

Supplementary Information

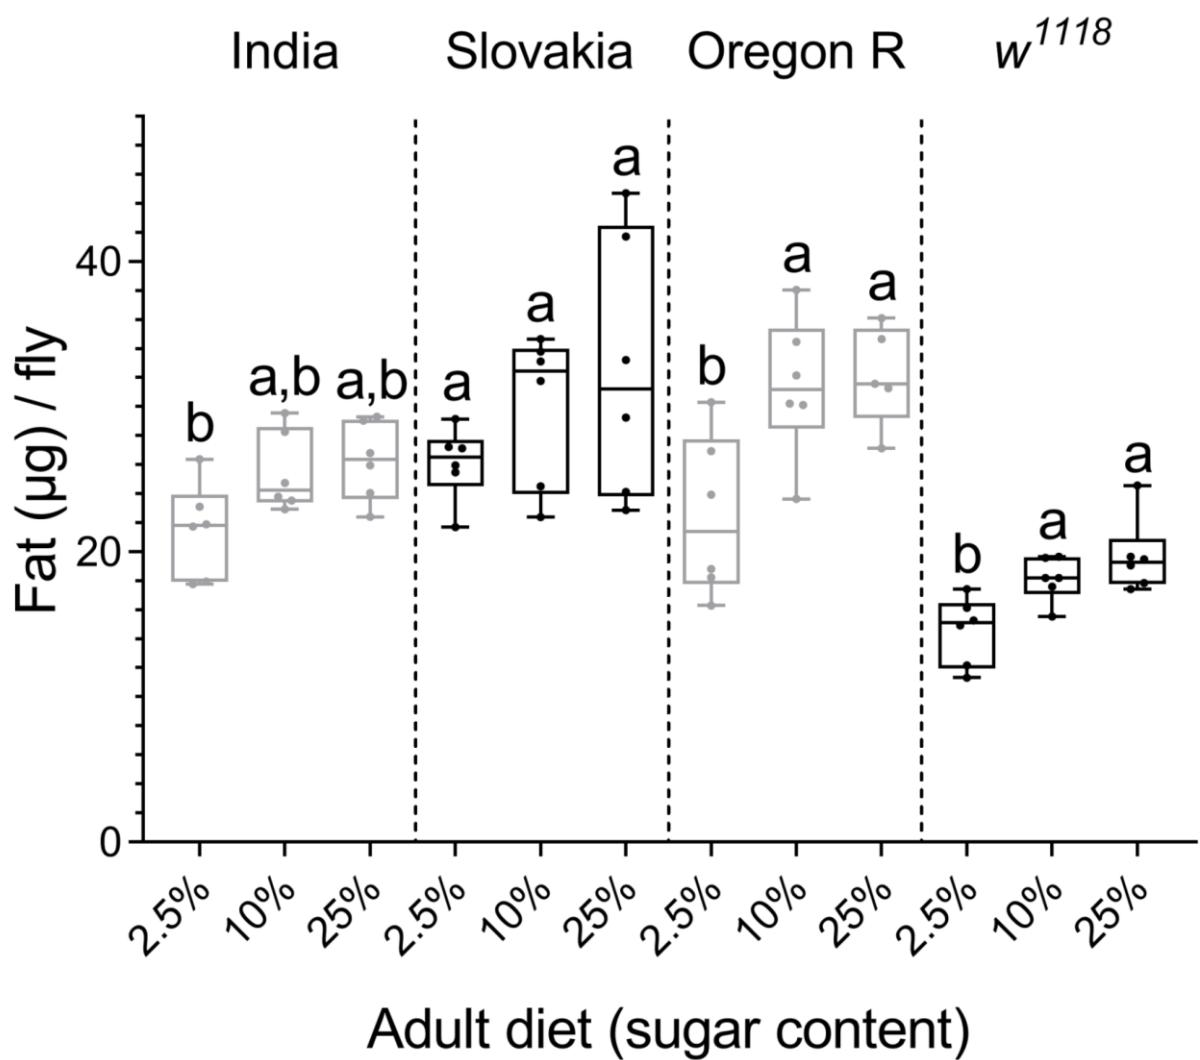

**The influence of developmental diet on reproduction and metabolism in
*Drosophila***

**Peter Klepsatel, Diana Knoblochová, Thirnahalli Nagaraj Girish, Heinrich Dircksen
and Martina Gáliková**

Supporting Figure Legends

Figure S1. Intraspecific variation in the effect of sugar in the adult diet on the amount of fat in 10 day-old males. Data for each population/strain were analysed by one-way ANOVA followed by Tukey's HSD test ($\alpha = 0.05$). Plots marked with different letters are significantly different from each other. Box plots depict minimum, first quartile, median, third quartile, and maximum value. For details, see Material and methods.

Figure S1

Supplementary Tables

Table S1. The results of ANOVA for the effect of population, the yeast content in the developmental and the adult diet, and their interactions on early fecundity, egg-to-adult viability, early fecundity standardised for body size, and early fecundity per ovariole. *df* - degrees of freedom; SSQ - the sum of squares for each source of variation.
