

Supplemental Fig. S5 Activation of cellular apoptosis upon proteasomal inhibition in stem cells. Cellular apoptosis was measured after 24h treatment with bortezomib at the indicated doses for H9-ESCs (A), H7-ESCs (B) and EP1-iPSCs (C) by measuring luminescence-based caspase-3/7 activity. Data presented are from three independent biological replicates. Error bars are SEM. **, p-value < 0.005
