**Supplementary Figure 1. Uric acid is not the downstream effector metabolite of inosine.** (a-c) Naive CD8+ T cells from C57BL/6 mice were activated by plate bound anti-CD3 and anti-CD28 antibodies and differentiated in the indicated conditional media in the presence and absence of uric acid (1mM) for 4 days. (a) Cell proliferation (CFSE), (b) cell survival (7AAD), and (c) indicated intracellular effector molecules were determined by FACS. Data are presented as mean  $\pm$  SD ( $n=4$ ). (c) NS,  $P=0.1477$ ; \*,  $P=0.0307$  and  $0.0205$  for Granzyme B, TNF- $\alpha$ , and IFN- $\gamma$  for Glucose versus Glucose+Uric acid by unpaired two-tailed t-test. Data are representative of three independent experiments. Sample size ( $n$ ) represents biologically independent samples (b-c).

**Supplementary Figure 2. Incorporation of the ribose subunit of inosine into the central carbon metabolism in the presence of glucose in human T effector cells.** Active human T cells were incubated in media containing both [ $^{13}\text{C}_5$ ]-Inosine and [6,6-D<sub>2</sub>]-Glucose for 24 h, extracted as described in methods, and analyzed for the incorporation of [ $^{13}\text{C}_5$ ]-Ino in the presence of glucose into PPP metabolites (a) and glycolytic/Krebs cycle metabolites (b) by IC-UHR-FTMS. Data are presented as mean  $\pm$  SEM (n=3). All symbols and abbreviations are as described in Figure 2. Numbers in the X-axis represent those of  $^{13}\text{C}$  atoms in given metabolites.

**Supplementary Figure 3.** Gating strategy for analysis of (a) CD8+ T cell proliferation (b) intracellular cytokines and effector molecule expression (c) tumor infiltrated effector T cells and intracellular cytokines.
