THE LANCET Global Health

Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Walker D, Otieno P, Butrick E, et al. Effect of a quality improvement package for intrapartum and immediate newborn care on fresh stillbirth and neonatal mortality among preterm and low-birthweight babies in Kenya and Uganda: a cluster-randomised facility-based trial. *Lancet Glob Health* 2020; **8:** e1061–70.

Appendix

Table 1: Facility characteristics at matching

	Control N=10 facilities	Intervention N=10 facilities	Total N=20 facilities	p value^
Monthly delivery volume, mean (SD)	93 (82)	75 (51)	84 (67)	0.57
Deliveries to staff ratio, mean (SD)	63 (28)	52 (25)	58 (26)	0.39
Stillbirth proportion, median % (IQR)	1 (0·3-4)	2 (1-4)	1 (1-4)	0.38
LBW proportion, median % (IQR)	4 (3-7)	6 (2-6)	5 (3-6)	0.97
Pre-discharge newborn mortality, median % (IQR)	0 (0-1)	0.5 (0-1)	0 (0-1)	0.83
Caesarean section rate at 6 caesarean-capable facilities, median % (IQR)	20 (16-20)	47 (11-47)	21 (18-27)	< 0.001

[^]Two tailed paired t-test for means, Mann-Whitney U-test for medians

Table 2: Difference in the primary outcomes for facility pairs

Pair	Intervention (odds)*	Control (odds)*	Odds Ratio~
1	0.03	0.09	0.32
2	0.24	0.28	0.85
3	0.36	0.35	1.02
4	0.15	0.16	0.91
5	0.10	0.15	0.67
6	0.62	0.71	0.88
7	0.60	0.38	1.56
8	0.17	0.14	1.21
9	0.07	0.37	0.20
10	0.07	0.13	0.50
Exponentiated mean log or	dds ratio (95% CI):		0.70 (0.49-0.99)
			p value=0·04^

^{*}weighted by the number of deliveries within each facility

[^]two tailed paired t-test

[~] Intervention log odds - control log odds = log odds ratio (exponentiated)

Table 3: Additional outcomes among all births occurring at study facilities with adjustment for matching and clustering

	Control		Intervention	Intervention Odds Ratio		95% CI		p value
	n_c/N_c	%	n_i/N_i	%		Lower	Upper	p value
Fresh stillbirth	674/30726	2.2	300/23194	1.3	0.84	0.59	1.19	0.32
Pre-discharge newborn mortality	363/30726	1.2	217/23194	0.9	0.90	0.74	1.09	0.29

 $n_{c/i}$ = number with outcomes in the control/intervention arm $N_{c/i}$ = Total number of non-missing eligible births in the control/intervention arm

Table 4a and 4b. Characteristics of the infants who were excluded from the study versus those who were included, aggregated totals (4a) and separated by intervention and control (4b).

4a.

Characteristics	n ₁ #	Eligible but excluded*	n ₂ #	Eligible and included	p-value!
Preterm fresh stillbirth	2436	0 (0)	2909	9·2 (268)	NA
Pre-discharge mortality	2436	4.0 (97)	2909	3.7 (108)	0.61
Pre-discharge maternal mortality	2196	0.3 (7)	2772	0.7 (18)	0.10
Apgar at 5 min <7 live births	2436	4.8 (118)	2909	9.9 (287)	<0.001
Maternal age (years)	2423		2895		
<18		10.7 (259)		11.4 (329)	
18-35		83·5 (2024)		83.5 (2417)	
>35		5.8 (140)		5·2 (149)	0.47
Caesarean delivery (mothers)	2404	23.0 (552)	2863	21.6 (617)	0.22
Multiple gestation	2436	19.6 (477)	2909	21·1 (614)	0.17
Low birth weight (<2500 g)	2436	64·8 (1579)	2909	75·8 (2206)	<0.001
Sex, male	2436	46·2 (1125)	2909	47.7 (1387)	0.28
Birth weight in grams (Mean, SD)	2436	2252 (451)	2909	2174 (440)	<0.001
Gestational age in weeks (Mean, SD)	2268	35·1 (3·4)	2848	35.0 (3.5)	0.051

^{*}Exclusion due to failure to consent, declined participation, could not trace/contact

 $^{^{\#}}$ n₁ and n₂ are total denominators for the control and intervention group, respectively.

¹Chi-squared test of proportions or unpaired t-test for means.

 $^{^{\#}}n_1$ and n_2 are total denominators for the control and intervention group, respectively.

¹Chi-squared test of proportions or unpaired t-test for means.

Figure 1. Conceptual diagram showing the relationship between the intervention and the outcome along with the potential confounders and mediators.

We used this directed acyclic graph to show the relationship under investigation within the context of potential confounders and mediators.

- The red arrow shows the hypothesized relationship under investigation.
- **Delivery volume** depends on the level of facility. A higher-level facility that has high delivery load is more likely to have more c-sections, it is more likely to have higher volume of poor outcomes because they get more serious and referred cases. Because of the higher volume there may be greater investment in improving facility resources and/or capacity building of human resources. In contrast, because of the high work load they may have less time to invest in the simulation training or participate in QI collaboratives.
- **Apgar score** is a potential mediator because it indicates health status of newborn immediately after birth and it is also likely to have been influenced by the intervention, thus on the causal pathway.
- Performance of **cesarean section** may be influenced by the intervention package. Providers may be more or less likely to turn to a cesarean section if preterm birth is suspected. Similarly, increased vigilance of intrapartum care may result in higher incidence of cesarean section for intrauterine fetal distress. Performance of cesarean section may impact the likelihood of a very preterm infant being delivered by CS only to die shortly after birth vs becoming a fresh stillbirth.

- Infant sex. Male infants are at higher risk of mortality, in general, and we also know that female infants are at higher risk of born with intrauterine growth retardation in low- and middle-income countries. There may be provider or societal biases that lead to greater efforts to save infants of one sex or the other.
- Although the intervention was the same, its implementation is likely to have differences because of inherent differences between the sites in **Kenya and Uganda**. The facilities in these countries are different in terms of the services they provide and the number of deliveries they cater to. There may also be differences in the underlying provider skill or competencies for managing preterm labor and birth.
- **Birthweight** together with gestational age are the largest determinants of newborn survival. Among preterm infants there is a wide array of birthweights and gestational ages that are directly related to newborn survival.

CONSORT 2010 checklist
