Table S2: Ratio of the rest-day column to the weekly average for cities with the most pronounced OMI NO₂ weekly cycle. The ratios are calculated based on annually averaged OMI (2005-2017) and TROPOMI (May 2018-April 2019) columns. The ratio based on 2005-2007 OMI data is given within parentheses. Notes: ^a based on GOME 1996-2001 [Beirle et al., 2003]; ^b based on SCIAMACHY 2003-2005 [Kaynak et al., 2009]; ^c uses ground-based data for 2010 [Kim et al., 2016]; ^d based on aircraft data for 2010 [Kim et al., 2016].

City, Country	OMI	TROPOMI	previous estimates
<i>Rest day: Sunday</i>

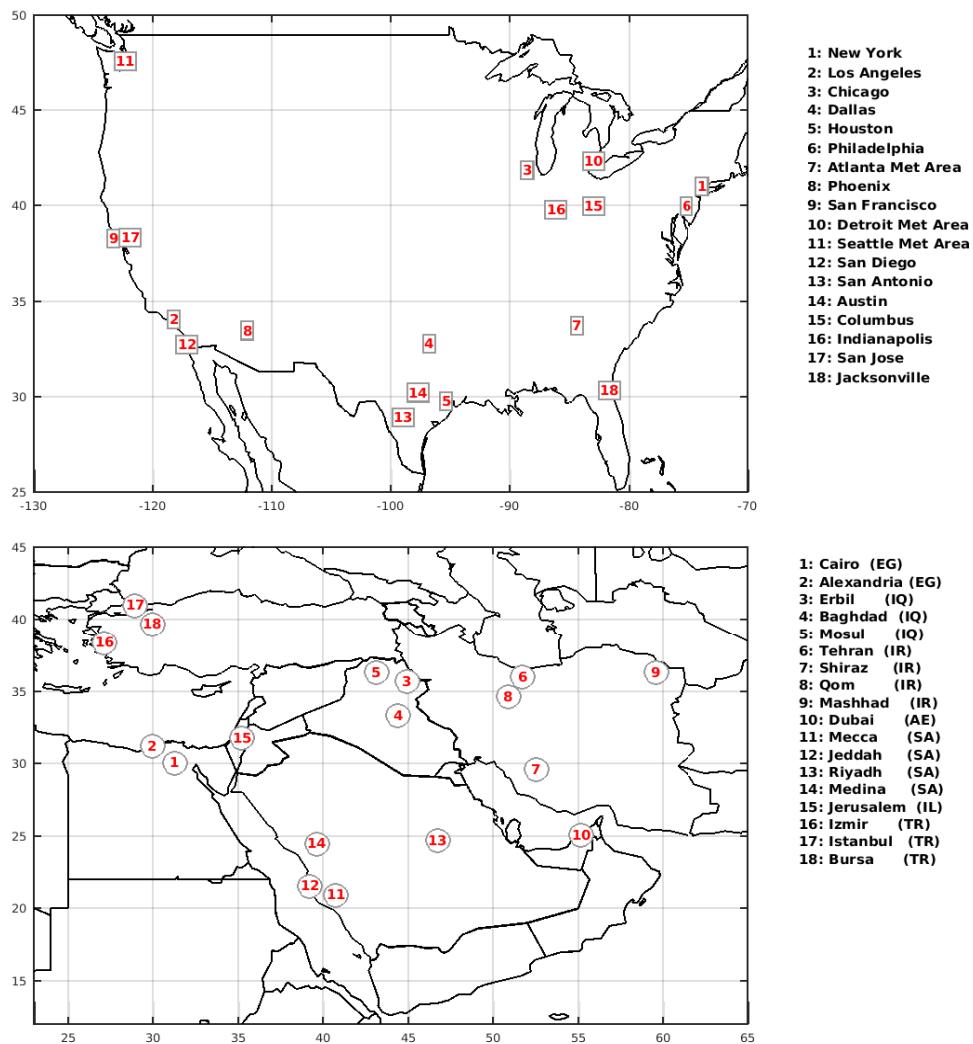

Figure S1: Location of the cities in the U.S. and the Middle East shown in Figures 4 and 6 of the main article. The administrative units are from the 2016 EUROSTAT countries dataset available in 60m resolution at <https://ec.europa.eu/eurostat/web/gisco/geodata/reference-data/administrative-units-statistical-units/countries>. The map is generated using MATLAB R2013a (8.1.0.604), Natick, Massachusetts, The MathWorks Inc.

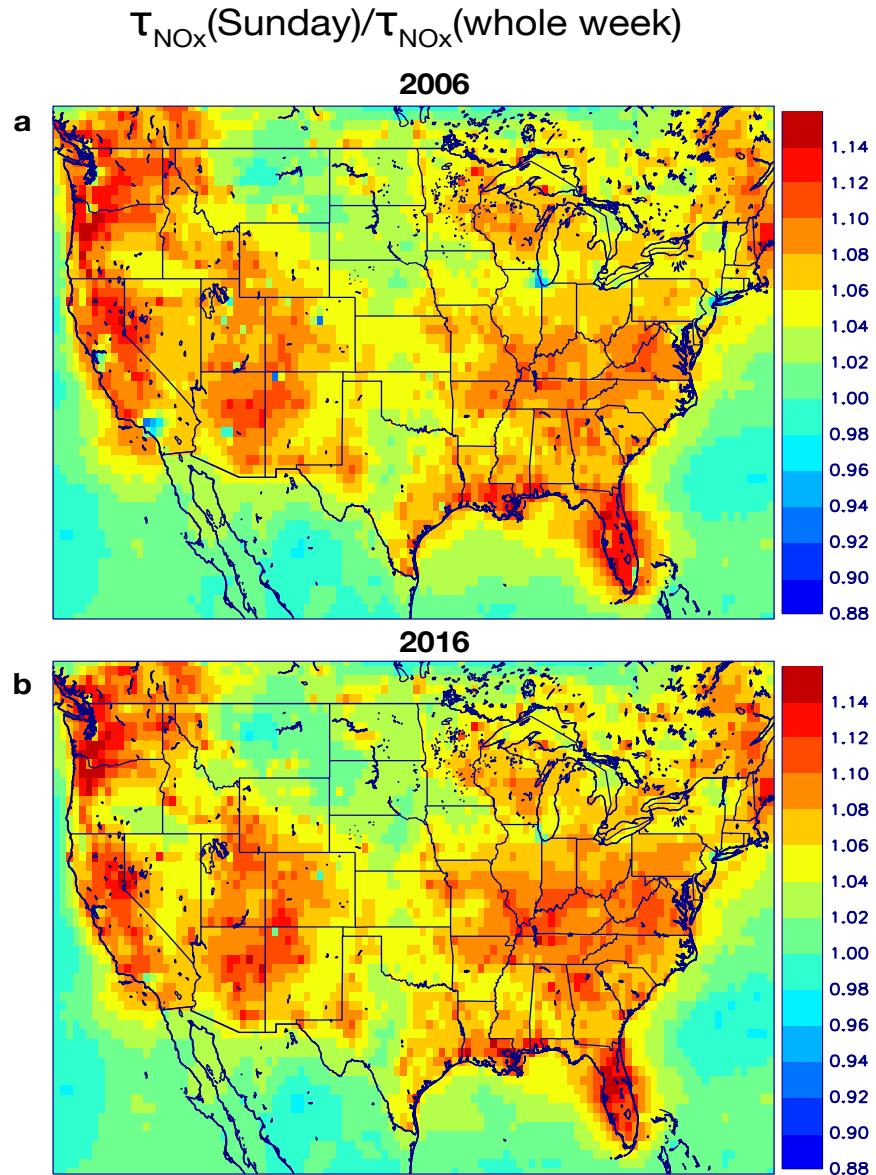

Figure S2: Ratio of the yearly averaged NO_x lifetime on Sunday to the yearly averaged NO_x lifetime for the whole week (a) in 2006 and (b) in 2016, as calculated by the MAGRITTE model. The same meteorological fields and natural emissions are used in both simulations, which differ only by their anthropogenic emissions.
