Reporting Summary

Nature Research wishes to improve the reproducibility of the work that we publish. This form provides structure for consistency and transparency in reporting. For further information on Nature Research policies, see <u>Authors & Referees</u> and the <u>Editorial Policy Checklist</u>.

Sta	atis	tics					
For	all st	atistical analy	ses, confirm that the following items are present in the figure legend, table legend, main text, or Methods section.				
n/a	Za Confirmed						
	x	The exact sar	nple size (n) for each experimental group/condition, given as a discrete number and unit of measurement				
	x	A statement	on whether measurements were taken from distinct samples or whether the same sample was measured repeatedly				
x			ll test(s) used AND whether they are one- or two-sided tests should be described solely by name; describe more complex techniques in the Methods section.				
X		A description of all covariates tested					
X		A description	of any assumptions or corrections, such as tests of normality and adjustment for multiple comparisons				
	x		tion of the statistical parameters including central tendency (e.g. means) or other basic estimates (e.g. regression coefficient) in (e.g. standard deviation) or associated estimates of uncertainty (e.g. confidence intervals)				
×		For null hypothesis testing, the test statistic (e.g. <i>F</i> , <i>t</i> , <i>r</i>) with confidence intervals, effect sizes, degrees of freedom and <i>P</i> value noted Give <i>P</i> values as exact values whenever suitable.					
X		For Bayesian analysis, information on the choice of priors and Markov chain Monte Carlo settings					
x		For hierarchical and complex designs, identification of the appropriate level for tests and full reporting of outcomes					
X	Estimates of effect sizes (e.g. Cohen's d , Pearson's r), indicating how they were calculated						
			Our web collection on <u>statistics for biologists</u> contains articles on many of the points above.				
So	ftw	vare and o	code				
Poli	cy in	formation abo	out <u>availability of computer code</u>				
Data collection		ollection	The standard Illumina NextSeq data pipeline was used to collect all sequencing data.				
Data analysis		nalvsis	The analysis code is in the supplemental text or is available upon request. Burrows Wheeler Aligner 0.7.12 was used to analyze				

For manuscripts utilizing custom algorithms or software that are central to the research but not yet described in published literature, software must be made available to editors/reviewers. We strongly encourage code deposition in a community repository (e.g. GitHub). See the Nature Research guidelines for submitting code & software for further information.

Data

Policy information about availability of data

All manuscripts must include a data availability statement. This statement should provide the following information, where applicable:

- Accession codes, unique identifiers, or web links for publicly available datasets
- A list of figures that have associated raw data $% \left(1\right) =\left(1\right) \left(1\right) \left($
- A description of any restrictions on data availability

sequencing data.

The data that support the findings of this study will be available upon reasonable request.

Field-specific reporting

Life sciences study design

Blinding

All studies must disclose on these points even when the disclosure is negative.

Sample size

The sample size of the experiment of synthesis bias was determined by the maximum number of sequences Twist Biosciences can make on a single synthesis array. The sample size of the system model experiment was determined to allow all testing conditions to have sufficient sequencing reads in a single sequencing run.

Data exclusions

No data was excluded from this study unless the sequencing coverage was too high to be comparable to the other data points, in which case the data was randomly subsampled down to a threshold, reported in the text.

Replication

The experiment for testing our system model was performed in triplicates. The mean value and standard deviation are shown in the figure.

Randomization

We hashed the file content with a pseudo-random key, and thus payload sequences are substantially different from one to another.

Reporting for specific materials, systems and methods

Blinding is not relevant to our study. We performed the same treatment and analysis to each sequence.

We require information from authors about some types of materials, experimental systems and methods used in many studies. Here, indicate whether each material, system or method listed is relevant to your study. If you are not sure if a list item applies to your research, read the appropriate section before selecting a response.

Ma	terials & experimental systems	Methods	
n/a	Involved in the study	n/a	Involved in the study
X	Antibodies	X	ChIP-seq
x	Eukaryotic cell lines	×	Flow cytometry
x	Palaeontology	×	MRI-based neuroimaging
X	Animals and other organisms		
x	Human research participants		
X	Clinical data
