

Supplementary figure 9 : Full-length Western Blotting with the cropped area corresponding to the image illustrated in figure 6E of the main text. Effect of FXR knock down on the synthesis of bone proteins. scr: scramble, tested clones (4, 7, 8, 13, 15, A, B, C). A: Western blotting of FXR in MCF-7 cells after exposure to shRNA. Immuno bands are quantified and normalized with β -actin expression (illustrated in full blot B). Immunoreactive band intensities were quantified using the software ImageJ®.
