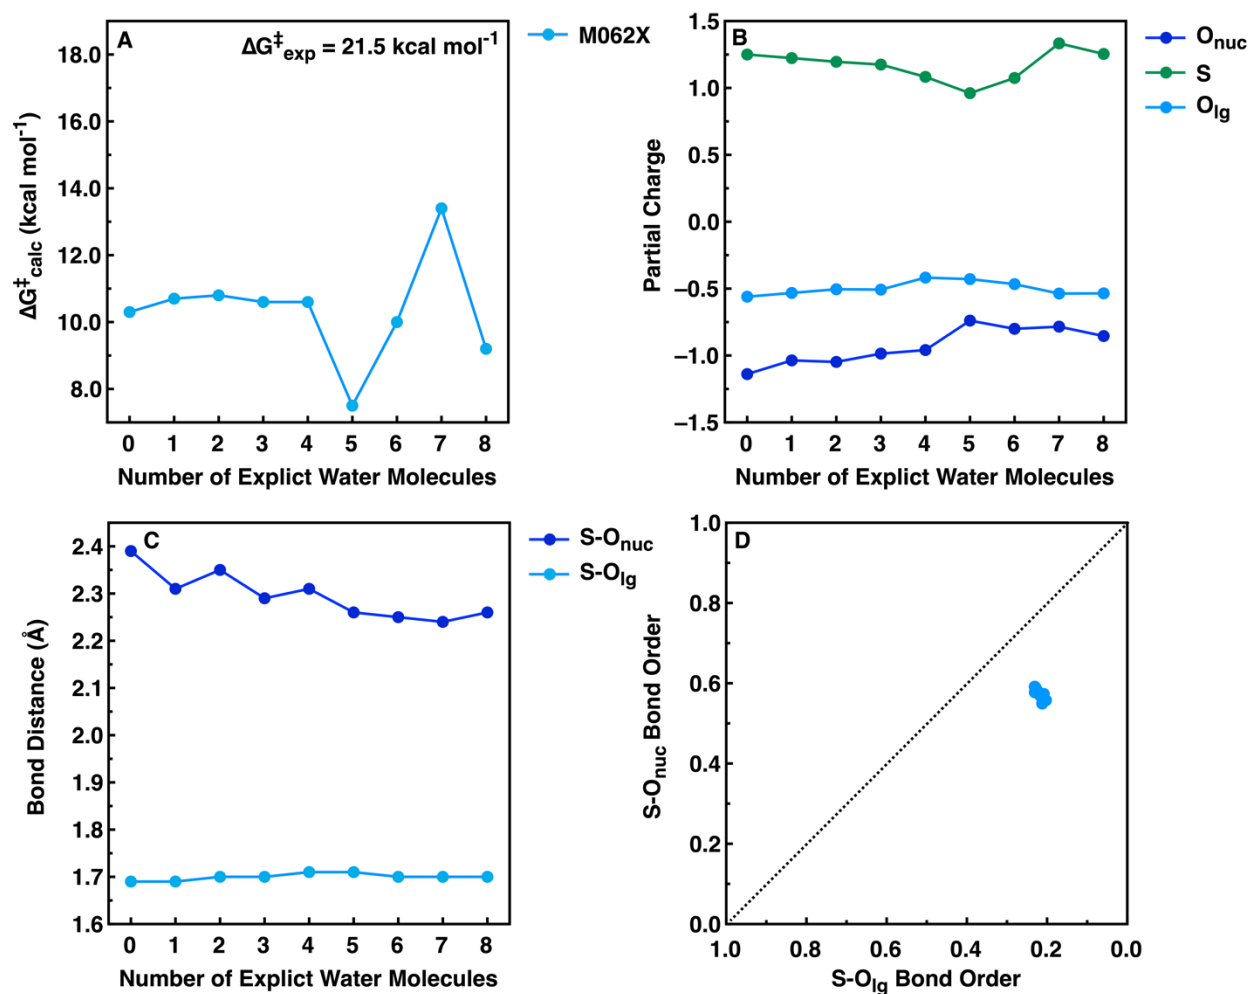

Figure S2. Overview of the (A) activation free energies, (B) partial charges at the transition state, (C) $S-O_{\text{nuc}}$ and $S-O_{\text{Ig}}$ distances at the transition state and (D) $S-O_{\text{nuc}}$ and $S-O_{\text{Ig}}$ bond orders at the transition state for the alkaline hydrolysis of 4-nitrophenyl sulfate with varying numbers of water molecules, obtained using the M062X⁴ functional, as described in the **Methodology** section. The calculated activation free energy was obtained using transition state theory at 313.15 K, based on kinetic data provided in ref. ². For the corresponding data obtained using the ω B97X-D³ and M11L¹ functionals, see **Figures 3** and **S1**, and for the corresponding raw data see **Tables S1** to **S21**.

Figure S3. Overlay of the S-O_{nuc} and S-O_{lg} bond orders at the transition state for the alkaline hydrolysis of 4-nitrophenyl sulfate with varying numbers of water molecules, obtained using the ωB97X-D,³ M062X⁴ and M11L¹ functionals, as described in the **Methodology** section. For the corresponding raw data see **Tables S1** to **S21**.

Figure S4. Representative structures of the ground, transition and product states for the alkaline hydrolysis of 4-nitrophenyl sulfate obtained using the M11L functional,¹ in the presence of varying numbers of explicit solvent molecules, as described in the **Methodology** section. The calculated S-O_{nuc} and S-O_{lg} distances are annotated for each optimized reacting state (in Å), and the corresponding data obtained using the ω B97X-D³ and M062X⁴ functionals is shown in **Figures 4** and **S5**, respectively. Finally, coordinates of all optimized stationary points are provided as **Supporting Information**.

Figure S5. Representative structures of the ground, transition and product states for the alkaline hydrolysis of 4-nitrophenyl sulfate obtained using the M062X functional,⁴ in the presence of varying numbers of explicit solvent molecules, as described in the **Methodology** section. The calculated S-O_{nuc} and S-O_{lg} distances are annotated for each optimized reacting state (in Å), and the corresponding data obtained using the ω B97X-D³ and M11L¹ functionals is shown in **Figures 4** and **S4**, respectively. Finally, coordinates of all optimized stationary points are provided as **Supporting Information**.

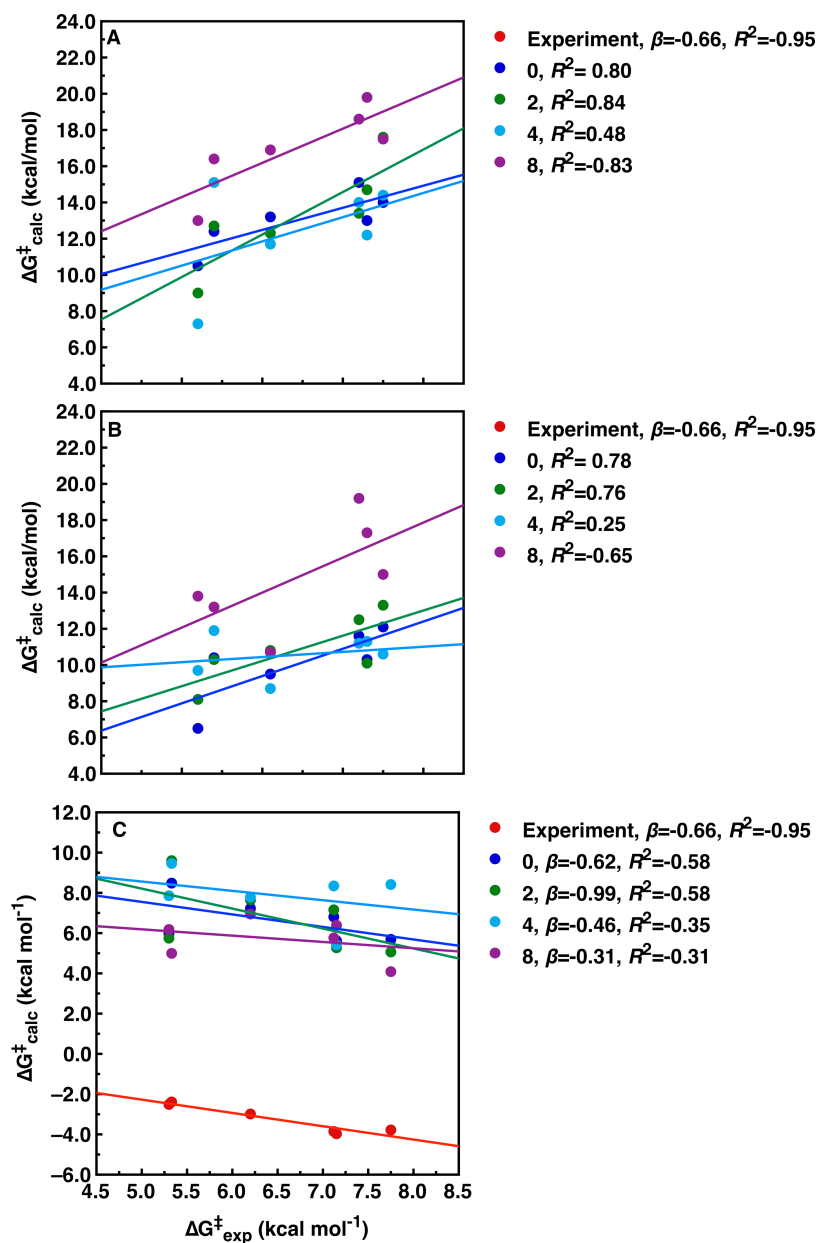

Figure S6. A comparison of experimental ($\Delta G^{\ddagger}_{\text{exp}}$) and calculated ($\Delta G^{\ddagger}_{\text{calc}}$) activation free energies for the alkaline hydrolysis of the aryl sulfate diesters studied in this work (**Figure 2**), in the presence of 0 (implicit solvent), 2, 4 or 8 explicit water molecules. Data was obtained using either the (A) ω B97X-D,³ (B) M11L¹ or (C) M062X⁴ functionals. The corresponding raw data is presented in **Tables S34 to S57**. Experimental activation free energies were obtained at 313.15 K using transition state theory based on kinetic data provided in ref. ².

Figure S7. Partial charges on (A) the nucleophile oxygen, (B) the sulfur atom and (C) the leaving group oxygen, at the transition states for the alkaline hydrolysis of the aryl sulfate diesters studied in this work (Figure 2), in the presence of 0 (implicit solvent), 2, 4 or 8 explicit water molecules. Partial charges were calculated using the M11L¹ functional and the CHELPG charge calculation scheme⁵ as described in the Methodology section. The corresponding charge distributions obtained using the wB97xD³ and M062X⁴ functionals are shown in Figures 6 and S8, respectively, and the corresponding raw data is shown in Table S58 to S81.

Figure S8. Partial charges on (A) the nucleophile oxygen, (B) the sulfur atom and (C) the leaving group oxygen, at the transition states for the alkaline hydrolysis of the aryl sulfate diesters studied in this work (Figure 2), in the presence of 0 (implicit solvent), 2, 4 or 8 explicit water molecules. Partial charges were calculated using the M062X⁴ functional and the CHELPG charge calculation scheme⁵ as described in the **Methodology** section. The corresponding charge distributions obtained using the wb97xD³ and M11L¹ functionals are shown in **Figures 6** and **S7**, respectively, and the corresponding raw data is shown in **Table S58 to S81**.

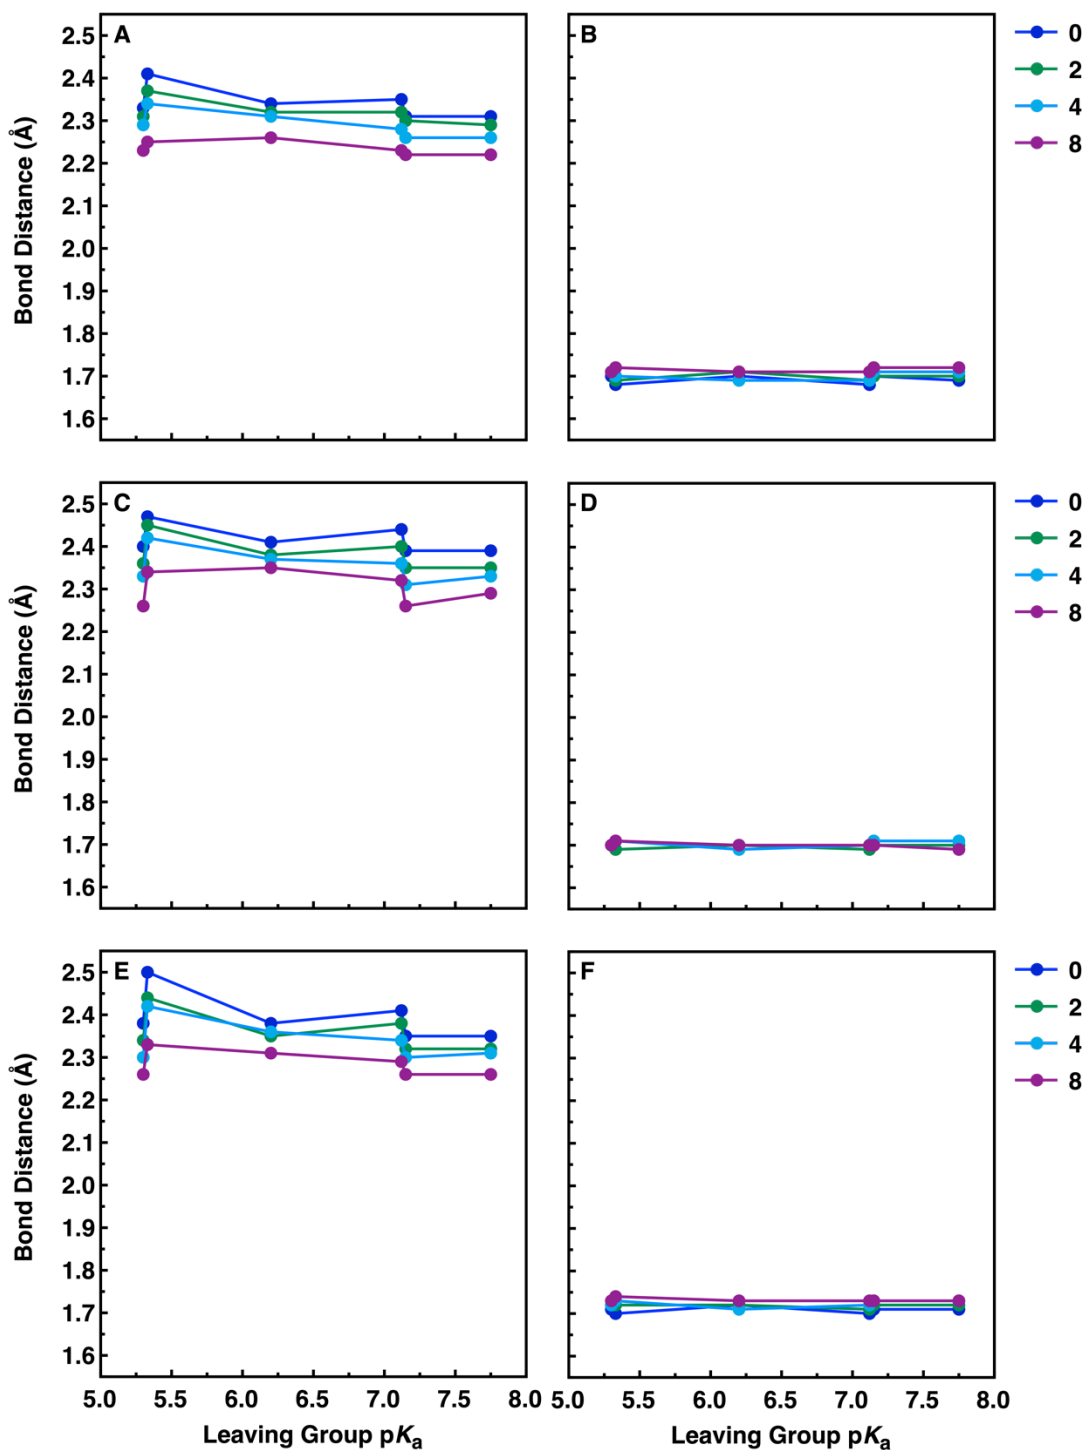

Figure S9. Calculated (A,C,E) S-O_{nuc} and (B,D,F) S-O_{lg} distances at the transition states for the alkaline hydrolysis of the aryl sulfate diesters studied in this work (**Figure 2**), in the presence of 0 (implicit solvent), 2, 4 or 8 explicit water molecules. Data was obtained using either the (A,B) M11L,¹ (C,D) M062X⁴ or (E,F) ω B97X-D³ functionals. The corresponding raw data is presented in **Table S82 to S105**.

Supplementary Tables

Table S1. Energy decomposition of the calculated activation free energies ($\Delta G_{\text{calc}}^{\ddagger}$) for the alkaline hydrolysis of 4-nitrophenyl sulfate in the presence of 0 to 8 additional explicit water molecules, obtained using the ω B97X-D³ functional.^a

Water Molecules	ΔE^{\ddagger}	ΔZPE^{\ddagger}	$-T\Delta S^{\ddagger}$	$\Delta G_{\text{calc}}^{\ddagger}$	$\Delta G_{\text{exp}}^{\ddagger}$	ν
0	10.6	0.2	3.2	14	21.5	-269.6541
1	11.8	0.4	3.2	15.4	21.5	-273.9228
2	17.4	-0.4	0.6	17.6	21.5	-289.4289
3	14.5	-0.1	1.7	16.1	21.5	-275.8035
4	13.8	-0.3	0.9	14.4	21.5	-266.4356
5	20.2	-1	-3.2	16	21.5	-282.5629
6	20.7	-0.9	-1.4	18.4	21.5	-281.2544
7	16.2	0.6	-1.4	14.2	21.5	-282.4447
8	17.3	-0.3	0.5	17.5	21.5	-281.4245

^a All energies are shown in kcal mol⁻¹, and vibrational frequencies are shown in cm⁻¹. ΔE^{\ddagger} , ΔZPE^{\ddagger} and $-T\Delta S^{\ddagger}$ denote the contributions to $\Delta G_{\text{calc}}^{\ddagger}$ from the electronic energy, zero-point energy and activation free energy, respectively. ν denotes the first vibrational frequency. $\Delta G_{\text{exp}}^{\ddagger}$ denotes the experimental activation free energy at 313.15 K, obtained from the kinetic data presented in ref. ² using transition state theory.

Table S2. Energy decomposition of the calculated activation free energies ($\Delta G^\ddagger_{\text{calc}}$) for the alkaline hydrolysis of 4-nitrophenyl sulfate in the presence of 0 to 8 additional explicit water molecules, obtained using the M11L¹ functional.^a

8	8.2	0.3	0.7	9.2	21.5	-283.7645

^a All energies are shown in kcal mol⁻¹, and vibrational frequencies are shown in cm⁻¹. ΔE^\ddagger , ΔZPE^\ddagger and $-T\Delta S^\ddagger$ denote the contributions to $\Delta G^\ddagger_{\text{calc}}$ from the electronic energy, zero-point energy and activation free energy, respectively. ν denotes the first vibrational frequency. $\Delta G^\ddagger_{\text{exp}}$ denotes the experimental activation free energy at 313.15 K, obtained from the kinetic data presented in ref. ² using transition state theory.

Table S4. Experimental and calculated rate constants for the alkaline hydrolysis of 4-nitrophenyl sulfate in the presence of 0 to 8 additional explicit water molecules, obtained using the ω B97X-D³ functional.^a

Water Molecules	k_{calc}	$\log k_{\text{calc}}$	$\log k_{\text{exp}}$
0	1.090×10^3	3.0374	-3.9706
1	1.148×10^2	2.0599	-3.9706
2	3.339×10^0	0.5236	-3.9706
3	3.724×10^1	1.5710	-3.9706
4	5.728×10^2	2.7580	-3.9706
5	4.373×10^1	1.6408	-3.9706
6	9.228×10^{-1}	-0.0349	-3.9706
7	7.900×10^2	2.8976	-3.9706
8	3.922×10^0	0.5935	-3.9706

^a The calculated rate constant, k_{calc} , was derived from the calculated activation free energy, ΔG^\ddagger , at 313.15 K, using transition state theory. The corresponding experimental value was obtained from ref. ² after correcting the experimental second order rate constant by 0.017 M^{-1} to take into account the entropic cost of bringing the reacting fragments into the encounter complex, following ref. ⁶.

Table S5. Experimental and calculated rate constants for the alkaline hydrolysis of 4-nitrophenyl sulfate in the presence of 0 to 8 additional explicit water molecules, obtained using the M11L¹ functional.^a

Water Molecules	k_{calc}	$\log k_{\text{calc}}$	$\log k_{\text{exp}}$
0	2.311×10^4	4.3638	-3.9706
1	7.501×10^3	3.8751	-3.9706
2	3.356×10^3	3.5258	-3.9706
3	1.503×10^3	3.1770	-3.9706
4	2.578×10^5	5.4113	-3.9706
5	1.427×10^4	4.1544	-3.9706
6	1.503×10^3	3.1770	-3.9706
7	1.427×10^4	4.1544	-3.9706
8	2.183×10^2	2.3391	-3.9706

^a The calculated rate constant, k_{calc} , was derived from the calculated activation free energy, ΔG^\ddagger , at 313.15 K, using transition state theory. The corresponding experimental value was obtained from ref. ² after correcting the experimental second order rate constant by 0.017 M^{-1} to take into account the entropic cost of bringing the reacting fragments into the encounter complex, following ref. ⁶.

Table S6. Experimental and calculated rate constants for the alkaline hydrolysis of 4-nitrophenyl sulfate in the presence of 0 to 8 additional explicit water molecules, obtained using the M062X⁴ functional.^a

Water Molecules	k_{calc}	$\log k_{\text{calc}}$	$\log k_{\text{exp}}$
0	4.175×10^5	5.6207	-3.9706
1	2.195×10^5	5.3414	-3.9706
2	1.869×10^5	5.2716	-3.9706
3	2.578×10^5	5.4113	-3.9706
4	2.578×10^5	5.4113	-3.9706
5	3.765×10^7	7.5758	-3.9706
6	6.763×10^5	5.8301	-3.9706
7	2.073×10^3	3.3166	-3.9706
8	2.448×10^6	6.3889	-3.9706

^a The calculated rate constant, k_{calc} , was derived from the calculated activation free energy, ΔG^\ddagger , at 313.15 K, using transition state theory. The corresponding experimental value was obtained from ref. ² after correcting the experimental second order rate constant by 0.017 M^{-1} to take into account the entropic cost of bringing the reacting fragments into the encounter complex, following ref. ⁶.

Table S22. Experimental and calculated rate constants for the alkaline hydrolysis of substituted sulfate diesters in the presence of 0 explicit water molecules (pure implicit solvation), obtained using the ω B97X-D³ functional.^a

Substituent	k_{calc}	$\log k_{\text{calc}}$	$\log k_{\text{exp}}$
4-chloro-3-nitro	1.859×10^2	2.2693	-3.7799
4-nitro	1.090×10^3	3.0374	-3.9706
2,6-difluoro	5.439×10^3	3.7355	-3.8539
2-fluoro-4-nitro	3.943×10^3	3.3958	-2.9872
2,3,4,5,6-pentafluoro	3.027×10^5	5.4810	-2.3872
3-fluoro-4-nitro	1.427×10^4	4.1544	-2.5114

^a The calculated rate constant, k_{calc} , was derived from the calculated activation free energy, ΔG^\ddagger , at 313.15 K, using transition state theory. The corresponding experimental value was obtained from ref. ² after correcting the experimental second order rate constant by 0.017 M^{-1} to take into account the entropic cost of bringing the reacting fragments into the encounter complex, following ref. ⁶.

Table S23. Experimental and calculated rate constants for the alkaline hydrolysis of substituted sulfate diesters in the presence of 2 explicit water molecules, obtained using the ω B97X-D³ functional.^a

Substituent	k_{calc}	$\log k_{\text{calc}}$	$\log k_{\text{exp}}$
4-chloro-3-nitro	2.859×10^3	3.4562	-3.7799

3-fluoro-4-nitro	7.162×10^7	7.8550	-2.5114

^a The calculated rate constant, k_{calc} , was derived from the calculated activation free energy, ΔG^\ddagger , at 313.15 K, using transition state theory. The corresponding experimental value was obtained from ref. ² after correcting the experimental second order rate constant by 0.017 M^{-1} to take into account the entropic cost of bringing the reacting fragments into the encounter complex, following ref. ⁶.

Table S33. Experimental and calculated rate constants for the alkaline hydrolysis of substituted sulfate diesters in the presence of 8 explicit water molecules, obtained using the M062X⁴ functional.^a

^a RS, TS and PS denote the reactant, transition and product states, respectively. E, ZPE and S denote the absolute electronic energies, zero-point energies and entropies, and ΔE , ΔZPE and $-T\Delta S$ denote the corresponding values relative to the RS (all values in kcal mol⁻¹, except S which is presented in cal mol⁻¹ K⁻¹). ν denotes the first vibrational frequency (cm⁻¹). ^b As this imaginary frequency is so small and it's in the product state (thus not affecting the calculated activation free energy for the hydrolysis of this compound), we have ignored it. We note that these structures were obtained using a super fine optimization grid.

^a RS, TS and PS denote the reactant, transition and product states, respectively. E, ZPE and S denote the absolute electronic energies, zero-point energies and entropies, and ΔE , ΔZPE and $-T\Delta S$ denote the corresponding values relative to the RS (all values in kcal mol⁻¹, except S which is presented in cal mol⁻¹ K⁻¹). ν denotes the first vibrational frequency (cm⁻¹).

Table S58. Partial charges at the transition state for the alkaline hydrolysis of substituted sulfate diesters in the presence of 0 additional explicit water molecules (pure implicit solvation), obtained using the ω B97X-D³ functional.^a

Water Molecules	O_{nuc}	S	O_{lg}

Cartesian Coordinates of Optimized Stationary Points

Due to the large number of stationary points involved, Cartesian coordinates of all stationary points have been presented as a separate zip file.
