Supplementary Materials for

Synthetic lethality by targeting the RUVBL1/2-TTT complex in mTORC1-hyperactive cancer cells

Seung Ho Shin, Ji Su Lee, Jia-Min Zhang, Sungbin Choi, Zarko V. Boskovic, Ran Zhao, Mengqiu Song, Rui Wang, Jie Tian, Mee-Hyun Lee, Jae Hwan Kim, Minju Jeong, Jung Hyun Lee, Michael Petukhov, Sam W. Lee, Sang Gyun Kim, Lee Zou, Sanguine Byun*

This PDF file includes:

Figs. S1 to S10

Table S1

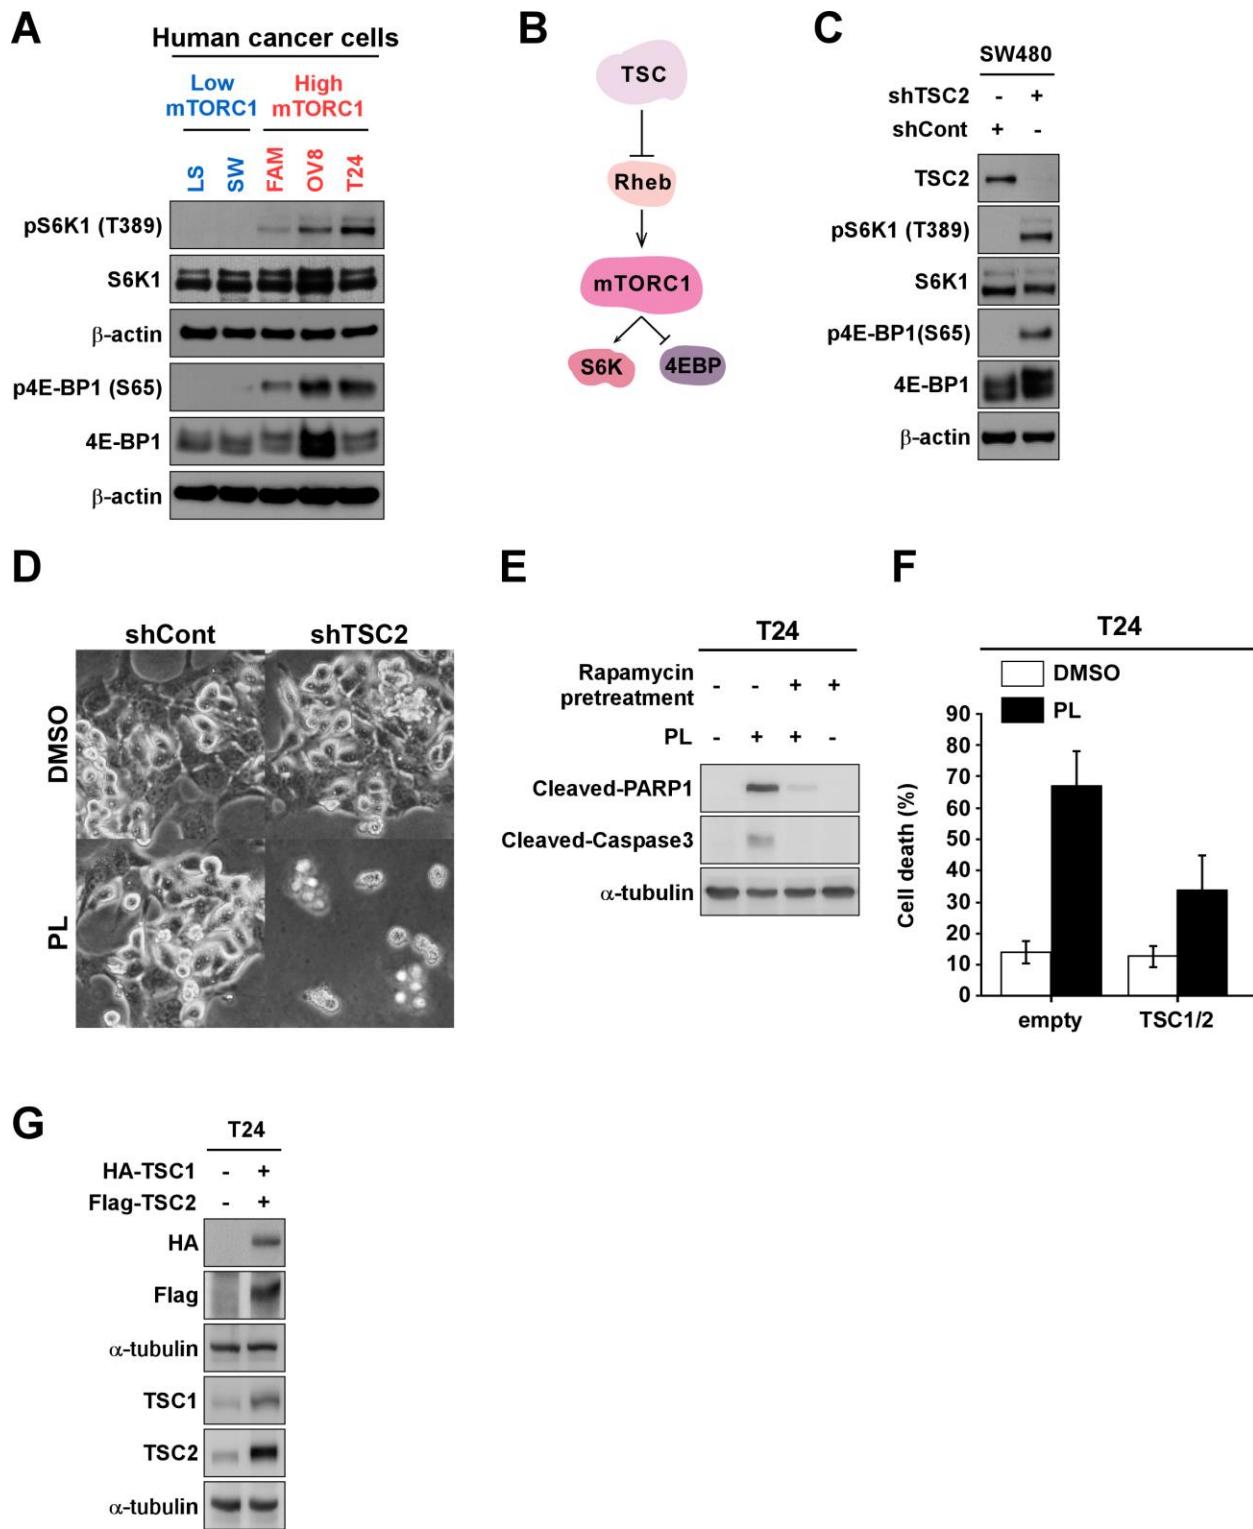

Fig. S1. mTORC1 activity in various cells and effect of PL on cell viability depending on mTORC1 activity. (A) Human cancer cells with varying degree of mTORC1 activity. Human cancer cells with low-mTORC1 activity (LS, LS174T; SW, SW480) and high-mTORC1 activity (FAM, FAMPAC; OV8, OVCAR-8; T24) are shown. (B) The TSC complex is a key negative regulator of mTORC1 signaling

through the deactivation of Rheb, an indispensable factor for mTORC1 activation. When activated, mTORC1 phosphorylates S6K1 and 4E-BP1. **(C)** Knockdown of TSC2 in SW480 cells increases mTORC1 activity. **(D)** Effect of PL on SW480 shControl and SW480 shTSC2 cell viability. SW480 shControl and SW480 shTSC2 cells were treated with PL (10 μ M) for cell death measurement. Representative pictures were taken before measurement of cell death. **(E)** Pretreatment of rapamycin (16 hr) blocks PL-induced apoptosis markers. **(F)** Effect of PL on TSC1/2-overexpressed T24 cell viability. 48 hr after TSC1/2 transfection to T24 cells, PL (10 μ M) was treated for cell death measurement. **(G)** Overexpression of TSC1/2 was confirmed by immunoblotting.

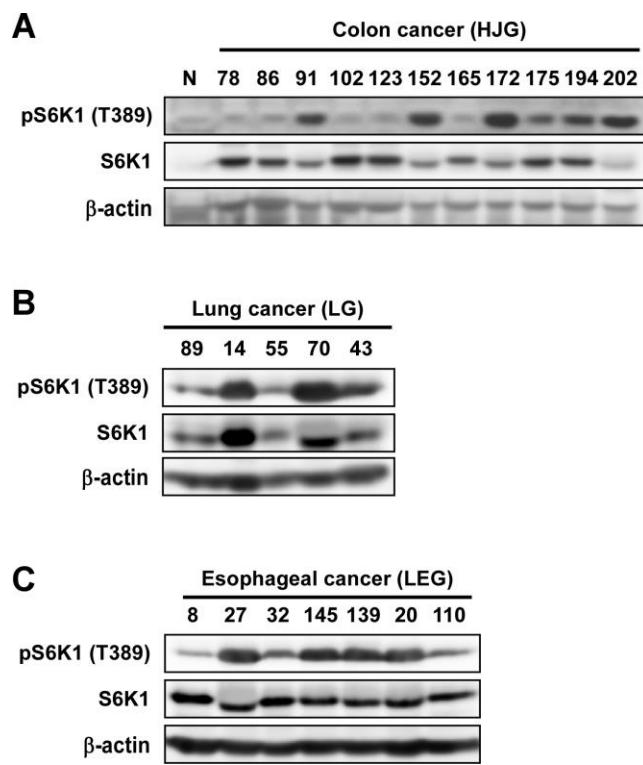

Fig. S2. Analysis of p70S6K1 phosphorylation levels in patient-derived tumor tissues. p-p70S6K1 and p70S6K1 levels of (A) colon, (B) lung and (C) esophageal cancer PDX tumors were measured by immunoblotting.

Fig. S3. Mass spectrometry analysis on biotin-PL pull down. 'A' indicates peptide counts for biotin-PL group and 'B' indicates peptides counts for free PL + biotin-PL group. Among candidates with unique peptide counts higher than 5 in the biotin-PL group, proteins that were reduced 40% or more after free PL competition were selected.

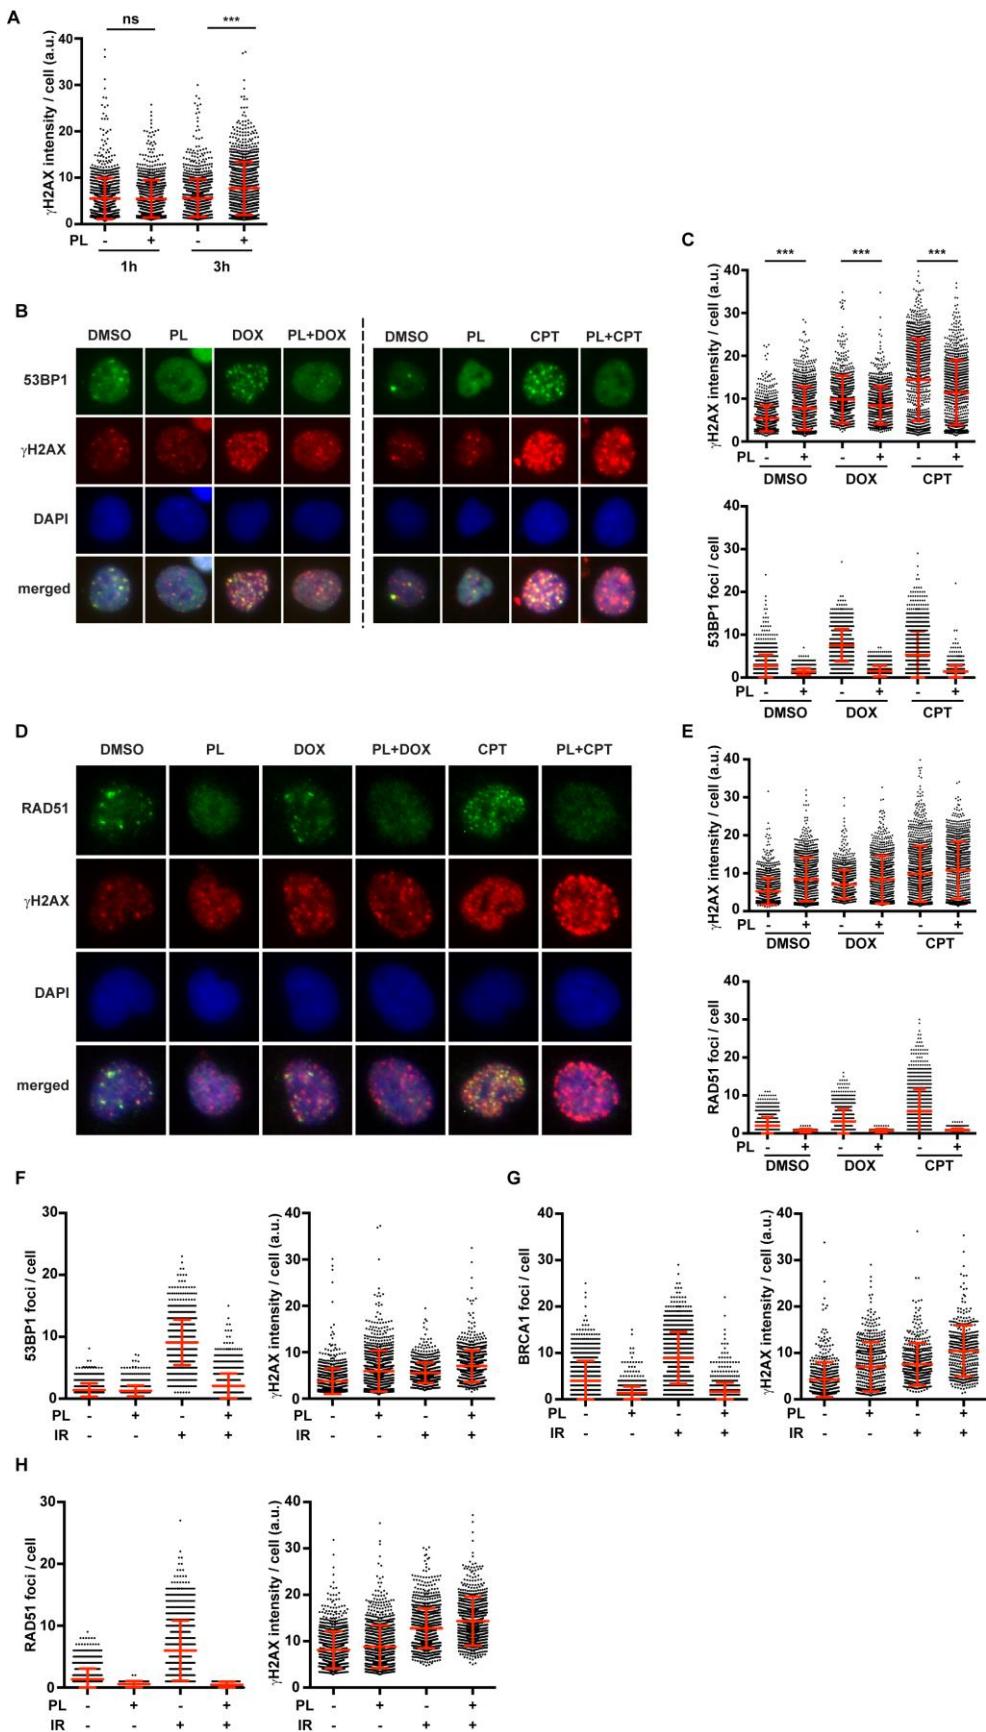

Fig. S4. PL suppresses DNA damage responses. (A) PL was incubated with the cells for 1h or 3h. (B) Representative images showing PL inhibits the foci formation of 53BP1 triggered by endogenous or exogenous DNA damages. The cells are pretreated with PL for 2hr before the addition of DOX (2 μ M) or CPT (1 μ M) for 1hr. The signal of γ H2AX and 53BP1 are monitored by immunofluorescence. Note: CPT majorly induces 53BP1 foci at G1 phase cells. The representative images of CPT-induced foci in G1 phase cells are selectively shown. (C) The intensity of γ H2AX and 53BP1 in cells from fig. S4B was measured, with each cell plotted individually. Mean \pm S.D. is shown. n = 1,000 cells for each condition. (D) Representative images showing PL inhibits the foci formation of RAD51 triggered by endogenous or exogenous DNA damages. The cells are pretreated with PL for 1hr before the addition of DOX (0.1 μ M) or CPT (0.05 μ M) for 3hr. The signal of γ H2AX and RAD51 are monitored by immunofluorescence. (E) The intensity of γ H2AX and RAD51 in cells from fig. S4D was measured, with each cell plotted individually. Mean \pm S.D. is shown. n = 1,000 cells for each condition. (F-H) The intensity of γ H2AX, 53BP1, BRCA1, and RAD51 in cells from Fig. 3F was measured and plotted individually. Mean \pm S.D. is shown. n = 1,000 cells for each condition. ns: not significant and *** p < 0.001, (unpaired Student's t test).

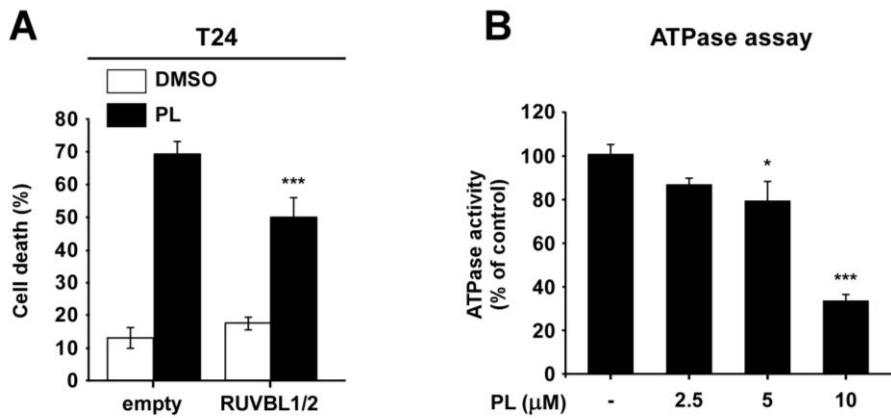

Fig. S5. PL targets the RUVBL1/2-TTT complex. (A) RUVBL1/2 overexpression reduces PL-mediated cell death. 48 hr after RUVBL1/2 transfection in T24 cells, PL (10 μ M) was treated for cell death measurement. (B) The effect of PL on RUVBL1/2 ATPase activity. PL was added to RUVBL1/2 and ATPase activity was measured (*, $p < 0.05$; ***, $p < 0.001$, significant difference between PL treated and DMSO treated control).

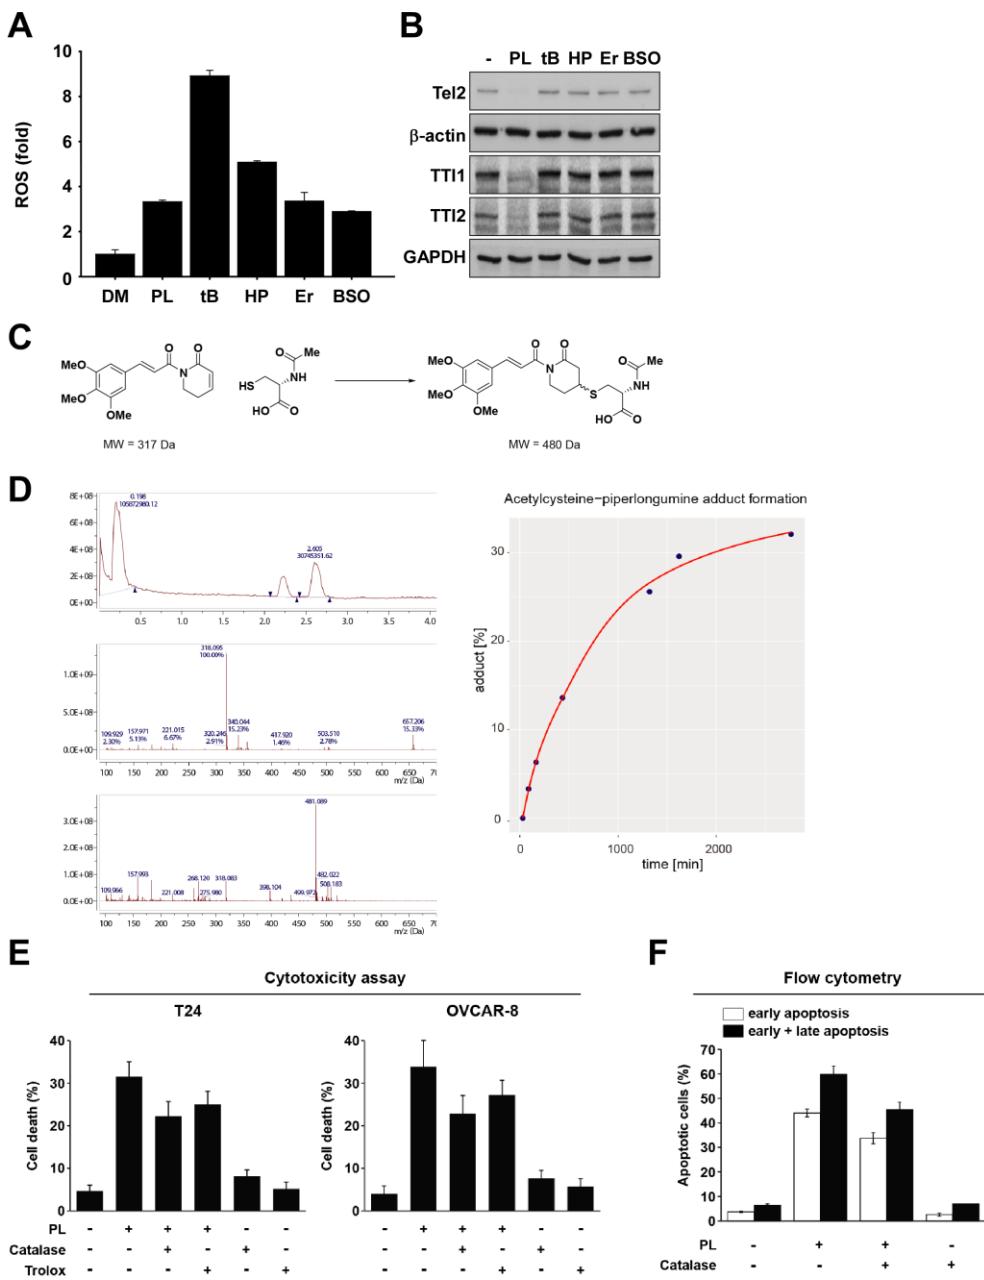

Fig. S6. PL-mediated inhibition of the RUVBL1/2-TTT signaling is ROS-independent. (A) ROS was measured 4 hours after various ROS inducers were treated to OVCAR-8 cells. tB, tert-butyl hydroperoxide; HP, hydrogen peroxide; Er, erastin; BSO, L-buthionine-sulfoximine. (B) Immunoblot was used to examine expression of Tel2, TTI1, and TTI2 after treating various ROS inducers for 6 hours. (C) N-acetylcysteine-PL adduct formation. (D) Peaks corresponding to PL at mass of 318.095 and to adduct at 481.089 were identified. The percent adduct formation was calculated. (E) Catalase (2000 U/ml) and Trolox (750 µM) were pretreated for 1 hr before PL (10 µM) was added. Cell death was measured 24 hr after PL treatment. (F) Catalase was pretreated for 1 hr before PL treatment in OVCAR-8 cells. Early apoptosis was measured using the Annexin V-only-positive population, and late apoptosis was measured using the Annexin V and propidium iodide-positive populations.

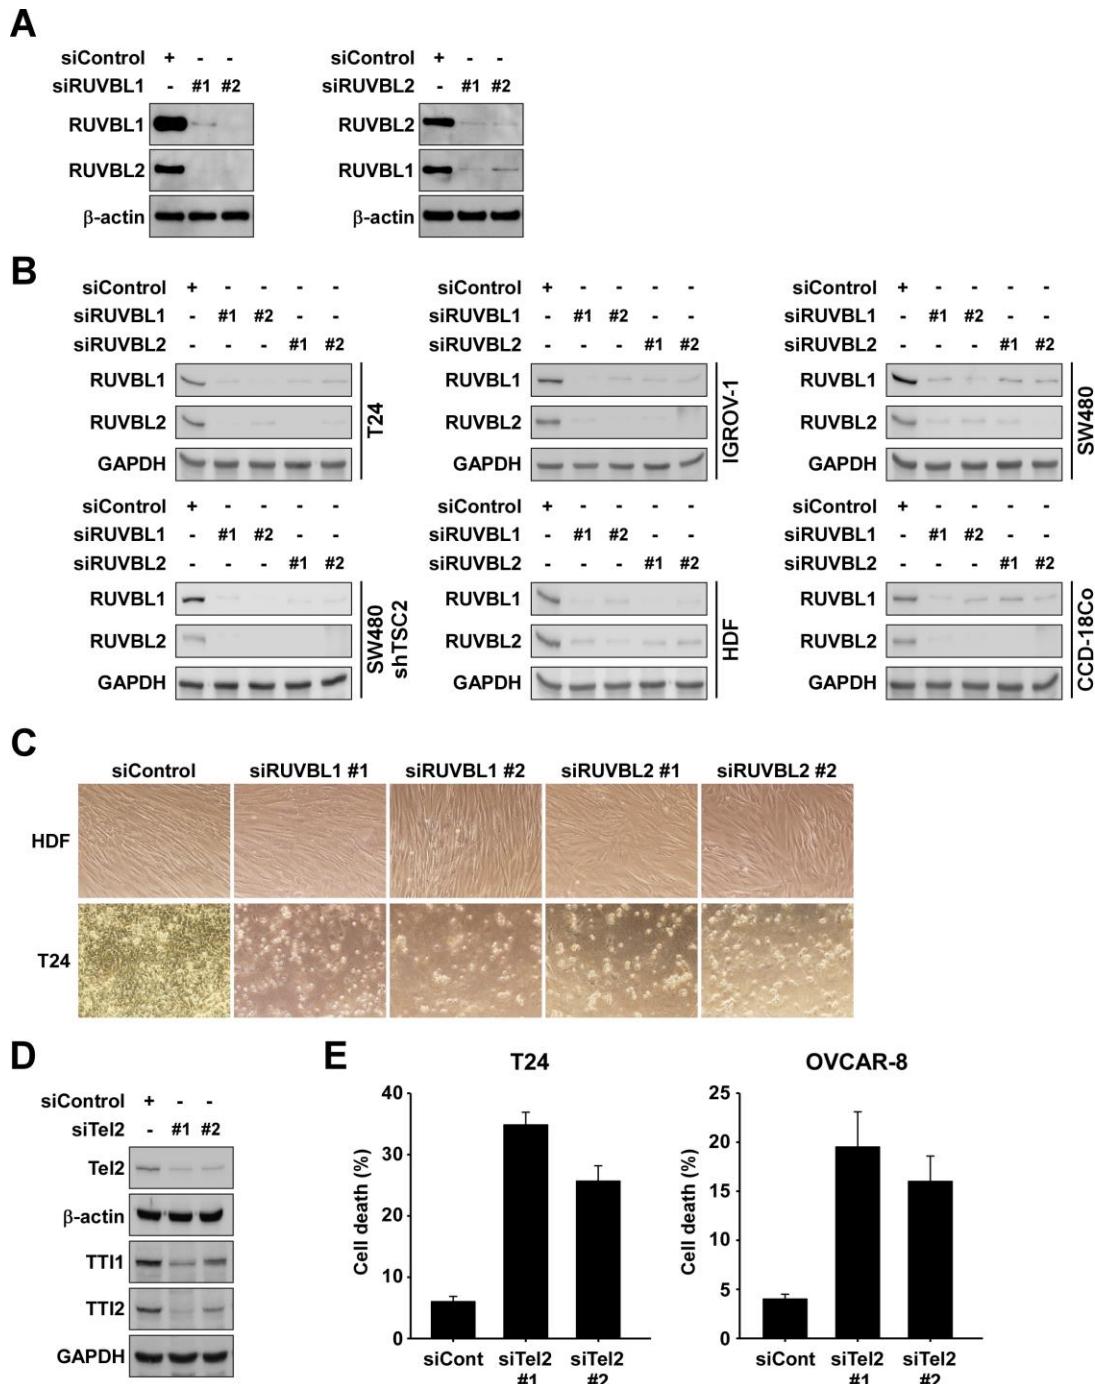

Fig. S7. Effect of RUVBL1/2 and Tel2 knockdown. (A-B) Knockdown of RUVBL1 and RUVBL2 was confirmed by immunoblot in OVCAR-8 cells (A), T24, IGROV-1, SW480, SW480-shTSC2, HDF and CCD-18Co cells (B). (C) Representative pictures of HDF (normal) and T24 (high-mTORC1 cancer) cells after RUVBL1/2 knockdown shows differential effect on viability. Pictures were taken 6 days (HDF) or 5 days (T24) after siRUVBL1/2 transfection. (D) Expression levels of TTT proteins after Tel2 knockdown were examined by immunoblot in T24 cells. (E) Cell death was measured 5 days after siTel2 transfection in T24 and OVCAR-8 cancer cells.

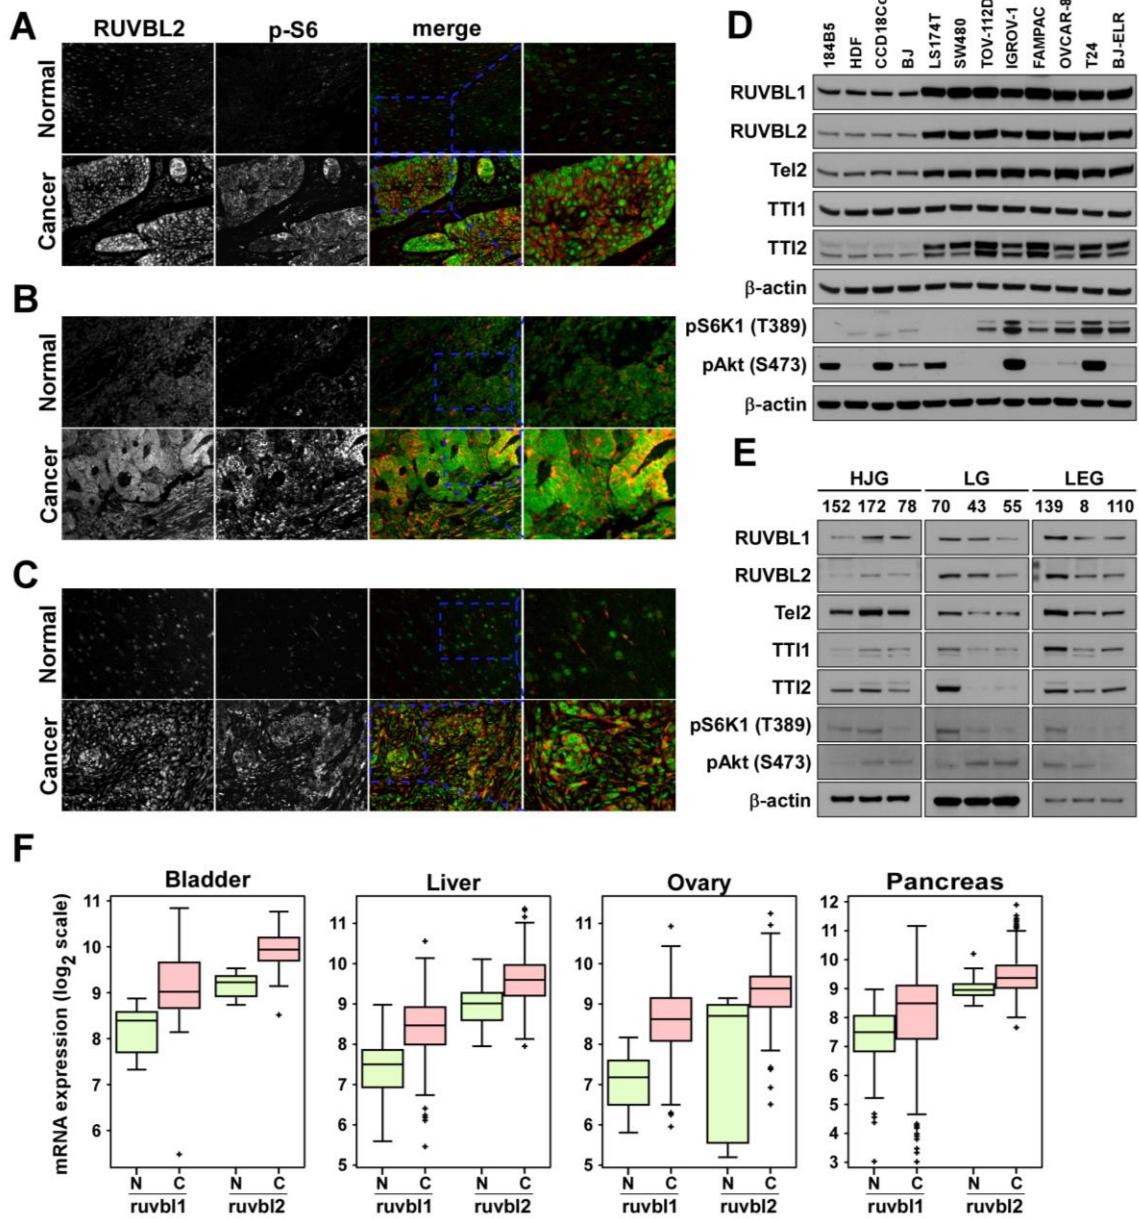

Fig. S8. Expression of RUVBL1/2-TTT complex components. Pictures of RUVBL2 (green) and phospho-S6 (red) staining from (A) esophagus cancer and its corresponding normal tissue, (B) lymph node cancer and its corresponding normal tissue, and (C) invasive squamous cell carcinoma of the skin and its corresponding normal tissue. Higher magnification of the merged picture is shown in the last panel. (D) Various cell lines were examined for RUVBL1/2, Tel2, TTI1, TTI2, p-p70S6K1, and p-Akt expression using the corresponding antibody. (E) Patient-derived primary tumors were analyzed for RUVBL1/2, Tel2, TTI1, TTI2, p-p70S6K1, and p-Akt expression using the corresponding antibody. (F) mRNA levels of ruvbl1 and ruvbl2 in human samples. Gene expression in 883 tumor and normal human tissue samples from three data sets (Gene Expression Omnibus, ArrayExpress, and Expression Project for Oncology) were analyzed using GENT. N, normal; C, cancer. All comparisons between normal and cancer: $p < 0.002$.

Fig. S9. Human tissue array information.

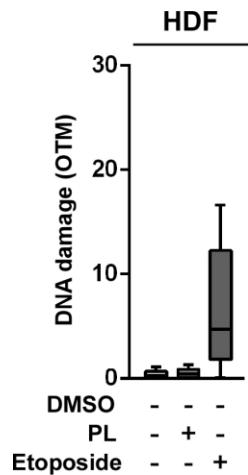

Fig. S10. Effect of PL and etoposide on DNA damage in human dermal fibroblasts (HDF). Cells were treated with PL (10 μ M) or etoposide (40 μ M) for 14 hours and collected for DNA damage measurement using comet assay. DNA damage was quantified based on the Olive Tail Movement (OTM) value, automatically calculated using a computer program, CometScore.

Table S1. Screening results for selective cytotoxicity in SW480 shTSC2 (KD) and SW480 shControl (WT) cells.

Compound	KD-WT (RFU)
Piperlongumine	21.466
ABT-199	20.9765
Ivermectin	20.5855
