Table of contents

Inclusion criteria for HM sample donors	S-2
Table S1. Characteristics of the analyzed milk samples.	S-2
Figure S1. The fragmentation pattern for PIs, PSs and ether analogues of TGs and PEs	S-4
Table S2. List of the identified lipids included in the batch targeted extraction.	S-5
Figure S2. The total ion chromatograms (TICs) of the lipid extracts of the FM and HM	S-11
Table S3. The % relative amount of lipid species within specific class of lipids in colostrum samples	S-12
Table S4. The % relative amount of lipid species within specific class of lipids in HM samples collected between 0 and 6 months	S-14
Table S5. The % relative amount of lipid species within specific class of lipids in HM samples collected between 6 and 12 months.	S-16
Table S6. The % relative amount of lipid species within specific class of lipids in HM samples collected after 12 months.	S-19
Table S7. The % relative amount of lipid species within specific class of lipids in FM samples	S-22
Table S8. The complete list of statistically significantly different between the colostrum and further lactation stage samples accordingly to the ANOVA unequal variance test	S-26
Table S9. Lipids statistically significantly different between the colostrum and further lactation stage HM samples accordingly to the Mann-Whitney test unpaired.	S-32
Table S10. The complete list of statistically significantly different lipids between the samples of caprine whole milk-based FM and FM supplemented with soy lecithin accordingly to the Mann-Whitney test unpaired.	S-35
Table S11. Lipids indicating a statistically significant ($p < 0.01$) difference between HM and FM samples in the different lactation stages and age range targets.	S-38
Figure S3. Clustering shown as a heatmap for the top 80 TGs indicated in the test t.	S-46
Figure S4. Clustering shown as a heatmap for the PCs detected in HM and/or FM samples.	S-47
Figure S5. Clustering shown as a heatmap for the SMs detected in HM and/or FM samples.	S-47
Figure S 6. Clustering shown as a heatmap for the PEs, PIs and PSs detected in HM and/or FM samples.	S-48
Figure S7. The MS/MS spectra and FA distribution of the TG 50:2 detected in HM and FM samples.	S-49

Inclusion criteria for HM sample donors

Women and their children participating in the study had to meet the inclusion criteria:

- mothers of singleton infants breastfeeding exclusively/fully lactating for the first 6 months,
- breastfeeding mothers of singleton infants at age 6 months or higher (complementary foods starting at 6 months was permitted for all infants as per American Academy of Pediatrics (AAP) guidelines and World Health Organization recommendations as long as their sole milk source was maternal breast milk up to the age of 1 year,
- infants had to be ≥ 35 weeks' gestation and in good general health at the time of enrollment.

Subject exclusion criteria included:

- mothers diagnose: preexisting type I or II diabetes, hypertension, parathyroid disease, and uncontrolled thyroid disease.
- twins or multiple births
- infants < 35 weeks' gestation; with a history of 72 hours in the NICU; any inborn error of metabolism; the history of congenital anomalies; or a history of consuming 10% of their diet as formula at the time of enrollment
- combined feeding at the time of enrollment (i.e., partially breastfeeding and formula-feeding their infants).

Table S2. Characteristics of the analyzed milk samples.

^a measured mass calculated based on m/z value of observed ions on MS spectrum, [M+H]⁺ for SMs, PCs, PEs, PSs, PIs, [M+NH₄]⁺ for TGs, [M+Na]⁺ for DGs and MGs. DG, diacylglycerol; MG, monoacylglycerol; PC, glycerophosphocholine; PC-O, ether analogue of glycerophosphocholine; PE, glycerophosphoethanolamine; PE-O, ether analogue of glycerophosphoethanolamine; PS, glycerophosphoserine, PI, glycerophosphoinositol; SM, sphingomyelin; TG, triacylglycerol; TGO, ether analogue of triacylglycerol.

Figure S2. The total ion chromatograms (TICs) of the lipid extracts of the FM 4.2 (a), FM 3.1 (b), mature HM – W.13.3 (c), and colostrum HM – W.24.0 (d) samples analysed using RP-LC-Q-TOF-MS in the positive ionisation mode. Number corresponds to the identified lipids based on m/z value and interpretation of MS/MS spectra. DG, diacylglycerol; MG, monoacylglycerol; PC, glycerophosphocholine; PC-O, ether analogue of glycerophosphocholine; PE, glycerophosphoethanolamine; PE-O, ether analogue of glycerophosphoethanolamine; PS, glycerophosphoserine, PI, glycerophosphoinositol; SM, sphingomyelin; TG, triacylglycerol; TGO, ether analogue of triacylglycerol.

Table S3. The % relative amount of lipid species within specific class of lipids in colostrum samples. The average value calculated for extraction duplicates is shown. The empty space indicate that lipid specie was below the specified threshold (% contribution within class was lower than 1%, this include not detected species)

^aNegative fold change value value means higher peak area in colostrum samples than in mature HM samples, positive fold change value means higher peak area in mature HM samples than in the colostrum samples; ns, not statistically significant; DG, diacylglycerol; MG, monoacylglycerol; PC, glycerophosphocholine; PC-O, ether analogue of glycerophosphocholine; PE, glycerophosphoethanolamine; PE-O, ether analogue of glycerophosphoethanolamine; PS, glycerophosphoserine, PI, glycerophosphoinositol; SM, sphingomyelin; TG, triacylglycerol; TGO, ether analogue of triacylglycerol.

Table S9. The complete list of lipids statistically significantly different between the colostrum and further lactation stage HM samples (Mann-Whitney test, $p < 0.01$, multiple testing correction: Benjamini-Hochberg colostrum vs mature HM (lactation stage other than colostrum)).

Compound	p (HM colostrum vs mature HM)	p (Corr) (HM colostrum vs mature HM)	Average peak area fold change colostrum (n=11) vs mature HM (n=34)

nd, not detected; ns, not statistically significant; blank space correspond to the not statistically significant different lipids; ^anegative fold change value value means higher peak area in the FM samples than in the HM samples, positive fold change value means higher peak area in the HM samples than in the FM samples. DG, diacylglycerol PC, glycerophosphocholine; PC-O, ether analogue of glycerophosphocholine; PE, glycerophosphoethanolamine; PE-O, ether analogue of glycerophosphoethanolamine; PS, glycerophosphoserine, PI, glycerophosphoinositol; SM, sphingomyelin; TG, triacylglycerol; TGO, ether analogue of triacylglycerol.

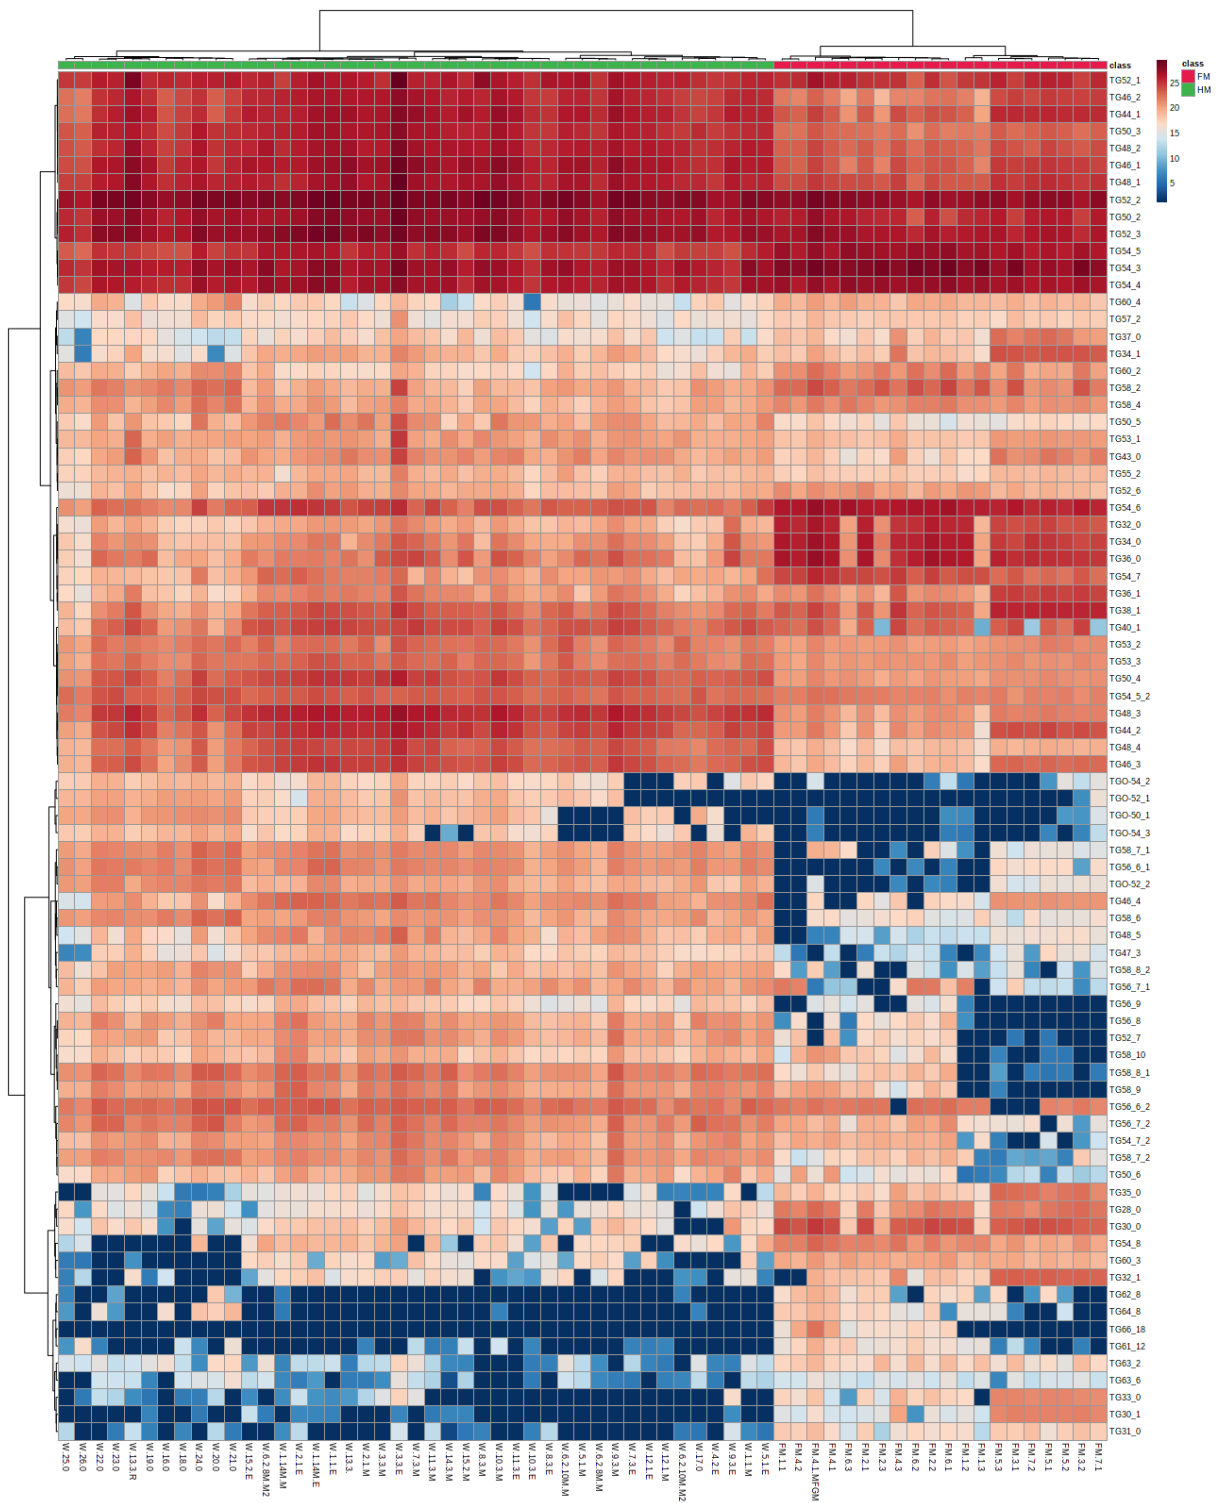

Figure S3. Clustering shown as a heatmap (distance measured using the Euclidean algorithm, and the clustering algorithm using Ward's method, for the top 80 TGs indicated in the Mann-Whitney test unpaired).

Figure S4. Clustering shown as a heatmap (distance measured using the Euclidean algorithm, and the clustering algorithm using Ward's method for the PCs detected in HM and/or FM samples.

Figure S5. Clustering shown as a heatmap (distance measured using the Euclidean algorithm, and the clustering algorithm using Ward's method for the SMs detected in HM and/or FM samples.

Figure S6. Clustering shown as a heatmap (distance measured using the Euclidean algorithm, and the clustering algorithm using Ward's method for the PEs, PIs and PSs detected in HM and/or FM samples.

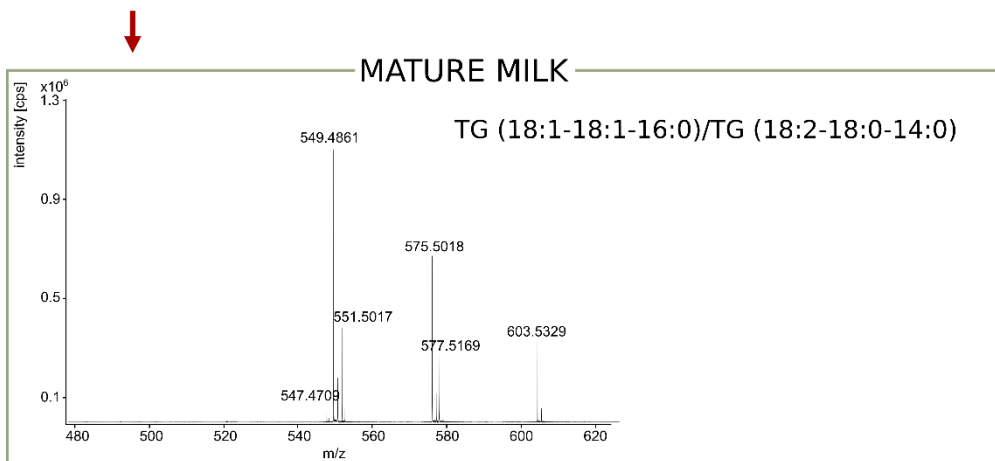

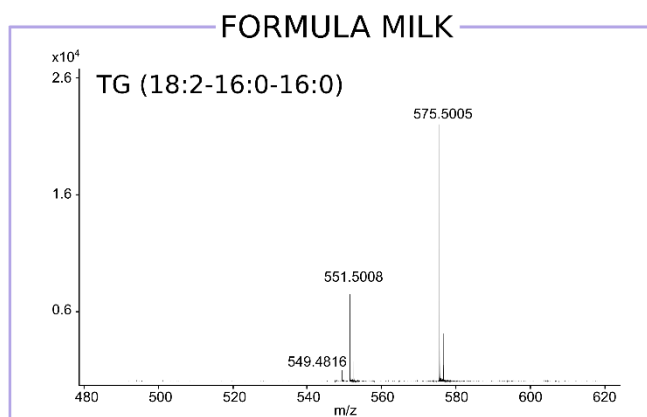

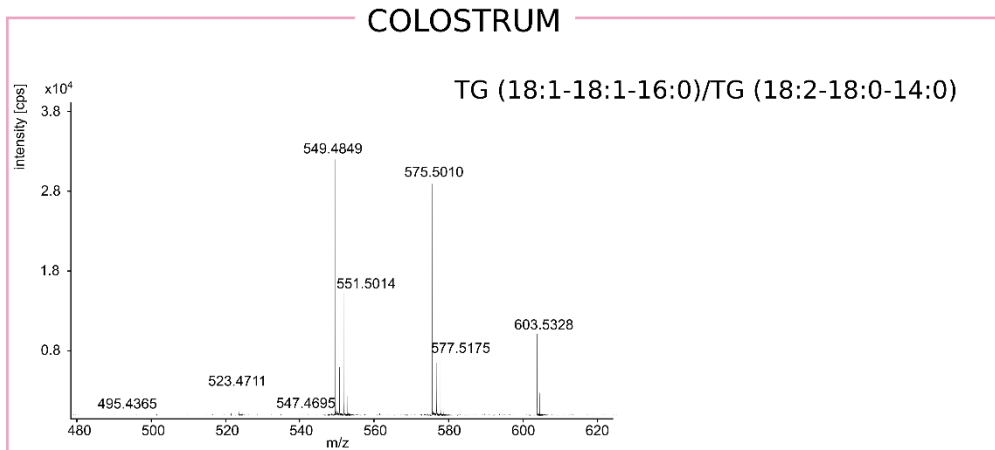

Figure S7. The MS/MS spectra and fatty acyl substituents distribution of the TG50:2 detected in HM and FM samples. TG, triacylglycerol.
