¹Solutions of different nucleotides were based on the recipe described in Heinken et al. (1), trace elements based on trace element solution SLA of Imhoff and Trüper (2) and vitamins were added to compensate for the lack of yeast extract in CDM. The amount of AA present in the free amino acid medium (AA-CDM), except L-Cys, is based on the δ index weighed - AA relative contents of bacteria described by Moura *et al.* (3). The L-cysteine (L-Cys) concentration, as also used to reduce the medium, remained the same as in YCFA. Amino acids were added before the medium was autoclaved. The target pH for all media was 6.5, with a pH range of 6.5 ± 0.1 for vitamin auxotrophy experiments and 6.6 ± 0.2 for amino acid auxotrophy experiments after gas phase equilibration in the anaerobic cabinet.

²The amounts of vitamins used in CDM were based on those reported in YCFA (4) and extra compounds based on empirical information regarding synthesis salvage pathways (5) were added as follows. Biotin (B7): Pimelic acid; Cobalamin (B12): Cyanocobalamin; Folate (B9): Folic acid, *p*-Aminobenzoic acid; Niacin (B3): Nicotinic acid, Nicotinamide; Pantothenate (B5): Pantethine; Pyridoxine (B6): Pyridoxal HCl, Pyridoxamine:2HCl. All vitamins were filter sterilised (0.22 μm filter) and added after the medium was autoclaved.
