

Supplementary Material

Table S1. Overview of sampling locations

Table S2. Mapping and coverage statistics for all samples.

Table S3. Correlations between F_{ST} , d_{XY} and π for different window sizes (10kb, 20kb, 50kb, 100kb and 200kb).

Table S4. Parameter estimates and likelihood scores for different demographic models simulated using DADI. The most likely model is highlighted in grey.

Table S5. Bootstrap analyses of the most likely demographic model. Parameters (with 95% confidence intervals) converted to absolute numbers.

Table S6. Gene content of the top 1% high F_{ST} -windows.

Figure S1. *ADMIXTURE* and PCA plots for different filtering settings.

Figure S2. *ADMIXTURE* plots for $K = 2$ to $K = 4$. The distribution of cross-validation errors indicates that $K = 1$ is the best configuration.

Figure S3. The genomic landscape of Taiga and Tundra Bean Goose for relative divergence (F_{ST}), absolute divergence (d_{XY}) and nucleotide diversity (π) aligned to chicken chromosomes. The colors in the nucleotide diversity tracks correspond to the Taiga (blue) and the Tundra Bean Goose (red).

Figure S4. Demographic scenarios with and without population expansions and their likelihood scores that were tested with DADI. The most likely model concerns isolation with recent asymmetrical gene flow without any population expansions (log likelihood = -31,804).

Table S1. Information about sampling locations for all goose specimens in this study. Species identity of Finnish samples based on mitochondrial DNA sequencing, other samples based on morphology.

Final Results							
	Coalescent Units (95 % CI)		Absolute Units (95% CI) ¹				
N (<i>A. fabalis</i>)	1.3 (1.2 – 1.4)		120,508 (110,954 – 130,061) individuals				
N (<i>A. serrirostris</i>)	0.68 (0.61 – 0.75)		62,855 (56,102 – 69,608) individuals				
Ts	14.35 (13.32 – 15.38)		2,660,798 (2,470,104 – 2,851,492) years				
Tm	0.31 (0.26 – 0.37)		58,285 (48,651 – 67,918) years				
m(F → S)	2.51 (2.25 – 2.76)		0.0000121 (0.0000014 - 0.0000149)				
m(S → F)	13.27 (12.07 – 14.48)		0.0000651 (0.0000651 - 0.0000781)				

¹ Absolute units were calculated using the following formulas and numbers:

$\Theta = 200\ 197$ (theta, output from DADI-analyses)

$\mu = 1e10-9$ (mutation rate)

$L = 539\ 793\ 400$ (length of sequence)

$N = \Theta / (4 * \mu * L)$

N (*A. fabalis*) = $N1 * N$

N (*A. serrirostris*) = $N2 * N$

$Ts = Ts * N$

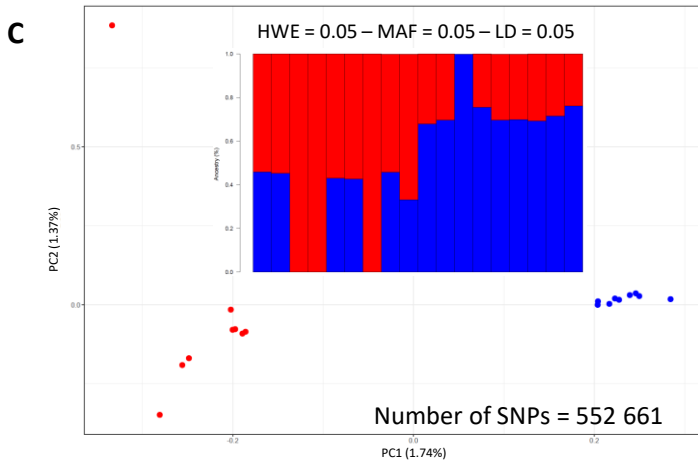

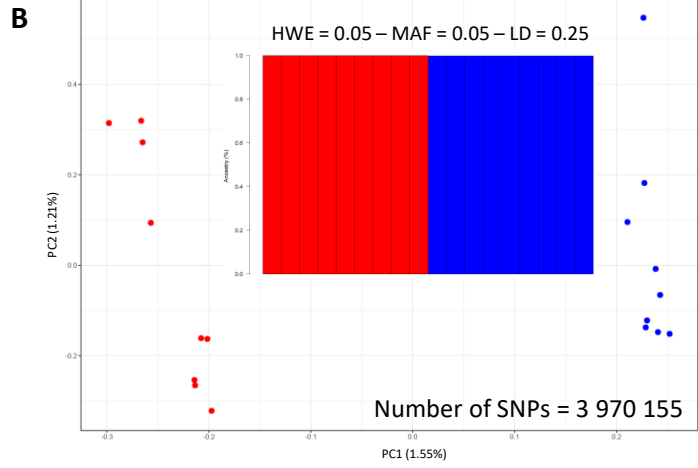

$Tm = Tm * N$

$m(S \rightarrow F) = m12 / 2N$

$m(F \rightarrow S) = m21 / 2N$

Table S6. List of candidate genes in the top 1% F_{ST} -windows.

Candidate Gene	Putative function (based on Uniprot)
POLB	DNA repair
VDAC3	Channel for diffusion of small hydrophilic molecules
ANK1	Cytoskeleton organization
NKX6-3	Transcription factor (central nervous system?)
AGPAT6	Involved in several metabolic processes
KCNU1	Testis-specific potassium channel
UNC5D	Neuron differentiation
DUSP26	Phosphorylation of proteins
RNF122	May induce necrosis and apoptosis
TTI2	Regulator of the DNA damage response
MAK16	RNA-binding
SLC18A1	Neurotransmitter transport
ATP6V1B2	ATP-binding
LZTS1	Regulation of cell growth
GFRA2	Receptor for neurturin
PBDC1	Unknown function
GLI1	Transcriptional activator in development
STAC3	Muscle function
