

Additional File 10. Comparison of methylation levels at the 260 DMPs in controls following IL-13+IL-17 exposure to methylation levels among cases and controls at baseline (vehicle treated). The figure shows the absolute value of the change in methylation between the two groups: red circles = (exposed controls)-(baseline cases) and blue circles = (exposed controls)-(baseline controls). As the data suggests and the figure illustrates, methylation levels among cases at baseline (red) look more like the controls following IL-13+IL-17 stimulation.
