

Figure S1. Alternate presentation of cytokine data. Mice were subcutaneously infected with $1-3 \times 10^7$ CFUs of WT or $\Delta fakA$ *S. aureus*. Mice were sacrificed 4 or 7 days p.i.. Infection site skin was collected and cytokine levels measured in homogenate. Dots indicate an individual mouse, whereas bars indicate the median of $n=6$. * $p < 0.05$; ** $p < 0.01$ by Mann-Whitney test using GraphPad Prism Ver. 8. Some additional cytokines (LIX and IL-10) are included.
