

# Zoonotic causes of febrile illness in malaria endemic countries: a systematic review Supplementary Information

## Zoonoses Search Concept Construction

To construct a list of frequently reported zoonotic causes of human fever, we conducted preliminary searches of Medline and Embase using the search syntax '(exp Fever/ OR fever.mp.) AND (exp Zoonoses/ OR zoonoses.mp OR zoonosis.mp)' limited to humans.

The outputs of these searches were combined and de-duplicated in R.<sup>1</sup> The complete list of all subject headings associated with these articles was extracted and each heading was classified by two independent reviewers to identify headings for named disease causing agents or named diseases. Headings that referred to non-specific pathogen groups e.g., ‘arboviruses’ and those that referred to non-specific clinical symptoms, signs, syndromes, or diseases e.g., ‘jaundice’ and ‘parasitic diseases’ were excluded. All headings classified as either a pathogen or disease by one or both reviewers (JEBH and PH) were matched to a list of 1,415 infectious organisms known to be pathogenic to humans<sup>2</sup>. Non-zoonotic pathogens or diseases based on the classification by Taylor et al.<sup>2</sup> were excluded. The frequency of appearance of each zoonosis-related heading in the initial search output dataset was tabulated. Pathogen/disease subject headings that appeared in >10 references identified through the initial ‘Fever and Zoonoses’ searches were retained.

For the ‘zoonoses’ concept, the list of zoonotic pathogens identified above was combined with lists of zoonotic diseases from the World Health Organization (WHO)<sup>3</sup> and World Organisation of Animal Health (OIE)<sup>4</sup>.

All identified pathogens or diseases were then classified to differentiate pathogens that are normatively acquired by people through direct or indirect transmission from vertebrate animals to humans, as compared to pathogens where zoonotic transmission has been recorded but where sustained transmission within human populations also occurs and the majority of human infections are not acquired through zoonotic transmission. This classification was made following the definitions used in Wolfe et al.<sup>5</sup> Three reviewers (JAC, SC, and MPR) independently classified listed pathogens or diseases using the stages in the transformation of an animal pathogen into a specialized pathogen of humans described in Wolfe et al.:<sup>5</sup>

- Stage 1. A microbe that is present in animals but that has not been detected in humans under natural conditions (that is, excluding modern technologies that can inadvertently transfer microbes, such as blood transfusion, organ transplants, or hypodermic needles).
  - Stage 2. A pathogen of animals that, under natural conditions, has been transmitted from animals to humans ('primary infection') but has not been transmitted between humans ('secondary infection').
  - Stage 3. Animal pathogens that can undergo only a few cycles of secondary transmission between humans, so that occasional human outbreaks triggered by a primary infection soon die out.
  - Stage 4. A disease that exists in animals, and that has a natural (sylvatic) cycle of infecting humans by primary transmission from the animal host, but that also undergoes long sequences of secondary transmission between humans without the involvement of animal hosts.
  - Stage 5. A pathogen exclusive to humans.<sup>5</sup>

Tie-breaks were resolved by a fourth independent reviewer (JEBH). Pathogens classified as stages 1 to 3 were retained. Pathogens classified as stage 4 or 5, where sustained chains of transmission between humans occur, were excluded from the review.

Pathogens or diseases included in the list of study zoonoses therefore included all pathogens and diseases that were:

- Identified through the WHO list, OIE list or preliminary zoonoses search approach AND
  - Classified as a zoonoses<sup>2</sup> AND
  - Classified as a stage 1, 2 or 3 zoonosis.<sup>5</sup>

The search concept for each pathogen or disease included exploded subject headings for both the pathogen and the diseases caused in humans and terms for both pathogen and disease were also included as keywords (e.g., exp anthrax/ OR anthrax.mp. OR exp Bacillus anthracis/ OR bacillus anthracis.mp.). In instances where pathogen species within the same genus varied in their zoonotic status, search concepts were constructed to include all zoonotic and non-zoonotic species and articles relating to non-zoonotic species were excluded at a later stage. Finally, the list of pathogen- or disease-specific searches were combined using OR syntax to generate the full ‘zoonoses’ search concept (Medline Search Syntax and Embase Search Syntax sections below).

### Abstract Screening

Conference proceedings, records that did not include any abstract text, and records that did not have an abstract in English were excluded. Remaining records were evaluated against the criteria listed in table S1. Records that did not present data from a malaria-endemic country were also excluded. Full text articles were sought for all articles not excluded at the abstract review step.

**Table S1. Criteria applied for abstract screening.**

Criterion	Guidance	Outcome
InclFeverPopn	Does the Title/Abstract refer to clinical and/or laboratory evaluation of a group of two or more humans that are explicitly described using one or more of the following terms: Febrile / fever(s) / pyrexia(s) / temperature $\geq 38.0^{\circ}\text{C}$ / body temperature elevation?	If Yes, retain and evaluate InclZooPath.  If No, exclude.
InclZooPath	Does the Title/Abstract refer to diagnosis of this febrile population with one or more of the pathogens/diseases included in this study (table 1 in main paper)?	If Yes, retain and evaluate Exc1PathogenFocus.  If No, evaluate InclBcx.
InclBcx	Does the Title/Abstract refer to the use of blood culture for the diagnosis of this febrile population?	If Yes, retain and evaluate Exc1PathogenFocus.  If No, exclude.
Exc1PathogenFocus	Does the Title/Abstract refer to a group of two or more humans that are principally classified on the basis of a common (i.e. 100% frequency) aetiological diagnosis, some proportion of which may also have fever?	If Yes, exclude.  If No, retain for full text review.

442  
443  
444

### Full Text Review

Full text articles were evaluated by two independent reviewers against the criteria listed in table S2.

**Table S2. Criteria applied for full text review of articles.**

Criterion	Guidance	Outcome
Inc2FP	Does the article provide details/inclusion criteria for one or more human population(s) (of more than one person) that explicitly includes acute fever/febrile illness as part of the inclusion criteria?	If Yes, retain and evaluate Inc2ZP.  If No, exclude.
Inc2ZP	Does the article provide data on the diagnosis of a zoonotic pathogen as defined on the species level list (table 1 in main paper)?	If Yes, retain and evaluate Inc2DT.  If No, exclude.
Inc2DT	Does the article provide details of one or more diagnostic test procedure(s) for one or more of the zoonotic pathogens included in this study that meets >1 of the following criteria and are used to test >1 febrile people? 1 – culture of the pathogen from sample(s) collected from a febrile person 2 – direct detection of the pathogen (e.g., by PCR based techniques) from sample(s) collected from a febrile person 3 – serological diagnosis of acute infection based on testing of both acute and convalescent phase serum samples and demonstration of seroconversion 4 – diagnosis of acute infection based on detection of pathogen-specific antibody or antigens in a single serum sample only for selected pathogens, for which widely accepted case definitions deemed pathogen-specific antibody or antigen detection sufficiently accurate (table 2 in main paper) 5 – IgM detection in CSF for selected pathogens for which widely accepted case definitions include IgM detection in CSF (table 2 in main paper)	If Yes, retain, record coding of valid tests and evaluate Exc2nTests.  If No, exclude.
Exc2nTests	Does the article lack detail on the number of people tested for each study pathogen with each testing method/case definition that meets the above criteria?	If Yes, exclude.  If No, retain and evaluate Exc2AllNeg.
Exc2AllNeg	Does the article give the number of people tested for a study pathogen with a test method/case definition that meets the above criteria, but all tested individuals are negative?	If Yes, exclude.  If No, retain and evaluate Exc2DV.
Exc2DV	Does the article present data from a study designed to evaluate diagnostic test and/or vaccine performance without presenting ‘new data’ on the number/proportion of patients diagnosed with pathogen x from a described population of febrile humans?	If Yes, exclude.  If No, retain and evaluate Exc2Rev.
Exc2Rev	Does the article provide a review of previously published data only, without presenting ‘new’ primary data on the number/proportion of patients diagnosed with pathogen x?	If Yes, exclude.  If No, retain and evaluate Exc2PF.

Exc2PF	Does the article refer to a group of two or more humans that are principally classified on the basis of a common (e.g., 100% frequency) aetiological diagnosis, some proportion of which may also have fever?	If Yes, exclude.  If No, retain and carry forward for data extraction.

445

**Data extraction**

446 Articles were excluded during data extraction if they did not meet one or more of the study inclusion criteria or  
 447 did meet one or more of the exclusion criteria described above for full text review. For all included studies, data  
 448 were extracted in two stages. First, article level data were extracted following the guidance given in table S3.  
 449

450

451 Article level data collection on individual pathogens included the names of each of the zoonotic pathogens that  
 452 the article described diagnostic methods for and the names of the zoonotic pathogens that were diagnosed in the  
 453 study. These classifications record the named zoonoses that each study reported looking for and diagnosing,  
 454 irrespective of the diagnostic approach used or level of detail given.  
 455

456

457 At the second step, data were extracted the for each combination of zoonotic pathogen and diagnostic test  
 458 approach that met study validity criteria following the guidance given in table S4. In instances where more than  
 459 one diagnostic method was used for a given pathogen (e.g., culture and serology-based case definitions), data on  
 460 the total number of individuals tested and positive using valid diagnostics for a given pathogen were aggregated.  
 461 Data were only extracted for diagnosed pathogens and no data were extracted for pathogens not identified, even  
 462 when common diagnostic approaches were used. For example, in studies conducting blood cultures the number  
 463 of individuals tested and positive for each identified zoonosis were extracted but no data were extracted on the  
 464 number of individuals who tested negative for other pathogens that could be identified by that blood culture.  
 465

466

467 When duplicate records were identified, e.g., when two articles reported identical data on pathogen detection in  
 468 the same population, the later duplicate record was removed from the dataset for analysis.  
 469

470

471 Extracted data were used to classify study and outcome level attributes according to the pre-defined criteria for  
 bias assessment given in table S5.

**Table S3. Data extracted for each article included in the review.**

Data to be extracted	Guidance
Country and WHO region	Record the country or countries in which the reported study was conducted (i.e. the country where the febrile population was identified, and data were collected). Country name spellings and regional classifications are as defined by the WHO.
Start year of data collection	Record the start year for the period over which the reported study was conducted (i.e. the period when the febrile population was identified, and data were collected).
End of data collection	Record the end year for the period over which the reported study was conducted (i.e. the period when the febrile population was identified, and data were collected).
Fever population description	Record a general description of the febrile population investigated in this study.
Fever population eligibility	Record the inclusion and exclusion criteria used to define eligibility of participants in this study.
Specific aetiologies excluded	Record if patients with any specific aetiologies or syndromes were excluded in this study. Generalised exclusions such as “known causes of fever”, “obvious focus of infection” or ‘obvious explanations of febrile illness’ were not classified here.
Details of exclusions	Record the details of the named aetiologies and/or syndromes excluded.
Differentiated or undifferentiated fever	Classify each study population as undifferentiated febrile population or differentiated febrile population according to the reported clinical presentation.
Febrile population classification	Classify differentiated febrile populations as: i) febrile neurologic presentation; ii) febrile haemorrhagic presentation; iii) febrile gastrointestinal presentation; iv) febrile respiratory presentation; v) specific febrile aetiology suspected (i.e., leishmaniasis, leptospirosis, plague, and rickettsiosis); vi) fever in a high specific co-morbid group (i.e. malignancy, immunocompromise).
Age	Record details provided about the ages of the febrile population
Demographic restriction	Record the details of any demographic restriction of the study population e.g., restriction of the study population to individuals meeting specific criteria for age or sex.
Urban or rural population	Record whether or not the study was conducted in a predominantly urban population, predominantly rural or mixed.
Inpatient or outpatient population	Record whether or not the febrile population described were inpatients (e.g., admitted to a healthcare facility), outpatients (e.g., patients seeking care at a healthcare facility but apparently not admitted) or if the study was population-based.
Outbreak	Record whether or not the study reports that data collection was conducted during a reported outbreak or not and the disease/syndrome described if Yes.

Zoonotic pathogens diagnosed among febrile patients	Was any proportion of the reported febrile population diagnosed with a zoonotic pathogen?
Pathogens looked for	For each zoonosis mentioned in the article record 1 if the article describes a diagnostic approach taken to identify individuals infected with that pathogen. Record 0 for each zoonosis where this is not the case.
Pathogens diagnosed	For each zoonosis mentioned in the article record 1 if the article reports more than one member of a febrile population diagnosed with this pathogen (irrespective of the diagnostics used). Record 0 for each zoonosis where this is not the case.

472

473

**Table S4. Data extracted for each zoonotic pathogen diagnosed by a valid method.**

Data to be extracted	Guidance
Zoonotic pathogen identified	Record the pathogen diagnosed using valid diagnostic methods.
Type of sample	Record the details of the sample(s) tested with each specific test/approach.
Diagnostic method used	Record the type of diagnostic test(s) used for each specific test/approach.
Number of individuals tested for that pathogen by valid methods	Record the number of febrile patients tested using the valid diagnostics described in this row of the dataset specifically.
Number of individuals diagnosed as positive for that pathogen by valid methods	Record the number of febrile patients classified as positive using the valid diagnostics described in this row of the dataset specifically.
Indicator for multiple diagnostic methods for given pathogen in this reference	Record Yes (1) if there is more than one row of data for this pathogen and reference combination.

474

475

**Bias evaluation**

476

477

478

479

**Table S5. Criteria for bias assessment and classification of study and population level attributes.**

Criteria	Risk of bias classification	Description
Study representativeness	Low	Undifferentiated febrile population with no demographic restriction and no aetiologies or syndromes excluded.
	Medium	Undifferentiated febrile population with demographic restriction or one or more aetiologies and/or syndromes excluded.
	High	Febrile population classified as differentiated (table S4) or sampled during an identified disease outbreak.
Precision of percentage fevers attributed to zoonosis	Low	Number of individual tested > 385.
	Medium	Number of individuals tested > 139 and ≤385.
	High	Number of individuals tested ≤ 139.

## Results

**Table S6: Characteristics and summary of the 244 articles and 309 records of zoonosis diagnosis included in the review.**

Study population abbreviations: UN = undifferentiated; D = differentiated; COMORBID = febrile co-morbid group GI = febrile gastrointestinal; HEM = febrile haemorrhagic; NEU = febrile neurological; RESP; febrile respiratory; SP = specific febrile aetiology suspected.

Diagnostics abbreviations: ELISA = enzyme linked immunosorbent assay; HI = haemagglutination inhibition test; IFA = immunofluorescence assay; IgM = IgM detection; MAT = microscopic agglutination test; PCR = polymerase chain reaction-based test; PRNT = plaque reduction neutralisation test. When multiple diagnostics used different tests are separated by “,”.

An excel format version of this table, including additional data fields is accessible at: <http://dx.doi.org/10.5525/gla.researchdata.890>
