Supplementary Figure 1. Validation of TM cells with dexamethasone induced myocilin expression.

Primary hTM cells were cultured in the absence or presence of 100 nM dexamethasone (Dex) for 3 days following which mRNA was isolated, qPCR performed to document expression of *MYOC*. Data are mean \pm standard deviation from 3 technical replicates for all 4 donor strains. *** $p < 0.001$, t-test compared with control (EtOH).
