- Table S6.** List of proteins classified into the category of Extracellular matrix proteins based on GO annotations

1. GAG release levels in the chondrocyte secretome upon cytokine exposure

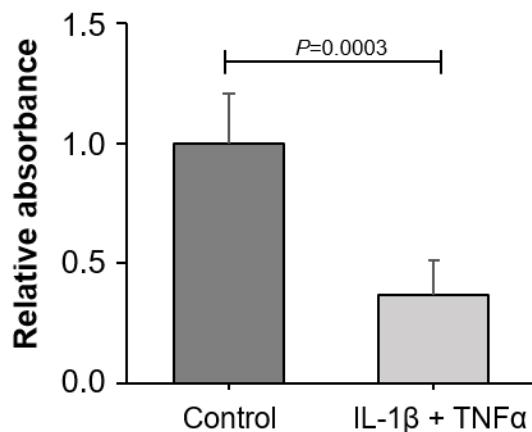

Figure S1. GAG release levels in the chondrocyte secretome upon cytokine exposure (IL-1 β +TNF α , both 10 ng/mL) versus control conditions. GAG release as measured by DMMB assay shows a significant reduction of GAG in the chondrocyte secretome upon cytokine exposure as compared to control. Measurements from four horses (four biological replicates) were combined to provide final values for each group (mean \pm SD).

2. Apoptotic rate in primary chondrocytes exposed to pro-inflammatory cytokines

Primary equine articular chondrocytes in the experimental group were treated with the pro-inflammatory cytokines IL-1 β and TNF α (both at 10 ng/mL) (equine recombinant, R&D Systems, Minneapolis, MN, USA) for 7 days. Rate of apoptosis was measured using the luminescence based Promega Caspase-Glo 3/7 Assay System, by determining caspase 3 and 7 activation, according to the instructions of the manufacturer. Luminescence was detected using a Tecan SPARK 10M Plate Reader (Tecan, Männedorf, Switzerland).

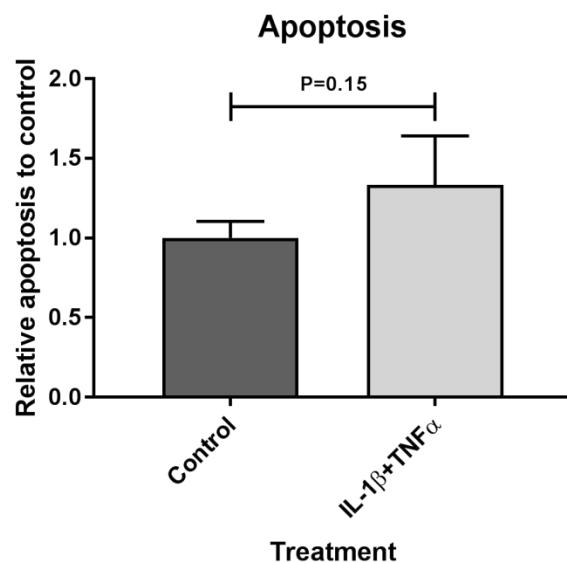

Figure S2. Rate of apoptosis of chondrocytes under inflammatory ($IL-1\beta+TNF-\alpha$, both 10 ng/mL) versus control conditions. Apoptotic rate was unchanged under inflammatory conditions ($P=0.15$).
