

Figure 1. Preference tests (Mean \pm SE) of insects between two healthy plants (HP). Each test was performed by releasing 20 viruliferous (I+) or non-viruliferous (I-) insects and observed after 60 min. Pie charts denote the proportion of responding (purple) versus non-responding individuals (orange). n: number of replicates; NS = not significant at $\alpha = 0.05$.

Table 1. Headspace volatile compounds of tobacco and wheat (mean \pm SEM) in nanograms per g of fresh plant, sampled over 24 h from healthy plants (HP), virus-infected plants (i.e., tobacco infected by PLRV (VP-1) and wheat infected by BYDV (VP-2)) and endophytic entomopathogenic inoculated plants comprising *Metharizium acridum* inoculated plants (MP) and *Beauveria bassiana* inoculated plants (BP). Values with different letters within each plant model in the same raw are significantly different to each other ($p < 0.05$).

Table 2. Summary of pairwise comparisons of volatile profiles between different treatments for tobacco and wheat models. HP: healthy plants, VP: virus-infected plants (comprising tobacco infected by PLRV (VP-1) and wheat infected by BYDV (VP-2)), MP: *Metharizium acridum* inoculated plants (MP) and BP: *Beauveria bassiana* inoculated plants. “*” and “ns” for $p \leq 0.05$ and not significant at $\alpha = 0.05$, respectively.

	Tobacco			Wheat		
	F	p-adjusted		F	p-adjusted	
HP vs VP	4.75	0.036	*	3.86	0.108	ns
HP vs MP	10.87	0.048	*	11.26	0.078	ns
HP vs BP	5.88	0.042	*	17.84	0.030	*
VP vs MP	7.56	0.060	ns	7.67	0.030	*
VP vs BP	8.03	0.048	*	19.99	0.036	*
BP vs MP	9.11	0.072	ns	22.90	0.030	*
