IMPACT/DISCUSSION: Uninsured patients are far more likely than those with insurance to defer healthcare or go without it all together. The consequences can be severe, particularly when preventable conditions go unnoticed. Primary care interventions serve as a principal point of contact for patients and have been shown to reduce emergency department visits. Primary care follow up was essential to re-consider the cause of his two months of left leg symptoms not responding to conservative therapy. Additional cervical imaging led to an understanding that his leg symptoms originated Friday from expansion of his cervical spinal stenosis.

Cervical spondylotic myelopathy is an important cause of weakness in the lower extremities. Diagnosis requires correlation between history, physical exam and imaging. Some patients experience prolonged periods of stability while other patients can experience abrupt worsening often following minor neck injuries. Acute myelopathy is a neurologic emergency, requiring immediate neuroimaging and prompt neurosurgical consult. Delayed diagnosis can lead to harm.

CONCLUSION: A primary care intervention for this uninsured patient helped identify and treat a potentially fatal neurologic condition.

Cervical spondylotic myelopathy is an important cause of weakness in the lower extremity, and early identification and treatment may prevent harm.

PANHYPOPITUITARISM: ARE WE MISSING IT? A 'CENTRAL' PROBLEM IN METASTATIC MELANOMA: IMMUNOTHERAPY INDUCED HYPOPHYSITIS

Padmini Giri[1,2]; Laith Al-Janabi[1]; Verisha Khanam[1]; Sourabh Fnu[1]; Ameer H. Khan[1]; Ankita Gandhi[2]; Manishkumar Patel[3]. [1]Internal Medicine, Wayne State University/School of Medicine, Rochester Hills, MI; [2]Internal medcine, Wayne state university, Rochest hills, MI; [3]Internal Medicine, Wayne State University, Rochester Hills, MI. (Control ID #3369691)

LEARNING OBJECTIVE #1: Uncommon causes for hypopituitarism include medications. One example includes Nivolumab, an immune-checkpoint-inhibitor, targeting the PD-1-protein, causing downregulation of T-cell response and increasing antitumor activity by immune-system.

LEARNING OBJECTIVE #2: Although considerable clinical benefits have been established by the use of these therapies, they are also linked with a broad spectrum of dangerous side-effects including immune-related-adverse-events due to increased activation of the immune system. These immune-related-adverse- effects can vary from mild to severe and can be seen in the form of gastrointestinal, dermatological, endocrine features, and much more.

CASE: 51-year-old Caucasian female with metastatic melanoma receiving Nivolumab (8 sessions complete) presented with abdominal pain, fever, a generalized rash, diarrhea, lethargy, hypoxia with hypotension. She was admitted initially to floor and treated as sepsis and started on IV fluid and IV antibiotic. Persistent hypotension ensued, hence, transferred to ICU in Septic shock with no improvement of her BP after 7-liter fluid boluses; at the time viral source of infection was suspected. Because of blood test finding and possible rare side effect AM cortisol was ordered and showed 1.0 prolactin, TSH/T4 were low, suggesting panhypopituitarism. The patient's BP improved with just one dose of IV steroid. It was suspected that her chemotherapy treatment is the cause for these symptoms as the patient had a recent PET scan done which was only positive for spread to abdominal lymph-nodes and brain metastasis.

IMPACT/DISCUSSION: Nivolumab was recently approved by the FDA for unresectable-melanoma. Approval of newer medications/broaden use of such therapies although has many clinical benefits, can be associated with adverse effects, in patients who are already trying to fight a life-threatening ailment. Immune- mediated-events with Nivolumab accounts for $\leq$ 12% of adverse effects. Anti-PD-1-associated-hypophysitis is a sporadic phenomenon, occurring in <1% of patients in multiple studies. The presentation in which our patient presented was atypical. It is like a mind-block for healthcare-professionals when an immunosuppressed patient presents with septic shock, to automatically look for an underlying infection. Healthcare-professionals are unfamiliar with these rare consequences of these therapies. Healthcare professionals

are unfamiliar with these rare consequences of these therapies, nivolumab induced panhypopituitarism is rare with serious endocrinological/ hemodynamic penalties. It's critical for practitioners to be cognizant of these complications throughout the already tough journey of cancer-therapy.

CONCLUSION: Advances led to the development of effective treatments using newer immune response modifying agents. Increased frequency of immune-checkpoint-inhibitor use results in IRAEs. In addition the common disturbances, clinicians should recognize life-threatening complications, like ACTH-mediated adrenal insufficiency described in this case.

PARA-KNEE-OPLASTIC: AN UNUSUAL CAUSE FOR JOINT PAIN

Taylor Phillips[1]; Justin Nichols[2]; Matthew Burday[1]. [1]Internal Medicine, ChristianaCare, Newark, DE; [2]Medicine/Pediatrics Residency Program, Christiana Care Health System, Philadelphia, PA. (Control ID #3391947)

LEARNING OBJECTIVE #1: Recognize the association between hypertrophic pulmonary osteoarthropathy and malignancy.

LEARNING OBJECTIVE #2: Recognize the proper treatment strategy for patients suffering from hypertrophic pulmonary osteoarthropathy.

CASE: A 52 year old male construction worker presented to the hospital with complaints of low back pain, bilateral knee and ankle pain as well as subjective lower extremity weakness and instability. His past medical history was significant for hypertension, rheumatoid arthritis and ongoing tobacco use. One week prior he had been diagnosed in the emergency room as having an acute flare of his rheumatoid arthritis and was discharged with prednisone and NSAIDs. He stated that his symptoms initially improved on this regimen, but rapidly worsened upon completion of his medication course. Examination demonstrated tenderness to palpation in the knee and ankle joint spaces bilaterally as well as midline lumbar spinal tenderness. There were no appreciable deficits in strength. Reflexes and sensation were intact. Cardiac and lung exams were normal. Initial labs revealed an elevated ESR, normocytic anemia and hyponatremia. He was admitted to the hospital and treated with oxycodone and prednisone for pain management.

During the hospitalization there was a gradual worsening of his symptoms despite treatment. Further workup revealed a normal creatine phosphokinase and negative rheumatoid factor, cyclic citrullinated peptide and ANA. X-rays revealed scattered periosteal reactivity consistent with hypertrophic osteoarthropathy. Further workup for an underlying malignancy was performed, and a chest CT exhibited a mass in the right lower lobe. Biopsy of this mass revealed squamous cell carcinoma. The patient was transitioned off of prednisone and oxycodone and treatment with NSAIDs was started. He experienced rapid improvement in his symptoms and was discharged with NSAIDs and recommendations to follow up with an oncologist regarding further treatment.

IMPACT/DISCUSSION: Hypertrophic pulmonary osteoarthropathy (HPOA) is a paraneoplastic syndrome which has a 95% association with malignancy and is seen in 0.7-17% of patients with primary lung cancer. HPOA manifests as severe disabling arthralgia, digital clubbing and periostitis. HPOA is classically misdiagnosed as an inflammatory arthritis but has an encouraging response to NSAIDs and little response to opiates. Imaging remains the mainstay of diagnosis with x-rays revealing periostitis without evidence for cortical destruction or fracture. NSAIDs are the gold-standard for symptomatic relief, but resolution has only been seen with correction of the underlying malignancy.

CONCLUSION: Hypertrophic pulmonary osteoarthropathy is frequently misdiagnosed as an inflammatory arthritis but has a high association with underlying malignancy.

NSAIDs are the gold standard for symptomatic relief in patients with HPOA but definitive treatment can only be obtained through correction of the underlying pulmonary disease.

PARANEOPLASTIC LIMBIC ENCEPHALITIS AS THE PRIMARY PRESENTATION OF OCCULT LUNG MALIGNANCY

Talal A. Al-Mohamad, Shivam Thakur, David Bigley. Internal Medicine, Christiana Care Health System, Newark, DE. (Control ID #3391640)

LEARNING OBJECTIVE #1: Recognizing paraneoplastic limbic encephalitis and its strong association with lung cancer, along with the importance of CSF and serum antibody testing early on in patients with undifferentiated encephalopathy

CASE: Paraneoplastic neurological syndromes are a sequelae of malignancy that present with symptoms of limbic or brainstem origins. The presentation of these syndromes are often vague, making it a challenging diagnosis for the clinician.

Our case describes a 72-year-old female with a history of hypothyroidism and type 2 diabetes mellitus who presented with altered mental status (AMS). The patient's family noted she had a marked cognitive decline over the last month. Prior to admission she had been working full-time and living independently. Over a one- month period the patient's mentation had worsened to the point of her requiring assistance with basic ADLs. In the ED the patient was acutely confused, however, remained hemodynamically stable. CT head was negative for acute intracranial pathology, and CXR revealed multiple lung nodules with no focal consolidation. The patient was admitted for rapidly declining mentation of unknown etiology. In the patient's initial hospital course, an MRI brain showed T2/FLAIR hyperintensity in portions of the medial aspects of both temporal lobes including both hippocampi in a symmetric distribution representative of limbic encephalitis. The patient's mentation progressively worsened and she eventually required transfer to the ICU. There she was noted to be obtunded, a VBG showed a severe acidemia and she was intubated for acute hypercapnic respiratory failure. A lumbar puncture was unremarkable. A more extensive panel of infectious/autoimmune labs were sent and she was started on steroids. Eventually, lab testing came back overtly positive for anti-ANNA (HU-Ab) and anti-NMDA receptor-Ab with follow-up lung biopsy positive for small-cell lung cancer (SCLC) leading to a diagnosis of paraneoplastic limbic encephalitis (PLE).

IMPACT/DISCUSSION: Our case describes acute encephalopathy secondary to PLE as the primary presentation of SCLC. Paraneoplastic limbic encephalitis is a rarer cause of AMS that must be considered, especially if more common etiologies have been ruled out. Such patients should have paraneoplastic CSF and serum antibodies included as part of their workup. This is crucial even in the absence of known underlying malignancy, as many patients presenting with PLE have no known history of malignancy. Fifty percent of PLE cases are secondary to SCLC, 20% due to testicular malignancy, and 8% due to breast cancer.

CONCLUSION: The diagnosis of PLE and underlying malignancy allows for a more guided treatment plan. Delay in diagnosis can result in further neuronal damage and likely the use of inappropriate treatment modalities. Thus, positive antibody titers should guide the clinician towards a targeted evaluation of malignancy. Treatment options include treating the underlying malignancy, immune therapy, high-dose steroids, and plasmapheresis.

PAROXYSMAL COLD HEMOGLOBINURIA (PCH): AN ATYPICAL DIAGNOSIS OF AUTOIMMUNE HEMOLYTIC ANEMIA (AIHA)

Vanessa Peña[2]; Alaina C. Chodoff[1]; Rakhi Naik[3]. [1]General Internal Medicine, Johns Hopkins, Baltimore, MD; [2]Johns Hopkins School of Medicine, Baltimore, MD; [3]Hematology/Oncology, Johns Hopkins School of Medicine, Baltimore, MD. (Control ID #3391979)

LEARNING OBJECTIVE #1: Recognize PCH as a distinct autoimmune hemolytic anemia

LEARNING OBJECTIVE #2: Distinguish the defining clinical features that should prompt consideration of PCH

CASE: A 54-year-old man with a history of gastric bypass surgery was admitted to the hospital with jaundice and acute onset of dark-colored urine. A few days prior to presentation, he experienced fevers, chills and myalgias. Initial laboratory testing revealed the following: hemoglobin 9.9 g/dL, reticulocyte count 0.3%, platelets 129,000/ mm,^{3} WBC count 12,420/ mm^3, ferritin 41,291 ng/mL, total bilirubin 7.7 mg/dL, AST 153 U/L, ALT 23 U/L. Within a few hours of admission his hemoglobin decreased to 7.0 g/dL. Subsequent work-up revealed an elevated LDH and a low haptoglobin, consistent with hemolysis. A peripheral smear showed spherocytes, neutrophil rosetting, and neutrophil erythrophagocytosis; there were no schistocytes. The direct antiglobulin test (DAT) was positive for complement and negative for IgG. A cold agglutinin screen was negative. This constellation of findings was suggestive of a rare immune-mediated phenomenon known as Paroxysmal Cold Hemoglobinuria (PCH). PCH is confirmed by a diagnostic test known as the Donath- Landsteiner Test, which tests for the presence of a biphasic hemolysin, that returned positive.

An extensive infectious work-up to evaluate for bacterial, viral and fungal infections was unremarkable, including syphilis and tick-borne illness. Flow cytometry did not detect a monoclonal B-cell population or PNH clone. The patient remained on steroids. He improved with supportive care and avoidance of cold temperatures, supported objectively by a decreasing LDH and increase in reticulocytosis.

IMPACT/DISCUSSION: Autoimmune hemolytic anemia (AIHA) is generally subdivided into 4 major subtypes: warm, cold, mixed, and the exceptional PCH (<1%). While PCH is extremely rare in adults, it should be suspected when the DAT is positive for complement but negative for IgG and the cold agglutinin screen is negative. Neutrophil erythrophagocytosis on peripheral smear, while rarely seen, has a strong association with PCH; the diagnosis is confirmed using the Donath-Landsteiner antibody test. Syphilis was once the most common underlying cause, but since its decline, most cases of PCH are idiopathic, similar to this patient. Other underlying causes to consider include autoimmune disorders and hematologic malignancies, which are more likely to cause chronic or recurring PCH. PCH is typically a self-limiting diagnosis that is treated with supportive care and cold avoidance to prevent antibody binding and the activation of the complement cascade. Steroids are often started empirically, although multiple studies have shown they do not alter the course of PCH.

CONCLUSION: Diagnosis of PCH requires a high index of suspicion based on characteristic laboratory findings

DAT pattern, cold agglutinin screen, and peripheral smear are essential for differentiating between the 4 major AIHA subtypes

PATIENT WITH ALTERED MENTAL STATUS TWO WEEKS AFTER THE DIAGNOSIS OF HIV

Jinyuan Liu[1]; Florangel De Leon Rodriguez[1]; Edward Lee[1]; Dhruv Patel[2]; Yelena Averbukh[2]. [1]Albert Einstein College of Medicine, Bronx, NY; [2]Medicine, Montefiore Medical Center, Bronx, NY. (Control ID #3367917)

LEARNING OBJECTIVE #1: Recognize the clinical features of acute HIV meningoencephalitis

LEARNING OBJECTIVE #2: Treatment in the context of potential risk for immune reconstitution inflammatory syndrome

CASE: A 21-year-old African American male with recently diagnosed HIV presented with three days of altered mental status and bizarre behaviour. He was diagnosed with HIV two weeks prior but had been lost to follow up. He was febrile at 102 F, tachycardic at 135 bpm and hypotensive at 90/60 mmHg. Neck examination showed no nuchal rigidity. He was alert and oriented but was lethargic with decreased concentration and short-term memory. WBC count was 1 k/uL. HIV-1 viral RNA load was 2,100,000 copies/mL. CSF analysis revealed WBC 4 cells/uL, glucose 40 mg/dL and total protein >200 mg/dL. Serum studies detected EBV, CMV and Coxsackie virus. However, CSF analysis of common opportunistic infections did not reveal any positive findings. CT head revealed no abnormalities.

HAART was not immediately started because of the risk of immune reconstitution inflammatory syndrome (IRIS). The patient was intubated due to acute respiratory failure. MRI revealed leptomeningeal enhancement and edema involving bilateral parietal and occipital cortex and cerebellum; this finding along with clinical symptoms and laboratory results supported the diagnosis of acute HIV meningoencephalitis. CD4 count was 120 cells/mm^3, indicating that IRIS was less likely to occur. HAART was initiated and he was discharged eight days later with a full recovery.

IMPACT/DISCUSSION: Meningoencephalitis due to primary HIV-1 infection is an unusual but dangerous manifestation. Existing literature suggests that the diagnosis is often not suspected initially due to its rarity and because clinical symptoms overlap with other diseases caused by opportunistic infections of the CNS. Symptoms of memory and psychomotor impairment, laboratory results and specific MRI findings can help narrow down the diagnosis.

Starting HAART can put patients with primary HIV infection at risk of IRIS. However, existing literature also suggests that HAART is a beneficial treatment for acute HIV meningoencephalitis. Thus, it is important to determine the likelihood of developing IRIS prior to delivering treatment. Patients who develop IRIS generally have a pre-treatment CD4 count of <100 cells/mm^3.

A standard treatment of acute HIV meningoencephalitis has not been established yet, and some patients have been documented to have full recovery even without HAART. However, the severity of our patient's disease and the swiftness of his recovery after initiation of HAART draw attention to the benefits of this treatment.

This case also highlights the importance of ensuring prompt follow up after initial diagnosis of HIV, especially within minority populations who have poorer continuity of health care.

CONCLUSION: Clinical presentation, CSF and MRI findings can help pinpoint the diagnosis of acute HIV meningoencephalitis

Carefully assess risk of IRIS prior to initiation of HAART therapy

PELLAGRA BENEATH PRE-EXISTING SKIN DISORDERS

CATHERINE L. TENG. Yale New Haven Health, Greenwich Hospital, Greenwich, CT. (Control ID #3352008)

LEARNING OBJECTIVE #1: Recognize the typical and atypical presentations of niacin deficiency

LEARNING OBJECTIVE #2: Recognize niacin deficiency at-risk populations

CASE: A 70 year old female with a past medical history of eczema presented for worsening confusion, frequent falls, diarrhea and poor oral

intake. Her symptoms started two years prior when the patient started having intermittent paranoid activity. On exam, she was noted to have extensive desquamating hypopigmented rash which was attributed to eczema. She was found to be hypernatremic with mild neutropenia and thrombocytopenia. She required intensive care unit stay due to hypoglycemia and hypotension. Extensive infectious disease, neurological, hematologic and endocrine workup were unremarkable.

Eventually, she was noted to have elevated chromogranin sl level 146 μg/L and low serotonin 13 ng/mL. Such results were a possible indication of low tryptophan secondary to niacin deficiency. Following almost five weeks of hospitalization, her workup revealed unmeasurable niacin levels. Pellagra was diagnosed.

Patient was started on a high dose niacin and exhibited rapid recovery of neurologic function as well as clearing of rash. Her pellagra was thought to be secondary to poor oral intake. One year later, despite treatment and rapid improvement, the patient suffered from amyotropic lateral sclerosis.

IMPACT/DISCUSSION: Our case report contributes to a growing body of literature that describes the occurrence of pellagra in the modern era in an effort to identify the common etiologies of niacin deficiency. It also reports a possible atypical presentation of pellagra via hypoglycemia and manifestations of adrenal insufficiency.

Niacin deficiency, also known as pellagra, remains a presence in developed countries and should be considered by clinicians. Niacin (Vitamin B3) is an essential nutrient for the synthesis and metabolism of carbohydrates, fatty acids, and proteins. Niacin deficiency, known as pellagra, is well known as the "four Ds" - dementia, dermatitis, diarrhea and death". In nutrition rich countries, primary niacin deficiency virtually disappeared since the nineteenth century. If present, it is often secondary to underlying pathologies including alcohol dependence, malabsorption disease or congenital disease such as Hartnup disease. It is important for clinicians to not miss this condition, even in nutrition rich countries, as it is not only treatable, but also could lead to fatal outcomes if left unrecognized.

CONCLUSION: Pellagra remains a presence in developed countries and should be considered by clinicians. Recognizing the typical and atypical presentations of niacin deficiency amongst at-risk popoluations is of paramount importance as it is not only treatable, but also could lead to fatal outcomes if left unrecognized.

PERICARDIAL ANGIOSARCOMA: RARE CAUSE OF PERICARDIAL EFFUSION

Sabin Parajuli[1]; Paru Khadka[2]; Judith H. Veis[1]. [1]Internal Medicine, Medstar Washington Hospital Center, Washington, DC; [2]B.P. Koirala Institute of Health Sciences, Dharan, Nepal. (Control ID #3391626)

LEARNING OBJECTIVE #1: Diagnose pericardial angiosarcoma as a rare cause of pericardial effusion and cardiorenal syndrome

LEARNING OBJECTIVE #2: Recognize acute cardiomyopathy as an adverse effect of doxorubicin

CASE: 44-year-old man with hypertension presented two months following a motorcycle accident with sudden onset exertional dyspnea, later at rest with central chest pain for 3 days. A large pericardial effusion seen on echocardiogram, on pericardiocentesis bloody fluid with negative cytology, bacterial, viral and AFB was found. The effusion was felt to be an inflammatory response to trauma. Four months later, he noted worsening dyspnea, CT chest showed mediastinal and hilar lymphadenopathy and mass like lesions surrounding the heart which had not previously been present. Cardiac MRI revealed intrapericardial mass within the right atrioventricular groove anterior to the right ventricular/right atrial free wall measuring up to 5.5cm. Biopsy revealed high grade angiosarcoma, unamenable to resection. Acute Kidney injury with peak creatinine 3.4 mg/dl developed with volume overload, hyponatremia (128), hyperphosphatemia (8.4) and hyperuricemia (14.7). Urine studies revealed very low Fe Na of 0.1%, Fe Urea 5.7% and hyaline casts. Right heart catheterization revealed high filling pressures and low cardiac output with restrictive/constrictive physiology. Renal function improved to baseline with diuresis, rasburicase and doxorubicin. ECHO was repeated prior to discharge which showed reduced ejection fraction (EF) of 30-35% (baseline 55%) and minimal pericardial effusion. Based on interdisciplinary discussion and review of ECHO images, thought to be doxorubicin-induced.

IMPACT/DISCUSSION: Angiosarcoma originating from the heart, although exceptionally rare, is the most common cardiac primary malignant tumor. Primary pericardial angiosarcoma is extremely rare, and associated with a poor prognosis, mean survival time of 6-11 months.

This relatively young healthy male was found to have bloody pericardial effusion in the first presentation. CT PE done, however history of trauma and its temporal relation to effusion was misleading. Malignancy is the commonest cause of bloody pericardial effusion, should always be ruled out.

Pericardial constriction is caused by both the tumor itself and the hemorrhagic pericardial fluid leading to renal venous congestion and/or decreased renal perfusion causing cardiorenal syndrome.

Acute doxorubicin induced cardiomyopathy, after a single dose within 2 weeks is uncommon but can occur unlike the more common early-onset chronic cardiomyopathy, developing within 1 year after cumulative doses. He was given low dose carvedilol and planned to start standard heart failure as outpatient as tolerated.

CONCLUSION: Always rule out malignancy in cases hemorrhagic pericardial effusion. Rare case like pericardial angiosarcoma can be the cause.

Pericardial angiosarcoma can present as cardiorenal syndrome and can induce early cardiomyopathy.

PERICARDIAL TAMPONADE (PT) REVEALS DIAGNOSIS OF METASTATIC LUNG ADENOCARCINOMA

Kathleen McCabe, Amir Naderi, Abdul Shehzad. Internal Medicine, The Jewish Hospital of Cincinnati, Blue Ash, OH. (Control ID #3391441)

LEARNING OBJECTIVE #1: Understand the relationship between PT and metastatic disease of the pericardium

LEARNING OBJECTIVE #2: Understand the management of PT and work-up to define underlying etiology

CASE: A 39 yo M with PMHx significant for HTN, gout and 3-pack-year smoking history presented with dyspnea and chest pain over a 9-month period. The chest pain was localized over the right upper chest wall and was pleuritic in nature. He denied fever/chills, cough, edema or orthopnea. No recent travel or sick contacts. He had recently quit smoking 2 months prior to presentation. No significant family history. Vital signs were unremarkable aside from tachycardia, 115 bpm. On exam, patient was pale appearing, in acute distress, with accessory muscles use, bilateral rales and distant breath sounds. CBC, RFP, proBNP, troponin were unremarkable. CRP was elevated. EKG with non-specific ST changes. CXR demonstrated interstitial infiltrates concerning for atypical infection/edema. Patient was started on ceftriaxone and azithromycin. Further work-up including CT chest indicated bilateral pleural effusions, hilar adenopathy, and a large pericardial effusion which was confirmed with a transthoracic ECHO with evidence of RV diastolic collapse consistent with PT. Patient underwent emergent pericardiocentesis, with drainage of 1050 ml bloody fluid aspirated. A pericardial drain was placed which drained another 750 mL over the proceeding 2 days. Follow up echo after drain removal showed complete resolution of pericardial effusion. After diuresis of net negative 10 L, repeat chest imaging revealed a right upper

lung opacity concerning for mass. Pericardial fluid cytology resulted back as metastatic adenocarcinoma, favoring lung primary. Further staging of cancer revealed 5-6 brain metastatic lesions. Gamma knife radiation and systemic therapy was planned to be initiated as outpatient pending molecular pathology results.

IMPACT/DISCUSSION: Pericardial tamponade occurs due to a build-up of fluid around the pericardium leading to compression of the heart. This can occur from any cause of pericarditis; namely malignancy, viruses, uremia and chest trauma. Metastatic involvement of the heart and pericardium is far more common than primary cardiac tumors and is detected in 1 to 20% of autopsy studies of cancer patients.

CONCLUSION: Pericardial disease may be the first manifestation of malignancy and is an important consideration when assessing patients with pericardial effusions. Prompt recognition, management and determining the underlying cause of cardiac tamponade is of utmost importance in managing these patients.

PERILOUS PETS- A STRANGE CASE OF PERITONITIS

Alexandria Lucas. Internal Medicine, University of Kentucky, Lexington, KY. (Control ID #3392147)

LEARNING OBJECTIVE #1: Recognize *Pasteurella multocida* as a potential cause of peritonitis.

LEARNING OBJECTIVE #2: Recognize the importance of a sterile environment for peritoneal dialysis patients.

CASE: An 18-year-old female with end stage renal failure due to lupus nephritis on peritoneal dialysis presented to the ED with shortness of breath and severe abdominal pain. The patient was positioned on her side, in obvious distress, with a temperature of 102.6F. On examination, she exhibited extreme tenderness to palpitation of the abdomen with involuntary guarding. She reported a similar past instance in which she was diagnosed with pseudomonal peritonitis. Her abdominal fluid sample was cloudy with >10,000 nucleated cells. She was diagnosed with peritonitis and administered empiric cefepime, vancomycin, metronidazole, and fluconazole. The patient's cultures produced *Pasteurella multocida*, a zoonotic pathogen found in the oral cavity of animals such as domesticated cats. Upon further questioning, she revealed the presence of two felines in the residence, denying recent bites or interference with the dialysis equipment. The patient was treated with intraperitoneal ceftazidime for three weeks in an attempt to save her PD catheter and avoid restarting hemodialysis. Since the patient clinically improved on treatment and had negative repeat cultures, she was discharged home with intraperitoneal antibiotics.

IMPACT/DISCUSSION: Peritoneal dialysis is an optimal solution for patients with end stage renal disease (ESRD) who may require a more flexible alternative with their treatment, allowing the convenience of in- home therapy and eliminating required visits to a dialysis center. However, the primary disadvantage is that a sterile environment is required to avoid an increased risk of infection. This was a rare case of PD-related peritonitis caused by *P. multocida*, likely related to the presence of cats in the patient's residence. It emphasizes the importance of controlling infectious sources for those on PD, especially when there are animals residing in the home.

CONCLUSION: -*P. multocida* can be a potential contaminant of peritoneal fluid, especially in those with animals in the home.

- Physicians should emphasize the importance of maintaining a sterile environment for patients undergoing peritoneal dialysis.

PERIORBITAL HEMORRHAGE AS A PRESENTATION OF AL AMYLOIDOSIS

Hal Zhang, Caila Magazine, David McCants. Internal Medicine, Baylor College of Medicine, Houston, TX. (Control ID #3387785)

LEARNING OBJECTIVE #1: Recognize periorbital hemorrhage can be a presenting symptom of amyloidosis

LEARNING OBJECTIVE #2: Recognize EKG and lab findings of amyloid cardiomyopathy

CASE: Our patient is a 61 year old male with no past medical history who presented with intermittent bruising around his eyes. The bruising started with his left eye about six months before presentation and self- resolved within four days; then three days before presentation, he noticed right eye bruising. Neither were associated with trauma or vision changes. He denied fevers, chills, chest pain, shortness of breath, and lower extremity swelling, however he had lost 20 pounds within the last year. He denied drug use and did not take any medications.

Physical exam was significant for ecchymoses and subconjunctival hemorrhage of his right eye.

Initial labs were notable for normal CBC, creatinine, ALT, AST, elevated bilirubin and INR, low total protein and albumin, elevated BNP and troponin.

EKG showed low voltage throughout. Echocardiogram showed severe left ventricular (LV) hypertrophy CT abdomen and pelvis showed multiple lytic bone lesions.

Further lab testing showed elevated beta 2 microglobulin, low kappa lambda ratio, and a monoclonal IgG lambda peak measuring 0.59 g/dl.

Finally, a fat pad biopsy was performed which confirmed the diagnosis of amyloidosis, most likely AL given the monoclonal spike.

IMPACT/DISCUSSION: Amyloidosis is the deposition of proteins into extracellular tissue leading to multiorgan dysfunction including renal, hepatic, cardiac, and bony involvement. However, presentation with periorbital hemorrhage is uncommon though it has been cited as pathognomonic for AL amyloidosis. Therefore, it is reasonable to consider amyloidosis in patients presenting with periorbital hemorrhage along with multiorgan involvement.

One cause of periorbital hemorrhage is infiltration of the capillaries leading to capillary fragility. Upon literature review, another cause could be coagulation abnormalities such as acquired factor X deficiency, present in 15 to 41% of patients with AL amyloidosis.

Recognizing signs of infiltrative cardiomyopathy secondary to amyloidosis can also be an important diagnostic clue. Infiltration of the heart leads to LV hypertrophy causing myocyte injury and leading to troponin elevation. Normally, in patients with LV hypertrophy from hypertension, elevated EKG voltages would be expected however in infiltrative disease such as amyloidosis, a restrictive physiology is seen due to protein deposition leading to low voltage EKG instead. Interestingly, low voltage EKG often precedes LV hypertrophy per literature review and serves as an early marker of heart disease.

CONCLUSION: Consider the diagnosis of amyloidosis in patients with unexplained periorbital hemorrhage along with signs of multi-organ dysfunction

Capillary fragility and acquired factor X deficiency can be reasons for periorbital hemorrhage in amyloidosis Elevated troponin, low voltage EKG, LV hypertrophy can be markers of amyloid cardiomyopathy secondary to restrictive physiology

PERMANENT PACEMAKER PLACEMENT IN PATIENTS WITH CEREBELLAR STROKE- MEDIATED AUTONOMIC DYSREGULATION

Kevin Kohm[1]; Eric Pagan[1]; Jack Xu[1]; Jeremy Johns[1]; Vivek Bose[1]; Delphine Tang[2]; Michael Moussouttas[3]; John Kassotis[2]. [1]Internal Medicine, Rutgers Robert Wood Johnson Medical School, Somerset, NJ; [2]Department of Cardiovascular Disease, Rutgers Robert Wood Johnson Medical School, New Brunswick, NJ; [3]Department of Neurology, Rutgers Robert Wood Johnson Medical School, New Brunswick, NJ. (Control ID #3390732)

LEARNING OBJECTIVE #1: Recognize persistent autonomic dysregulation associated with lateral medullary syndrome.

LEARNING OBJECTIVE #2: Manage dysrhythmias associated with lateral medullary syndrome with placement of a permanent pacemaker.

CASE: A 58 year-old man with no significant past medical history presented with acute onset of weakness, nausea, vomiting, and diaphoresis after urination. On examination, he was hemodynamically stable but profoundly bradycardic, somnolent and had difficulty opening his eyes due to dizziness. He was found to have an ectopic atrial bradycardic rhythm at 35 beats per minute (BPM) on electrocardiogram, which converted to a junctional bradycardic rhythm at 38 BPM. He was given atropine 0.5mg and repeat ECG showed a similar ectopic atrial rhythm at 65 BPM with moderate improvement of symptoms. A transvenous pacer was then placed. However, he continued to experience mild somnolence and dizziness. Non-contrast computed tomography of the brain showed a large infarct of the territory supplied by the left posterior inferior cerebellar artery. Given the severity of symptoms prior to transvenous pacing and ongoing sinus dysrhythmia when challenged off of transvenous pacing, the decision was made to place a permanent pacemaker (PPM). After dual-chamber PPM placement, the patient was atrial sensed-ventricular paced and had self-terminating episodes of paroxysmal atrial fibrillation for the remainder of his hospital stay. His symptoms fully resolved and he was discharged home.

IMPACT/DISCUSSION: Ischemic strokes affecting the territory supplied by the posterior inferior cerebellar artery typically cause the clinical triad of contralateral sensory deficit, ipsilateral ataxia, and ipsilateral Horner's syndrome. This is known as lateral medullary syndrome (LMS). Because the baroreceptor regulatory center is located in the lateral medulla oblongata, LMS may present with signs and symptoms of autonomic dysregulation. This has been described previously as a cause of life-threatening arrhythmia, heart block, and symptomatic bradycardia. Autonomic dysregulation resulting in arrythmias usually recovers as the edema and mass effect of the ischemic region improves over time. However, patients with ongoing symptomatic dysrhythmias may require placement of a permanent pacemaker (PPM). It is therefore essential to recognize that persistent arrythmias after medullary infarct may represent autonomic dysfunction which necessitates placement of a PPM.

CONCLUSION: Medullary infarct may manifest with signs of dysautonomia, including arrythmias. Autonomic dysfunction resulting in dysrhythmias after medullary infarct may require placement of a PPM.

PH AND ETOH: METFORMIN-ASSOCIATED LACTIC ACIDOSIS (MALA) IN ALCOHOL- ASSOCIATED CIRRHOSIS

Grace L. Lisius. School of Medicine, University of Pittsburgh, Pittsburgh, PA. (Control ID #3361632)

LEARNING OBJECTIVE #1: Learning Objective #1: Construct a differential for severe lactic acidosis in a patient with abdominal pain.

LEARNING OBJECTIVE #2: Learning Objective #2: Identify patient risk factors for MALA.

CASE: A 62-year-old man with type 2 diabetes, alcohol-associated cirrhosis (MELD of 29), and chronic pancreatitis, presented to the emergency department with abdominal pain. His week-duration of epigastric pain radiated to the back and was associated with nausea and vomiting. He denied diarrhea, fevers, or ingestions. Medications included metformin. He consumed a pint of vodka daily.

He was hemodynamically stable and normoglycemic, with non-peritonitic epigastric abdominal tenderness and no ascites. Labs showed a lactic acidosis with pH of 6.82, anion gap of 45, and lactate of 25. He had an elevated creatinine, no leukocytosis, an alcohol-pattern transaminitis, and mild lipase elevation. He also had trace urine ketones and a negative toxic alcohol panel. Metformin level was pending.

On ICU admission, the differential diagnosis included lactic acidosis from bowel ischemia versus metformin- associated lactic acidosis (MALA). He subsequently required norepinephrine to maintain his blood pressure and was too unstable to CT scan. His acidosis was managed with fourteen hours of hemodialysis resulting in pH normalization, lactate decrease to 6.1, and no rebound acidosis on dialysis cessation. Abdominal CT found diffuse proctocolitis without pneumatosis or perforation, and pancreatic tail inflammation. His metformin level eventually resulted as 0.11 mcg/mL, slightly above the detection threshold. In the absence of other causes for his severe lactic acidosis and in communication with toxicology, his course was felt to be most consistent with MALA, precipitated by acute illness of colitis, acute on chronic pancreatitis, and alcohol use on his underlying cirrhosis.

IMPACT/DISCUSSION: Lactic acidosis has two categories: Type A from tissue hypoperfusion in shock and ischemia, and Type B, originating from metabolic derangements, commonly seen in diabetes mellitus with ketones and metformin, alcohol use, malignancy, and HIV infections.

Metformin increases lactate production by intestinal capillaries and decreases hepatic metabolism of lactate by inhibiting gluconeogenesis. MALA is rare, 4.3 cases per 100,000, but can have mortality rates up to 45%. Comorbid conditions are most predictive of outcomes, rather than lactate and metformin levels. Patients at higher risk of developing MALA have impaired renal function, liver disease, alcohol use, unstable heart failure, and critical illness. Severe cases are managed with hemodialysis and careful monitoring on dialysis discontinuation for rebound acidosis, given metformin's large volume of distribution.

CONCLUSION: A patient with a severe lactic acidosis must be evaluated for Type A etiologies from tissue hypoperfusion and Type B metabolic derangements. Patients at higher risk for MALA have underlying hepatic or renal disease, alcohol use, or acute illness.

PITUITARY APOPLEXY: SEEING THE BLEED

Alexander Pohlman[2]; Octavio A. Vega[1]. [1]Internal Medicine, Rush University Medical Center, Chicago, IL; [2]Internal Medicine, Rush Medical College, River Forest, IL. (Control ID #3387939)

LEARNING OBJECTIVE #1: Recognize signs and symptoms of pituitary apoplexy.

LEARNING OBJECTIVE #2: Assess patients with pituitary apoplexy for hypopituitarism.

CASE: A 47 year old man with a PMH of HTN, Prediabetes, and OSA presented with new onset headache and blurred vision affecting his peripheral fields. Headache was dull, throbbing, worse with cough/valsalva and transiently improved with acetaminophen. He reported no head trauma, weakness, numbness, slurred speech, dizziness, or jaw claudication. Medications: Amlodipine, Ramipril, HCTZ; No anticoagulants. Exam: BP 119/78, Pulse 93, Resp 16, Temp 98.1, PERRL, intact

CN II-XII, 5/5 motor function and intact sensation bilaterally. Physical Exam and labs (CBC, CMP, FLP, and TSH) were otherwise unremarkable. MRI was recommended but he presented to the ED 3 days later with rapidly progressive peripheral vision loss.

Imaging demonstrated a sellar mass c/w pituitary macroadenoma with c/f apoplexy. He was admitted to ICU and underwent transsphenoidal pituitary tumor resection. Headache and vision symptoms improved significantly after surgery, but he experienced significant polyuria with labs c/w Diabetes Insipidus (DI). Pituitary hormonal axes were evaluated and monitored closely, ultimately requiring hydrocortisone and desmopressin.

IMPACT/DISCUSSION: Pituitary apoplexy is a rare complication of pituitary adenoma. 0.6-10% of pituitary tumors are complicated by apoplexy; mortality is ~1.6%, however, long term deficits can occur if diagnosis and treatment are delayed. Approximately 80% of pituitary apoplexy patients experience some degree of hypopituitarism. Common deficiencies include ACTH (70%), thyrotropin (50%), gonadotrophin (75%), and ADH. ADH deficiency may cause transient DI in 10-20% of patients and permanent DI in 2-7% of patients. Symptoms (headache, vision changes, nausea, hypopituitarism) of pituitary adenoma progress faster in cases complicated by apoplexy, so early recognition to ensure prompt diagnosis with neuroimaging and surgical treatment is essential. Hormone changes may be seen before and after surgical correction. Thus both acute and long-term assessment of hormonal axes (prolactin, IGF-1, ACTH, urinary cortisol, LH/FSH, TSH) is required. 4-6 weeks after discharge patients should be evaluated for residual adenoma (using MRI or serum concentration of an adenoma product), visual acuity/fields, hormonal function, and 24 hour urine if there is significant nocturia. Long-term monitoring should include similar testing every 6-12 months initially to detect growth of residual adenoma tissue and the adequacy of hormonal replacement.

CONCLUSION: Pituitary apoplexy is a rare but potentially life threatening complication of pituitary adenoma. It must be considered and evaluated with neuroimaging in patients experiencing sudden-onset symptoms suggestive of pituitary mass.

Prompt diagnosis and treatment in addition to life-long assessment of pituitary hormonal axes is essential in preventing short-term and long-term complications.

PLASMA DONATION INDUCED SPLENIC INFARCT

Bernadette Schmidt[1]; Manishkumar Patel[2]; Victoria Gonzalez[2]. [1]Internal Medicine, Wayne State University, Rochester Hills, MI; [2]Internal Medicine, Wayne State University, Rochester Hills, MI. (Control ID #3392157)

LEARNING OBJECTIVE #1: Plasmapheresis donation is believed to be a relatively safe procedure that involves an extracorporeal technique involving removing whole blood, separating the plasma from other cellular components and returning a portion of blood components back into circulation. It has a low complication rate and most of the side effects are well-tolerated and reversible such as hypotension, vasovagal episodes, or hematoma. Less common are the anecdotal reports of myocardial infarction, stroke, and pulmonary emboli which are thought to be caused by an induced hypercoagulable state. We present a novel case of splenic infarction following plasmapheresis donation in an otherwise healthy woman.

CASE: A 41-year-old female with a history of bi-weekly plasma donations for the past 2 months presented to our hospital with left upper quadrant abdominal. Her pain began 1 week prior to presentation, an hour after her last plasma donation, and continued to progressively worsen. She denied a history of smoking or IV drug use and had no known history of arrhythmias, cancer, or endocarditis. On presentation, she was hemodynamically stable and afebrile. A CT abdomen with contrast showed a 3.4x2.9cm segmental hypodensity in the spleen with a mild adjacent stranding consistent with a splenic infarct.

Due to the unclear etiology of the splenic infarct, anticoagulation was not initiated. Hypercoagulable investigations were all within normal limits. An echocardiogram was performed to identify a possible cardioembolic source but showed no vegetations, thrombus or mass and there was no patent foramen ovale. During her 4 day hospital stay, she was placed on cardiac telemetry which did not identify any arrhythmias. After her work-up was completed, her pain was more controlled and she was discharged home.

IMPACT/DISCUSSION: This case is a unique example of splenic infarct presenting in a patient without predisposing risk factors, solely precipitated by apheresis. Donating plasma is thought to be somewhat of a benign, altruistic, act with minimal adverse events; yet, it has been seen to be the instigator for arterial thrombotic events. Multiple mechanisms of plasma donation can possibly explain arterial thrombosis in this circumstance. It has been shown that the platelets-derived growth concentration increases at the end of an apheresis for about an hour. Apheresis may generate platelet activation with an increase in the surface expression of glycoproteins. These pro-coagulant mechanisms that are activated after apheresis have reportedly led to a stroke, myocardial infarct and in this rare case splenic infarct. Interestingly, these donors were without phenotypic expression of hypercoagulable genes; yet, endured detrimental consequences. Our case report highlights plasma donation as a potential etiology for organ infarct for which further studies may be required.

CONCLUSION: Apheresis was the only indefinable precipitating factor leading to thrombosis in an otherwise healthy woman with a negative hypercoagulable work-up.

PLATYPNEA-ORTHODEOXIA FAILING MECHANICAL VENTILATION

Nicoleta Rus[1]; Muhammad F. Habib[2]; Muath Alsharif[1]; Nahla Elzubeir[3]; Anuja Kamat[4]; Naguib Tarek[1]. [1]IM, TTUHSC, Amarillo, TX; [2]Amarillo Cardiovascular Center, Amarillo, TX; [3]Internal Medicine, Texas Tech University Health Sciences Center at Amarillo, Amarillo, TX; [4]Internal Medicine, Texas Tech University Health Sciences Centre, Amarillo, Amarillo, TX. (Control ID #3391653)

LEARNING OBJECTIVE #1: Recognizing patent foramen ovale (PFO) as a cause of worsening hypoxia post intubation

CASE: 40 year old male with chronic type II respiratory failure, OSA, and OHS presented with worsening dyspnea, urinary retention and weight gain. BMI was 60, O2 saturation was 90% on 5 L venturi mask, BP 152/91, Hr 80 /min. He had platypnea, prominent S2, no JVD and 3+ pedal edema. Serum creatinine was 2.2 mg/dL, EKG revealed left atrial enlargement, ABG showed respiratory acidosis, but CXR was normal. Due to persistent hypoxemia on Bipap, he was intubated. Despite maximum ventilator settings, nitric oxide, diuretics and dialysis, hypoxia continued. Echocardiogram with bubble study showed pulmonary HTN with patent foramen ovale (PFO) having right to left shunt.

IMPACT/DISCUSSION: PFO is prevalent in 27% of the population and is associated with anomalies like atrial septal aneurysm and can lead to serious complications like cryptogenic stroke and platypnea- orthodeoxia syndrome.

Our patient had acute on chronic type II respiratory failure secondary to volume overload. Despite being intubated, paradoxically hypoxemia worsened. Echocardiogram showed PFO with right to left shunt suggestive of Eisenmenger physiology. It is likely that PEEP exaggerated the shunting of PFO thereby creating resistance to the ventilator-provided oxygenation.

Among the paradoxes of PFO, e.g. paradoxical emboli and the paradox of platypnea-orthodeoxia, we should be vigilant about the paradoxical hypoxemia that may happen post intubation. Patients on mechanical ventilation may require high PEEP and the presence of PFO in these cases may complicate the ventilator management. There are no guidelines to address such a complex situation. A multidisciplinary approach is needed in such complex scenarios.

CONCLUSION: Intubation with PFO can lead to severe hypoxemia, especially when other causes of hypoxemia are also present. PFO causing worsening hypoxemia post intubation is a known but frequently missed phenomenon. Hence, in the setting of platypnea-orthodeoxia syndrome, as in our patient, evaluation for PFO should be done. We want to highlight the importance of PFO in causing hypoxemia post intubation, especially for hospitalists who manage their own patients in ICU. We recommend a multidisciplinary team approach including cardiology leading the potential PFO closure decision if severe hypoxemia develops on the ventilator. Further guidelines are needed to develop criteria for prophylactic closure of PFO in elective intubations.

PLUMMER-VINSON SYNDROME: A RARE PRESENTATION OF SEVERE IRON DEFICIENCY ANEMIA IN THE 21ST CENTURY

Lauren Wessler, Aaron Reyes, Cara Sweeney. Internal Medicine, NYU Langone Health, New York, NY. (Control ID #3389849)

LEARNING OBJECTIVE #1: Recognize PVS as a sequela of severe chronic iron deficiency anemia

LEARNING OBJECTIVE #2: Manage a patient with PVS using a multidisciplinary approach

CASE: A 46yoF presented with subacute leg edema and exertional dyspnea. She had no medical history aside from two remote uncomplicated vaginal deliveries. She immigrated to the United States from Mexico 20 years ago and had limited contact with healthcare. On review of systems, she had mild esophageal reflux, abdominal swelling and heavy painful menses. Vitals were within normal limits with an exam notable for conjunctival pallor, systolic ejection murmur, jugular venous distension, bibasilar pulmonary crackles, palpable non-tender lower abdominal mass, and 1+ pitting edema of the lower extremities. Labs were notable for a hemoglobin (Hg) of 3.3 with MCV 54.2, iron 15, TIBC 416 and reticulocyte count 1.82. Transthoracic echocardiogram showed elevated right and left atrial pressures, grade II diastolic dysfunction and normal ejection fraction. Transvaginal Ultrasound (TVUS) showed multiple large fibroids. Esophagogastroduodenoscopy (EGD) revealed an anterior esophageal web below the upper esophageal sphincter, redemonstrated on esophagram, confirming the diagnosis of PVS. She received 3 units of RBCs with improvement of Hg to 8.3 with a rapid approach to euvolemia following intravenous diuresis. She was discharged with weekly intravenous iron infusions and follow-up with Primary Care, Hematology, Gastroenterology and Gynecology as well as the Legal Immigration Health Clinic to assist with obtaining insurance.

IMPACT/DISCUSSION: For this patient, lack of access to healthcare and untreated menorrhagia led to a severe iron deficiency anemia (IDA) causing transient high-output heart failure and PVS. PVS is a rare condition characterized by a triad of dysphagia, IDA and post-cricoid esophageal webs.

First described in 1912, the prevalence of PVS has declined worldwide paralleling IDA. It is now more common in developing nations and affects women more than men at a ratio of 8.5 to 1. Work-up includes EGD and esophagram to identify webs with a colonoscopy and TVUS to identify sources of blood loss. Iron supplementation improves dysphagia, though in severe cases, patients may require endoscopic dilation.

While the prognosis of PVS is good, there is an association with esophageal squamous cell cancer and gastric adenocarcinoma, so annual surveillance is recommended. The primary care physician (PCP) is essential in coordinating a multidisciplinary approach in symptom management, identification and prevention of blood loss, malignancy screening, and involvement of social workers and legal services to ensure continued access to care.

CONCLUSION: While the causal relationship has not been proven, PVS is a rare sequela of severe chronic IDA and carries the potential for significant morbidity and risk of malignancy. The PCP has an important role in coordinating the multidisciplinary care of a patient with PVS including continued access to healthcare.

POOR CONTINUITY OF CARE AS A MAJOR CONTRIBUTOR TO SIX-YEAR DELAY IN DIAGNOSIS OF CREST SYNDROME

Scott Anderson[2]; Michelle Ray[2]; Frank Jing[2]; Yvonne N. Covin[1]. [1]General Internal Medicine, UT Health San Antonio, San Antonio, TX; [2]UT Health San Antonio School of Medicine, San Antonio, TX. (Control ID #3391237)

LEARNING OBJECTIVE #1: Recognize CREST Syndrome and its cutaneous manifestations

LEARNING OBJECTIVE #2: Understand the role of continuity of care in diagnostic accuracy

CASE: A 49 y.o. Hispanic female with recurrent esophageal strictures, Raynaud's, diffuse skin thickening, and sclerodactyly presented to multiple hospitals from 2013 to 2019 for recurrent bouts of abdominal pain, ileus, anemia, and weight loss. Over six years, she received three esophageal dilations for strictures without an established diagnosis. She presented to our general medicine clinic with worsening rash, dysphagia and weight loss. Medical history significant for Raynaud's, GERD, anxiety, anemia, kidney stones, appendectomy, cholecystectomy, hysterectomy and BTL, she is a current smoker with 10 pack year history. Family history was significant for DM2, HTN, CVA, and pelvic cancer and autoimmune disease in a sister.

On exam, she had a hyperpigmented rash with circumscribed papules on lower back and left leg. Medications included Baclofen, Gabapentin, Ranitidine, Flexeril, and Oxybutynin. Labs show mild hypernatremia, normal GFR and a positive ANA, anticentromere, anti-SSA and antiphospholipid antibodies. Chest CT revealed nodular opacities in the subpleural right upper lobe, right middle lobe ground glass nodules, and dilated fluid- filled esophagus. Pulmonary function tests showed non-reversible obstructive pattern and decreased diffusing capacity consistent with interstitial lung disease. Patient diagnosed with systemic sclerosis, suggestive of CREST syndrome.

IMPACT/DISCUSSION: Systemic Sclerosis is a multisystem autoimmune disorder, associated with vascular dysfunction and progressive fibrosis. Patients with limited disease often have CREST syndrome (calcinosis cutis, Raynaud's, esophageal dysmotility, sclerodactyly, and telangiectasia) with less organ damage. Anticentromere antibodies are specific for the syndrome. Two of five cardinal features are diagnostic of CREST syndrome, but this case went unrecognized even with three features. The major contributor to her delayed diagnosis is poor continuity of care and dispersed responsibility. The National Academy of Medicine cites poor communication as a major cause of diagnostic errors (missed, and delayed diagnosis). Silos of medical records between health systems propagated her extended diagnostic journey. While it is not known why she initially sought emergency care over primary care, this case underscores the value of strong primary care teams to contextualize new symptoms. Furthermore, investment in health information exchange is paramount to timely diagnosis.

CONCLUSION: Physicians should be mindful of CREST (a closely related spectrum of sclerosing disorders) in patients with esophageal dysmotility, Raynaud's, fibrotic skin and/or limited organ dysfunction. Coordinated healthcare for complex health problems should be prioritized.

PORTAL VEIN THROMBOSIS CAUSED BY HYPERTHYROIDISM

Aya Kato, Yuichiro Matsuo, Eiji Hiraoka. General internal medicine, Tokyo Bay Urayasu Ichikawa Medical Center, Urayasu, Chiba, Japan. (Control ID #3386997)

LEARNING OBJECTIVE #1: Assess thyroid function in encountering portal vein thrombosis

CASE: A 59-year-old Japanese man presented to our hospital with epigastric pain for five days, being not associated with fever, weight loss, nausea or vomiting. He had had Grave's disease for 20 years, being treated with thiamazole 5mg every other day. His vital signs were within normal limit. He had epigastric tenderness. Other physical examination was non-contributory. Laboratory tests were remarkable for hyperthyroid state. Abdominal contrast-enhanced CT scan showed portal vein trunk and superior mesenteric vein thrombosis. After diagnosing acute portal vein thrombosis(PVT) and hyperthyroidism, anticoagulation was initiated and the dose of thiamazole was increased. His abdominal symptoms disappeared on hospital day 3 and he was discharged on day 16. Thyroid function was normalized 2 months thereafter. To evaluate the cause of PVT, we performed further imaging tests for malignancy; esophagogastroduodenoscopy, colonoscopy and magnetic resonance cholangiopancreatography, which were all normal. In terms of thrombophilia, serum protein C/S and antithrombin III activity were normal and antiphospholipid antibody was negative. Then, we discontinued anticoagulation 12 months after. Finally, he was sent to his primary care physician on maintenance dose of thiamazole 5mg every day. After 3 years, he was re-hospitalized with the recurrence of PVT and hyperthyroidism. We started anticoagulation and increased the dose of thiamazole. The symptom disappeared on hospital day 4, and he was discharged on hospital day 15.

IMPACT/DISCUSSION: We experienced a case of recurrent PVT with hyperthyroidism. It has been reported that hyperthyroid state is associated with increased risk of pulmonary embolism, deep vein thrombosis and cerebral venous thrombosis. To the best of our knowledge, this is the first case that suggests the possible association of hyperthyroidism with PVT. Hyperthyroidism shifts the hemostatic balance towards hypercoagulable state. Hypercoagulability may be caused by an increase in the level of various coagulation and anti-fibrinolytic factors such as factor VIII, X, IX, von Willebrand factor, fibrinogen and plasminogen-activator inhibitor-1(PAI-1) in hyperthyroid state. Increased levels of factor VIII, von- Willebrand factor antigen and PAI-1 was also reported among patients with PVT and may be the underlying pathogenesis of hyperthyroidism-associated PVT. In this case, he did not have the risk of thrombosis except for hyperthyroidism. Furthermore, he had PVT twice concomitantly with the recurrence of hyperthyroidism. These findings suggest that the PVT might be caused by hyperthyroidism-induced hypercoagulable state.

CONCLUSION: Hyperthyroidism might be a possible cause of PVT

Thyroid function tests should be performed in encountering PVT

To prevent recurrence of PVT, careful monitoring of thyroid function and keeping its normal function is important

POSTPARTUM CONUNDRUM

Lauren E. Mathews[1]; Jessica Bender[2]. [1]Internal Medicine, University of Washington, Seattle, WA; [2]General Internal Medicine, University of Washington, Seattle, WA. (Control ID #3390592)

LEARNING OBJECTIVE #1: Distinguish postpartum thyroiditis from other common postpartum diagnoses

LEARNING OBJECTIVE #2: Diagnose and manage postpartum hypothyroidism

CASE: History and Physical 35 yo woman presented with 1 month of generalized swelling, pain, 35lb weight gain. Four months prior, she had a C-section and was not breastfeeding as she never lactated. She presented to 3 other hospitals and was diagnosed with postpartum cardiomyopathy but worsened despite empiric daily diuresis. She noted pain in her hands/feet/knees, fatigue, constipation, dyspnea, fogginess, dry skin, slurred speech.

Past medical history: HCV, opioid use disorder, G1P1. Medications: Methadone, Lasix

Exam

Vital signs normal. She was pale; had flat affect, flushed cheeks, swollen eyes, scalloped tongue, hoarse voice, diffuse non pitting edema, taut skin, generalized weakness, painful extremities. Thyroid was enlarged.

Labs

Cr 1.44. BNP normal. TSH 411. Free T4 <0.2. CK 717. Cortisol 1.4

Clinical Course

Presentation was consistent with severe hypothyroidism without electrolyte abnormality, alteration in hemodynamics or mentation. EKG was normal. Hydrocortisone IV was given after Cortisol level was drawn, then Levothyroxine IV and LT3. Because of the patient's diffuse edema and presumed bowel wall edema, she was continued on IV medications for several days. Her speech, edema, pain, fT4 and T3 improved daily. Ultimately it was determined to be a very severe presentation of postpartum hypothyroidism. Anti-TPO was high.

IMPACT/DISCUSSION: General internists may have less familiarity with conditions that commonly affect postpartum patients. The postpartum period is a time of immunologic rebound and thyroid antibody titer rise, leading to 5% prevalence of postpartum thyroiditis.[1] Usual course for postpartum thyroiditis is initial transient thyrotoxicosis (2-6 months), then transient hypothyroidism (3-12 months), and return to euthyroid state by 1 year.[1] Half of patients present as ours did, with isolated hypothyroidism.[1]

Postpartum thyroiditis can be confused with normal postpartum or other postpartum diagnoses such as depression, lymphocytic hypophysitis, and rheumatologic conditions. Our patient was initially misdiagnosed with postpartum cardiomyopathy which also presents with edema and fatigue. Her non-pitting edema and lack of lactation were clues to delve further. Barriers to diagnosis may have included bias due to OUD and lack of familiarity with postpartum thyroid dysfunction.

Risk factors for postpartum thyroiditis are T1DM, chronic viral hepatitis, SLE, gestational diabetes. The American Thyroid Association recommends patients with postpartum depression be screened for thyroid dysfunction as there is an unclear association.

Patients considering future pregnancy should continue LT4 due to high risk for hypothyroidism.

1 Nguyen CT et al. Postpartum Thyroiditis. Clin Obstet Gyn 2019;62:359-64

CONCLUSION: Recognize common diagnoses in postpartum patients and consider thyroid dysfunction

Know the risk factors for postpartum thyroiditis, screen and treat appropriately

POST-PARTUM LIVIDO RETICULARIS AND VISION LOSS AS A HARBINGER TO DIAGNOSIS OF ANTIPHOSPHOLIPID SYNDROME

Yvonne N. Covin[1]; Michelle L. Ray[2]; Scott Anderson[2]; Frank Jing[2]. [1]General Internal Medicine, UT Health San Antonio, San Antonio, TX; [2]School of Medicine, University of Texas Health, SAN ANTONIO, TX. (Control ID #3391376)

LEARNING OBJECTIVE #1: Livedo reticularis is an important diagnostic clue to antiphospholipid syndrome

CASE: A 30-year-old female G5P2113 with Noonan's syndrome presented to clinic with left foot numbness, and a bilateral lower extremity violaceous rash with swelling. The rash erupted 7 months ago after a normal vaginal delivery. Obstetrics ruled out peripartum etiologies. She reported the rash worsened with cold exposure and standing. Additionally, she had subjective fevers, intermittent blurry vision, joint pain, and blue fingertips with cold exposure. Her past medical history includes a previous miscarriage at 7 weeks gestation. She is uninsured and denies tobacco, alcohol, or drugs. At her first visit, an autoimmune panel and punch biopsy were ordered. Within days, before she completed the diagnostic tests, she developed vision loss, headaches, and a new facial rash. In the ED, her exam was significant for a malar rash. Dermatology performed a punch biopsy on her leg. Pathology was described as a leukocytoclastic vasculitis with epidermal necrosis. Labs revealed a positive ANA, positive anti-phospholipid antibody, hypocomplementemia, and proteinuria. Her team diagnosed her with SLE. Symptoms improved with prednisone. She is now maintained on Plaquenil.

IMPACT/DISCUSSION: Livedo reticularis (LR) describes a cutaneous physical sign characterized as a bluish-purple, persistent or transient net-like cyanotic pattern. The underlying pathophysiologic reason for LR is an abnormality in local blood circulation which can develop in a variety of pathological or physiological states. These states range from arteriolar vasospasm in response to cold environment to hypothyroidism or cutis marmorata telangiectatic congenita. LR is also associated with a presence of antiphospholipid antibodies with or without associated SLE. A study conducted by Kester S. et. all found 40% of patients had LR presenting as the first sign of antiphospholipid syndrome, with presence of SLE making this chance only more likely. The histopathology of LR depends on the root cause of the manifestation. If idiopathic, no changes may be noted, but secondary causes may show clues such as calciphylaxis, monoclonal cryoglobulinemia, intraluminal thrombosis, or as in our case, epidermal necrosis. The underlying cause for LR in this case was antiphospholipid syndrome with associated SLE. The presence of antiphospholipid antibody could explain her previous miscarriage. Unfortunately, her uninsured status influenced the 7-month delay in diagnosis, and time at risk for SLE and antiphospholipid syndrome complications.

CONCLUSION: Livedo reticularis should be recognized by general physicians due to its association with serious underlying pathology. Our awareness of the common diseases will improve patient outcomes through accurate differential diagnosis creation.

POST-TRAUMATIC HEADACHE (PTH)

Daanish Chawala, Shani Scott, Matthew Shaines. Department of Medicine, Montefiore Medical Center, Bronx, NY. (Control ID #3392205)

LEARNING OBJECTIVE #1: Recognize an illness-script for PTH

LEARNING OBJECTIVE #2: Manage patients with PTH appropriately

CASE: A 69 year-old female with history of diabetes mellitus type 2 complicated by peripheral neuropathy, chronic low back pain, and anxiety presented with two months of daily 30-minute episodes of 10/10, unilateral, pounding headaches. She reports hitting her head on a bathroom hook without loss of consciousness after which point she began to experience pain precisely at the site of her injury. She notes no change in intensity or frequency; no photo/phonophobia, nausea or vomiting; and no identifiable triggers, positional or otherwise. The patient had been self-treating with copious amounts of ibuprofen without relief though she notes that the episodes remit spontaneously. Prior to her ambulatory presentation, she frequented the local Emergency Department. On three separate occasions over two months, her emergent visits summated to several negative laboratory and imaging work up. Exam of her cranium was completely benign. The patient was already taking gabapentin for diabetic neuropathy but was advised to cease use of ibuprofen and to call the office if her headaches failed to improve for a trial of amitriptyline.

IMPACT/DISCUSSION: There are approximately 1.7 million reported cases of traumatic brain injury each year in the U.S. and the most common complication is headache, occurring in a reported 25-78% of cases. The majority of PTH (defined somewhat arbitrarily by the International Headache Society as those that onset within 7 days of injury) have been shown to subside within 3 months of presentation. There are a significant minority of cases, however (a reported range of 18-65%), of such headaches that persist beyond three months with increased documented prevalence among females, those with pre-existing headache, and those with family history of migraine. Beyond pain associated with specific head/neck injury, chronic/persistent PTH is not a monolithic entity and can resemble any type of headache, with approximately 77% of patients developing tension-type headaches and a significant minority who develop migraine headaches. A smaller minority of patients are documented to develop scalp dysesthesias at the site of injury, neuralgias, or temporomandibular joint dysfunction among other syndromes. It is important to recognize PTH as an exceedingly common phenomenon in both the emergency and ambulatory settings and to avoid treatment pitfalls that may inadvertently delay recovery from PTH or prolong or exacerbate patients' symptom burden. For example, analgesia overuse and associated rebound headache was noted in one study to negatively affect 42% of patients presenting with tension-type PTH and withdrawal of analgesics was shown to be as efficacious in resolving PTH as it was for its non-traumatic counterpart.

CONCLUSION: Post traumatic headaches can vary in presentation and persist for months after initial injury Appropriate treatment includes management of confounding factors such as analgesic overuse

POUR SOME SUGAR ON ME: A CASE OF NON-ISLET CELL TUMOR HYPOGLYCEMIA (NICTH) ASSOCIATED WITH GASTROINTESTINAL STROMAL TUMOR (GIST)

Grace L. Lisius[1]; Christopher C. Marino[2]; Shea A. Ford[3]. [1]School of Medicine, University of Pittsburgh, Pittsburgh, PA; [2]Internal Medicine, The University of Pittsburgh Medical Center, Pittsburgh, PA; [3]Internal Medicine, UPMC, Pittsburgh, PA. (Control ID #3392085)

LEARNING OBJECTIVE #1: Recognize refractory hypoglycemia as a paraneoplastic manifestation in a patient with gastrointestinal stromal tumor (GIST).

LEARNING OBJECTIVE #2: Diagnose and manage non-islet cell tumor hypoglycemia (NICTH).

CASE: A 35-year-old non-diabetic woman with imatinib-resistant GIST with extensive liver metastases on investigational avapritinib therapy presented after being found unresponsive in the setting of profound refractory hypoglycemia. Two weeks prior, the patient developed intermittent blurry vision and agitation. Initial capillary glucose was <20 mg/dL. Hypoglycemia workup revealed a negative sulfonylurea screen and low insulin, pro-insulin, C-peptide, β-hydroxybutyrate, growth hormone, insulin-like growth factor (IGF)-1, and insulin-like growth factor binding

protein (IGFBP)-3 levels. Cortisol and IGFBP-2 levels were normal and insulin autoantibodies were absent. IGF-2 and big IGF-2 testing was unavailable. These findings were consistent with NICTH. She required continuous dextrose 20% infusion to maintain euglycemia. Glucocorticoids were started and she was gradually weaned from the dextrose infusion. She was switched to regorafenib for her metastatic GIST though had difficulty tolerating the medication and was readmitted shortly after for recurrent hypoglycemia. She continued glucocorticoid therapy and was started on continuous tube feeds resulting in more sustained glucose control.

IMPACT/DISCUSSION: The etiology of the patient's refractory hypoglycemia was most consistent with GIST-associated NICTH and diminished glycogen stores from metastatic replacement of hepatic tissue. NICTH is a rare paraneoplastic process associated with a variety of tumors, most commonly of mesenchymal, vascular, or epithelial origin. Unlike the classically insulin-mediated hypoglycemia from islet cell tumors, NICTH is most commonly caused by overproduction of incompletely processed IGF-2, known as big IGF-2, which stimulates insulin receptors and suppresses growth hormone and glucagon release. An elevated big IGF-2 level or an IGF-2/IGF-1 ratio >10 in the setting of suppressed insulin, C-peptide, IGF-1, IGFBP-3, and growth hormone levels support this diagnosis. Immediate management includes aggressive correction of hypoglycemia with dextrose infusion or tube feeds. Glucagon administration can increase glucose levels, but may not significantly improve hypoglycemia if there is extensive tumor invasion of the liver. Definitive management is surgical resection of the underlying tumor. If the tumor is unresectable, treating the underlying malignancy and glucocorticoids are mainstays of therapy. Glucocorticoids impair insulin sensitivity, stimulate gluconeogenesis, and increase clearance of big IGF-2.

CONCLUSION: NICTH is a challenging diagnosis that requires timely recognition to avoid devastating complications or death. Management of NICTH associated with unresectable tumors is difficult, but can improve with treatment of the underlying malignancy and glucocorticoid therapy.

PRIMARY ELEVATED TRANSAMINASES IN GALL STONE DISEASE: AN ATYPICAL PRESENTATION

Vaishnavi Boppana, Himabindu Boja, Cassie Shaw. Internal medicine, University of New Mexico, Albuquerque, NM. (Control ID #3391484)

LEARNING OBJECTIVE #1: Acknowledge counterintuitive biochemical findings in gall stone diseases.

LEARNING OBJECTIVE #2: Describe the pathophysiology behind elevated transaminases in biliary tree diseases.

CASE: A 19 year-old woman presented with right upper quadrant (RUQ) abdominal pain, nausea and vomiting for 1 week. Upon examination, she was noted to have RUQ tenderness without guarding or rebound and a negative murphy's sign. Notable laboratory findings included Aspartate transaminase (AST) 1009, Alanine transaminase (ALT) 818, Alkaline phosphatase (ALP) 234 and Total Bilirubin 2.1 with direct 1.4.

Her platelet count was 432 and INR was 1.2. Her acetaminophen level was negative. Ultrasound of the abdomen was significant for cholelithiasis and biliary sludge. Her biliary duct measured 5mm without cholecystitis and a normal liver parenchyma. Subsequent Contrast Tomography (CT) abdomen with contrast showed possible stones in the cystic duct and distal common bile duct (CBD). A follow-up Magnetic Resonance Cholangiopancreatography (MRCP) confirmed the CBD stone and biliary tree dilation. The rest of the workup including hepatitis panel, autoimmune panel and a urine drug screen were all negative. The patient underwent Endoscopic ultrasound (EUS) and Endoscopic retrograde cholangiopancreatography (ERCP) wherein she underwent sphincterotomy followed by removal of two CBD stones and stenting. Her liver tests normalized prior to discharge.

IMPACT/DISCUSSION: General Internists commonly encounter abnormal liver tests in their clinical practice. Clinical conviction is that predominant elevation of transaminases is presumed to be caused by a primary hepatic injury, while, a cholestatic predominant pattern is associated with a biliary tree abnormality. Our patient's hepatocellular pattern in the setting of a primary biliary pathology challenged this dogma. Biliary obstruction in the proximal ducts have been shown to cause an hepatocellular pattern of injury. In an observational study by Campos et al, pancreaticobiliary lithiasis accounted for 39.3% of diagnoses with marked increase in aminotransferases. There are two speculated pathogeneses behind this lab phenomenon. The first is that biliary duct obstruction causes expansion of bile canaliculi with stasis, increasing pressure and local inflammation, affecting surrounding hepatocytes, predisposing to hepatocellular necrosis and increased transaminases. The second theory is that spillage of transaminases into blood could be due to diffuse leaky cell membranes secondary to the bile duct obstruction. No matter the cause, the increase in transaminases is transient and tends to improve after calculi dis-impaction.

CONCLUSION: The common correlation between hepatocellular pattern of liver lests and a primary hepatocellular injury cannot be taken at face value. In cases of elevated transaminases, General Internists should continue to consider extra-hepatic biliary tract diseases including those associated with bile duct obstruction.

PRIMARY EXTRANODAL LYMPHOMA OF THE URINARY TRACT

Alexis Tchaconas[2]; Blaine Huss[3]; Joseph Truglio[1]. [1]Internal Medicine, Pediatrics and Medical Education, Icahn School of Medicine at Mount Sinai, Maplewood, NJ; [2]Internal Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [3]Internal Medicine, Mount Sinai Hospital, New York, NY. (Control ID #3345695)

LEARNING OBJECTIVE #1: Recognize the presentation of malignancy in the urinary tract.

LEARNING OBJECTIVE #2: Differentiate primary extranodal lymphoma of the urinary tract from urothelial carcinoma.

CASE: RP is a 67-year-old female with a 5-pack-year smoking history and hepatitis C virus, treated with sustained virologic response without cirrhosis who presented to the clinic with bloating for 1 week. She described the bloating as constantly feeling full. RP endorsed constipation for 3 days, though she had been passing gas without issue and denied fever, dyspnea, melena or hematochezia. On exam, her abdomen was protuberant, soft and nontender with dullness to percussion and irregular consistency over the lateral aspect of the RUQ. Basic labs were significant for Cr 1.83mg/dL (baseline 1.2mg/dL), BUN 25mg/dL, FeNa 55%, urine protein:creatinine ratio 0.33 and urinalysis without sediment or hematuria. On abdominal ultrasound there was moderate right hydronephrosis. CT and MRI of the abdomen revealed a 6.4cm mass in the right proximal ureter/renal pelvis with surrounding lymphadenopathy, suspicious for a urothelial neoplasm. She then underwent ureteropyeloscopy and the tumor was encasing the right adrenal gland, which led to a radical open nephroureterectomy with en bloc right adrenalectomy and lymph node biopsies. Surgical pathology revealed follicular lymphoma Stage IE and Grade 3a, given that sampled lymph nodes and bladder cytology were benign. She did not require any further treatment and was followed closely with a surveillance cystoscopy every 6 months.

IMPACT/DISCUSSION: A majority of urinary tract (UT) malignancies are urothelial carcinomas, while a smaller percentage are due to metastatic tumors, including cases of advanced lymphoma. An exceedingly rare

cause of UT malignancy is primary extranodal lymphoma (PENL), accounting for <1% of cases. PENLs are non-Hodgkin's lymphomas that arise in non-lymphoid tissue. While on imaging PENLs of the UT can be indistinguishable from urothelial carcinoma, they often lack typical presenting symptoms, such as painless hematuria and flank pain. They can also lack typical B symptoms characteristic of primary nodal lymphomas, often leading to a presumed diagnosis of urothelial carcinoma until the tumor is biopsied. Urothelial carcinomas require complete imaging of the UT due to multifocality, followed by cystoscopy and chest/abdomen imaging for staging. Definitive treatment is with surgery. A diagnosis of PENL requires further workup, including local lymph node biopsies and cytogenetic analysis, to determine staging and need for additional therapy. Given the rarity of PENL in the kidney and ureter, this case provides a unique learning opportunity on the presentation, management and progression of disease.

CONCLUSION: While PENLs comprise about one-quarter of non-Hodgkin's lymphomas, involvement of the UT is rare and understudied. It is important to recognize the symptoms and laboratory studies that distinguish urothelial carcinoma from PENL of the UT, given differences in their management.

PRIMARY MEDIASTINAL B-CELL LYMPHOMA PRESENTING WITH GASTROINTESTINAL SYMPTOMS AND ACTIVATED B-CELL SUBTYBE IN AN ADOLESCENT

Haneen Ismail, Mohammed Alsaggaf, Kieron Dunleavy. IM, George Washington, Arlington, VA. (Control ID #3375879)

LEARNING OBJECTIVE #1: Identiying primary mediastinal B-cell lymphoma presenting with only gastrointestinal symptoms

LEARNING OBJECTIVE #2: Identifying ABC subtype of diffuse B-cell lymphoma in adolescent

CASE: A 22 year-old man who presented with persistent episodic epigastric pain for five months. The patient was given proton pump inhibitors and other acid-reducing agents but without relief. He reported early satiety and weight loss of about 5% of his body weight and occasional melena. He denied night sweats or fevers. An upper endoscopy revealed fungating and ulcerated mass in the stomach measuring 5 x 5 cm in size with friable surfaces found on the greater curvature of the gastric body. Multiple biopsies were taken and the histology was most consistent with diffuse large B-cell lymphoma (DLBCL). PET/CT scan showed large hypermetabolic anterior mediastinal lymph node measuring 8x4.4 cm and irregular hypermetabolic gastric wall thickening involving the distal greater curvature and no evidence of bone marrow or CSF involvement. Patient was started on chemotherapy (DA-EPOCH-R regimen) without intrathecal chemoprophylaxis. Overall, he tolerated DA-EPOCH-R very well and was escalated to dose level 4. He underwent end of therapy FDG-PET scan which showed anterior mediastinum with SUV of approximately 2.5 (Deauville 3) and hence was considered negative.

IMPACT/DISCUSSION: Gastrointestinal involvement in PMLBCL has not been extensively studied. Given that our patient had a large anterior mediastinal mass at initial diagnosis, we considered this to be primary mediastinal B-cell lymphoma and we selected treatment accordingly which the patient tolerated very well and had an excellent response following cycle 4. Moreover, we report ABC subtype of PMLBCL in an adolescent male patient which is unusual for this age group and to our knowledge, this is the first case reporting this association. The combination of antigens expressed by the lymphoma cells was consistent with the activated B-cell (non-germinal center) subtype of DLBCL that was positive for CD45, CD20, BCL2, BCL6 and MUM1; negative for CD10 and EBER. Ki67 was 95%. MYC was positive in approximately 30% of the cells. There are few cases that reported gastrointestinal (GI) involvement in PMLBCL at first presentation. Sotirios G., et al. conducted a retrospective study that showed two out of 204 patients (1.0%) had gastric involvement at presentation manifested as upper GI hemorrhage and PET/CT-identified gastric involvement at diagnosis of PMLBCL. Lazzarino et al. found one case out of 106 (0.94%) and Massoud et al. 1/108 (0.93%).

CONCLUSION: This case reports gastrointestinal symptoms as the first manifestations of primary PMBCL. It also demonstrates an association between ABC subtype of PMBCL and adolescent.

PROGRESSIVE SHORTNESS OF BREATH DURING EARLY PREGNANCY

Haihua Zhang. Internal Medicine, Tufts Medical Center, Boston, MA. (Control ID #3386108)

LEARNING OBJECTIVE #1: Enable the diagnosis of miliary TB with appropriate diagnostic approaches

LEARNING OBJECTIVE #2: Recognize the clinical features of miliary TB in pregnancy with identifiable risk factors

CASE: A 30-year old woman at 15 weeks of gestation via IVF was admitted for progressive dyspnea for 4 weeks with associated productive cough, weight loss, tachycardia and fevers. She denied contact with birds, recent travel, IVDU, tobacco use. She was originally from Brazil and had a positive PPD years ago without treatment. Two weeks prior, CXR showed diffuse grand glass opacities. She received a course of azithromycin without clinical improvement. She presented to OSH 3 days prior to admission for worsening dyspnea. A CTPA showed bilaterally diffused grand glass opacities with hilar lymphadenopathy without PE. HIV was negative. Upon admission, a bronchoscopy was performed and BAL was negative for bacterial infection and negative for AFB stain as well. A course of high dose steroid was started which led to transient clinical improvement and, subsequently, it deteriorated, requiring HFNC. A high-resolution CT chest was performed, revealing diffused, randomly distributed tiny nodules throughout the lungs, more focal and less ground glass compared to prior CTPA, suggesting miliary TB. Subsequently, she underwent a bronchoscopy guided tissue biopsy and tissue Xpert PCR was positive for TB. She was started INH/Rif/EMB but suffered fetal loss at 20 weeks, IRIS, intracranial TB and intraocular TB.

IMPACT/DISCUSSION: Miliary TB has been shown to be associated with pregnancy, a state of decreased T-cell mediated immunity. For patients who undergo IVF, strong immunosuppressors, progesterone, and glucocorticoids, are commonly used to optimize the intrauterine environment. Therefore, performing IVF in patients with infertility secondary to genital TB would increase incidents of relapsed and disseminated TB. It is important to screen and treat latent TB prior to IVF in patients with identifiable risk factors.

It is extremely difficult to diagnose miliary TB in pregnant patients given the non-specific and overlapping symptoms. Clinicians should have high index of suspicion in pregnant women presenting dyspnea refractory to antibiotics. High-resolution CT chest is the gold standard for diagnosis of miliary TB. CT pulmonary angiogram is suboptimal to the identification of parenchymal pathology. In this case, CTPA artificially demonstrated grand glass opacities instead of nodular pattern, dallying diagnosis. Additionally, Xpert PCR should be the conventional method for diagnosis of miliary TB as AFB stain has low sensitivity. Furthermore, high dose steroid should be avoided prior to definitive diagnosis as it would exacerbate military TB via lymphohematogenous spread to extra-pulmonary organs.

CONCLUSION: It is important to screen and treat latent TB prior to IVF in patients with identifiable risk factors.

High resolution chest CT and Xpert PCR to increase sensitivity of miliary TB Avoid steroids before miliary TB is definitively excluded.

PSEUDO-ASPIRATION: A CASE OF MILIARY TUBERCULOSIS

Kyla Sherwood[1]; Neil Zhang[1]; James Hofschneider[2]. [1]Internal Medicine, UCSF, San Francisco, CA; [2]Medicine, Commonwealth Healthcare Corporation, Saipan, . (Control ID #3392153)

LEARNING OBJECTIVE #1: Recognize the varied clinical presentations of miliary tuberculosis

LEARNING OBJECTIVE #2: Identify risk factors for miliary tuberculosis

CASE: A 60 year-old male presents to primary care. He had a recent prolonged hospitalization for stroke complicated by dysphagia resulting in malnutrition and respiratory failure from presumed aspiration pneumonia. Bacterial sputa cultures grew Pseudomonas aeroginosa repeatedly. Initial chest x-ray showed patchy opacities in bilateral lower lungs. His course was complicated by persistent leukocytosis, fevers, and respiratory distress despite several courses of antibiotics with Pseudomonal coverage.

He now presents for new patient evaluation two weeks after discharge. He has had ongoing fevers with dyspnea and productive cough. Further history reveals he was born in the Philippines, has diabetes, and had prior tobacco use. His temperature is 102F, heart rate 154, and respiratory rate 60. He is cachectic with bilateral rhonchi. He is admitted to the hospital. HIV antibody is negative. Chest x-ray shows diffuse nodular opacities in bilateral lungs. Three sputa samples show 3+ AFB smear positivity and positive Gene Xpert testing, confirming the diagnosis of miliary tuberculosis (TB).

IMPACT/DISCUSSION: Miliary TB is a form of disseminated TB from hematogenous spread, either as a progressive primary infection or reactivation of latent focus. Miliary TB accounts for less than 2% of all TB cases and is fatal if untreated. Multiple medical conditions increase risk: HIV, malignancy, malnutrition, tobacco use, renal failure, diabetes, alcohol use, and use of certain immunosuppressive medications.

Its presentation can be varied and nonspecific with a wide spectrum of severity. Careful history and exam are required to determine sites of suspected involvement, which should undergo microbiologic testing. All patients require chest imaging, though notably initial x-rays may not demonstrate the classic miliary appearance. Dilated fundoscopic examination showing characteristic choroidal tubercules highly supports the diagnosis of miliary TB. Treatment of miliary TB is similar to active pulmonary TB; CNS and pericardial involvement merit corticosteroids.

His initial presentation was thought due to aspiration pneumonia given dysphagia, dependent opacities, and bacterial sputum culture of Pseudomonas. Yet, he had persistent fevers, leukocytosis, and respiratory distress despite appropriate antibiotics—raising suspicion for a separate process. Review of his case revealed TB risk factors: origin from a TB endemic area, diabetes, tobacco use, and malnutrition. Progressive chest x-ray and microbiologic findings were diagnostic of miliary TB. He received RIPE therapy but passed away from extensive disease.

CONCLUSION: This case highlights the importance of maintaining a high index of suspicion for miliary TB given its varied presentations. His TB risk factors, progressive imaging findings, and lack of improvement to antibiotics prompted further evaluation, ultimately leading to the final diagnosis.

PSEUDOMEMBRANOUS COLITIS – NOT ALWAYS FROM CLOSTRIDIUM DIFFICILE

Jasmin Hundal, Tanya Chandra, Jaimy Villavicencio. Internal Medicine, University of Connecticut, Hartford, CT. (Control ID #3389854)

LEARNING OBJECTIVE #1: Recognize the need for knowing the different etiologies of pseudomembranous colitis

LEARNING OBJECTIVE #2: Understand the importance of sensitivity and specificity of different diagnostic tests.

CASE: We present the case of a 90-year-old female who presented from her nursing facility with fever. She endorsed generalized myalgia with other history limited due to dementia. On evaluation she was found to be afebrile, tachycardic, tachypneic with a high white blood cell count.

During work up, a CT scan showed asymmetric rectal wall thickening concerning for proctitis vs rectal mass.

She was started on ceftriaxone and metronidazole, however started having multiple episodes of watery diarrhea. Stool *Clostridium Difficile*(C.Dif) toxin as well as ova, parasites and culture was sent which were all negative. She underwent a sigmoidoscopy, which showed pseudomembranes. She was empirically started on treatment for C.Dif with oral vancomycin as well as metronidazole. She underwent a colonoscopy, which again showed localized, pseudomembranous in the rectum. Biopsies were taken from the colon, and a repeat stool C.Dif toxin test was sent which was negative. She was discharged on the same regimen to complete the course of treatment for suspected C.Dif. Biopsy results after discharge were suggestive of ischemic colitis.

IMPACT/DISCUSSION: Pseudomembranous colitis (PMC) is an inflammatory condition of the colon and is characterized by elevated plaquescomposed of mucus and inflammatory cells. Pseudomembranes are formed due to decreased blood flow and oxygenation to the area which leads to the endothelial damage[1]. PMC is commonly known to be caused by C.Dif, however it is not specific for it. PMC can be seen in other conditions such as infections (Cytomegalovirus, Staphylococcus aureus, Escherichia coli), medications (budesonide, glutaraldehyde, indomethacin) and autoimmune diseases[1].

The sensitivity of polymerase chain reaction (PCR) for C.Dif toxins is 90% and specificity is 96%[2]. Thus, in our patient with 2 negative PCR tests, antibiotics for C.Dif should have been discontinued. Endoscopy with biopsy is sometimes needed for a definitive diagnosis of PMC [2]and in our patient this revealed an alternate cause.

CONCLUSION: - It is essential to broaden differential diagnoses when testing for C.Dif is negative, instead of empirically treating for it.

- It is important to correctly use and interpret diagnostic tests to improve patient care and limit healthcare expenses.

PULMONARY EMBOLI ARE MORE THAN SKIN DEEP

Patrick M. Light[1]; Jennifer M. Kaplan[2]; Lee Lu[2]. [1]Medical School, Baylor College of Medicine, Houston, TX; [2]Internal Medicine, Baylor College of Medicine, Houston, TX. (Control ID #3344803)

LEARNING OBJECTIVE #1: Recognize skin abscess as the source of pulmonary septic emboli and endophthalmitis.

LEARNING OBJECTIVE #2: Remind physicians of the non-cardiac sources of septic emboli.

CASE: A 58-year-old woman with a history of recurrent childhood skin infections presented with a worsening upper back swelling, fevers, chest pain, and bilateral blurry vision for 5 days. She complained of localized pain at her upper back that did not radiate. The chest pain was mild and pleuritic. The patient denied history of intravenous drug abuse. Physical exam revealed fever, tachycardia, and a fluctuant mass on the upper back. The CT scan showed "innumerable scattered lung nodules with internal air/cavitation most concerning for septic emboli." A dilated fundoscopic exam revealed vitreal haziness concerning for endophthalmitis. Cultures were collected from the blood, wound, and anterior chamber of the eye; methicillin resistant *Staphylococcus aureus* (MRSA) grew from all sources.

Incision and drainage was performed on the upper back abscess and intravenous (IV) vancomycin was started. However, blood cultures drawn 2 days after beginning therapy still grew MRSA. A transthoracic echocardiogram (TTE) and a subsequent transesophageal echo (TEE) revealed no vegetations. Despite being on therapeutic levels of vancomycin for 5 days and clinical improvement, cultures continued to grow MRSA. The source of the MRSA bacteremia with pulmonary septic emboli and endophthalmitis was originated from her skin infection.

She slowly improved on vancomycin therapy and was discharged to a skilled nursing facility to finish 6 weeks of IV antibiotic therapy. After completing this regimen, a chest X-ray showed partial resolution of her pulmonary nodules.

IMPACT/DISCUSSION: Classically, septic emboli to the lungs arise from an intravascular or intracardiac source. Despite being relatively uncommon, cases of deep-seated skin/soft tissue infection causing septic emboli have been reported. The incidence is not known. However, the majority of these cases were in pediatric patients. In addition, the primary site of infection was typically a large muscle group. Of note, our patient developed these pulmonary emboli from an extensive skin infection. Skin infections have the capacity to disseminate widely with consequent bacteremia, pulmonary emboli, and endophthalmitis. The mechanism by which septic emboli occur from a soft tissue source remains unclear; it has been hypothesized that a significant and substantial number of bacteria are able to translocate into local vasculature within the abscess. This report identifies a novel case of a skin infection in an adult patient leading to disseminated eye infection and septic pulmonary emboli.

CONCLUSION: Most septic emboli are commonly from an intracardiac or intravascular source; however, skin or soft tissue infection have been recognized to be one of the non-cardiac causes of diffuse septic emboli.

PUTTING THE RIGHT FOOT FORWARD IN DIAGNOSING PYODERMA GANGRENOSUM

NABEEL AZZAWI[1,2]; Muhammad Khan[1,2]; Francheska Castro[1,2]; Mathew Sasaki[2]. [1]INTERNAL MEDICINE, UCF/IM, Kissimmee, FL; [2]Internal medicine, VAMC, Oralndo, FL. (Control ID #3390708)

LEARNING OBJECTIVE #1: Given the lack of definitive tests or guidelines for diagnosing PG, it is important to recognize the different presentations so as to spare the patient from unnecessary interventions, especially those that worsen disease progression and increase morbidity and deformity of the PG lesion.

CASE: a 60-year-old male who presented with a 1-week history of an erythematous and edematous right foot, that was initially presumed to be a case of non-purulent cellulitis. The only identifiable inciting factor was an initial physical therapy session with manipulation of the right foot. Despite resolution of leukocytosis, the patient continued to progress symptomatically on trials of doxycycline, vancomycin, meropenem, and ceftriaxone. As the erythema and edema were not resolving, podiatry was consulted for an incision and drainage of what was suspected to be an abscess at the time. The wound rapidly ulcerated and was subsequently diagnosed as PG when skin biopsy revealed neutrophilic infiltrates of the dermis. The patient was discharged on oral prednisone with a follow up for outpatient skin grafting to aid in wound healing

IMPACT/DISCUSSION: This is one of the rare instances where we were able to track the progression of pyoderma gangrenosum with photographic evidence from its pre-ulcerative onset, where the differential is typically broad, to its classic ulcerative lesion. Given the lack of definitive tests or guidelines for diagnosing PG, it is important to recognize the different presentations so as to spare the patient from unnecessary interventions, especially those that worsen disease progression and increase morbidity and deformity of the PG lesion. This presentation was unusual for PG as there was no history of pathergy, inciting trauma, or underlying inflammatory, rheumatic, or hematologic disease despite extensive work-up following diagnosis. Additionally, the initial skin presentation was not the characteristic pustule progressing to ulcer, but rather a nondescript edematous erythema of the right foot.

CONCLUSION: Pyoderma Gangrenosum is typically a diagnosis of exclusion and is often misdiagnosed as an infectious or inflammatory process. Clinically, PG often starts as small tender pustules that rapidly progress into a painful ulcer with irregular borders.

Given the lack of definitive tests or guidelines for diagnosing PG, it is important to recognize the different presentations so as to spare the patient from unnecessary interventions, especially those that worsen disease progression and increase morbidity and deformity of the PG lesion.

Having several images(day to day presentations) would make it easier for the provider to clearly differentiate PG, from cellulitis/abscess when the presentations are atypical.

PYODERMA GANGRENOSUM, FEVER, AND LEUKOCYTOSIS PRESENTING AS A PRE- LEUKEMIA SYNDROME 6 MONTHS PRIOR TO CONVERSION TO AML

Emily Mai, J. R. Penick. Hospital Medicine, University of Alabama Hospital, Birmingham, AL. (Control ID #3389514)

LEARNING OBJECTIVE #1: Identify pyoderma gangrenosum as an associated finding of AML

LEARNING OBJECTIVE #2: Recognize importance of regular follow-up for patients with CCUS

CASE: A 52-year-old obese woman with diabetes and hypertension presented to the ward with persistent fevers and leukocytosis in excess of 30,000 WBCs. She underwent extensive infectious workup, including multiple blood, urine and stool cultures, c. difficile toxin, T2 candida, T-spot, and fungal antigens; all of these were negative. She received two weeks of antibiotics without improvement. Rheumatologic workup was unrevealing. Hematologic workup was suspicious for a myelodysplastic process based on flow cytometry, but a repeat as well as a bone marrow biopsy were consistent with reactive changes. FISH studies for AML gene rearrangements and FLT3 mutation analysis were negative. A T-cell receptor (TCR) gene rearrangement study showed two mutations but was non-diagnostic.

Four weeks later, she noted a lower extremity ulcer. A biopsy was consistent with pyoderma gangrenosum (PG). She was started on steroids with resolution of fever and systemic inflammatory symptoms. On her second follow-up visit with hematology after discharge, a CBC noted 48% blasts. Repeat bone marrow biopsy was obtained and demonstrated acute myelogenous leukemia.

IMPACT/DISCUSSION: PG is a rare neutrophilic dermatosis of unclear etiology associated with an underlying disease process, often AML. Neutrophil dysfunction, genetic factors, and systemic inflammation are the leading factors thought to contribute to PG. Among the subtypes, bullous PG is most often associated with hematologic disease. Due to the strong association between these entities, patients presenting with bullous PG without clear evidence of hematologic disease should be monitored closely for the development of such malignancies.

For our patient, there was evidence of hematologic disease, but no clear diagnosis. Her flow cytometry and TCR rearrangement testing were consistent with clonal cytopenia of undetermined significance (defined as having an unexplained cytopenia, clonal hematopoiesis with ≥2 percent variable allele frequency of a leukemia-associated gene, and no other evidence of hematologic malignancy). Patients with this have considerable but poorly-defined risk of progression to myelodysplastic syndromes or AML. There are no evidence-based guidelines regarding frequency of follow-up, but this is often based on severity of cytopenia.

CONCLUSION: Our patient presented with leukocytosis and fever; despite a thorough workup, diagnosis could not be made for 6 months. Her development of PG was instrumental in determining follow-up and ultimately led to the final diagnosis, as its' known disease associations helped guide further monitoring. A patient presenting with PG in the setting of cytopenia should raise concern for hematologic malignancy. Even without clear diagnosis of malignancy, patients may possess mutations that pre-dispose them to developing one, warranting regular follow-up.

PYODERMA GANGRENOSUM ASSOCIATED WITH UNDIAGNOSED HIV

Christopher Little, Shaunak Mulani. Department of Medicine, University of Florida College of Medicine, Gainesville, FL. (Control ID #3384784)

LEARNING OBJECTIVE #1: Consider HIV infection among underlying etiologies for neutrophilic dermatoses.

LEARNING OBJECTIVE #2: Avoid pathergy-associated exacerbation of PG when repeated surgical interventions fail.

CASE: A 38-year-old woman with sickle cell trait was transferred for a non-healing, lower extremity wound.

Four months prior, she believed an insect bite to her left calf caused redness, swelling and pain which worsened over two weeks. She had 2 lifetime sexual partners, no history of injection drug use and a family history of RA. She was admitted with normal vitals. Initial workup for vasculitis and infection were negative. Debridement and skin grafting with IV antibiotics was followed by 4 months of outpatient management. She was readmitted for graft failure. Despite 5 debridements and antibiotics, the wound showed decreased granulation and erosion of skin around the donor site.

She was transferred to a tertiary care center with normal vitals and an unchanged exam. Dermatology made a presumptive diagnosis of pyoderma gangrenosum (PG). HSV swabs were obtained, as herpetic infections are known to mimic PG, but were negative. While she had no history of PG-associated comorbidities, HIV was considered as a rare association. Testing was positive (CD4 count 46). Antibiotics were stopped after negative cultures. Immunosuppressants were held to limit activation of latent infections. Initiation of HAART was complicated by psychosocial barriers including the patient's belief in divine healing and reluctance to discuss her HIV diagnosis. Final pathology showed eosinophil-predominant dermal infiltrate. While this argued against the typical neutrophilic-predominant dermatosis seen in PG, the clinical context favored a variant of PG. She ultimately agreed to HAART.

IMPACT/DISCUSSION: Infections and sepsis remain at the forefront of clinical consideration given their high rates of morbidity and mortality, but clinicians must consider alternative diagnoses when typical therapies fail. This rare case of PG presented as the initial manifestation of dysfunctional immunity in a patient with HIV. PG has an estimated incidence of 3 to 10 cases per million per year. Nearly 50% of those have underlying systemic disease, most commonly IBD, arthritis, or hematologic disease. Fewer than 10 cases of PG have been reported with a new diagnosis of HIV. In one 2014 case, PG improved with HAART alone. This suggests treating HIV can heal PG.

Additionally, PG must be considered when wounds worsen with surgical intervention. Pathergy is a phenomenon where PG is induced by incidental or iatrogenic trauma, which is seen in up to 30% of cases. In this case, 6 surgical procedures were performed before identifying the underlying immunodeficiency driving the neutrophilic dermatosis.

CONCLUSION: PG is a diagnosis of exclusion but must be considered given characteristic clinical findings and HIV should be tested when more common underlying systemic diseases are not present.

Surgical intervention should be avoided in cases of PG when pathergy is suspected.

RARE CASE OF FACTOR V LEIDEN DEFICIENCY AND IDIOPATHIC PAGET-SCHROETTER SYNDROME

Courtney Moore, Abhiroop Verma, Caleb Hansen. Internal Medicine, Ascension Providence, Southfield, MI. (Control ID #3391200)

LEARNING OBJECTIVE #1: Recognize rare location of thrombus associated with thrombophilia and implications on long term management

CASE: 43 year old female who presented with complaints of right upper extremity pain, edema and discoloration of a week's duration. History was notable for Factor V Leiden, she was G2P2002, and was not on any OCP's or anticoagulants. Family history was significant for multiple first-degree relatives with FVL. She was an active smoker with a 24 pack year history. She denied trauma, repetitive or strenuous physical activity of the upper extremity or medical procedures. Exam revealed bilateral palpable pulses, right sided supra/infraclavicular edema and tenderness extending to the proximal humerus without facial plethora. Labs revealed an unremarkable CBC and coagulation panel. Cervical rib was absent on X-ray. RUE US revealed an occlusive thrombus of the subclavian vein. Therapy was initiated with IV heparin. Vascular surgery was consulted to evaluate for Paget Schroetter syndrome (PSS). Patient declined further procedural intervention and elected for conservative management with anticoagulation. Her symptoms improved and she was discharged on Eliquis. She returned one week later reporting persistent heaviness and pain in her right arm. Venogram revealed persistent partial occlusion and she underwent catheter directed thrombolysis. Hyperabduction during the procedure demonstrated no flow through the subclavian, confirming underlying PSS. Post-procedural venogram revealed resolution of obstruction and restoration of flow.

IMPACT/DISCUSSION: Data is scarce regarding the number of patients with underlying hypercoagulable state and PSS. Due to the distinct history and presentation of PSS, combined with low rates of recurrence following surgicery, few patients are screened for an underlying thrombophilia. Our patient with FVL presenting with PSS in the absence of provocation, repetitive use, or inciting event is rare. PSS incidence is 2/100,000 with average age at presentation in the early 30's and more predominant in males. More than 80% of people with an acute thrombus present within 24 hours of strenuous upper extremity activity or an event where the arm was abducted. Upper extremity VTE accounts for a small percentage (1%-4%) of all thrombotic events in the general population.

Less than 5% of thrombi related to FVL form in the subclavian vein, majority are of iliofemoral origin. Of the thrombi formed in the upper extremity more than half are associated with instrumentation. Rates of recurrent thrombus formation in FVL is as high as 12% and rates of recurrence of PSS using just thrombolysis were as high as 23%. Our patient is undergoing the recommended treatment; localized thrombolysis with surgical decompression of the rib and scalenectomy. Using this treatment plan up 95% of patients have no recurrence. Data regarding recurrence in PSS in patients with FVL is unavailable.

CONCLUSION: Further evaluation needed for upper extremity thrombosis, anti-coagulation alone may not be enough

RARE CASE OF THORACIC GANGLIONEUROMA IN ADULT PATIENT

Maitreyee Rai[1]; Nadia Aslam[2]; Charles Geller[3]. [1]Internal Medicine, Crozer Chester Medical Center, Brookhaven, PA; [2]internal medicine, Crozerchester medical center, Secane, PA; [3]Cardiothoracic Surgery, Crozer Chester Medical Center, Upland, PA. (Control ID #3392464)

LEARNING OBJECTIVE #1: Diagnose thoracic ganglioneuroma as a cause for posterior mediastinal mass.

LEARNING OBJECTIVE #2: Manage and work up patients presenting with incidental posterior mediastinal mass.

CASE: The patient is a 60-year-old caucasian male with no significant past medical history, non-smoker, presents with an incidental finding of mediastinal mass noted on chest x-ray. A follow up computed tomography (CT) scan and magnetic resonance imaging (MRI) of the chest showed a left posterior mediastinal mass extending from T5-6 to T9-10 vertebral level (size 6.9 x 3.3 x 8.4 cm), suspicious for teratoma. He underwent an elective thoracotomy and excision of the mass. The initial frozen section showed fibrous adipose tissue. The final pathology report was concluded as ganglioneuroma with fatty replacement and the diagnosis was supported by the immunohistochemical stain positive for S100 protein.

IMPACT/DISCUSSION: Ganglioneuromas (GN) are rare, well-differentiated neurogenic tumors composed of mature sympathetic ganglion cells that arise from neural crest cells that commonly occur in the posterior mediastinum, retroperitoneum, adrenal glands, and cervical spine. Its incidence is rare, accounting for 0.1 to 0.5% of central nervous system tumors and 1% of spinal and paraspinal tumors. GNs are most frequently diagnosed in children and young adults. In our patient, GN was diagnosed after the age of 50 years. Usually, GN is asymptomatic and found incidentally on imaging. Rarely, GNs can present with sympathomimetic symptoms because of catecholamines or neuropeptides production. Malignant transformation of these well- differentiated tumors is exceedingly rare. Mediastinal masses have variable histopathological and radiological features. The imaging modality of choice is contrast-enhanced CT scan and MRI imaging. The definitive diagnosis in our case was made by the histopathology showing ganglioneuroma, and IHC staining positive for S 100 highlighting the ganglion cells and Schwann cells. Additionally, the tumor cells were negative for p16 and CD34 markers, therefore, ruling out low-grade liposarcoma and solitary fibrous tumor respectively. Complete surgical excision is the treatment of choice.

CONCLUSION: Mediastinal lesions are rare entities and data regarding their clinical and histopathological features are limited. The absence of distinguishing imaging features implies that the diagnosis of these tumors is made histologically. Surgical resection is the most effective option.

RARE CAUSE OF THROMBOCYTOPENIA IN APPALACHIA INVOLVING A POINT MUTATION IN THE ANKRD26 GENE

Harish Madala[2,3]; Arisha Carreon[1]. [1]Internal Medicine, Ballad Health Norton Community Hospital, Norton, VA; [2]Hematology/ Oncology, Southwest Virginia Cancer Center, Norton, VA; [3]Hematology/ Oncology, Holston Valley Medical Center, Kingsport, TN. (Control ID #3369777)

LEARNING OBJECTIVE #1: Differentials for thrombocytopenia

LEARNING OBJECTIVE #2: Importance of identifying anchoring bias

CASE: A 65 yo female with chronic fatigue syndrome was referred for workup of low platelets, presumed to be from Idiopathic Thrombocytopenic Purpura. Family history was significant for clinical bleeding diathesis with thrombocytopenia in patient's child, twin sister, nieces from sister, and two of the niece's children. Family pedigree suggested a non-X-linked Autosomal Dominant inheritance. Initial bone marrow biopsy in 2012 was normal. Work-up showed negative ANA, hepatitis panel, Helicobacter pylori and for autoimmune diseases and no paraproteinemia. Wiskott Aldrich syndrome gene analysis was negative and abdominal ultrasound showed no hepatosplenomegaly. Peripheral smear showed normal sized platelets, no clumping and no blasts. Repeat bone marrow biopsy showed normocellular bone marrow with trilineage hematopoiesis; normal female karyotype; FISH negative for myelodysplastic syndrome mutations. Patient was unresponsive to a trial of prednisone. Eventually, genetic testing revealed heterozygosity in ANKRD26c.-126T>C, consistent with Nonsyndromic Thrombocytopenia (THC2).

IMPACT/DISCUSSION: Thrombocytopenia, defined as having a platelet count of less than 150 × 103 per μL, is a commonly encountered problem in medical practice. Differential causes for thrombocytopenia include; decreased production, increased consumption, or sequestration. ANKRD26 is a gene mutation that causes Autosomal Dominant Nonsyndromic Thrombocytopenia (THC2), and is associated with mild bleeding tendencies along with mild to severe thrombocytopenia. The point mutation in ANKRD26 is thought to alter the binding of key transcription factors, resulting in abnormal signal transduction which adversely affects platelet formation, and also indirectly affects other signal transduction pathways which may increase the risk of myeloid precursor transformation. There are 21 known families affected with this syndrome worldwide.

CONCLUSION: ANKRD26/ TH2 is identified by mild to severe thrombocytopenia with normal platelet size and no phenotypic complications.

The predominating theory regarding thrombocytopenia in ANKRD26 mutations is dysregulation of pathways which affect platelet formation.

The ability to recognize this disorder is important for proper management and surveillance of the affected population. Incorrect diagnosis and anchoring bias during evaluation can lead to unnecessary and potentially harmful treatments such as chronic steroids and/or splenectomy.

Patients with this syndrome may need surveillance by annual blood counts for early detection of myeloid neoplasms as they are at increased risk for developing acute leukemias.

REACT TO REACTIVE: AN ATYPICAL PRESENTATION OF REACTIVE ARTHRITIS

Naga Vaishnavi Gadela[1]; Dimitrios Drekolias[1]; Jason Jacob[2]. [1]Department of Internal Medicine, University of Connecticut, Farmington, CT; [2]Department of Medicine, Hartford Hospital, Hartford, CT. (Control ID #3390780)

LEARNING OBJECTIVE #1: Diagnose reactive arthritis in the absence of the usual triad of gastrointestinal, genitourinary symptoms, and eye involvement.

LEARNING OBJECTIVE #2: Distinguish reactive arthritis among other causes of dactylitis.

CASE: Our patient is a 37-year-old male with no significant past medical history who presented with left foot pain which has been gradually worsening for 3 weeks. He did not notice any inciting event, denied trauma, vigorous exercise, unsafe sex practices, genital symptoms or fever. Physical examination was unrevealing except for mild swelling near the left 4th metatarsal joint concerning for dactylitis. X-ray of his left foot that did not reveal bone or joint abnormalities. He underwent conservative management with NSAIDs. Two months later, along with his 4th toe metatarsalgia, patient presented with complaints of right 3rd toe dactylitis and left knee pain. Left knee x-ray revealed mild soft tissue swelling with no evidence of acute fracture or dislocation. Notable labs included erythrocyte sedimentation rate 26mm/hr and C-reactive protein 1.15 mg/dl. Given asymmetric oligo-arthritis, rheumatologic workup was sent and was negative for rheumatoid factor, anti-citrullinated protein antibodies, anti-nuclear antibodies, anti-dsDNA, and HLA-B27. Infectious workup was negative for Lyme disease, HIV and gonorrhea. There was no juxta-articular bone formation on any of the x-rays. Our patient was tested positive for chlamydia and was subsequently treated with doxycycline with close follow up.

IMPACT/DISCUSSION: Reactive arthritis is a form of spondyloarthritis (SpA) that can occur after gastrointestinal or genitourinary infections. It is relatively rare with a highly heterogeneous incidence in the range of 0.62-27 per 100,000. Chlamydia is the most common pathogen involved. Clinical presentation includes asymmetric oligoarthritis of usually 1-4-week duration. Ocular, cutaneous, and oral lesions can also occur. Laboratory findings may include evidence of infection and elevated inflammatory markers. HLA-B27 is positive in 30%-80% of patients. Other etiologies of dactylitis include psoriatic arthritis, sickle-cell disease, or rarely sarcoidosis. Treatment of reactive arthritis includes NSAIDs, intra-articular or systemic steroids, and in the case of resistant reactive arthritis, nonbiologic DMARDs such as sulfasalazine and methotrexate. Patients with a history of chlamydia-induced arthritis should receive standard anti-microbial treatment for the infection, in order to prevent relapses

CONCLUSION: This case highlights the importance of considering infectious workup in patients with chronic asymmetric oligo-arthritis, even in the absence of classic triad of symptoms and high-risk behavior.

A high index of suspicion highlighting infectious and rheumatologic causes should be kept for dactylitis which can also be a presenting feature of reactive arthritis.

RECOGNITION OF HEALTH-HARMING LEGAL NEEDS AND THE VALUE OF THE MEDICAL- LEGAL PARTNERSHIP

Christina M. Kaul[1]; Omolara T. Uwemedimo[2]; Johanna Martinez[3]. [1]Internal Medicine, Zucker School of Medicine at Hofstra/Northwell, Woodbury, NY; [2]Pediatrics, Zucker School of Medicine at Hofstra/ Northwell, New Hyde Park, NY; [3]Medicine, Northwell Health, Lake Success, NY. (Control ID #3386592)

LEARNING OBJECTIVE #1: Recognize the impact of health-harming legal needs on patient outcomes

LEARNING OBJECTIVE #2: Value lawyers as part of an interprofessional healthcare team

CASE: Ms. A.S. is a 16-year old female with a past medical history of end stage renal disease and hypertension whose care was complicated by unmet social and legal needs. The patient was born in Jamaica, where she was diagnosed with hypertension but not started on antihypertensives. During a trip to the United States (US), she was admitted to an outside hospital for hypertensive emergency and acute renal failure. Renal biopsy revealed extensive glomerulosclerosis. She was initiated on peritoneal dialysis and two weeks later required readmission for hemodialysis (HD) initiation. The patient was then transferred to our hospital for further care. Given her immigration status, the patient was initially not eligible for the kidney transplant list. At discharge, the patient was linked to our Nephrology clinic, where she was referred to our medical- legal partnership (MLP). With the assistance of the MLP, she was able to receive medical insurance and a medical visa. Also due to the MLP, she was placed on the transplant list three months after presentation and received an extension of her medical visa for continued care. Currently, the patient remains in the US, continues on HD, and awaits transplant.

IMPACT/DISCUSSION: It has been well established that social determinants of health (SDH) have a major impact on health outcomes. Health-harming legal needs (HHLN) are a subset of SDH that can be addressed legally. In turn, MLPs were established to link patients to legal services. Unfortunately, MLPs are often absent in health systems due to lack of establishment or lack of understanding about the value of lawyers in healthcare. Even if MLPs are present, there are cases when clinicians lose touch with HHLN or lawyers lose sight of medical issues, leading to communication barriers and lapses in care.

Our health system has established a robust MLP that has positively impacted many patients. In this case, without an MLP, our patient could have suffered delays in care, complications, or even death. Also, having lawyers co-located in our medical practice strengthens communication, allowing for continued care expediency. Without this collaboration, the legal team would not have known the patient's condition and would not have filed a medical visa extension. The patient would have returned to Jamaica, causing disjointed care and likely worsened health. Our patient is a clear example of the benefits of an MLP: she was able to stay in the US to continue care, avoid family separation, and remain eligible for a transplant. MLPs are a vital component in providing comprehensive care to marginalized patient populations and advancing health equity.

CONCLUSION: Primary care providers should recognize HHLN and understand the value of lawyers as an integral part of a medical team.

Medical providers should feel empowered to establish programs that link patients with HHLN to legal services

RECOGNIZING AND TREATING AGITATION IN NON-VERBAL ADULTS WITH DEVELOPMENTAL DISABILITIES

Brooke Gogel[1]; Alexis Tchaconas[1]; Joseph Truglio[2]. [1]Internal Medicine, Pediatrics, Icahn School of Medicine at Mount Sinai, New York, NY; [2]Internal Medicine, Pediatrics and Medical Education, Icahn School of Medicine at Mount Sinai, Maplewood, NJ. (Control ID #3390007)

LEARNING OBJECTIVE #1: Develop an appropriate differential diagnosis for acute behavioral change in non-verbal adults with developmental disabilities

LEARNING OBJECTIVE #2: Discuss the broad treatment options for agitation in non-verbal adults with developmental disabilities

CASE: LF is a 32-year-old non-verbal female with Rett's Syndrome (RTT) and seizure disorder who presented to the clinic with acute behavioral changes. According to her mother, who serves as her primary caregiver, LF had significant behavioral changes over the past few weeks, manifesting itself as more frequent episodes of full-body muscle contractions, audible tachypnea, difficulty sleeping, and blank stares. She was also noted to repeatedly bring her hands to her mouth. There was no report

of constipation, vomiting, diarrhea, fever or changes in urination. On exam, she was a thin-appearing woman in a wheelchair with contracted lower extremities. Vital signs were within normal limits. In order to ascertain a possible organic cause, a comprehensive medical work-up was pursued. Given her mother's concern for a dental problem, an oral exam was performed, which revealed normal dentition without signs of infection. Next, the patient was hospitalized to try to address concerns of increased seizure frequency. However, EEG revealed stable seizure activity and therapeutic antiepileptic levels. During the workup, her mother implemented simple but effective therapeutic interventions that helped keep LF calm, including bathing and playing music.

IMPACT/DISCUSSION: There is a growing population of non-verbal adults with developmental disabilities (DD). As medical advances have increased the life expectancy of these patients, they are now under the care of general internists. Rett Syndrome is one such example: RTT is an X-linked dominant neurodevelopmental disorder caused by a mutation on the MECP2 gene on the X chromosome and one of the most common causes of severe impairment in females. While initial studies on Rett Syndrome painted a dismal prognosis, newer studies indicate survival into adulthood is actually typical. These patients pose particular challenges for general internists, as changes in baseline behavior require comprehensive workups to determine if there is an underlying medical problem. In addition to a thorough physical exam, the workup for acute agitation relies heavily on caregiver insight. However, it is equally important that physicians be able to manage acute agitation. Current evidence suggests a multifactorial therapeutic approach to the patient with DDs, including newer non-medical interventions such as music or water therapy. These interventions have shown improvements in both social and physical domains and have been found to reduce caregiver stress.

CONCLUSION: Addressing acute behavioral change in non-verbal adults with developmental disabilities requires a thorough history and physical exam, as well as coordination among interdisciplinary care providers who can create personalized therapeutic approaches.

RECURRENT MUCOID PSEUDOMONAS INFECTION AND BRONCHIECTASIS: A LATE DIAGNOSIS OF CYSTIC FIBROSIS (CF) IN A 65-YEAR-OLD MAN

Jennifer C. Li[1]; Bennett Vogelman[2]. [1]Internal Medicine, University of Wisconsin Hospital and Clinics, Madison, WI; [2]Medicine, University of Wisconsin, Madison, Madison, WI. (Control ID #3390059)

LEARNING OBJECTIVE #1: Distinguish the clinical presentation of adult-diagnosed cystic fibrosis as compared to pediatric-diagnosed cystic fibrosis.

LEARNING OBJECTIVE #2: Evaluate underlying etiologies for patients presenting with recurrent bronchiectasis.

CASE: A 65-year-old Caucasian man with history of CAD, HFrEF, and OSA presents with 3 weeks of productive cough, exertional dyspnea, sinus pressure, and frontal headache. 18 months ago, he was treated for mucoid Pseudomonas and MSSA pneumonia with 6 weeks of ciprofloxacin and 3 weeks of piperacillin/tazobactam transitioned to 3 weeks of dicloxacillin. 8 months prior, he was again treated for mucoid Pseudomonas, MSSA, and Aspergillus pneumonia with 7 weeks of piperacillin/tazobactam, ciprofloxacin, and voriconazole. Currently, his CT shows bronchiectasis with extensive bronchial plugging and tree-in-bud nodules and sinusitis. Bronchoscopy with BAL showed pan-sensitive mucoid Pseudomonas and MSSA, which was treated with piperacillin/tazobactam and ciprofloxacin. Extensive workup uncovered Phe508del and Arg117His CF alleles; he was unable to produce enough sweat for a chloride test. Work-up was negative for primary and secondary immunodeficiencies, systemic inflamatory diseases, alpha-1 antitrypsin deficiency (A1AD), allergic bronchopulmonary aspergillosis (ABPA), and other conditions. Additional history revealed recurrent and prolonged sinus infections in his late 20s; his nephew was diagnosed with CF in childhood. He has no history of pancreatitis and has never fathered. He was referred to the University of Wisconsin CF center for lumacaftor/ivacaftor therapy.

IMPACT/DISCUSSION: Although CF is most commonly diagnosed in childhood, 10% of CF patients are diagnosed after age 18. With the advent of new targeted CF therapies, delays in diagnosis could lead to worse outcomes for patients. This case of late-diagnosed CF highlights unique diagnostic features in adults for a disease otherwise typically diagnosed in childhood. For examples, one of the diagnostic criteria for CF includes labortaory evidence such as sweat chloride testing or genetic testing; though adult-diagnosed patients typically have lower sweat chloride values, so the value of genetic testing is greater. Other distinguishing features noted in this case include retained pancreatic function and lack of gastrointestinal manifestations. Similarities to child-diagnosed CF are described as well, which include bronchiectasis, predominance of Pseduomonas infections, and sinusitis. Furthermore, bronchiectasis entails a broad differential, which includes CF, immunodeficiencies, systemtic inflammatory diseases, A1AD, APBA, primary ciliary dyskinesia, leukocytic dyfunction, and etc. Given the patient's presentation of recurrent bronchiectasis, this case demonstrates how to evaluate the possible causes underlying this condition.

CONCLUSION: Internists can recognize CF manifestations in older adults presenting with bronchiectasis, tree-in-bud nodule CT findings, and mucoid Pseudomonas pneumonia, particularly with recurrent episodes.

RECURRENT PSE: NOT ALWAYS A COMPLIANCE ISSUE

Erin Schikowski[1]; Amar Kohli[1]; Jared D. Romeo[2]. [1]Internal Medicine, UPMC, Pittsburgh, PA; [2]Internal Medicine, University of Pittsburgh, Pittsburgh, PA. (Control ID #3364014)

LEARNING OBJECTIVE #1: Develop an illness script for portosystemic shunt in patients with cirrhosis.

LEARNING OBJECTIVE #2: Recognize the importance of time course when determining the etiology of portosystemic encephalopathy (PSE).

CASE: 50-year-old woman with primary biliary cholangitis/autoimmune hepatitis, cirrhosis, and recurrent PSE presented with altered mental status for several days, making this her third episode in the span of three weeks. Prior episodes were presumed to be secondary to medication noncompliance, and on a separate occasion UTI. On admission she was unable to name her home medications but reported having three bowel movements daily. She reported no symptoms of infection. Physical exam revealed mild abdominal distention, and point-of-care ultrasound showed an insufficient fluid pocket for diagnostic paracentesis. Glucose was 61, and electrolytes were normal with the exception of Na 135. Ammonia was 54, decreased from 77 last admission. Zinc level was sent. She was monitored closely for hypoglycemia, which did not recur, and treated with rifaximin and lactulose at increased frequency compared to her home regimen. Mental status improved, though she continued to have inattention consistent with low-grade hepatic encephalopathy.

Triphasic MRI was negative for hepatocellular carcinoma but revealed evidence of advanced portal hypertension, including a large spontaneous splenorenal shunt. Plans were made for outpatient follow up with possible shunt closure by IR. After discharge, zinc level returned low at 25.

IMPACT/DISCUSSION: It is important to distinguish among episodic, recurrent, and persistent time courses in patients with PSE. Here the time course was at least recurrent, possibly persistent. Persistence requires that symptoms are always present, interspersed with episodes of more overt encephalopathy. She had two potentially reversible etiologies of recurrent PSE: zinc deficiency and portosystemic shunt. Large studies

demonstrating the efficacy of zinc supplementation are lacking; however, one study of patients with refractory disease did show that supplementation was associated with decreased encephalopathy grade (Takuma et al., 2010). Perhaps more important, she had large spontaneous splenorenal shunt, which diverts ammonia from the liver and can cause more sustained encephalopathy resistant to medical therapy. Splenorenal shunt prevalence has been estimated at 10.5% (Xingshun et al., 2017) and 18.5% (Tarantino et al., 2009), making it relatively rare. However, its identification allows for targeted treatment. MRI can be used for both hepatocellular carcinoma screening, as in this case, and shunt detection. PSE that is resistant to proper therapy, with elevated ammonia, would be mainstays of the illness script for portosystemic shunt.

CONCLUSION: 1. Portosystemic shunt should be considered in recurrent and/or persistent PSE.

2. It is important to avoid search satisficing, even in patients with history of medication noncompliance.

RECURRENT SEPTIC ARTHRITIS CAUSED BY COCCIDIOMYCOSIS

Miren Pena[1]; Megan Lewis[1]; Uzair Mushtaq[2]. [1]Internal Medicine, UT Health Science Center San Antonio, San Antonio, TX; [2]Internal Medicine, UTHSCSA, San Antonio, TX. (Control ID #3386657)

LEARNING OBJECTIVE #1: Consider Coccidiomycosis as a cause of culture negtive septic joint

CASE: A 40 year old male with a past medical history notable for ERSD on dialysis, diabetes mellitus, and pulmonary coccidiomycosis diagnosed in 2014 presented in the Spring of 2019 with two months left knee pain concerning for septic arthritis. He had no signs of systemic or pulmonary infection. He had been evaluated at an outside clinic two months prior with a joint aspiration showing 49,000 WBCs with a 92% neutrophil predominance. MRI was consistent with infection, but bacterial and fungal cultures were negative. He was prescribed Bactrim, however, his symptoms continued to worsen and started to affect his gait. On admission, he was prescribed fluconazole 400mg PO, levofloxacin and vancomycin for 4 weeks. He underwent left knee arthrotomy and debridement with once again negative bacteria growth and negative fungal and AFB stains. However, Cocci Ab Complement fixation titer was positive.

The patient presented again a few months later with worsening knee pain despite reported adherence and completion of antibiotic regimen. He underwent left knee irrigation and debridement. Surgical pathology showed granulomatous and acute and chronic inflammation with organisms consistent with coccidiomycosis. Synovial fluid culture showed coccidioides immitis.

IMPACT/DISCUSSION: Coccidiomycosis infections are frequently acquired in endemic regions of the country and for the most part result in an asymptomatic presentation or primary lung infection. Between 0.2 to 4.7% of exposures may result in extra-pulmonary manifestations including dissemination to the skin, subcutaneous tissue, meninges/spinal cord, vertebrae and joints. This case report highlights a case of potential fluconazole- resistant disseminated coccidiomycosis in San Antonio, Texas, a likely endemic area according to the CDC. This patient showed signs of disseminated disease localized to the left knee approximately 5 years after a diagnosis of pulmonary disease was made in 2014. In an immunocompromised patient presenting with septic arthritis and a remote history of coccidiomycosis it is advisable to include this pathogen in your differential, sometimes even despite negative cultures.

CONCLUSION: Coccidiomycosis infections are frequently acquired in endemic regions of the country, and a monoarticular infection of the knee joint is the most frequent type of joint affected in dissemination. In this case we discussed a patient who, after multiple rounds of antibiotics and negative fungal cultures, had no improvement in his knee pain and was later found to have surgical pathology and synovial culture consistent with coccidiomycosis.

RECURRENT VENOUS AND ARTERIAL THROMBOEMBOLIC EVENTS AS FIRST MANIFESTATIONS OF PANCREATIC MALIGNANCY

Afsaneh Amouzegar[1]; Gena M. Walker[2]. [1]Department of Medicine, University of Pittsburgh School of Medicine, Pittsburgh, PA; [2]Department of Medicine, University of Pittsburgh School of Medicine, Pittsburgh, PA. (Control ID #3392164)

LEARNING OBJECTIVE #1: Identify thromboembolic events as potential presenting manifestations of malignancy

LEARNING OBJECTIVE #2: Recognize the possibility of underlying pancreatic malignancy in patients with arterial and venous thrombosis in the absence of an identifiable hypercoagulable disorder

CASE: A 64-year-old man presented with acute onset right hemiparesis and facial droop. His past medical history was notable for hypertension, diabetes mellitus type 2, coronary artery disease, and recently diagnosed bilateral popliteal deep venous thrombosis for which he was taking Apixaban. At presentation, his vital signs were stable and initial labs were unremarkable, except for hemoglobin 9.4 and troponin 0.46. On physical exam, he had aphasia, right facial palsy, and decreased right upper and lower extremity muscle strength with intact sensation. Head CT angiogram revealed distal left A2/A3 anterior cerebral artery segment occlusion. Patient underwent thrombectomy and was started on Enoxaparin. One week after starting anticoagulation, patient developed new right hemiparesis and was found to have multiple new strokes with one dominant stroke in the left middle cerebral artery distribution on brain MRI. His course was further complicated by acute bilateral lower extremity ischemia discovered to be due to bilateral popliteal artery thrombosis. CT of the abdomen and pelvis showed multiple wedge-shaped infarcts in the spleen and left kidney, a hypoenhancing 2.6 x 1.9 cm mass in the head of the pancreas, and multiple enlarged mesenteric, periportal, and retroperitoneal lymph nodes. Hypercoagulability workup including testing for lupus anticoagulants and hereditary thrombophilia were negative. Endoscopic ultrasound-guided fine needle aspiration biopsy of the mass revealed pancreatic head adenocarcinoma.

IMPACT/DISCUSSION: Reported incidence of thromboembolic events in pancreatic malignancy is estimated to be 17-57%. Among thromboembolic disorders, venous events, such as deep venous thrombosis, pulmonary embolism, splenic and mesenteric vein thrombosis are more prevalent than arterial events, which are estimated to have a lower incidence of 2-5%. Thromboembolic events, in particular, those preceding the diagnosis of pancreatic cancer, or events happening early in the course of malignancy have been associated with an overall poorer prognosis and a higher risk of death. Cerebrovascular events and myocardial infarction are the most commonly reported arterial thromboembolic events associated with pancreatic neoplasms. Simultaneous development of arterial and venous thrombosis often raises suspicion for an underlying hypercoagulable disorder; However, in adult patients, it should also prompt consideration for evaluation of underlying malignancy.

CONCLUSION: The above case is a reminder that in the absence of an identifiable hypercoagulable disorder, simultaneous development of arterial and venous thrombosis should raise concerns for underlying pancreatic malignancy.

REPEAT TESTING REVEALS THE DIAGNOSIS: A CASE OF ACUTE HEPATITIS A

Altaib Al Yassin[1]; Matthew Petersile[2]; Jonathan Kassira[1]; Joshua Lee[1]; Matthew Greenwood[1]; Isabel Zacharias[2]. [1]Internal Medicine, University of Massachusetts Medical School, Worcester, MA; [2]Gastroenterology, UMASS, Worcester, MA. (Control ID #3373740)

LEARNING OBJECTIVE #1: Identify acute Hepatitis A as a cause for acute liver failure

LEARNING OBJECTIVE #2: Recognize that repeat testing for Hepatitis A IgM should be performed if clinical suspicion for acute Hepatitis A is high

CASE: A 65-year old male with a history of type 1 diabetes and hypothyroidism presented with malaise, lethargy and gait instability in the setting of daily alcohol consumption. He was found to have a transaminitis of AST 170 and ALT 161, Total bilirubin 1.2 and INR of 1.3. Initial workup including acute hepatitis panel was negative. The patient's labs progressively worsened to AST of 11,460, ALT of 8,743, bilirubin of 8.0, and INR 1.6 and the patient was transferred to a tertiary medical center for possible liver transplant evaluation. Despite medical treatment, the patient's mental status deteriorated and he was transferred to the ICU for concern of fulminant liver failure and the patient began evaluation for possible liver transplant. At that time, further testing including a repeat viral hepatitis panel demonstrated a positive Hepatitis A IgM. Over the next several days the patient's labs and clinical status improved and he was transferred out of the ICU. A transjugular liver biopsy was obtained showing mixed panlobular hepatitis with mixed inflammation including predominantly lymphoplasmocytes, eosinophils, and neutrophils consistent with acute hepatitis A infection. The patient was discharged home with outpatient follow up.

IMPACT/DISCUSSION: Hepatitis A Virus (HAV) is a common cause of acute hepatitis globally, with approximately 1.5 million cases annually. Acute Hepatitis A infection often presents with nausea, vomiting, fever, malaise, and abdominal pain. Lab work suggestive of acute HAV includes markedly elevated transaminases > 1000 IU/dL. The diagnosis of acute hepatitis A virus (HAV) infection is confirmed by presence of anti-HAV IgM antibodies. However, early in the disease course testing for Hepatits A IgM antibodies can be negative. The majority of acute HAV infections resolve with conservative therapy. However, a small proportion of infected patients (<1%) can progress to acute liver failure. Acute liver failure is defined as evidence of coagulopathy (INR > 1.5), presence of encephalopathy without pre-existing liver disease and duration of symptoms less than 26 weeks. Early recognition is crucial since liver failure is associated with high rate of morbidity and mortality. Patients with acute liver failure should be considered for transfer to a liver transplant center as worsening liver failure from Hepatitis A may result in necessity of a liver transplant.

CONCLUSION: Hepatitis A virus infection is an important diagnosis to consider in patients with severe transaminitis. Heapatitis A IgM antibody testing may be negative early in the disease course and testing should be repeated if clinical suspicion for acute hepatitis remains high as this may reveal the diagnosis. Patient with acute liver failure should be considered for transfer to a liver transplant center.

RETURN PRECAUTIONS: A CASE OF INTERMITTENT ANGIOEDEMA

Daniel Minter, Irina Kryzhanovskaya. Medicine, University of California San Francisco, San Francisco, CA. (Control ID #3391168)

LEARNING OBJECTIVE #1: Evaluate conditions with episodic clinical manifestations

LEARNING OBJECTIVE #2: Recognize angioedema as a cause of intermittent soft tissue swelling **CASE:**

A 55-year-old man with a history of allergic rhinitis presented for evaluation of recurrent soft tissue swelling.

8 days prior, he had swelling of the distal phalanx of his right fourth finger followed by painful swelling over his bilateral wrists. This was associated with a raised, erythematous, and pruritic papular rash on his palms that extended up his forearms bilaterally, which subsequently resolved.

Two days later, the patient experienced similar swelling to his bilateral ankles without any associated rash. Additionally, he described a sensation of transient fullness to the right half of his tongue that self-resolved over the course of a day.

He presented 4 days later to his primary care clinic for further evaluation. He was, again, symptom-free at this time. His exam was notable only for the presence of inducible dematographism. The patient was prescribed an epinephrine pen, referred for laboratory testing, and told to present to the emergency room if he developed any further swelling, especially of his face or oral cavity.

Four hours after leaving his primary care appointment, the patient's upper lip doubled in size. He did not have any tongue swelling, wheezing, rash, or shortness of breath. Given this concerning new finding and the return precautions from his primary care provider, he presented to the emergency department.

On arrival to the ED, his VS were within normal limits. Exam was notable for asymmetric perioral edema without uvular edema. A laboratory evaluation was notable for normal C4 level of 28.9 (11-30), tryptase 4 (<11), and negative testing for C1 esterase inhibitor.

He was started on antihistamine therapy and observed overnight in the hospital. His symptoms improved, and he denied further episodes of tissue swelling at his follow up in the allergy/immunology clinic.

IMPACT/DISCUSSION: This patient's presentation of recurrent subcutaneous swelling was most consistent with allergic (histaminergic) angioedema, given his apparent allergic diathesis and prominent associated urticaria.

Angioedema refers to localized, nondependent tissue swelling due to increased vascular permeability. The underlying mechanisms leading to angioedema can be classified as (1) histaminergic or mast-cell mediated, (2) bradykinin-mediated, or (3) due to unknown mechanisms.

Management depends on the type of angioedema, as non-histaminergic causes will not respond to antihistamines, epinephrine, or corticosteroids. In cases with potential airway involvement, close observation in the hospital setting may be warranted to monitor for involvement of the uvula or glottic region.

CONCLUSION: The present case highlights the difficulty associated with diagnosing conditions with episodic symptoms. In such instances, effective communication with our patients (often in the form of "return precautions") can help us ultimately reach a final diagnosis.

RHABDOMYOLYSIS AND ACUTE KIDNEY INJURY ASSOCIATED WITH LEGIONELLA PNEUMONIA

Mitsuhiro Shimada. Internal Medicine, Mount Sinai Beth Israel, New York, NY. (Control ID #3375952)

LEARNING OBJECTIVE #1: To recognize rhabdomyolysis as a complication of *Legionella* pneumonia

CASE: A 46-year-old man with a history of hypertension presented with 1-day of dyspnea and productive cough. He also noted 3-day of worsening malaise, chills, and non-bloody diarrhea. There was a *Legionella* outbreak at his apartment building.

Vital signs included temperature 97.9 F, HR 88 bpm, BP 128/83 mm Hg, RR 20 bpm, and SpO2 95% on 5L NC. Lung exam revealed decreased breath sounds over the left upper lung field without crackles. Lab showed WBC 13.5 x10^9 /L with 37% bands, BUN 37 mg/dL, creatinine 3.36 mg/dL, and CPK 11,372 U/L. A chest X-ray revealed a large focal opacity in the left middle lung field. CT of the chest showed a large mass-like consolidation in the left upper lobe.

He was admitted to the ICU for severe community-acquired pneumonia complicated by rhabdomyolysis and acute kidney injury (AKI). Azithromycin, levofloxacin, and ceftriaxone were initiated. He was intubated for acute hypoxic respiratory failure and started on vasopressors for septic shock. Urine *Legionella* antigen test was positive. CPK continued to rise to 21,414 U/L and creatinine to 7.52 on day 4. Renal replacement therapy was started. His AKI failed to improve, and septic shock persisted even though his antibiotic regimen was broadened multiple times for potential superinfection. His condition continued to decline, and multi- organ failure ensued, and he died on day 17.

IMPACT/DISCUSSION: The first report on the association between *Legionella* pneumonia and rhabdomyolysis was published in 1980. Since then several cases have been reported, however, the incidence of *Legionella*-associated rhabdomyolysis remains unknown. Although the exact mechanism of *Legionella*- associated rhabdomyolysis is not well-understood, it is hypothesized that either release of endotoxin into the systemic circulation with subsequent muscle injury or direct invasion of *Legionella* into the muscles plays a role. Rhabdomyolysis and subsequent AKI in *Legionella* pneumonia are associated with poor clinical outcomes. Among 16 reported patients with *Legionella* pneumonia who developed rhabdomyolysis and AKI, 11 patients required hemodialysis (HD), and 2 patients died. Prompt treatment with appropriate antibiotics and aggressive fluid resuscitation could lead to full recovery without HD in some patients.

CONCLUSION: Rhabdomyolysis and subsequent AKI are uncommon, but potentially fatal complications of *Legionella* pneumonia. My case illustrates the importance of recognizing rhabdomyolysis and AKI as complications of *Legionella* pneumonia.

RIGHT ATRIAL THROMBUS FORMATION: CONSIDERATIONS AND MANAGEMENT

Mohamed Gabr[1]; Richard Lucariello[2]. [1]Internal Medicine, Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, NY; [2]Internal Medicine (Cardiology), Montefiore Medical Center / Albert Einstein College of Medicine, Bronx, NY. (Control ID #3391064)

LEARNING OBJECTIVE #1: Identify the causes of right atrial thrombus formation

LEARNING OBJECTIVE #2: Recognize the presentation, treatment, and follow-up of right atrial thrombus

CASE: A 58-year-old woman with end-stage renal disease presented to the emergency department with shortness of breath. She reported that it had been worsening for weeks, particularly with exertion, but without associated chest pain. She also reported occasional palpitations. Physical examination was only remarkable for irregularly irregular heart sounds. EKG revealed atrial fibrillation (AF) with a rapid ventricular rate. Labs were unremarkable except for an elevated creatinine and low hemoglobin. A transthoracic echo (TTE) revealed a 3.4 x 1.6 cm right atrial thrombus proximal to the tricuspid annulus with a normal ejection fraction. Anticoagulation with heparin was initiated, and the patient underwent an IR-guided thrombectomy. TTE after the procedure revealed persistence of the thrombus. Cardiac MRI was obtained to differentiate thrombus from mass, and confirmed the likelihood of chronic thrombus. The dialysis catheter that was in place was changed, and patient was discharged on warfarin. Repeat TTE 4 months later had no evidence of intracardiac thrombus.

IMPACT/DISCUSSION: Right atrial (RA) thrombus formation is a serious occurrence that must be recognized by physicians. While thrombi seen in the RA can be in transit from venous circulation, the presence of in-dwelling catheters, pacemaker leads, septal closure devices, or tricuspid prosthesis can predispose to the formation of RA thrombi. The exact incidence is unknown; studies have described about 7% of patients with central venous catheters having RA thrombi. In addition, RA thrombi can occur in approximately 3 to 6% of patients with atrial fibrillation (AF), compared to a 13% incidence of left atrial thrombi in AF. Patients may present with shortness of breath, which occurs as a result of pulmonary thromboembolism (PTE) that occurs in roughly 36% of patients with RA thrombi, with some studies reporting up to a 98% incidence. TTE is usually sufficient for diagnosis, although other modalities such as transesophageal echocardiography or cardiac MRI are sometimes necessary for better visualization and characterization of the thrombus. Urgent treatment of RA thrombi is necessary due to high potential for complications such as PTE, right ventricular hypokinesis, hemodynamic compromise, and mortality. Treatment options include medical management with anticoagulation and/or thrombolysis, percutaneous intervention, or surgical thrombectomy. Nevertheless, there is no consensus or studies providing evidence for the optimal treatment strategy. Therefore, the choice of treatment depends on the thrombus characteristics, presence of PTE, hemodynamic status, and contraindications.

CONCLUSION: RA thrombus is a serious and possibly fatal complication of implantable hardware, AF, or PTE in transit. Clinicians should maintain high suspicion in susceptible patients to promptly identify and treat it in a timely manner.

RIGHT TO LEFT SHUNT RESULTING IN RIGHT TO LEFT CONFUSION: MALIGNANCY ASSOCIATED GERSTMANN SYNDROME

Allbert Jang, Tameka Smith, Peter Caldwell. Department of Medicine, Tulane University, New Orleans, LA. (Control ID #3372778)

LEARNING OBJECTIVE #1: Recognize the signs and symptoms of Gerstmann syndrome.

LEARNING OBJECTIVE #2: Recall the importance of a bubble study or Doppler flow when searching for an embolic etiology of stroke.

CASE: A 68-year-old man with recently diagnosed prostate adenocarcinoma presented after one day of altered mental status. He reported confusion, trouble communicating his thoughts, and difficulty speaking. He was experiencing sensory neglect in his right lower extremity, difficulty with short-term recall, writing his name, and performing simple arithmetic. He identified every finger on his left hand as thumbs, and he had left-right disorientation. CT head non contrast was unrevealing. CT angiography of the head and neck revealed supraclavicular lymphadenopathy and a 6 mm pulmonary nodule in the superior right lower lobe. MRI brain revealed scattered areas of ischemia in the left parietal and posterior temporal lobe in the distribution of the left middle cerebral artery, concerning for emboli. Transthoracic echocardiogram showed patent foramen ovale (PFO), and doppler ultrasound of the legs showed several thrombi bilaterally.

A diagnosis of Gerstmann syndrome was made. CT chest, abdomen, and pelvis revealed a right lower lobe pulmonary embolism, multiple bilateral pulmonary nodules, mediastinal lymphadenopathy, and a T8 mass with a pathological fracture. Anticoagulation was initiated. A lymph node biopsy was completed, and he was diagnosed with stage IV adenocarcinoma of the lung.

IMPACT/DISCUSSION: Internal Medicine physicians are often the team leaders for patients with stroke complicated by paradoxical embolism, as the patients require coordination with multiple specialties. Our patient experienced the classic tetrad of Gerstmann syndrome, which consists of agraphia, acalculia, right-left disorientation, and finger agnosia. It is a rare disorder associated with lesions of the dominant hemisphere at the temporal and parietal lobe junction and can be seen in a number of conditions such as Alzheimer's, multiple sclerosis, mucormycosis, and cerebrovascular accidents. Few case reports exist on the diagnosis of Gerstmann syndrome, especially when associated with a malignancy and thrombo-embolic disease.

In addition, our patient was found to have a PFO when we were investigating the etiology of his stroke. Initial workup when investigating possible cardiac etiology involves a transthoracic echocardiogram with bubble study or doppler. The American Society of Echocardiogram guidelines recommend using bubble study over doppler for detection of intracardiac communication as it is better at detecting these shunts. **CONCLUSION:** This case highlights the importance of recognizing the presentation of Gerstmann syndrome as it can assist with localizing parietal lobe pathology. Additionally, we discussed the utility of using echocardiogram with agitated saline (bubble study) over doppler for identifying a patent foramen ovale.

RITUXIMAB INDUCED STRESS CARDIOMYOPATHY : AN UNUSUAL CASE OF CARDIOTOXICITY

Rahul Gupta[1]; Purva Ranchal[2]; Christopher Nabors[1]; Merita Shehu[1]. [1]Internal Medicine, Westchester Medical Center, Elmsford, NY; [2]Internal Medicine, westchester medical center, Valhalla, NY. (Control ID #3391853)

LEARNING OBJECTIVE #1: Diagnose cardiovascular complications related to rituximab

LEARNING OBJECTIVE #2: Assess cardiac risk for patients prior to administering immunotherapy

CASE: 56 year old man with history of fevers of unknown origin for five years presented with sudden right eye ptosis with CT head showing acute intraparenchymal hemorrhage in the right midbrain. Vitals were significant for temperature of 100.4F, BP 110/60, heart rate 90 bpm, and physical exam was unremarkable except for ptosis. No acute neurosurgical intervention was performed and the patient was kept under observation. During the course of hospitalization, patient continued to have fever ranging from 100.4 to 103.1F. Labs were significant for positive antineutrophil antibody (ANA) 1: 80 with speckled pattern and positive EBV DNA PCR. Patient had an extensive work up for the fever including blood cultures, urine culture, CT chest, abdomen, pelvis, bone marrow biopsy, bronchoscopy, HIV, PET-CT, rheumatological work up which were negative. Chest X-ray (CXR) showed clear lungs with transesophageal echocardiogram showing ejection fraction of 60% with no wall motion abnormalities and no vegetations. Diagnosis of chronic EBV infection was made and patient was started on Rituximab. Immediately after finishing rituximab infusion, patient developed tachypnea, tachycardia and acute respiratory distress requiring emergent intubation. CXR showed worsening pulmonary edema and bilateral pleural effusions. Labs showed troponin of 7.2 ng/ml with BNP of 2500 pg/ml. Echocardiogram showed akinesis of antero-septum, apex and distal anterior wall with severely reduced ejection fraction of 20%, suggestive of stress induced cardiomyopathy secondary to rituximab infusion. Patient underwent aggressive diuresis with repeat echocardiogram one week later showing mild akinesis of the apical septum with ejection fraction of 45%. Patient was subsequently extubated with clinical improvement in respiratory status.

IMPACT/DISCUSSION: Rituximab is a monoclonal antibody against CD20 receptors of B-cells and has shown efficacy in rheumatoid arthritis, autoimmune diseases and against multiple malignancies. It has been known to cause cardiac adverse effects such as angina and arrhythmias, especially in patients with known cardiovascular disease. However, its cardiotoxic profile is not well documented in patients with normal cardiac function. In fact, there is only one case report in the literature of stress induced cardiomyopathy in a patient with normal cardiac function. LVEF recovery could not be documented in that patient as he died of non-cardiac cause. Here we have presented a unique case of a patient with normal cardiac function who developed acute stress cardiomyopathy from treatment with rituximab, with improvement in the cardiac function with aggressive medical therapy.

CONCLUSION: Stress cardiomyopathy is a rare but life threatening complication of rituximab. Complete cardiac evaluation should be performed in all patients prior to administering this medication.

RPR IN THE DANGER ZONE: A CASE OF THE PROZONE EFFECT IN SECONDARY SYPHILIS

Lavanya Dharmarajan, Bari Rosenberg, Yoo M. Shin. Internal Medicine, Emory University, Atlanta, GA. (Control ID #3392027)

LEARNING OBJECTIVE #1: Understand the prozone effect in diagnosing syphilis

LEARNING OBJECTIVE #2: Recognize the presentation of secondary syphilis

CASE: A 34-year old male with a history of AIDS (CD4 count 268 cells/μL, viral load 31 copies/mL) and Kaposi's sarcoma presented with two days of diarrhea, abdominal pain, and a new rash on his hands. He had unprotected sexual intercourse with a new partner a few days prior to admission.

On presentation, he was febrile and tachycardic. Physical exam revealed a hyperpigmented rash on his palms and soles bilaterally and condyloma lata on rectal exam. Initial laboratory workup revealed an alanine aminotransferase of 467 unit/L, aspartate aminotransferase of 259 unit/L, alkaline phosphatase of 1255 unit/L, and a total bilirubin of 0.3 mg/dL. An RPR was non-reactive. Gonorrhea and chlamydia screening from the rectum was positive.

Secondary syphilis was suspected due to his pathognomonic presentation despite the unreactive RPR. The patient's RPR sample was re-run after dilution which was reactive with a titer of 1:32. The patient was treated for secondary syphilis with one dose of 2.4 million units of benzathine penicillin IM. His diarrhea was thought to be secondary to proctitis from GC/Chlamydia, however, due to the severity of symptoms, he was treated empirically with a course of doxycycline for lymphogranuloma venereum. His symptoms improved and liver enzymes began to downtrend. Outpatient follow up showed near normalization of liver enzymes.

IMPACT/DISCUSSION: Secondary syphilis occurs in approximately twenty-five percent of individuals with untreated primary syphilis. Manifestations of secondary syphilis are varied, and can include the classic palmar and solar rash, a diffuse body rash, condyloma lata, glomerulonephritis, hepatitis, CNS involvement in addition to constitutional symptoms such as fever, malaise, lymphadenopathy, arthralgias, and weight loss.

Syphilitic hepatitis, as seen in this case, typically presents with a disproportionally elevated alkaline phosphatase level, with normal to mildly elevated transaminase and bilirubin levels. Liver enzymes normalize after treatment for syphilis.

False negative results can occur due to an antibody-antigen mismatch called the prozone phenomenon. Agglutination reactions rely on an antibody to antigen ratio within the zone of equivalence, or optimal ratio. The prozone refers to an excessively high antibody to antigen ratio, while the

post zone refers to a low antibody to antigen ratio. Both can lead to false negative results, as a visible precipitant will not form properly.

CONCLUSION: This case demonstrates that when the clinical suspicion for syphilis is high, it is prudent to have the laboratory dilute the sample in an attempt to bring the antibody to antigen ratio into the zone of equivalence if the initial RPR is non-reactive.

SATURDAY NIGHT FEVER OF UNKNOWN ORIGIN

Ryan Khodadadi[1]; Ryan Anderson[1]; Alexandra Wolanskyj-Spinner[2]. [1]Internal Medicine, Mayo Clinic, Rochester, MN; [2]Hematology, Mayo Clinic, Rochester, MN. (Control ID #3388359)

LEARNING OBJECTIVE #1: Recognize hemophagocytic lymphohistiocytosis (HLH) as a rare cause of fever of unknown origin (FUO).

LEARNING OBJECTIVE #2: Distinguish between primary/secondary HLH, their respective associations, unique treatments, and highlight diagnostic criteria.

CASE: A previously healthy 56-year-old male with T-cell rich B-cell lymphoma presented for further evaluation of a three-week history of unexplained fevers and fatigue on a Saturday evening.

On initial evaluation, he was febrile to 38.9°C but denied any localizing signs or symptoms of infection. History was negative for autoimmune disease, infection, or new medications. Despite chemotherapy completion, he continued to have persistent pancytopenia, requiring weekly transfusions. Examination revealed conjunctival pallor, scleral icterus, and hepatosplenomegaly.

Laboratory evaluation revealed anemia (6.5 g/dL), thrombocytopenia (18 x /L), leukopenia (2.3 x /L), normal absolute neutrophil count (ANC), transaminitis (ALT 202 U/L, AST 172 U/L and alkaline phosphatase 202 U/L), triglycerides 375 mg/dL, INR 1.4, aPTT 26s, fibrinogen 142 mg/dL. Peripheral blood smear, bilirubin and creatinine were normal and a broad workup was negative for a source of infection but ferritin was 17550 mcg/L. Bone marrow aspirate/ biopsy revealed a normocellular bone marrow without morphologic features of lymphoma involvement but showed macrophages with hemophagocytosis.

IMPACT/DISCUSSION: Hemophagocytosis is a process by which hematopoietic cells are engulfed by aberrantly activated macrophages leading to cytopenias due to immune dysregulation. HLH is a rare group of disorders where this process occurs, the etiology of which can be primary (familial) due to underlying genetic mutations (perforin, munc, and syntaxin) or secondary (acquired) in adults triggered by infection, rheumatologic conditions or malignancy. In this case, HLH was due to underlying lymphoma.

It is important for the internist to consider HLH as a cause of FUO in patients with known malignancy presenting with fever, hepatosplenomegaly and pancytopenia. Initial testing includes the above studies to fulfill 5 diagnostic criteria: fever >38.5°C, splenomegaly, peripheral blood cytopenia, hyperglyceridemia, hypofibrinogemia, evidence of hemphagocytosis, low/absent natural killer cell activity, ferritin > 500 ng/mL, and elevated soluble CD25. Similar to a comprehensive FUO workup, differential diagnoses include infection, autoimmune conditions, and malignancy. Treatment is targeted towards the identified trigger for secondary HLH while the HLH-04 protocol and hematopoietic cell transplantation are required for primary HLH. Prognosis is poor with an adult survival rate of 50% following treatment. In this patient, targeted treatment for lymphoma was resumed.

CONCLUSION: While HLH clinically mimics more common presentations of FUO, it requires prompt targeted treatment given survival rate

Diagnosis of HLH requires fulfilling 5 of 8 diagnostic criteria

Primary and secondary HLH present similarly but require vastly different treatments

SCARLET FEVER: A PEDIATRIC PRESENTATION IN THE ADULT NEUTROPENIC PATIENT

Brendan Swain[2]; Priscilla Tanamal[2]; Caroline Abe[2]; Azeez Osho[2]; Carriel Nipp[2]; Blake R. Barker[1]. [1]Internal Medicine, UT Southwestern Medical Center at Dallas, Dallas, TX; [2]UT Southwestern, Dallas, TX. (Control ID #3392000)

LEARNING OBJECTIVE #1: Identify key history, physical exam, and laboratory findings that lead to a diagnosis of scarlet fever in an adult neutropenic patient.

CASE: A 68-year-old male with a history of hypertension, type 2 diabetes, cirrhosis and metastatic prostate cancer presented with a sore throat, neck and groin rash, and marked weakness. The patient was in his usual state of heath until three days before presentation when he developed a sore throat and a small, pruritic rash on his neck. The rash spread to his upper chest and became erythematous. The patient developed generalized weakness and was brought to the emergency department. On presentation, the patient reported sore throat, cough, fevers, chills, rash and weakness but denied myalgia, joint pain or rhinorrhea.

The patient had a family history of hypertension and diabetes. He denied alcohol, tobacco, or recreational drug use. He had completed two radiation treatments and multiple rounds of chemotherapy for prostate cancer. One week prior to admission, he started a new chemotherapy agent, docetaxel. The patient's physical exam was notable for an erythematous oropharynx, muffled speech, and diffuse erythema covering the neck and upper chest with very small papular elevations and a similar rash on his groin. The patient had an unremarkable basic metabolic panel and a complete blood count notable for leukopenia of 0.3 with absolute neutrophil count (ANC) of 10. A rapid streptococcal antigen test was positive and a CT scan of the neck showed right palatine tonsil prominence, indicating tonsillitis. Two blood cultures drawn on hospital day one grew penicillin-resistant E. coli. The patient was started on Zosyn to cotreat the patient's streptococcal pharyngitis and E. coli bacteremia. His leukopenia was treated with filgrastim. By day 3, his ANC had improved, and his rash began to desquamate. He was discharged on Augmentin and Bactrim.

IMPACT/DISCUSSION: Scarlet fever is a syndrome describing an amalgam of symptoms caused by exotoxins released in Group A Streptococcal (GAS) infection. These symptoms typically include fever, pharyngitis, tonsillitis, an erythematous, sandpaper-textured rash, circumoral pallor and a "strawberry tongue". Typically, scarlet fever is diagnosed in the pediatric population and most commonly occurs in ages 5 through 15. It is diagnosed by clinical features in conjunction with laboratory evidence of a GAS infection. The rapid streptococcal antigen test (RSAT) is used commonly because of its high specificity. Because the RSAT is less sensitive, it should be followed by a throat culture in patients with a negative result. Streptococcal infections in the elderly are not uncommon. GAS is the most common bacterial cause of acute pharyngitis. However in this population, GAS infection rarely presents as scarlet fever. This case is unique as it demonstrates a pediatric presentation of a GAS infection in a neutropenic adult.

CONCLUSION: In the neutropenic adult patient, streptococcal infection can present as scarlet fever.

SCREENING FOR CHAGAS DISEASE - IS THERE A ROLE IN THE OUTPATIENT SETTING?

Charlotte Rastas[1]; Eirini Iliaki[2]. [1]Internal Medicine, Cambridge Health Alliance, Boston, MA; [2]infectious Diseases, CHA, Cambridge, MA. (Control ID #3348366)

LEARNING OBJECTIVE #1: Assess which patients may be at risk of Chagas disease and should be screened

LEARNING OBJECTIVE #2: Recognize some of the severe complications of untreated Chagas disease

CASE: A 43 year old Spanish speaking woman with a past medical history significant for depression, anxiety, Chagas disease diagnosed in 2017, and an unclear history of colitis presented to the emergency department with 7 hours of right arm weakness and difficulty speaking. The patient was originally from rural El Salvador and had moved to the United States in 2017. She had a family history that was only significant for extensive heart disease and she was not taking any medications. In the emergency department, the patient had a CT scan of her head which showed prominent subtentorial CSF space on the left but no acute abnormalities. MRI of the head showed an acute infarct of the left temporal parietal lobes. Echocardiogram demonstrated an ejection fraction of 55% and akinesis of the basal to mid inferolateral and anterolateral walls. Findings were attributed to untreated Chagas disease. The patient was started on aspirin 81 mg daily, a high intensity statin, and lifelong anticoagulation with Warfarin. With extensive physical and occupational therapy, she recovered most of her function. She followed up with infectious disease as an outpatient and treatment was begun with benznidazole. However, it had to be stopped secondary to side effects of the medication.

IMPACT/DISCUSSION: This patient was a relatively young and healthy woman who presented with a debilitating stroke. According to the World Health Organization, an estimated 8 million people worldwide are infected with Chagas disease, most of whom are originally from Latin America. This disease can have a wide range of health complications, including stroke, cardiomyopathy, gastrointestinal complications, and polyneuropathy. Most Chagas disease is vertically transmitted. As a consequence, it is recommended that at- risk patients of child bearing age are screened and treated if they test positive. In the United States, first line treatment is with benznidazole. This medication has numerous side effects and cannot be given in pregnancy. Once a diagnosis is made, echocardiogram to assess for abnormalities is recommended. One of the classic signs of Chagas cardiomyopathy is a left ventricle apical aneurysm, which signifciantly increases the risk of developing a stroke. There are currently no recommendations about preemptive anticoagulation for these patients. With climate change, it is likely that there will be more cases of Chagas disease from outside endemic areas, which may prompt more screening and treatment recommendations.

CONCLUSION: - Consider screening pregnant women and women of child bearing age from endemic areas, given the risk of vertical transmission

- Among patients who test positive, the consensus is that they should be treated if they can tolerate the medication, in order to avoid complications of Chagas disease, such as this case of stroke

SCROFULA: AN UNCOMMON CAUSE OF NECK SWELLING WITHIN THE UNITED STATES

Lauren Malishchak. Internal Medicine, Brigham and Women's, Brookline, MA. (Control ID #3390801)

LEARNING OBJECTIVE #1: Diagnose tuberculosis lymphadenitis.

LEARNING OBJECTIVE #2: Recognize lymphadenitis as a common presentation of extrapulmonary TB.

CASE: Mr. G is a 26-year-old man with no prior medical history who presented with left greater than right sided neck swelling associated with mild pain of one week. He was given a 7-day course of amoxicillin-clavulanate, but his swelling worsened, so he sought further care.

The patient is Indonesian and was raised in a rural town 4 hours outside of Jakarta. He shared a home with his parents, both of whom are alive and without any significant medical history. He was employed by a cruise line. He denied substance use and had never been sexually active. His only animal contact was a pet pigeon. He took no medications routinely.

On admission, he was afebrile and normotensive, with a heart rate of 80 and respiratory rate of 15. Examination was notable for a 2x3cm mass in the posterior cervical chain, with minimal overlying erythema and mild tenderness to palpation. He had nontender lymphadenopathy in the deeper portion of the right posterior cervical chain. The remainder of the exam was normal.

Initial work-up was notable for a normal BMP, CBC, and LFTs. HIV was non-reactive. An ultrasound showed a neck collection with internal flow, consistent with a lymph node. A CT neck and chest demonstrated multistation, bilateral cervical lymphadenopathy with necrotic change and peribronchial nodular opacities in the bilateral upper lobes.

He was subsequently admitted for a pulmonary TB rule-out with 3 induced sputums, which were negative.

An IGRA was negative, as were a number of fungal studies. High suspicion for TB prompted an excisional biopsy, from which AFB stains were negative. Two days later, RIPE therapy was initiated by infectious diseases given high suspicion and notorious difficulties identifying TB. Five days after the biopsy, a Fite stain was positive for tuberculosis, confirming cervical TB lymphadenitis.

IMPACT/DISCUSSION: TB is typically perceived by clinicians as a pulmonary disease, but it can present with many different symptoms and findings. The CDC reported 9,029 TB cases in the US in 2018 and it is estimated that as many as 20% of these patients presented with extrapulmonary manifestations. Despite this, extrapulmonary findings are rarely discussed or taught to trainees, which may cause diagnostic error that can result in significant risk to the public given the disease's morbidity and mortality. This case demonstrates that patients with active TB can present looking clinically well and without significant pulmonary findings. Clinicians with high suspicion should pursue diagnostics, particularly in patients with high-risk demographics.

CONCLUSION: - Extrapulmonary TB can be hard to confirm and requires persistence to diagnose.

- The diagnosis of TB lymphadenitis may require FNA or excisional biopsy with culture if initial sputum samples are negative.

- The use of the Fite stain, which has higher affinity for the mycolic acids in mycobacterial cell walls, may also be helpful.

SEARCHING FOR THE ANTIGEN: A CASE OF RECURRING HYPOXIA

Catherine C. Waymel, Andi Hudler, Juan Lessing. Internal Medicine, University of Colorado at Denver, Englewood, CO. (Control ID #3389763)

LEARNING OBJECTIVE #1: Identify challenges of correctly diagnosing hypersensitivity pneumonitis.

LEARNING OBJECTIVE #2: Describe the importance of obtaining a thorough and thoughtful exposure history in patients with symptoms that suggest hypersensitivity pneumonitis.

CASE: An 80-year-old man presented with several weeks of progressive dyspnea and productive cough. Four weeks prior to presentation he was hospitalized with presumed viral pneumonia which improved with a steroid taper, but recurred upon returning home. Upon presentation the patient had profound hypoxia and required heated high flow oxygen to maintain saturations above 90%. Physical examination revealed a temperature of 37.5° C, pulse of 91, respirations of 18, and bibasilar crackles. Chest x-ray revealed bilateral alveolar opacities and computed tomography demonstrated diffuse ground glass opacities and evidence of fibrosing interstitial lung disease (ILD). The patient was admitted to the Intensive Care Unit for management of acute hypoxic respiratory failure and was started on broad spectrum antibiotics for presumptive hospital- acquired pneumonia. After 24 hours without improvement, high dose intravenous steroids were initiated with improvement in oxygenation. Upon further discussion, the patient revealed having "black mold" in his home humidifier. A hypersensitivity pneumonitis antigen panel was positive for *Aureobasidium pullulans* antibodies. The patient was discharged on prednisone and was instructed to remove the home humidifiers.

IMPACT/DISCUSSION: Hypersensitivity pneumonitis (HP) is an immune reaction to inhaled antigens that leads to inflammation of the lung parenchyma and airways. It is a rare diagnosis; a 2018 epidemiologic study of HP in insured patients in the US revealed a prevalence of 11.2 per 100,000 patients over the age of 65 (PMID 29236517). The most common presentation includes dyspnea, cough, and diffuse crackles which may be intermittent, recurring with repeated antigen challenges. HP may be misdiagnosed as pneumonia, asthma, or another ILD, and can progress to irreversible pulmonary fibrosis if the offending agent is not removed. Discovery of an antigen is independently associated with improved survival in HP (PMID 27719974). Respiratory illnesses are common in hospital and outpatient practices, so it is impractical to suggest that an exhaustive HP exposure history be performed for all patients with respiratory symptoms. However, a thorough exposure history should be performed for those with recurrent symptoms, and for those who do not respond to treatment as expected for other conditions or who have a known long-term exposure to an antigen.

CONCLUSION: Without diagnosis, management, and antigen removal, HP can lead to irreversible pulmonary fibrosis. HP should be considered, and a thorough exposure history taken, when the disease course does not match the presumed diagnosis, or is refractory to management of the presumed diagnosis.

SEEING CLEARLY ABOUT DOUBLE VISION: A CASE OF INTERNUCLEAR OPHTHALMOPARESIS AND A SYSTEMATIC APPROACH FOR DIPLOPIA

Mike K. Cheng. Medicine, UCSF, San Francisco, CA. (Control ID #3392186)

LEARNING OBJECTIVE #1: Develop a systematic approach towards the diagnosis of diplopia

LEARNING OBJECTIVE #2: Recognize the signs of internuclear ophthalmoparesis and common causes

CASE: A 72-year-old male with history of hypertension on carvedilol, chronic kidney disease, controlled diabetes type 2, and hyperlipidemia on atorvastatin presented with sudden and persistent horizontal double vision. He denied any trauma, fever, pain, vision loss, or loss of sensory or motor ability. On exam the patient's blood pressure was 160/73 but he was afebrile. There were no obvious deformities of his eye or vision loss. His diplopia resolved as each eye was covered but returned with both eyes open. The patient had dysconjugate movement of eyes with horizontal gaze and upon gaze to the left, his right eye was unable to adduct and his left eye displayed abducting nystagmus. Neurological exam was otherwise normal.

Lab tests showed a mildly elevated blood glucose but were otherwise unremarkable. CT scan of the brain was without hemorrhage or new lesion. Ophthalmology was consulted and upon examination of the patient, the consultants were concerned for internuclear ophthalmoparesis and recommended MRI assessment.

Ultimately the MRI revealed an acute infarct of the right superior paramedian pons and he was treated for his stroke.

IMPACT/DISCUSSION: This case is a valuable illustration of the importance of the clinical exam and knowledge of anatomy in the systematic evaluation of diplopia. Whereas monocular diplopia would suggest local eye disease, the patient's binocular diplopia that only occured when both eyes were open suggested an issue with ocular misalignment. The horizontal nature of his diplopia narrowed the differential to etiologies affecting the medial or lateral rectus muscles or their innervation. The outward deviation of his eyes (exotropia) further eliminated causes of inward deviation of his eyes (esotropia). Ultimately the impaired adduction of one eye on lateral gaze with abducting nystagmus on the opposite eye correlated with the diagnosis of internuclear ophthalmoparesis (INO).

Furthermore this case shows the importance of recognizing stroke as a common cause of INO. In a case series of 410 patients with INO, infarct was responsible for 38% of case of which 87% were unlilateral, as was the case with this patient with affected right eye. Demyelination was responsible for 34% of cases and 73% were bilateral. The remaining 28% were due to unusual causes including trauma, infection, and tumor*.

*Virgo JD, Plant GT. Internuclear ophthalmoplegia. *Practical Neurology* 2017;17:149-153

CONCLUSION: A systematic approach towards diplopia with focus on the exam to elicit monocular vs. binocular, vertical vs. horizontal, exotropia vs. esotropia narrows the differential for diplopia.

The typical signs of internuclear ophthalmoparesis (INO) are impaired adduction of the affected eye and abduction nystagmus of the contralateral eye.

Infarct is one of the most common causes of INO, particularly if it is unilateral, and should trigger urgent evaluation.

SEPTIC EMBOLI FROM A PSEUDOMONAS AERUGINOSA-INFECTED AORTIC GRAFT

Siamak Kohan, Michelle Koh, Janette Zara. Department of Medicine, University of California, Los Angeles, Los Angeles, CA. (Control ID #3372568)

LEARNING OBJECTIVE #1: Recognize *Pseudomonas aeruginosa* vascular graft infection as a source of septic emboli

LEARNING OBJECTIVE #2: Consider PET/CT as an additional imaging option when no source of infection is identified on other modalities

CASE: A 57-year-old woman with a history of cystic fibrosis with subsequent bilateral lung transplant complicated by an aortic rupture with repair presented with a progressively tender right lower extremity rash. She reported awakening with a red nodule that, within four hours, spread to include multiple purpuric, non- blanching papules on the plantar and lateral edges of the right tarsus and posterior calf. She was treated with ceftolozane/tazobactam and tobramycin since blood cultures from an outside hospital were positive for multi- drug resistant *Pseudomonas aeruginosa* mucoid. An ultrasound of the bilateral lower extremities showed no thrombosis and further imaging with a transthoracic echocardiogram (TTE) and computed tomography angiography (CTA) of the chest, abdomen, and pelvis found no infectious process. Pathology from a dermatologic biopsy was consistent with leukocytoclastic vasculitis, a non-specific finding in inflammatory and infectious processes. A positron

emission tomography-computed tomography (PET/CT) later revealed focal uptake on the surgical graft of the ascending thoracic aorta. Together, the findings were consistent with septic emboli resulting in Osler's nodes from a *Pseudomonas*-infected aortic graft.

IMPACT/DISCUSSION: The diagnosis of septic emboli can be challenging since it can encompass a wide range of presentations. In this case, the Osler's nodes initially suggested an endocarditis source. However, the TTE revealed no vegetations and CTA imaging showed no other infectious sources, though, endocarditis could not be completely excluded since no transesophageal echocardiogram was done during this admission. Given high clinical suspicion, a PET/CT was ordered, and identified the vascular graft infection (VGI) of the aorta. VGIs are highly infrequent and typically feature gram-positive bacteria as causative agents. This case is unique in that *P. aeruginosa* is a relatively uncommon cause of both VGI and septic emboli. Mucoid *P. aeruginosa* also produces biofilm that confers greater resistance to antibiotics. While there is no universally accepted definition or diagnosis for aortic VGI, the current gold standard for diagnosing VGI is the use of CT to identify perigraft fluid or gas and pseudoaneurysm, which were both absent in this case. Septic emboli often require a long duration of antibiotic treatment with source control given its high association with adverse complications. Although, in this case, only a prolonged course of antibiotics was provided because no surgical options were available for source control given the graft location.

CONCLUSION: Maintaining a high index of clinical suspicion for septic emboli is critical in quickly and accurately recognizing the infectious source to initiate treatment early on in the disease course.

SEVERE ANAPLASMOSIS, NOT CVA: CASE REPORT AND REVIEW OF LARGE MEDICAL SYSTEM CASES

Joseph Tholany[2]; Chelsey Hill[2]; Mohamed H. Yassin[3]; Yasser Eldaour[1]. [1]Internal Medicine, UPMC, Pittsburgh, PA; [2]Internal Medicine, UPMC Mercy, Pittsburgh, PA; [3]ID, UPMC, Pittsburgh, PA. (Control ID #3341353)

LEARNING OBJECTIVE #1: Anaplasmosis is a tick-borne illness caused by *Anaplasma phagocytophilum*. A review of CDC reports showed an increase in Anaplasmosis, with 1,193 cases reported in 2009 compared to 5,672 cases reported in 2017, with the majority of cases between May and October. Neurologic manifestations are uncommon.

CASE: A 72-year-old male presented in August with acute left-sided weakness. Patient was found to have an acute kidney injury (creatinine 5.3 mg/dL), thrombocytopenia (platelet count 25,000/mL), and rhabdomyolysis (CPK 25,000 units/L). Workup for an acute stroke was negative. Peripheral blood smears showed *Anaplasma* neutrophil inclusions in >30% of the buffy coat prep. PCR testing was positive for Anaplasmosis. He was treated with doxycycline for 10 days, with improvement within 48 hours. He was discharged home after a 13-day hospital course with no residual neurological deficits.

IMPACT/DISCUSSION: A review of our medical system between January 1st, 2016 and December 31st, 2018 revealed 20 cases of Anaplasmosis. All cases presented between May and December and had fever of unclear etiology, but only our case presented with stroke-like symptoms. All cases involved people living in heavily wooded areas, with a mean age of 70 years.

CONCLUSION: The typical presentation of Anaplasmosis is a nonspecific febrile illness with leukopenia and thrombocytopenia. Although headache is common, stroke-like symptoms are a rare but known complication. Elderly and immunocompromised patients living in heavily wooded areas are at higher risk for Anaplasmosis. Delayed diagnosis was common (55% of case review) and associated with worse prognosis.

SEVERE ESOPHAGEAL INJURY AS A COMPLICATION OF RADIOFREQUENCY ABLATION FOR ATRIAL FIBRILLATION

Awa Drame, Daniel Rodriguez. Internal Medicine, University of South Florida, Tampa, FL. (Control ID #3373255)

LEARNING OBJECTIVE #1: New onset retrosternal burning shortly following radiofrequency ablation should prompt further assessment with CT chest/abdomen to ruleout lifethreatening esophageal injury.

LEARNING OBJECTIVE #2: RFA for Atrial Fibrillation can cause varying degrees of thermal esophageal injury; treatment includes airway management, fluid resuscitation, broad-spectrum antibiotics and surgical repair with esophageal stenting.

CASE: Radiofrequency ablation (RFA) for the treatment of atrial fibrillation consists in ablating the arrhythmogenic foci within the pulmonary vein and the left atrium. It is effective but carries a risk of esophageal injury.

We present the case of a 50-year-old male who presented to the hospital with 2 days of subjective fevers, dyspepsia and general malaise for 1 month. Past medical history was signifcant for paroxysmal atrial fibrillation for which he had RFA performed about 1 month ago. Upon arrival to the hospital, the patient was in mild acute distress (diaphoretic and tachycardic). Labs were significant for elevated procalcitonin (Procal: 28) and leucocytosis (WBC: 24,000). As there was no clear source of infection, he was started on broad spectrum antibiotics. The following morning, he developed right upper extremity paralysis. MRI showed multi-territory infarcts suggestive of a cardioembolic etiology. TTE showed new mitral valve vegetation and blood cultures grew streptococcal species. CT chest revealed the presence of a pneumomediastinum with pneumopericardium. EGD was planned in order to assess for esophageal-pericardial fistula; unfortunately, overnight he developed severe pleuritic chest pain with diffuse ST segment elevation suggestive of pericarditis. He quickly became hypotensive and had to be started on vasopressors and intubated. He expired shortly after. Our patient had developed an atrial esophageal fistula following his RFA. This allowed seeding of the mitral valve by gastrointestinal bacteria. The clinical picture was further complicated by multiple septic emboli to the brain.

IMPACT/DISCUSSION: Surveillance endoscopy studies following RFA for AF have reported varying degrees of thermal esophageal injury in approximately 15% of patients following the procedure due to the suceptibility of intestinal tissue to thermal injury from the ablation probe. The small ulcerations can evolve into transmural lesions which can damage adjacent structures like the esophagus, esophageal arteries and vagus nerve plexus. Atrial esophageal fistula formation causes complications such as sepsis, endocarditis from bacterial translocation and cerebrovascular infarcts like in our patient.

CONCLUSION: Esophageal perforation following RFA is rare but often fatal. Clinicians should therefore keep a high degree of suspicion in patients presenting with fevers, new epigastric pain or other esophageal symptoms 7-21 days following RFA as early diagnosis can drastically improve survival. Larger studies are needed to risk-stratify patients who would benefit from post-procedure surveillance.

SEX, STILL A CHALLENGING DISCUSSION

Jesse E. Ross[1]; Rachel Brook[2]. [1]Internal Medcine, UCLA, Los Angeles, CA; [2]Internal Medicine, UCLA, Los Angeles, CA. (Control ID #3392321)

LEARNING OBJECTIVE #1: Recognize many HIV positive adults are unaware of their diagnosis and even fewer have ever been tested

LEARNING OBJECTIVE #2: Understand the relevance and potential impact of sexual history

CASE: A 51 year old male with no past medical history presented to an outpatient clinic with cough and shortness of breath. Six months prior to admission, the patient was diagnosed with acute bronchitis, for which he was prescribed azithromycin with some improvement in symptoms. However, one month prior to admission, he subsequently experienced a gradual decline in exercise tolerance with worsening shortness of breath and non productive cough. Documented social history was notable for recent travel to Singapore, and his career as a CEO. No sexual or substance abuse history was noted. One week prior to admission the patient was seen in an urgent care and prescribed amoxicillin/clavulanic acid and prednisone, with no improvement in symptoms. The patient returned to clinic, as he was now unable to perform ADL's due to extreme shortness of breath. He also endorsed chills, myalgias, diarrhea, and a ten pound weight loss. His exam was notable for tachypnea, bibasilar crackles, and SpO2 of 75%. The patient was sent to the ED for further workup. Admission labs were notable for leukocytosis, with neutrophil predominance. Arterial blood gas revealed PaO2 of 50. CTA Chest showed diffuse groundglass opacities, inter and intralobular septal thickening, airway ectasia, small basilar airspace opacities, reactive lymph nodes and no evidence of pulmonary emboli, concerning for atypical infections such as PCP. However, given his lack of HIV risk factors, his outpatient provider was concerned for new onset interstitial lung disease. During our interview, he endorsed sexual activity with men, with intermittent barrier use. Given newly identified HIV risk factors, empiric PCP treatment was initiated. Subsequently, confirmatory HIV testing returned positive with a viral load of 1.97 million and a CD4 count of 78. Bronchoscopy with BAL was performed, confirming a diagnosis of PCP. He was treated appropriately with bactrim and steroids, with subsequent improvement.

IMPACT/DISCUSSION: Recent studies show that nearly 15% of HIV-infected persons living in the US remain unaware of their diagnosis. In fact, fewer than 40% of the US adult population report having ever been tested for HIV and only 38% of US males report having discussed sexuality with a physician. Our patient was a high functioning professional, who had completed multiple marathons, and followed regularly with a concierge provider for his annual physical exams. His annual exams included cardiac nuclear stress testing, CT coronary imaging, and echocardiograms. However, a complete social history was never documented. He subsequently presented with AIDS.

CONCLUSION: HIV continues to remain under tested and underdiagnosed in the US

Despite acknowledging that the sexual history is an essential part of the H&P, few adults report having discussed sex with a physician

SHELLFISH: A CULINARY DELICACY OR THE ULTIMATE DEMISE?

Nicole A. Doria, Jillian Kyle. Internal Medicine, UPMC, Pittsburgh, PA. (Control ID #3391272)

LEARNING OBJECTIVE #1: Recognize Plesiomonas shigelloides as a cause of diarrhea in travelers and seafood consumers

LEARNING OBJECTIVE #2: Recognize the value of stool culture when P. shigelloides enteritis is suspected

CASE: 70-year-old male veteran with history of GERD, PUD and treated HCV presented with 2 months of progressive watery diarrhea. He reported 3-4 daily bouts of liquid stool associated with diffuse abdominal pain. Recent pertinent history included travel to Cape Cod where he swam and ate raw oysters prior to symptom onset. He developed pre-syncope in the setting of dehydration leading to inpatient admission. He denied fevers, chills, hematochezia, melena, nocturnal diarrhea or mucoid stool. He denied personal or family history of IBD, Celiac disease or GI cancers. He reports taking loperamide TID daily with minimal symptom relief but no other relevant or causative medications. Vital signs on admission were normal. Physical exam was remarkable for diffuse abdominal tenderness and a mildly distended abdomen. Laboratory studies were significant for WBC 12.8 (84% neutrophils), Cl 107, HCO3 20, BUN 30 and Cr 1.3 (baseline 1). LFTs were unremarkable. CT A/P was unrevealing. Stool studies were positive for fecal leukocytes and stool culture grew heavy Plesiomonas shigelloides. Patient significantly improved after three-day course of ciprofloxacin.

IMPACT/DISCUSSION: Plesiomonas enteritis is typically self-limited and associated with raw or undercooked shellfish ingestion. Illness with this gram negative bacteria can present in several forms including secretory gastroenteritis, dysenteric colitis and chronic diarrhea. It does not typically require specific antimicrobial treatment. It is most commonly isolated in immunocompromised patients and those with hepatobiliary disease. This case is unusual given the severity requiring treatment in an otherwise healthy patient with no known ongoing liver disease. This case highlights the importance of stool cultures in diagnosing the causative agent in traveler's and chronic diarrhea, and those unresponsive to supportive therapy. Recent evidence suggests stool cultures have low diagnostic yield and high cost, and use has been declining. Positive stool cultures rates may be as low as 1.4%. In contrast, the biochemical profile of P. shigelloides has remarkably little strain-to-strain variation and is therefore easy to identify using conventional tests including stool cultures. This highlights the value of stool cultures in the correct clinical situation including not only immunocompromised patients, but those with recent travel and/or ingestion of raw or undercooked shellfish.

CONCLUSION: - P. shigelloides infections present with a typically self-limited diarrheal illness most commonly seen in immunocompromised patients, those with hepatobiliary disease, and in consumers of raw or undercooked fish.

- Stool culture can be especially valuable when P. shigelloides infection is suspected due to high yield and widely available treatment for those with more severe illness requiring treatment.

SHOW YOUR HAND, REVEAL YOUR HEART

CATHERINE L. TENG[1]; Ju Young Bae[1]; Khalil Hussein[1,2]; Matthew Lubin[1]. [1]Yale New Haven Health, Greenwich Hospital, Greenwich, CT; [2]Yale School of Medicine, New Haven, CT. (Control ID #3371968)

LEARNING OBJECTIVE #1: Recognize the clinical features of Holt-Oram Syndrome (HOS), also known as Hand-Heart Syndrome

LEARNING OBJECTIVE #2: Recognize that genetic disorders can be diagnosed in adults

CASE: A 68 year old man presented with dyspnea, pedal edema and palpitations. He had known history of atrial septum defect (ASD) but no remarkable family history. Exam revealed a pulse of 135 bpm, 3/6 holosystolic murmur, left triphalangeal thumb and right thumb that could not be extended. Electrocardiogram showed atrial flutter with rapid ventricular rate. Echocardiogram revealed normal left ventricle ejection fraction. Transesophageal echocardiogram confirmed secundum ASD and enlarged right atrium and right ventricle. ASD closure and Maze procedure were both successful.

IMPACT/DISCUSSION: We present a case of HOS, a 1 in 100,000, pleiomorphic, autosomal dominant disorder with variable penetrance. HOS features congenital heart disease and upper limb deformities such as triphalangeal thumbs and carpal-bone dysmorphism, often more prominent on the left.

Mutations in the TBX5 gene cause HOS. 85% of cases are new mutations. Congenital cardiac defects— most commonly secundum ASD—occur in 75% of patients. HOS cases without structural heart abnormalities are still at risk for conduction defects.

A diagnosis of HOS requires attention by a multidisciplinary team of geneticists, psychologists, congenital heart specialists and orthopedic surgeons.

Formal guidelines for follow up and treatment are yet undeveloped but echocardiogram and/or Holter monitor once yearly should be considered.

CONCLUSION: 1. When two or more congenital abnormalities are seen, a genetic condition must be considered

2. Internists must recognize genetic disorders such as HOS as these are not always diagnosed in childhood.

3. As with other genetic disorders, when HOS is diagnosed, patients require follow up by a multidisciplinary team.

4. Additional study of HOS is warranted in order to form effective treatment guidelines.

SIADH – GIVE MORE SALT TABS, RIGHT?

Puneet Kumar[1]; Rachel Brook[2]. [1]Internal Medicine, University of California, Los Angeles (UCLA), Los Angeles, CA; [2]Internal Medicine, UCLA, Los Angeles, CA. (Control ID #3375863)

LEARNING OBJECTIVE #1: Recognize the utility of a lumbar puncture (LP) in cases of hyponatremia

LEARNING OBJECTIVE #2: Recognize the need to evaluate consultant recommendations and not accept at face value

CASE: 75YO male was admitted for dofetilide initiation and was found to have asymptomatic hypotonic hyponatremia. TSH and cortisol were unremarkable. Occult malignancy imaging was negative. Sodium corrected with salt tabs, diuretics and fluid restriction. The patient was diagnosed with idiopathic SIADH and discharged. The patient re-presented a week later to the ED after a series of falls due to "sharp rushes of right leg pain". Etiology was presumed mechanical and the patient was sent home. The patient re-presented two weeks later. Exam was notable for impaired cognition and "muscle spasms". Sodium of 124, urine osmolality of 543 and serum osmolality of 253. Neurology was consulted given spasticity, which they said was due to the hyponatremia and signed off. The hyponatremia and mentation improved with salt tabs, diuretics and a fluid restriction. However, the spasticity persisted. At persistence of the primary team, neurology was re-consulted and asked to consider need for further workup. MRI brain, EEG, and LP were recommended. Brain MRI was unremarkable. EEG was nonspecific. A LP was obtained and initial studies were unremarkable. Upon further consideration of the patient's muscle spasms as myoclonic jerks, nonspecific EEG findings, behavioral changes and hyponatremia, the presentation was concerning for possible +LGI1 autoimmune (limbic) encephalitis. The patient was started IV steroids with minimal improvement, after which he underwent plasmapheresis resulting in improvement of his symptoms. CSF studies were notable for a positive mutation in VGKC (voltage gated potassium channel), with subsequent positive LGI1 confirmation.

IMPACT/DISCUSSION: Hyponatremia has a wide differential with existing diagnostic schema – centered around tonicity, volume, and electrolytes. This case highlights the utility of a lumbar puncture in certain cases of hyponatremia. When the patient initially presented, it would be reasonable to assume the "muscle spasms" and weakness were due to the hyponatremia. What was unique in this case, is that one - the muscle spasms were focal and two - as the hyponatremia improved, the muscle spasms did not. These served as diagnostic clues that the hyponatremia was not the primary etiology, but a symptom of a different process. Obtaining a prompt lumbar puncture helped in the diagnosis and treatment of this patient.

CONCLUSION: In cases of hyponatremia associated with spasms or weakness, focus should be paid to the focality and association with sodium fluctuations. If minimal improvement with sodium correction, consider obtaining CSF studies to evaluate for processes including autoimmune encephalitis, as in this case. Additionally, primary teams should always remember that they are the experts of their patients and not hesitate to re-engage consultants if there are concerns about recommendations.

SICK WITH SALMONELLA: INVASIVE SALMONELLOSIS IN AN SLE PATIENT

Meghana Anugu[1]; Leah Loerinc[2]; Lauren Gensler[1]. [1]Internal Medicine, Emory, Atlanta, GA; [2]Emory University School of Medicine, Atlanta, GA. (Control ID #3390385)

LEARNING OBJECTIVE #1: Recognize systemic lupus erythematosus as a risk factor for developing invasive non-typhoidal Salmonella disease

LEARNING OBJECTIVE #2: Understand relative bradycardia as an important tool in the diagnosis of infectious diseases

CASE: A 38yo African American homeless male with no past medical history presented to the Emergency Department with a 3-day history of high volume watery diarrhea, fevers. He denied sick contacts, animal exposures, or travel history. He endorsed worsening weight loss, fatigue, rash, and joint pains for years. Family history was notable for SLE (mother). On exam, patient's temperature was 39.4, heart rate 84, blood pressure 199/94. He had a desquamating, erythematous facial rash sparing the nasolabial folds. He had no lymphadenopathy, oral ulcers, or additional skin findings. His abdomen was diffusely tender to palpation. He had diffuse joint tenderness without erythema, warmth, or effusion. His labs were notable for WBC 2.8 (70.2% neutrophils), platelets of 66, ESR of 38, and a CRP of 4.4. Stool cultures, UA, Quant gold, hepatitis panels, and HIV were unremarkable. ANA returned positive at 1:1280 with a speckled pattern. His blood cultures speciated to Salmonella group D (enteriditis). He was transitioned to a 2-week course of ciprofloxacin for invasive Salmonellosis with clinical improvement.

IMPACT/DISCUSSION: Invasive non-typhoidal Salmonellosis is a relatively rare phenomenon. Invasion through the gastrointestinal tract into the bloodstream occurs in only 5% of patients with non-typhoidal Salmonella gastroenteritis, but the morbidity and mortality among these patients are high. A common risk factor for developing invasive disease is an immunosuppressed state, with systemic lupus erythematosus (SLE). Patients with SLE have defects in the innate and adaptive immune systems, as evidenced by high rates of opportunistic infections. In this patient, there was a high suspicion for disseminated Salmonella prior to blood cultures speciating.

Relative bradycardia, also known as Faget's sign, is defined as a lower-than-anticipated heart rate for a given temperature above 38.9°C and is found in a variety of non-infectious and infectious conditions. For each degree Celsius above 38.3, heart rates should increase by 8-10bpm in patients with normal atrial automaticity and AV conduction. Faget's sign is a poorly characterized, but important clinical finding in many infectious diseases. The literature demonstrates that the differential for infectious causes of Faget's sign remains broad, with disseminated infection from intracellular gram-negative organisms being the most commonly reported. Faget's sign indicated that this patient's infection was likely invasive and gave insight into the severity of his disease.

CONCLUSION: -Individuals with SLE are immunocompromised and have a greater risk of developing invasive disease following non-typhoidal Salmonella gastroenteritis

- Faget's sign can be a useful tool to narrow the clinical diagnosis prior to the return of diagnostic studies

SJOGREN'S RELATED UIP OUT OF BREATH BUT NOT OUT OF OPTIONS

Hanan Ibrahim[1]; Rawan Hammoudeh[2]; Ayad Alkhatib[1]. [1]Internal Medicine, Henry Ford Hospital, Detroit, MI; [2]Internal Medicine, Henry Ford Hospital, Detroit, MI. (Control ID #3387770)

LEARNING OBJECTIVE #1: Recognize Sjogren syndrome from the history and refer patients when appropriate

LEARNING OBJECTIVE #2: Diagnose Sjogren syndrome depending on patient history, lab work

CASE: A middle-aged male with a past medical history significant for UIP-ILD presented to our health system after being referred from an outside Pulmonologist for antifibrotic vs lung transplant evaluation after worsening of his shortness of breath, chest tightness and cough. Patient initially has been having worsening exertional dyspnea over 4 years. CT chest showed signs suggestive of pulmonary fibrosis, with progression of his symptoms he was referred for a lung biopsy and the results were suggestive of UIP (Usual Interstitial Pneumonia) pattern. Patient has been using 4 L of oxygen along with CPAP therapy at night. Autoimmune workup was sent for further evaluation. Patient's Autoimmune workup revealed a positive ANA (1:320), Positive SSA/Ro Ab (90 unit), negative SSA/Lb (3 units), negative RF (12), anti-CCP IgG, C-ANCA (<1:20), P-ANCA (<1:20), negative Scl-70 Ab (8). At this point he was referred to rheumatology for further evaluation.

During his visit, patient said that he has history of dry eyes and he is following with ophthalmology for it. He was using OTC hydrating eye drops. He denied any dry mouth, dysphagia, odynophagia or dental problems.

He also denied any skin rashes, joints pain, Raynaud's disease, hair loss, photosensitivity. Patient was started initially on Azathioprine with the plan to switch him to Rituximab infusion.

After Rituximab infusion, his shortness of breath and cough improved, his O2 requirements decreased dramatically and patient reported improvement of his overall symptoms and lifestyle.

IMPACT/DISCUSSION: Interstitial lung disease is a common and often life-threatening manifestation of different connective tissue disorders, often affecting the overall prognosis. By far ILD is the most common pulmonary manifestation of Sjogren syndrome. Patient can present with progressive exertional dyspnea, weight loss, fever, chest pain or tightness and cough. It is important to know and recognize this condition because it is potentially treatable. We emphasize in presenting this case on the importance of ruling out autoimmune diseases in patients with ILD diagnosis in the setting of multiple symptoms that would suggest other autoimmune causes. Keep in mind that ILD in Sjogren syndrome may require a biopsy of the lung for better histopathologic diagnosis.

CONCLUSION: Sjogren Syndrome is an autoimmune inflammatory disorder that affects mainly lacrimal and salivary glands resulting in decreased function and dryness of the eyes and mouth. It can have both exocrine and extra glandular features including the skin, lung, heart, kidney, CNS and Hematopoietic system. We emphasize the imprtance of ruling out autoimmune causes in ILD cases.

SKELETAL CRYPTOCOCCOSIS IN IMMUNOCOMPROMISED PATIENT

JALAL EL-AKAWI[1]; Malik Shehadeh[1]; Hussam Ammar[2]. [1]Internal Medicine, Medstar Washington Hospital Center, Washington, DC; [2]Medicine, Medstar, Washington, DC. (Control ID #3392069)

LEARNING OBJECTIVE #1: To diagnose skeletal cryptococcosis and recognize its radiological findings.

CASE: A 47-year-old male patient with a medical history significant for multiple sclerosis for which he has been on fingolimod. He presented to outside hospital with 2-week history of generalized weakness and inability to walk.

At outside hospital, magnetic resonance imaging of brain and spine showed old demyelination without any new enhancing lesions but there was an incidental lytic lesion on T6 vertebral body. He was treated for possible multiple sclerosis flare with pulse steroids with subsequent improvement in his symptoms. He was discharged home with plan to follow up as an outpatient regarding his T6 lytic lesion. However, a few days later his weakness returned, and he presented to our hospital.

Upon arrival to the hospital, vitals were unremarkable except for temperature of 38.9 Celsius. Laboratory investigations were significant for white blood count of 10.2 K/microL (normal 4 -10.8). Human immunodeficieny virus (HIV) test was negative. Chest X ray and urinalysis didn't show any suspicion of infection. Blood cultures and cerebrospinal fluid cultures were positive for cryptococcus neoformans. Patient was started on intravenous amphotericin and flucytosine.

While in the hospital, a computerized tomography (CT) of chest/abdomen/pelvis with contrast was performed and showed 16 mm lucent lesion in T6 vertebral body and irregular 41 X 17 mm lucent lesion in the right iliac bone. Patient underwent CT-guided bone biopsy of right posterior iliac bone. A total of 60 ml of frank pus was obtained and sent for gram stain and cultures, tuberculosis and fungal cultures. Cultures came back positive for cryptococcus neoformans.

The patient had significant improvement with antifungal treatment and was discharged to rehabilitation facility with plan to repeat imaging of the spine.

IMPACT/DISCUSSION: Cryptococcus neoformans is an encapsulated yeast that primarily affects the central nervous system and manifests as meningitis. However, any organ might be involved.

Skeletal cryptococcal infection is rare and only a few cases have reported in the literature. It can be part of disseminated infection or isolated infection to the bone. Vertebrae are the most common sites. Radiologic findings are non-specific and usually shows osteolytic lesions that sometimes can mimic tuberculosis of the bone.

Diagnosis requires bone biopsy. No standardized treatment protocol exists for skeletal cryptococcosis.

However, treatment usually involves a combination of surgical debridement and antifungal agents.

CONCLUSION: Skeletal cryptococcosis is rare and usually manifest as osteolytic lesions on bone imaging. Physicians must be alert to this disease and have a high index of suspicion especially in immunocompromised individuals.

SKIN EXAMINATION GUIDES DIAGNOSIS OF DISSEMINATED GONOCOCCAL INFECTION

Ariel Grady, Kartikeya Cherabuddi. Medicine, University of Florida, Gainesville, FL. (Control ID #3373683)

LEARNING OBJECTIVE #1: Recognize the spectrum of presentation of disseminated gonococcal infection

LEARNING OBJECTIVE #2: Identify patients at high-risk for gonorrhea and disseminated infection

CASE: The patient is a 26-year-old female who presented with polyarthralgia, fever and rash. She had no other pertinent past medical or family history. Sexual history revealed that she was in a relationship with a non-monogamous partner. She had recently given birth, and at her

postpartum visit six weeks prior to presentation she was noted to have increased drainage and was tested for chlamydia. The patient received the positive result a day prior to presentation and was never treated. Vitals were significant for a temperature of 102.2F and HR of 103. Physical examination revealed pustular lesions in an acral distribution with tenderness of the ankles and wrists. Labs were significant for leukocytosis (14.0 thou/mm^3) and elevated CRP (254 mg/L). Based on exam findings, directed testing was performed. HIV and syphilis testing was negative. Nucleotide acid amplification for *Chlamydia trachomatis* and *Neisseria gonorrhoeae* in urine was positive. Blood cultures also grew *N. gonorrhoeae*, confirming dissemination. She was successfully treated with ceftriaxone and azithromycin.

IMPACT/DISCUSSION: Disseminated gonococcal infection (DGI) is the hematogenous spread of the sexually transmitted organism *N. gonorrhoeae.* DGI typically presents as septic arthritis or the triad of polyarthralgia, dermatitis and tenosynovitis. Our patient presented with the latter. The pustules on her hands and wrists are characteristic of the skin manifestations seen in DGI. She had no evidence of septic arthritis which is important to identify as it potentially extends the duration of ceftriaxone from 7 to 14 days. This case illustrates that a good history and exam can help direct diagnostic testing.

It is also important to identify risk factors for disseminated infection. The patient had multiple risk factors, including age and risk of exposure via her partner. Additionally, patients with chlamydial infections are at higher risk of coinfection with gonorrhea. She had remained untreated after diagnosis which made her more susceptible to contracting the infection. Interestingly, most people who are diagnosed with DGI have no history of recent gonorrheal infection. At her post-partum visit, she was only diagnosed with chlamydia. She had also been relatively asymptomatic and unaware of her diagnosis which delayed therapy. If she had received timely treatment, which includes empiric gonorrheal coverage, she could have potentially avoided disseminated infection. The literature also states that women in the post-partum period are at higher risk of DGI due to alterations in cell mediated immunity. Recognition of such risk factors may prevent patient morbidity.

CONCLUSION: DGI presents as either septic arthritis or tenosynovitis, polyarthralgia, and characteristic skin findings

Recognition of risk factors, including recent pregnancy, may lead to early diagnosis and treatment

SKIN IN THE GAME: IDENTIFYING CUTANEOUS SIGNS CAN BE KEY TO TIMELY DIAGNOSIS OF VASCULITIS

Maya Appley, Greg Zahner, Richard Thompson, Bassem Ghali, Ari Hoffman. Medicine, UCSF, San Francisco, CA. (Control ID #3390885)

LEARNING OBJECTIVE #1: Name two common skin findings associated with microscopic polyangiitis

LEARNING OBJECTIVE #2: Identify livedo reticularis and racemosa and describe the clinical significance of each

CASE: A 68 year old man with a history of prostate cancer in remission, alcoholic cirrhosis, and stable interstitial lung disease presented with three weeks of fever, cough, myalgia, and unintentional forty pound weight loss over four months. Four days prior to presentation, he was discharged from an outside hospital after seven days of cephalexin for presumed pneumonia. He had no recent travel, sick contacts, new medications, nor active substance use. Family history was notable for two daughters with lupus, and a son with juvenile arthritis and granulomatosis with polyangiitis. At presentation, he was tachycardic and cachectic with temporal wasting. He had no lymphadenopathy, muscle tenderness, neurologic deficits, or rash. Initial laboratory data and imaging were unrevealing. He continued to be intermittently febrile and tachycardic on and off of antibiotics. Workup for infection and malignancy were negative. Rheumatologic studies showed elevated ESR, CRP and RF, with normal ANA and CK. He developed a violaceous, non- blanching, broken netlike rash over his forearms, upper back and knees, consistent with livedo racemosa. Labs showed p-ANCA positivity and skin biopsy was consistent with medium vessel vasculitis. He was diagnosed with microscopic polyangiitis (MPA) and treated with high-dose steroids and rituximab with rapid improvement.

IMPACT/DISCUSSION: MPA, a pauci immune small and medium vessel necrotizing vasculitis without granuloma, has non-specific symptoms, and can be difficult to differentiate from more common processes, such as infection or malignancy. Skin lesions are the third most common finding in MPA, after kidney inflammation and weight loss. Recognizing them can facilitate prompt diagnosis and treatment, reducing morbidity and mortality. Biopsy of involved organs can be useful in establishing the diagnosis, with the skin and kidney being the most common targets. Palpable purpura and petechiae are the most common skin lesions, followed by livedo reticularis and livedo racemosa.

Livedo appears as a violaceous or cyanotic, non-blanching, netlike rash and is associated with a variety of systemic illnesses. Livedo racemosa has a more broken netlike appearance and is less likely to resolve with warming than livedo reticularis. Livedo reticularis can be physiologic, but racemosa is always pathologic, and therefore, critical to recognize. Livedo racemosa requires an urgent, broad workup for hypercoagulability, connective tissue disease, cryoglobulinemia, vasculitis, and embolic disease.

CONCLUSION: Skin findings are common in MPA and can aid in its diagnosis and timely management.

Palpable purpura, petechiae and livedo are the most common skin findings in MPA. Livedo racemosa is an important skin finding for the internist to recognize, as it is always pathologic and requires urgent evaluation.

SMALL BOWEL OBSTRUCTION IN THE SETTING OF FISH BONE INGESTION AND JEJUNAL PERFORATION

Jason R. Saltiel, Megan Hosein, Diana Randlett. Medicine, NYU, New York, NY. (Control ID #3390394)

LEARNING OBJECTIVE #1: Recognize the radiographic features of bone ingestion and perforation/abscess formation.

CASE: A 58-year-old woman with type 2 diabetes presenting with abdominal pain.

The patient reported eating day-old unrefrigerated fried rice, followed by sharp intermittent periumbilical pain, dark green emesis and watery, non-bloody diarrhea, prompting presentation to the emergency room.

Her heart rate was 114, blood pressure 104/47, and abdominal exam was remarkable for periumbilical tenderness to palpation and abdominal distension. Labs revealed acute kidney injury (creatinine 2.7) and hyperglycemia (glucose 377). CT abdomen/pelvis with oral contrast showed "irregular mass-like thickening of the jejunal wall…and mass-like infiltration of the greater omentum 5.3 by 2.8cm adjacent to the thickened bowel with a linear hyperdensity in the center of the infiltration of the omentum." While enteritis was possible, there was concern for a small bowel neoplasm.

In further consultation with radiology, (after the patient reported a diet heavy in whole fish), the possibility of an ingested fish bone that perforated the jejunum was entertained. Piperacillin/tazobactam was initiated while awaiting expert counsel.

Over the next day the patient developed bilious emesis and her abdominal distension worsened. Repeat CT showed a new small bowel obstruction with a transition point in the left lower quadrant due to a new omental abscess near the "linear density". A jejunal micro-perforation due to a swallowed fish bone was diagnosed so a nasogastric tube was placed for

decompression. She had a successful exploratory laparotomy with washout of the abscess, and was discharged a week later.

IMPACT/DISCUSSION: This case was consistent with textbook Bacillus Cereus enteritis: rapid onset within hours of ingestion of infected food (due to preformed toxin) commonly associated with leftover fried rice. Per the initial read, her imaging could have been explained by a bad case of enteritis. Alternatively, a small bowel neoplasm was considered (such as adenocarcinoma, lymphoma, or carcinoid). Only a careful history regarding dietary habits, along with interdisciplinary rounds led the team to the alternative diagnosis of a small bowel micro-perforation.

This demonstrates the importance of being able to recognize the radiographic features of bone ingestion and perforation/abscess formation. Any collection or inflammation in the omental region and not within the bowel lumen should raise suspicion for a foreign body perforation in the right clinical context. There does not need to be obvious free air or extravasation of oral contrast for a perforation to be present.

CONCLUSION: Regional differences matter: unlike in the American diet, whole bone-in fish is common in Asia, China in particular, where fish bones are the most commonly encountered objects in EGDs performed for foreign body ingestions.

Interdisciplinary communication is key. Neither the medical nor the radiology team suspected a retained fishbone until the in-person review.

SOLITARY FIBROUS TUMOR: A RARE CASE OF DOEGE-POTTER SYNDROME AND PIERRE- MARIE-BAMBERG SYNDROME

Anup Solsi[1]; Karen Pho[1]; Shiva Shojaie[2]; Tarreq Noori[1]. [1]Internal Medicine, Valleywise Health/Creighton University, Phoenix, AZ; [2]University of Arizona School of Medicine, Phoenix, Phoenix, AZ. (Control ID #3390680)

LEARNING OBJECTIVE #1: Recognize clinical features of Doege-Potter Syndrome and Pierre-Marie- Bamberg Syndrome

LEARNING OBJECTIVE #2: Manage hypoglycemia associated with Doege-Potter Syndrome

CASE: A 68-year-old Hispanic man presented to the ED after an unwitnessed syncopal episode. History revealed a chronic non-productive cough, but no other symptoms. Examination revealed a cachectic appearing gentleman, with digital clubbing in bilateral digits. Pulmonary exam was significant for severely diminished breath sounds and dullness to percussion in the right lung field. Chest X-ray showed right lower lung opacity. A CT chest further demonstrated a 14x16x18 cm heterogeneous right lung mass arising from the right hilum and middle mediastinum. Biopsy of the mass was subsequently performed. On the third day of admission, his glucose level was low at 42 mg/dL, a pattern consistently seen on subsequent mornings during his stay. Further workup revealed a morning cortisol of 11.66 mcg/dL, C-peptide of 4.0 ng/mL, fasting insulin of 21 mIU/L and Insulin-like growth factor (IGF)-1 of 73 ng/mL. Final tissue diagnosis was consistent with a solitary fibrous tumor with high risk for aggressive behavior, as stains were positive for vimentin, desmin, CD34, BCL2 and CD99. Previous literature reviews have indicated this tumor has a well- known clinical correlation of hypoglycemia secondary to IGF-2 release, recognized as Doege Potter Syndrome (DPS). This prompted medical team to check an IGF-2 level, which came back at 63 ng/mL. Furthermore, the association of these tumors with digital clubbing has been characterized as Pierre-Marie- Bamberg syndrome, which was then diagnosed. He was started on treatment with prednisone with improved glucose levels. The patient was discharged home in a stable condition with instructions to follow up with oncology in an outpatient setting.

IMPACT/DISCUSSION: DPS is a paraneoplastic syndrome characterized by refractory hypoglycemia associated with solitary fibrous tumors, specifically pleural and peritoneal tumors. It is associated with abnormal secretion of IGF-2 by these tumors. Prompt biopsy of these tumors in conjunction with checking IGF levels can aid in diagnosing Doege-Potter Syndrome. Current literature supports the immediate initiation of glucocorticoids to medically manage the hypoglycemia associated with this condition; however, referral to the appropriate surgical specialty for tumor resection has shown the best outcomes for overall prognosis. The role of chemoradiation, unfortunately, has not been well studied in these patients. Awareness of DPS in patients diagnosed with solitary fibrous tumor is critical, as life threatening hypoglycemia can occur in 2-4% of patients.

CONCLUSION: Normal IGF levels do not rule out a diagnosis of DPS in patients with biopsy proven solitary fibrous tumor.

Early commencement of glucocorticoid therapy and referral to surgery provides the best outcomes for patients with this paraneoplastic syndrome.

SOMETHING IN THE WATER

Anthony J. Andrade, Amber Clapper. Internal Medicine, UT Health Science Center San Antonio, San Antonio, TX. (Control ID #3392166)

LEARNING OBJECTIVE #1: Importance of early identification and treatment of infectious gastroenteritis for prevention of associated complications.

LEARNING OBJECTIVE #2: Acknowledgment of persistent symptoms after acute infectious gastroenteritis and long-term treatment for high-risk patients for post-infectious irritable bowel syndrome.

CASE: 22-year-old man with no past history presents to clinic with diffuse acute abdominal pain starting 3 days ago, peaked 2 days ago, and is associated with 1 episode of emesis. Constipation relieved following OTC suppository leading to yellow-green stool. He denies water exposure, travel, hematochezia, and melena. For 4 years, the patient had chronic abdominal pain, alternating constipation/diarrhea, associated with diaphoresis and flushing. Symptoms persisted despite self-diet modifications. Vitals were normal with an abdominal exam showing diffuse tenderness, hyperactive bowel sounds, negative psoas sign and negative rebound. Initial labs showed leukocytosis, lactic acidosis, and hyponatremia for which the patient was sent to the ED where a CT showed complicated acute appendicitis with perforation. Laparoscopic appendectomy was performed. A stool PCR was positive for giardia leading to treatment with cipro/flagyl. At a follow up visit, patient was placed on mebendazole for persistent symptoms.

Three months post-op, symptoms partially resolved with continued progressive, non-bloody, watery stools with mushy to solid consistency, and shooting abdominal pain relieved with defecation. Patient lost 35 lbs since initial presentation. He denied family history of inflammatory bowel disease. Repeated stool PCR and CT were normal. Patient was given loperamide and a GI consult.

In GI clinic, patient reported 1 episode of melena/hematochezia prompting EGD/CSP, showing normal bowels with duodenitis on biopsy. Negative serology ruled out celiac disease. Leading to a final diagnosis of post-infectious irritable bowel syndrome (PI-IBS).

IMPACT/DISCUSSION: Based on the literature, about 40% of giardia patients will experience PI-IBS with prevalence that extends to about 6 to 10 years thought to be due to partial villous atrophy of the small intestine leading to malabsorption. Like regular IBS there is little specific treatment for the disease other than symptom management. Although most gastroenteritis is often an untreated disease, there still requires active intervention to reduce the complications associated with these diseases that may lead to a future of multiple scopes and clinic visits. Early intervention is currently the best course for reducing PI-IBS, which not only requires

attentive physicians but also health-care availability to the general population, especially those of resource limited settings whom are at high risk.

CONCLUSION: 1. Gastroenteritis requires timely diagnosis and treatment to reduce likelihood of long-term complications.

2. PI-IBS is a common complication that will require patient education and frequent symptom monitoring.

SPEED UP A SLOW DOWN: RECOGNIZING GLP-1 GASTROPARESIS AND SGLT-2 EUGLYCEMIC DKA

Corwin McGee, Juan Lessing. Internal Medicine, University of Colorado Hospital, Aurora, CO. (Control ID #3391618)

LEARNING OBJECTIVE #1: Recognize gastroparesis as the predominant side effect of GLP-1 agonist overdose and identify when to suspect euglycemic DKA in patients on SGLT-2 inhibitors.

LEARNING OBJECTIVE #2: Develop management plan for GLP-1 receptor agonist-induced gastroparesis and SGLT-2 inhibitor-induced euglycemic DKA.

CASE: A 62-year-old man with type II diabetes mellitus (DMII), chronic pain, and resolved gastroparesis was admitted to hospital for severe abdominal pain. The day before admission he accidentally took 3 times his intended dose of exenatide, a glucagon-like peptide 1 (GLP-1) receptor agonist. The following morning he developed sudden onset severe lower abdominal pain, nausea and vomiting, and inability to keep food or drink down. Home medications included exenatide, oxycodone, and dapagliflozin (a sodium-glucose co- transporter 2 [SGLT2] inhibitor).

Exam was notable for normal vitals with epigastric and periumbilical tenderness. Otherwise exam was normal.

Labs were notable for serum Cr 0.9 mg/dL; bicarbonate 15 mEq/L, with anion gap (AG) 22mmol/L; urinalysis had ketones; beta-hydroxybutyrate was 4.3 mmol/L (nl<0.28); and VBG pH 7.55/pCO2 19. Serum glucose was 283 mg/dL. Abdominal x-ray showed neither obstruction nor bowel distension.

Patient was started on scheduled metoclopramide for delayed gastric emptying side effect of exenatide. The high AG acidosis, elevated serum and urine ketones, and mildly elevated serum glucose in an individual on SGLT-2 inhibitor, was concerning for euglycemic diabetic ketoacidosis (DKA). He was started on treatment for DKA with D5W1/2NS and insulin drip. After AG closed we switched to basal insulin. His gastrointestinal (GI) symptoms all rapidly improved with treatment of DKA and gastroparesis. He was discharged on basal insulin, prandial sliding scale insulin, and scheduled metoclopramide. Exenatide and dapagliflozin were discontinued at discharge.

IMPACT/DISCUSSION: GLP-1 receptor agonists and SGLT-2 inhibitors are increasingly recommended and commonly used for second-line management of patients with DMII for glucose management and secondary effects such as weight loss and cardiovascular benefit [PMID 30497881]; Internists are wise to recognize their potential side-effects and to know how best to manage overdose states.

Delayed gastric emptying is a known side effect of GLP-1 agonist. To the best of our knowledge, there are less than 5 published cases of GLP-1 agonists overdose and none discuss management of GI symptoms. Patient was treated as gastroparesis flare because of the delayed gastric emptying side effects of GLP-1 agonist. This management led to quick symptom control. Recognition of DKA in the setting of euglycemia or near-normal glucose is also critical as SGLT-2 inhibitors are known to cause this state [PMID 28099783].

CONCLUSION: Manage patients with severe nausea and vomiting secondary to GLP-1 agonists as we would patients with severe gastroparesis. In any patient on SGLT-2 inhibitors with abdominal pain, nausea and vomiting, always consider DKA even if euglycemic.

SPIRALING INTO THE SOCIAL HISTORY: A CASE OF LEPTOSPIROSIS

Cecilia Nicol[1]; Shira A. Sachs[2]. [1]Internal Medicine, Weill Cornell Medicine, New York, NY; [2]Internal Medicine, Weill Cornell Medicine, New York, NY. (Control ID #3391731)

LEARNING OBJECTIVE #1: To recognize the importance of the social history in establishing a rare diagnosis

LEARNING OBJECTIVE #2: To understand the transmission and presentation of leptospirosis

CASE: 34 year-old African American man with no PMH presented with abdominal pain, headache, dark urine, pruritus, and epistaxis. The patient took no medications. He reported 4-6 alcoholic beverages each weekend. No drug or supplement use. Sexual activity with 1 monogamous female partner. No recent travel, hiking, fresh water exposure, sick contacts, or bites/tick exposure. Exam was notable for scleral icterus, sublingual jaundice, palpable liver 3cm below the costal margin, and scattered petechiae. CT A/P was normal. Labs showed total bilirubin 22 mg/dL, direct bilirubin 18, LDH 1600, platelets 12, AST 105/ALT 48, Alk phos 133, Cr 2.82. Negative hepatitis panel, HIV, EBV, CMV, blood cultures, Lyme, Ehrlichia, peripheral smear.

The next day, we explored more of the social history and discovered that the patient worked in sanitation and was routinely exposed to rodents and animal urine. He was started on empiric treatment for leptospirosis with doxycycline given a PCN allergy, and we saw marked improvement in his symptoms. On discharge, total bilirubin had trended down to 5.2 mg/dL, direct 4.6.

Several weeks later, Leptospirosis IgM returned positive.

IMPACT/DISCUSSION: Given the broad differential of direct hyperbilirubinemia, a comprehensive history was paramount in elucidating possible exposures. The social history in particular revealed contact with rodent urine, a classic exposure in leptospirosis that led us to narrow our differential and ultimately diagnose this rare disease in New York City.

Leptospirosis is an infectious disease typically transmitted to humans from rodents and other small mammals. Risk factors include direct occupational exposure to animal urine or contaminated soil, recreational fresh water activities, or exposures to infected pets. The majority of leptospirosis is diagnosed in resource-poor tropical settings and in the US, the incidence is only ~150 cases annually. As primary care physicians, it is important to have an understanding of local epidemiology. Around the time of this case, there were 3 leptospirosis cases clustered in a specific area of the Bronx, NY.

Leptospirosis presents with fever, rigors, myalgias, and headache in 75-100% of patients. Subconjunctival suffusion or hemorrhage may differentiate leptospirosis from other non-specific febrile illness. Weil's disease occurs when leptospirosis is complicated by jaundice and renal failure, as in our patient. In severe cases, total bilirubin can reach levels of 60-80 mg/dL. First-line treatment is penicillin or doxycycline.

CONCLUSION: Obtaining a good social history can have an enormous clinical benefit in highlighting toxic/metabolic, sexual, occupational, and infectious causes of elevated bilirubin. In this case, social history led us to diagnose leptospirosis clinically and begin empiric treatment well before the diagnosis was confirmed.

SPONTANEOUS BILATERAL ILIOPSOAS HEMATOMA FORMATION: A RARE COMPLICATION OF SYSTEMIC ANTICOAGULATION

Phillip C. Quigley, James D. Denham, Abigail C. Watts. Department of Internal Medicine, Emory University School of Medicine, Atlanta, GA. (Control ID #3388535)

LEARNING OBJECTIVE #1: Recognize iliopsoas hematoma as a rare complication of systemic anticoagulation

LEARNING OBJECTIVE #2: Describe treatments for iliopsoas hematoma: surgery, arterial embolization, and medical management

CASE: An 83-year-old male with a past medical history of coronary artery disease (with coronary artery bypass grafting), heart failure with preserved ejection fraction, and stage IV chronic kidney disease presented with volume overload attributed to decompensated heart failure. The patient was treated with intravenous diuretics with minimal improvement in volume status, and subsequent telemetry monitoring demonstrated new-onset atrial fibrillation. Given his high risk for stroke (CHA2DS2-VASc = 6), systemic anticoagulation was initiated with warfarin (with a low-intensity heparin drip as a therapeutic bridge). On hospital day #5, his hemoglobin acutely dropped from 7.4 g/dl to 5.9 g/dl without evidence of overt bleeding. INR was subtherapeutic at 1.79. Notably, the patient reported persistent left hip and groin pain during his hospitalization that limited ambulation. Hip x-rays were negative for evidence of fracture, and there was otherwise no trauma history. To evaluate for occult bleeding, computerized tomography (CT) of the abdomen and pelvis demonstrated 4.9 x 3.9 x 12.4 cm hematoma in the left psoas and 6.8 x 3.6 x 7.3 cm hematoma in the right iliacus muscles. Systemic anticoagulation was discontinued, and the patient was evaluated by general surgery, who opted against aggressive intervention. The patient was subsequently resuscitated with a total of 8 units of packed red blood cells. Following complications of renal failure requiring renal replacement therapy for volume control, the patient was ultimately discharged to hospice care on hospital day #27.

IMPACT/DISCUSSION: Anticoagulation is an effective, widely-used therapy for prevention of systemic embolization among patients with atrial fibrillation. Bleeding complications of systemic anticoagulation must be weighed against potential benefits of therapy. We present an exceedingly rare complication of systemic anticoagulation: spontaneous bilateral iliopsoas hematomas in a patient anticoagulated for paroxysmal atrial fibrillation. Spontaneous iliopsoas hematomas are generally unilateral and accompanied by varying symptoms, ranging from back or groin pain to femoral nerve palsy to frank shock. Iliopsoas hematoma can be diagnosed radiographically by ultrasound, CT, or MRI. Bleeding from the third or fourth lumbar artery makes the femoral nerve vulnerable to compression within the body of the psoas muscle at the iliopsoas groove. Management options include surgical evacuation, transcatheter arterial embolization, and conservative management with blood products and reversal of systemic anticoagulation.

CONCLUSION: Given the widespread use of systemic anticoagulation, providers must recognize atypical complications to effectively identify adverse drug events and counsel patients regarding potential risks of therapy.

SPONTANEOUS CELIAC ARTERY DISSECTION PRESENTING AS SEVERE DIFFUSE ABDOMINAL PAIN

Houda Boucekkine[1]; Simon Wu[2]. [1]Internal Medicine, University of California, Los Angeles, Los Angeles, CA; [2]Internal Medicine, UCLA, Los Angeles, CA. (Control ID #3392343)

LEARNING OBJECTIVE #1: Build a differential for acute abdominal pain that includes spontaneous artery dissections

LEARNING OBJECTIVE #2: Discuss possible management options for spontaneous mesenteric artery dissections

CASE: We present the case of a 57-year-old male with no past medical history who presented with acute onset, diffuse abdominal pain, found to have a celiac artery dissection. He was performing exercise when he felt a "pop" in his abdomen, followed by progressive burning pain. Initial physical exam was notable for mildly elevated blood pressure, a regular heart rate, and palpable distal pulses. The patient's abdomen was diffusely tender to palpation, particularly in bilateral upper quadrants, with mild guarding but no rebound. Labs, including a CBC, BMP, lactate, and lipase were unremarkable, with exception of an AKI. A CT abdomen/pelvis revealed a celiac artery dissection with thrombus emanating into the splenic artery and proximal common hepatic artery. He was started on an ACE inhibitor for BP control as well as an antiplatelet and anticoagulant, with plan to repeat imaging after 3 months to evaluate status of dissection and need for further therapy. At follow-up in 3 weeks, the patient's symtoms had resolved.

IMPACT/DISCUSSION: Celiac artery dissection is a type of mesenteric artery dissection that is often secondary to progression of an aortic dissection. Spontaneous mesenteric artery dissection (SMAD) is a phenomenon that typically affects the superior mesenteric artery, with variable natural history. Celiac artery dissection occurring as a primary phenomenon is rare, with few case reports/series in the literature. The presentation and clinical course of these patients have varied widely, and interventions span from no treatment to endovascular therapy. Given the rarity of this disease, typical risk factors are unclear. In the presented case, the patient's risk factors included exercise given the temporal relationship, and possibly undiagnosed hypertension. His initial workup, including labs and physical exam, was largely unremarkable, with no indication regarding the etiology of the abdominal pain. This illustrates that SMAD should be in the differential for abdominal pain and can present in a relatively benign matter in terms of initial workup. The management of an SMAD is unclear. This case adds to the literature regarding possible treatments, and may suggest that data regarding treatment of arterial dissections from other patient groups (such as vertebral artery dissections) may be used as a guide for treating SMAD (i.e. anticoagulation or antiplatelet therapy followed with repeat imaging).

CONCLUSION: - SMAD should be considered on the differential for acute abdominal pain. Physical exam may not be overtly significant or localizable, and laboratory workup may be unremarkable.

- Although standard treatment of spontaneous celiac artery dissection is not clear, anticoagulation or antiplatelet therapy could be used for a period of time followed by repeat imaging to evaluate further need for therapy.

SPONTANEOUS RETROPERITONEAL HEMORRHAGE SECONDARY TO CHRONIC CELIAC AXIS COMPRESSION SECONDARY TO MEDIAN ARCUATE LIGAMENT SYNDROME TREATED WITH EMBOLIZATION UTILIZING CONE BEAM CT

Bashar Khiatah[2]; Sam Jazayeri[1]; Charles Hubeny[3]; Brian Nadav[3]; Amanda Frugoli[1]. [1]Internal Medicine, Community Memorial Health Systems, Ventura, CA; [2]Internal Medicine, Communitry Memorial Hospital, Ventura, CA; [3]Interventional Radiology, Community Memorial Health Systems, Ventura, CA. (Control ID #3370000)

LEARNING OBJECTIVE #1: Describe the pathophysiology and relevant anatomy of Pancreaticoduodenal artery aneurysms due to Median Arcuate Ligament Syndrome.

LEARNING OBJECTIVE #2: Outline the basic diagnostic workup and treatment options for retroperitoneal hemoorhage due to PDA anuerysmal hemorrhage in the setting of Median Arcuate Ligament Syndrome.

CASE: A 51-year-old female presents with severe, sharp, non-radiating epigastric abdominal pain associated with nausea, vomiting, chills, and a near syncopal episode. Vitals on admission were significant for hypotension. Physical exam revealed diffuse tenderness to palpation in her abdomen. Labs were significant for anemia and leukocytosis. CT scan revealed a large amount of active contrast extravasation within the retroperitoneum interposed between the proximal pancreas and duodenum. Mesenteric angiography revealed a high-grade proximal celiac artery stenosis

consistent with median arcuate ligament compression. SMA angiography demonstrated an abnormal aneurysmal pancreatoduodenal artery (PDA). Embolization of the anterior inferior pancreatoduodenal artery was performed. A follow up CT scan showed a residual saccular pseudoaneurysm centered within an enlarging retroperitoneal hematoma. Mesenteric angiogram was agian performed with angiography of the celiac artery and gastroduodenal artery via the high grade celiac artery stenosis. Using digital subtraction angiography, a prominent superior PDA branch supplying the pseudoaneurysm was identified and treated with coil embolization. Cone beam CT angiography with subsequent 3D reconstruction was performed. 2D Maximal Intensity Projection images not only clearly demonstrated the pseudoaneurysm but also showed a second culprit posterior inferior PDA supplying the pseudoaneurysm which was successfully treated with coil embolization.

IMPACT/DISCUSSION: In Median Arcuate Ligament Syndrome (MALS), the celiac origin is severely compressed by the median arcuate ligament reducing blood supply in the celiac territory. The intraluminal pressure difference between the SMA and celiac arteries results in increasing compensatory blood flow across the pancreaticoduodenal arcade. This pathophysiology is thought to induce an increase in arterial blood pressure and secondarily weaken the arterial walls resulting in aneurysmal dilation. In this case, a multidisciplinary approach was effectively used to diagnose and treat this rare etiology of retroperitoneal hemorrhage due to PDA aneurysmal dilatation utilizing conventional mesenteric angiography, cone beam CT with 3D reconstruction, and selective mesenteric transarterial embolization. The anatomical information gleaned from the procedure will also be utilized for future surgical considerations.

CONCLUSION: Ruptured PDA aneurysm secondary to MALS is extremely rare, and classic treatments included surgical aneurysmectomy with or without reconstruction. However, rapid advances in interventional radiology have enabled the safe and effective treatment of visceral aneurysms via transcatheter arterial embolization.

SPONTANEOUS TUMOR LYSIS SYNDROME IN A PATIENT WITH LAWRENCE-MOON-BIEDL SYNDROME

Meghana Singh[1]; Anantha Sriharsha Madgula[1]; Swarup Kumar[2]. [1]Internal Medicine, UConn school of medicine, Hartford, CT; [2]Hematology/Oncology, University of Connecticut, FARMINGTON, CT. (Control ID #3390721)

LEARNING OBJECTIVE #1: Recognize that tumor lysis syndrome can occur in patients, not on any treatment for the malignancy.

CASE: A 59-year-old male with Lawrence-Moon-Biedl syndrome (LMBS) with a past medical history of congenital bicuspid aortic valve status-post valve replacement presented to the hospital with a chief complaint of fatigue and leg edema. He complained of 30-pound weight gain and was hyponatremic to 125 mmol/L. He was admitted for new-onset heart failure. He was noted to have elevation in his liver function tests (LFTs) with alanine transaminase of 53 U/L, aspartate transaminase of 77 U/L, alkaline phosphatase of 693 U/L, and total bilirubin of 5.6 mg/dL. His other labs were significant for leukocytosis of 11,300 cells/μL, potassium(K) 5.7 mmol/L, and phosphorus (P) 5.2 mg/dL. He underwent an ultrasound of his abdomen, which showed innumerable lesions in the liver, concerning for metastatic disease. CT scan of the chest, abdomen and pelvis showed multiple liver lesions, but no primary malignancy was identified. Further investigation with PET scan and biopsy of the liver lesion was recommended. Unfortunately, the patient rapidly deteriorated thereafter, hence this further workup could not be done. He developed worsening of renal function with his serum creatinine rising from 0.8 mg/dL to 1.4 mg/dL. His serum uric acid level was elevated at 15.4 mg/dL. He met the criteria for tumor lysis syndrome (TLS) and was treated with fluids, allopurinol, and rasburicase. The patient, however, continued to deteriorate, and his level of care was then transitioned to comfort measures only shortly before passing away.

IMPACT/DISCUSSION: TLS is a catastrophic adverse effect of malignancy caused by massive tumor lysis, which results in varied metabolic abnormalities due to the release of the intracellular contents into the bloodstream. It is mostly observed in patients undergoing treatment for hematological malignancies. TLS is now also being reported with increasing frequency in solid tumors in patients with high tumor burden. Some case reports suggest that most patients with tumor burden in the liver are likely to have spontaneous TLS which may be the case with this patient.

In order to diagnose TLS; the patient should meet at least two of the four Cairo Bishop criteria (uric acid>8mg/dl, potassium >6mEq/L, phosphorus >4.5mg/dL, Calcium <7 mg/dL). Immediate identification of TLS is critical as the treatment would involve early aggressive hydration to increase renal perfusion and thus decrease the risk of crystal precipitation. Medical therapies to treat TLS are allopurinol and rasburicase.

CONCLUSION: It is important for clinicians to know that TLS can occur in patients not on treatment for malignancy as well. Hyperphosphatemia, hyperuricemia and hyperkalemia, especially in the presence of liver metastasis, should alert physicians to check uric acid level and start intravenous hydration.

SQUANDERING SODIUM: CASE REPORT OF SYNDROME OF INAPPROPRIATE ANTIDIURETIC HORMONE CAUSED BY PROLACTINOMA

Frank R. Weigel, Erik Soto, Zahir Sheikh, Aboujamous Nader. Internal Medicine, Penn State Health Milton S. Hershey Medical Center, Hershey, PA. (Control ID #3373947)

LEARNING OBJECTIVE #1: Explain the pathophysiology of syndrome of inappropriate antidiuretic hormone and why it causes particular lab derangements

LEARNING OBJECTIVE #2: Recognize different etiologies that may result in syndrome of inappropriate antidiuretic hormone

CASE: Patient is a 58 year old female with past medical history significant for migraines who presented to the emergency department for evaluation of vomiting and diarrhea. Initial lab evaluation found the patient to be profoundly hyponatremic, prompting hospital admission. Her sodium level initially responded to intravenous fluid administration – however, her sodium levels began to again downtrend. Neurologic exam was normal except for blurred vision (new-onset) and some headaches unlike her prior migraines. While work-up continued, the patient continued to be hyponatremic with slow clinical response to fluid restriction and salt tablets. Her lab values revealed low serum osmolatrity with inappropriately high urine osmolarity and sodium. After other etiologies were excluded, syndrome of inappropriate antidiuretic hormone (SIADH) was determined to be the underlying etiology causing her hyponatremia. MRI brain revealed pituitary macroadenoma with displacement of the stalk to the right side. Subsequent pituitary studies revealed a slightly elevated prolactin, normal cortisol response to cosyntropin stimulation, normal TSH and low free T4, and a normal LH and FSH. Outpatient follow-up, with repeated lab measurements, demonstrated a more elevated prolactin level above the threshold for diagnosis of prolactinoma - and she was started on cabergoline therapy.

IMPACT/DISCUSSION: Hyponatremia has an expansive differential diagnosis, and initial diagnostic and management considerations are guided by lab evaluation and assessment of volume status. SIADH leads to hyponatremia in the setting of inappropriately concentrated urine, despite apparent intravascular irregularities. This typically results in low serum osmloarity, with inappropriately elevated urine osmolarity and urine sodium. Formal diagnosis requires the exclusion of other endocrine causes

(hypothyroidism, adrenal etiologies). Once SIADH is determined to be the likely cause of hyponatremia, further investigation into the etiology of SIADH must be initiated. Common causes of SIADH include: CNS disturbances, malignancy, and medication-induced.

CONCLUSION: It is important to be comfortable in the evaluation of hyponatremia, by both recognizing the pathophysiology behind different etiologies and how those etiologies cause lab value derangements. Hyponatremia, in both the acute and chronic setting, can be very dangerous resulting in headache, altered mentation, seizures, and coma. In the right clinical context, and with other common causes excluded, syndrome of inappropriate anti-diuretic hormone (SIADH) should be included in the differential diagnosis. SIADH can be the result of very different etiologies, however, the end result is inappropriately concentrated urine and deviation from the typical regulatory feedback system.

STATIN-INDUCED NECROTIZING AUTOIMMUNE MYOPATHY PRESENTING AS ACUTE SYSTOLIC HEART FAILURE

Mitchell Pitlick[1]; Floranne Ernste[2]. [1]Internal Medicine, Mayo Clinic, Rochester, MN; [2]Rheumatology, Mayo Clinic, Rochester, MN. (Control ID #3392626)

LEARNING OBJECTIVE #1: Recognize the spectrum of side effects of statins

LEARNING OBJECTIVE #2: Identify and diagnose statin induced autoimmune myopathy

CASE: A 69-year-old woman presented with one month of severe proximal muscle weakness. She was unable to walk, get out of bed or rise from a chair without assistance. She had no myalgias, Raynaud's, rashes, dysphagia, chest pain, shortness of breath, orthopnea, PND, or lower extremity edema. She had a history of hypertension and hyperlipidemia treated with lisinopril and 40 mg of atorvastatin, a dose she had taken for two years without side effects. On admission, she was profoundly weak but had no rash, skin tightening or joint swelling. Pertinent labs showed a CK of 11062 U/L, TSH of 6.3 mIU/L, AST of 525 U/L, ALT of 661 U/L, aldolase of 128.8 U/L, and creatinine of 0.86 mg/dL. Despite discontinuation of atorvastatin and intravenous fluid resuscitation, her CK remained significantly elevated, and she began to develop worsening dyspnea and lower extremity edema. An echocardiogram showed an EF of 15%. Rheumatologic workup revealed a strongly positive ANA of 1:640 in a homogenous pattern. Antibodies to all other extractable nuclear antigens were negative. EMG revealed frequent waning myotonic-like discharges and fibrillation potentials. A muscle biopsy showed several necrotic fibers with minimal mononuclear cells consistent with necrotizing autoimmune myopathy (NAM). Subsequent testing revealed a strongly positive anti-HMGCR antibody level of >200. A diagnosis of statin-induced NAM was made, and she was treated with pulse dose steroids and IVIG. She improved dramatically with increase in her EF to 47%. With prolonged physical therapy she regained nearly all her strength and continues to do well on low dose prednisone and methotrexate.

IMPACT/DISCUSSION: NAM is an immune-mediated myopathy characterized by subacute proximal muscle weakness, elevated CK levels and muscle fiber necrosis without significant inflammation. NAM is a rare side effect of statin use, occurring in 2–3 out of every 100,000 statin users and is associated with anti HMG-CoA reductase antibodies. Patients often have been exposed to statins for years prior to development of NAM, and their symptoms and CK elevation persist despite discontinuation of statins. NAM is treated with immunosuppression, often with IVIG and pulse dose steroids, with methotrexate or mycophenolate being used as maintenance therapy. It is important to recognzie NAM, as it requires prompt specialty referral and treatment. Additionally, this case is the first description of NAM affecting cardiac muscle and presenting as acute systolic heart failure.

CONCLUSION: -Statins cause a range of side effects ranging from benign myalgias to necrotizing autoimmune myopathy.

- Persistent CK elevations despite discontinuation of statins should raise concern for statin-induced necrotizing autoimmune myopathy, a condition that requires specialty consultation and immunosuppression.

ST ELEVATION IN AVR: TO CATH OR NOT TO CATH

Alvaro F. Vargas-Pelaez, Nicholas J. Beccarino, Cesar Soria. Internal Medicine, NYU Langone Medical Center, Greenlawn, NY. (Control ID #3349321)

LEARNING OBJECTIVE #1: Describe the potential causes of ST elevation in aVR

LEARNING OBJECTIVE #2: Discuss the prognostic significance of ST elevation in aVR

CASE: A 57-year-old man with ischemic heart disease presented to the emergency department with stable exertional chest pain. On arrival, the patient was pain free and vital signs were within normal limits. Electrocardiogram revealed ST elevation in aVR with ST depressions in leads II, III, and V5 - V6. The patient received aspirin and ticagrelor however, in the setting of a negative troponin and a lack of chest pain, left heart catheterization was deferred. The following day he developed chest pain at rest and was taken for cardiac catheterization which revealed severe triple-vessel disease without acute occlusion. An intra-aortic balloon pump was placed due to refractory pain. Subsequent troponin I was 124 ng/ml and transthoracic echocardiogram revealed a left ventricular ejection fraction of 30%. The patient underwent uncomplicated staged percutaneous coronary intervention and was discharged on hospital day seven.

IMPACT/DISCUSSION: Patients presenting with isolated ST elevation in aVR and multi-lead ST segment depressions are traditionally considered to be at high risk for acute occlusion of the left main or left anterior descending artery. These conditions typically lead to transmural infarction of the interventricular basal septum causing ST elevation in aVR. In tandem with diffuse ST depressions, ST elevations in aVR may be concerning for proximal occlusion in the proper clinical setting. However, recent evidence suggests that acute coronary occlusion is relatively uncommon in patients with these electrocardiogram findings, occurring in only 10% of patients compared to 60-80% in patients with ST elevations in other electrocardiographic distributions. These same electrocardiogram findings are more commonly seen in severe multivessel coronary disease, as a result of diffuse subendocardial ischemia and reciprocal elevation in avR as seen in this case. Although less commonly associated with acute plaque rupture, patients with these findings are at high risk for future cardiac events. Rates of myocardial infarction, heart failure, and mortality have been found to be higher in patients with ST elevation in aVR, with greater elevation associated with excess risk. ST elevation in aVR is not commonly associated with acute plaque rupture but does indicate high risk for cardiac morbidity.

CONCLUSION: Current cardiology practice guidelines state that isolated ST elevation in aVR with multi- lead ST segment depressions may represent acute occlusion of the left main or proximal left anterior descending artery. However, recent evidence suggests that the incidence of acute coronary occlusion in these cases is relatively low. Despite low rates of acute occlusion, these patients are at high risk for future coronary events. Although these patients may not need to be taken for angiography emergently, invasive coronary evaluation in a timely fashion is often warranted.

STEMI MANIFESTING AS CARDIAC CEPHALGIA

Douglas Kyrouac, Walter Schiffer. Internal Medicine, Washington University in Saint Louis, Saint Louis, MO. (Control ID #3388807)

LEARNING OBJECTIVE #1: Recognize cardiac cephalgia as an uncommon presentation of ischemic heart disease

CASE: A 66-year-old male with history significant for hypertension and hyperlipidemia presented to the ER for intractable headaches. He noted worsening headaches with exercise for the past couple of weeks prior to presentation. He frequented the gym 3 days per week for an hour at a time and reported that he would have headaches after 15 minutes on the elliptical. The sensation was described as a tightness or heaviness in his head that radiated to his neck and chest. He was able to continue his exercise but would have the headache until he rested for 10 to 15 minutes. These headaches became more frequent and worsened in intensity. The day of presentation, he was working in the yard when he experienced an unrelenting headache. This time, it did not improve with rest, so he presented to the ER for further evaluation.

Upon arrival to the ER, his blood pressure was 188/112 and heart rate was 97. ECG noted an anterior lateral STEMI. Troponin was 7.3 ng/dL and peaked at 139 ng/dL. He was given aspirin, Plavix, and heparin, and the cath lab was activated. Left heart catheterization demonstrated diffuse coronary artery disease, with a 60% stenosis of the distal left main, 100% occlusion of the proximal to mid left anterior descending, 90% occlusion of the ostial left circumflex followed by 60% proximal stenosis, and 90% stenosis of the right coronary artery. Complex percutaneous coronary intervention was performed with good flow after revascularization and his symptoms resolved. He recovered uneventfully and was discharged to complete cardiac rehabilitation.

IMPACT/DISCUSSION: Cardiac cephalgia as the main presenting symptom of ischemic heart disease is a rare occurrence, with 36 cases reported to date. Patients typically experience a headache that is related to exertion and relieved with sublingual nitroglycerin. There are few commonalities with respect to headache laterality or characteristic of pain, which can feel migrainous, thunderclap or pressure-like. Patients often have traditional risk factors for coronary atherosclerosis. Current guidelines for management of exertional headache recommend ischemic evaluation, including ECG and cardiac biomarker testing, for patients with risk factors for ischemic heart disease who present with exertional headache. The pathophysiology of cardiac cephalgia remains unknown but may be caused by central misinterpretation of converging autonomic and somatic nerve signals from the upper chest, neck, and head in the spinal cord. Another theory posits that myocardial ischemia causes release of neurochemical mediators, including bradykinin and substance P, which result in cerebral vasodilation and vasospasm. Definitive management with revascularization is the mainstay of treatment for cardiac cephalgia causing significant coronary artery stenosis.

CONCLUSION: Cardiac cephalgia is a rare but potentially underrecognized manifestation of ischemic heart disease.

STEMI OPENS EYES TO RIGHT ATRIAL METASTATIC RENAL CELL CARCINOMA

Ahmad Hallak[1]; Faiza Mubeen[2]; Sheikh Islam[1]; Kaylee J. Shepherd[3]. [1]Internal Medicine, Texas Tech University Health Sciences, Amarillo, TX; [2]Internal Medicine, Texas Tech University health science center, Amarillo, TX; [3]Internal Medicine, Texas Tech University Health Sciences Center, Amarillo, TX. (Control ID #3391446)

LEARNING OBJECTIVE #1: The majority of cardiac masses are metastatic tumors.

LEARNING OBJECTIVE #2: Workup of cardiac masses in the non-emergent settings may be warranted as it may alter decision-making.

CASE: A 62-year-old female presented to an outlying facility with acute onset of typical chest pain, paresthesia of the left arm, lightheadedness, and nausea. She was found to have ST elevations in the inferior leads with sinus bradycardia and elevated troponin of 0.184 ng/mL. She was administered thrombolytic therapy (TPA), placed on heparin and nitroglycerin drips and transferred to our facility via air ambulance.

She arrived vitally stable and asymptomatic. Transthoracic echocardiogram showed normal left ventricular function and a right atrial inferior wall mass. She underwent coronary angiography, which showed significant 3-vessel disease with significant left main disease. The patient was referred for coronary artery bypass graft surgery, during which the mass was excised. Pathology determined the mass to be metastatic clear cell renal carcinoma. CT imaging revealed a 5cm right kidney lower pole lesion with no enhancement, filling defects within the intrahepatic IVC and right inferior renal vein extending into the IVC, and no pulmonary or intracranial metastasis.

IMPACT/DISCUSSION: The typical symptoms of renal cell carcinoma (RCC) include flank pain, a palpable mass and hematuria, however with increased utilization of imaging this has become more the exception rather than the rule.

RCC is a highly vascular tumor with a tendency to metastasize early. At the time of diagnosis, up to 10% of patients with RCC have tumor thrombus involving the renal vein and inferior vena cava (IVC) and up to 1% of patients have tumor thrombus extending into the right atrium.

Cardiac metastasis will rarely become symptomatic until embolization, circulation obstruction, valvular interference, or direct myocardial invasion. Metastatic cancer has been diagnosed in the setting of ST elevations, however historically these have been related to pericardial metastasis with cardiac tamponade being the first manifestation of the malignancy. Up to our knowledge, there is no documented case of a patient diagnosed with RCC incidentally during MI.

Cardiac metastases are 20 times more common than primary cardiac tumors. The median survival period of patients with metastatic RCC is 6 to 12 months. Only 9% of patients survive at 5 years. Since this patient's surgery was not emergent, workup of the atrial mass may have altered the Surgeon's decision to proceed with CABG.

CONCLUSION: In the non-emergent setting, it may be warranted to work up any cardiac mass prior to undergoing any invasive operations.

STICK TO YOUR GUNS: THE PATH TO DIAGNOSIS OF WARM AUTOIMMUNE HEMOLYTIC ANEMIA

Aula Ramo[1]; Joyce Philip[2]; Jawad Sheqwara[3]. [1]Internal Medicine, Henry Ford Hospital, Detroit, MI; [2]Internal medicine, Henry Ford Hospital, Troy, MI; [3]Henry Ford Hospital, Detroit, MI. (Control ID #3392152)

LEARNING OBJECTIVE #1: Diagnosis of Warm Autoimmune Hemolytic Anemia (WAIHA) requires full consideration of infectious and malignant causes

LEARNING OBJECTIVE #2: Negative Direct Coomb's Test does not rule out WAIHA in the setting of high suspicion

CASE: A 35 year old Caucasian female with a past medical history of viral cardiomyopathy status post heart transplant and ulcerative colitis status post total colectomy presented with subacute dizziness and shortness of breath. The patient had no significant recent travel history and denied taking new medications nor recent infections. An echocardiogram showed normal cardiac functions and normal valves. Initial hemoglobin 5.3 g/dL, Lactate dehydrogenase (LDH) 602 IU/L haptoglobin <30 mg/dL. Reticulocyte percent of 2.2%. Total bilirubin 11 mg/dL with a direct bilirubin of 1.6 mg/dL. Direct Coomb's test (DAT) was negative on multiple occasions. DIC panel was negative. Peripheral smear showed micro spherocytes and was negative for schistocytes. Ultrasound showed mild splenomegaly. Viral studies were negative including hepatitis A/B/C, EBV and CMV IgM antibodies. Flow cytometry for CD 55 and CD 59 was negative. Electrophoresis was normal. Rheumatoid factor, C3, C4,

pyruvate kinase were within normal limits. Vitamin b12, folate, lead, copper, and zinc were normal. Monoclonal protein evaluation was negative for monoclonal protein. Bone marrow biopsy revealed no evidence of lymphoid or myeloid neoplasia. Given history of ulcerative colitis suggesting an autoimmune process, we decided to use a Super Comb's test which was positive. The patient was initially treated with pulse steroids, with modest response but following Super Comb test, steroids were maintained for longer period of time and hemolysis labs gradually improved with normalization of hemoglobin and resolution of hemolysis over 2 months

IMPACT/DISCUSSION: WAIHA is diagnosed in the presence of autoantibody antibodies that react with protein antigens on the red blood cell surface at body temperature. They are usually of the IgG subtype. This leads to red cell destruction and a hemolytic anemia with workup revealing elevated Lactated Dehydrogenase (LDH) and low haptoglobin (as in our patient) along with a positive direct Coomb's test (DAT). However, if culprit antibodies are of IgA or IgM type or are of low affinity, they can result in a negative test. Given negative DAT in our patient, next steps in workup necessitated the Supercomb's test

CONCLUSION: This case sheds light on the work up and differential diagnosis for hemolytic anemia. Infectious workup, cardiac imaging, and ruling out a bone marrow process should be considered. Secondly, it presents an uncommon presentation of a relatively common problem. Given high suspicion for WAIHA despite no clear cause for hemolysis, it is reasonable to consider the Supercomb's test to further diagnose and verify the diagnosis.

STONES, GROANS, PSYCHIATRIC OVERTONES, AND ?

Annalisa Madrigal-Lopez[1]; Rafael Otero[2]; Eddy Valdez[2]; Henry Kwang[1,2]. [1]University of Texas Rio Grande Valley School of Medicine, Edinburg, TX; [2]Internal Medicine, University of Texas Rio Grande Valley Internal Medicine Residency Program at Valley Baptist Medical Center, Harlingen, TX. (Control ID #3391887)

LEARNING OBJECTIVE #1: Outline the incidence and common clinical features associated with Multiple Myeloma (MM).

LEARNING OBJECTIVE #2: Illuminate the importance of stratifying a patient's clinical presentation to determine common or multifactorial etiology.

CASE: A 90-year-old Hispanic female with a history of hypertension, diabetes mellitus, and dyslipidemia presented to the emergency department complaining of dull generalized abdominal pain, generalized weakness, poor appetite, fatigue, weight loss, and constipation. The patient's family stated that the patient had become more reclusive within the last few weeks and no longer seemed like herself.

Upon admission, vital signs included temperature 98.1 F, heart rate 85, blood pressure 148/58, respiratory rate 18, and BMI 24. Laboratory revealed a corrected Calcium of 18.1, Parathyroid Hormone (PTH) of 5.8, Hemoglobin of 8.1, Creatinine of 1.59 and gamma gap of 6.6. Given the constellation of findings and fulfilling multiple CRAB criteria, there was high suspicion for MM and expedited workup for this was started. CT head revealed a soft tissue mass seen with bony erosion involving the left parietal bone measuring 3.1 x 2.2 cm suggestive of a mass related to MM[HK3]. Subsequently, bone marrow biopsy revealed an aberrant kappa light chain restricted plasma cell population with expression of CD38, CD45, CD56, CD117 and CD138, consistent with plasma cell myeloma. The patient was given aggressive IV fluid resuscitation, Calcitonin and Pamidronate for her hypercalcemia and was referred to oncology service for further long-term treatment.

IMPACT/DISCUSSION: MM is a malignancy formed by monoclonal plasma cells. It accounts for 1.8% of new cancer cases in the United States with approximately 32, 000 new cases per year. The most common presenting symptoms of MM are fatigue, bone pain, osteolytic lesions, and anemia. Using the common mnemonic to note organ/tissue impairment, CRAB (Calcium, renal insufficiency, anemia, bone lesions), the patient actually fulfilled all criteria on presentation. Hypercalcemia that occurs in approximately 10% of patients with MM has been linked to tumor-induced bone destruction and increased renal tubular calcium reabsorption. Most concurrently report with prominent bony pain; however, this patient presented with non-specific symptoms that could have been attributed to functional constipation, dementia, and age-related osteoporosis. This case illuminates the importance of stratifying patient symptoms in order to determine related or unrelated etiology in order to guide diagnostic testing.

CONCLUSION: The aim of this case is to describe a patient demonstrating multiple non-specific symptoms that had one main etiology to unify all its underlying characteristics.

This study curtails the idea that although the patient's age and related demographics are not the most common, that should not deter a health care provider from evaluating for this uncommon disease.

STOP THE PRESSES, A PREPOSTEROUS PRESENTATION OF PRES!

Justin B. Roy[1]; Rama R. Vunnam[1]; Dhirisha Bhatt[1]; Reshma R. Golamari[3]; Rohit Jain[2]; Nitasa Sahu[1]. [1]Internal medicine, Penn State Hershey, Hummelstown, PA; [2]Medicine, Hershey Medical Center, Cumberland, MD; [3]Internal Medicine, Penn State Health Milton S Hershey Medical Center, Hershey, PA. (Control ID #3386775)

LEARNING OBJECTIVE #1: Recognize atypical presentations of posterior reversible encephalopathy (PRES)

LEARNING OBJECTIVE #2: Identify tacrolimus as a causative agent of PRES

CASE: A 55-year-old female with past medical history significant for primary biliary cholangitis status post orthotopic liver transplant 3 months prior presented as a transfer from an outside hospital due to encephalopathy and multifocal lesions in the right basal ganglia concerning for acute stroke. Outside records indicated that 1 month prior the patient had a right fronto-parietal intracranial hemorrhage (ICH) treated with craniotomy and placed on seizure prophylaxis. The patient had been discharged to acute rehab and then readmitted 3 weeks later with headache and fatigue, and was found to have new right basal ganglia lesions. On review of her outside hospital MRI imaging it was determined that the patient had right temporal lobe, right posterior insula, and right occipital lobe lesions with restricted diffusion and largely unenhancing consistent with hemorrhagic PRES. Further review of her outpatient records found that the patient had no history of hypertension, making the most likely causative agent of PRES the tacrolimus initiated after solid organ transplant (SOT). While not definitive, it is also likely that PRES was the cause of her initial ICH as well. Her tacrolimus was discontinued and the patient on subsequent imaging was found to have improving lesions.

IMPACT/DISCUSSION: PRES is largely thought to be caused by hypertension, eclampsia, sepsis, immunosuppressive agents, chemotherapy, collagen vascular disease and renal failure. PRES occurs in <5% of SOT and is most commonly associated with tacrolimus in those cases. Classic presentation of PRES with bilateral parietal and occipital subcortical vasogenic edema is now recognized as typical, but atypical presentations should not dissuade the diagnosis of PRES. Atypical presentations with both edema and hemorrhage in the frontal lobe, cerebellum, basal ganglia and brain stem have all been described, and PRES should remain high on the differential in the correct clinical context despite non-classical distributions.

CONCLUSION: PRES occurs in <5% of SOT and is most often due to tacrolimus after transplant. Hemorrhage and atypical distributions of lesions should not dissuade a diagnosis of PRES

STREPTOCOCCUS EQUI ZOOEPIDEMICUS – NOT HORSING AROUND, A SERIOUS INFECTION IN HUMANS

Anna H. Owings[1]; Shradha Ahuja[2]; Svenja Albrecht[2]. [1]Internal Medicine, University of Mississippi Medical Center, Jackson, MS; [2]University of Mississippi Medical Center, Jackson, MS. (Control ID #3367873)

LEARNING OBJECTIVE #1: Recognize and diagnose rare zoonotic pathogen in patients who present acutely ill with significant history of consuming unpasteurized dairy products or with exposure to horses.

CASE: A 52-year-old male with a past history of end stage renal disease on dialysis, hypertension, hyperlipidemia, chronic tobacco use and aortic dissection type B post repair presented to the Emergency Department (ED) with a chief complaint of chest pain, fever and cough. While in the ED, the patient developed Atrial Fibrillation with Rapid Ventricular Rate and then converted to Atrial Flutter. He became hypotensive and was successfully cardioverted. Following cardioversion, vitals were stable with exception of fever, 103°F. Physical examination showed right upper quadrant abdominal tenderness, chest wall tenderness and auscultation of lungs with minimal rales on the left. Lab work revealed leukocytosis of 10.1 and procalcitonin of 94. A Chest X-Ray demonstrated persistent cardiomegaly and atelectasis of left lung base. A Computed Tomography Angiography (CTA) demonstrated no significant change in the chronic type B aortic dissection as well as, curvilinear opacities in both lower lobes and inferior left upper lobe compatible with subsegmental atelectasis versus scarring. Blood cultures were drawn, and patient was started empirically on Vancomycin and Zosyn. Two days later blood cultures grew *Streptococcus equi* subspecies zooepidemicus. Susceptibilities resulted and patient was switched to Ceftriaxone. Subsequent blood cultures were negative two days after the original. He continued to improve and was discharged home four days later with intravenous Cefazolin. Follow up appointment with his primary care physician one month after discharge revealed that patient was in his normal state of health.

IMPACT/DISCUSSION: *S. equi zooepidemicus* is a gram positive, non-sporulating, non-motile, catalase and oxidase negative organism. It is a zoonotic pathogen, which is rarely seen in humans but when isolated is typically seen in patients who have direct contact with horses or have consumed homemade/unpasteurized milk or cheese. Our patient reported that he owned four horses at home that all recently had "a cold". Extensive review of literature publications shows few cases of human disease from this pathogen, most dating to the 1980s. Case reports included meningitis, glomerulonephritis, rheumatic fever, cellulitis, pericarditis, toxic shock syndrome, endovascular infections, pneumonia, septicemia, spondylodiscitis and purulent arthritis. This pathogen which can reap serious and detrimental consequences if not caught in a timely manner. It is crucial to have a high suspicion of this infectious organism, S. *equi zooepidemicus*, when patient presents with history of horse interaction or consumption of unpasteurized dairy products.

CONCLUSION: It is important to have high suspicion of S. equi zooepidemicus when patient presents acutely ill with unique history of horse interaction or consumption of unpasteruized dairy products.

SUBACUTE ENDOCARDITIS: SEARCHING BEYOND HACEK ORGANSIMS

Kalyani Kumar, Rachel Shepard, Deepa Bhatnagar. Medicine, Tulane University, New Orleans, LA. (Control ID #3372746)

LEARNING OBJECTIVE #1: Contrast clinical presentations of subacute vs. acute endocarditis

LEARNING OBJECTIVE #2: Recognize treatment challenges of endocarditis in the absence of guideline directed therapy

CASE: A 62-year-old man with hepatitis C and intravenous drug use presented with a one-month history of lower extremity edema and dyspnea. He was afebrile and normotensive. A 3/6 systolic ejection murmur was present at the apex and 2+ pitting edema extended to the mid shins.

A transthoracic echocardiogram revealed LVEF of > 65% with severe mitral regurgitation and a vegetation on the posterior leaflet of the mitral valve. An additional vegetation on the anterior mitral valve leaflet was found on transesophageal echocardiogram. One the fourth day of admission, blood cultures returned positive for gram negative rods, later identified as burkholderia cepacia. Two years prior, he was treated with ceftazidime for a urine culture positive for burkholderia.

He was started on medical therapy with ceftazidime. Despite medical therapy, he developed septic arthritis of his left shoulder. He developed aphasia and an MRI revealed multiple septic cerebral emboli. Thus, he underwent mitral valve repair. At the time of discharge his edema and dyspnea had resolved; however he continued to have cognitive-linguistic defects secondary to cerebral emboli.

IMPACT/DISCUSSION: Subacute bacterial endocarditis is most commonly due to streptococcus viridans in patients with preexisting heart disease. Burkholderia Cepacia complex, a multidrug resistant genus of gram negative bacteria, is a rare cause of endocarditis, described only in a few case reports to date. It is a low virulence organism that usually affects immunocompromised patients such as those with cystic fibrosis and chronic granulomatous disease. B. Cepacia is found in water sources and thus is an increasingly common pathogen in IV drug users due to the use of tap water when reusing needles.

Infective endocarditis (IE) carries high rates of mortality, approaching 40% at 1 year. While patients with acute IE typically present with high fevers and rigors (80-90%), the diagnosis of subacute endocarditis is often delayed due to non-specific symptoms such as fatigue and dyspnea over the course of months. Subacute endocarditis thereby poses a significant diagnostic challenge. However, with recent advances in genome sequencing, more infections of Burkholderia including endocarditis are being diagnosed. Our ability to detect an increasingly wider array of pathogens may lead to a shift in the paradigm of categorizing IE by simply acute or subacute presentation. This case of burkholderia endocarditis was successfully treated with ceftazidime despite known expression of several B lactamase and cephalosporin target mutations in burkholderia species.

CONCLUSION: Clinical presentation of acute and subacute endocarditis varies as subacute endocarditis may be more indolent. An internist must remain aware of the organisms associated with subacute endocarditis to aid in the investigation and treatment.

SUBACUTE INFECTIVE ENDOCARDITIS MANIFESTING AS DYSPNEA IN A PATIENT WITH ASTHMA

Daniel S. Trierweiler, Matthew Moles, Brandon Combs. Internal Medicine, University of Colorado, Denver, CO. (Control ID #3369886)

LEARNING OBJECTIVE #1: Recognize that subacute infective endocarditis typically follows an indolent course with subtle clinical manifestations

LEARNING OBJECTIVE #2: Consider alternative diagnoses in patients who fail to improve with initial interventions in order to avoid delays in necessary care

CASE: A 66 year old woman with a history of mild asthma and aortic valve replacement (AVR) in 2016 presented to her primary physician with dyspnea on exertion over the previous 3 months. She was diagnosed with

an asthma exacerbation and treated with albuterol and five days of prednisone. The next day she presented to the emergency department and was admitted for neck pain and new mild hypoxia. CT pulmonary angiogram, CT angiogram of the neck and point of care cardiac ultrasound were normal. She was discharged on 2 liters of oxygen for hypoxia attributed to presumed asthma. She followed up in clinic one week later for continued dyspnea. With a history of AVR and ongoing dyspnea, formal echocardiography was ordered. A possible mitral valve (MV) vegetation was noted and was directly admitted for urgent transesophageal echocardiogram (TEE) which confirmed an 11 mm vegetation on the MV with trivial regurgitation. Blood cultures were persistently positive for Streptococcus gordonii, likely from an oral source as no other possible sources were identified. The patient received 6 weeks of ceftriaxone with subsequent resolution of the mitral vegetation as well as her dyspnea and hypoxia.

IMPACT/DISCUSSION: The incidence of infective endocarditis (IE) is approximately 2-7 per 100,000 persons in the population and native valve endocarditis represents a majority of cases. Subacute endocarditis may have a protracted course over weeks to months and can be difficult to diagnose due to non-specific manifestations. In subacute IE, 60% of cases are attributable to the strep. viridans group. S. Gordonii is a known colonizer of the oral cavity and uncommonly implicated in cases of IE. While our patient did not have a recent dental procedure, routine oral care alone can lead to bacteremia. Our patient had dyspnea accompanied by subacute hypoxia, which is not typical of IE, and apart from case studies is not well documented in the medical literature. While fever occurs in 90% of IE cases, older patients are often afebrile such as in this case. Transthoracic echocardiogram has variable sensitivity (50-90%) and is often the first diagnostic imaging test in the evaluation of IE. In this case TEE (sensitivity and specificity 90%) confirmed the vegetation and guided her subsequent treatment.

CONCLUSION: Diagnosis of subacute IE can be a challenge with an often indolent course and non-specific symptoms. Older patients may not have fever and recent dental procedures are not required to develop bacteremia. S Gordonii is a streptococcus species capable of causing IE. In this case anchoring on asthma likely delayed diagnosis of IE. Persistent symptoms not responding to typical therapies should prompt pursuit of alternate diagnoses in patients with unexplained dyspnea.

SUBCAPSULAR LIVER HEMATOMA WITH RUPTURE- A RARE COMPLICATION OF HELLP SYNDROME

Pratishtha Singh, Victor Collier. Internal Medicine, Grand Strand Medical Center, Myrtle Beach, SC. (Control ID #3390286)

LEARNING OBJECTIVE #1: Recognize, diagnose and manage Subcapsular Liver hematoma (SLH)

CASE: 16-year-old nulliparous female at 36 weeks gestation presented to a local hospital with signs and symptoms of pre-eclampsia requiring emergent C-section with delivery of twins. Post-op the patient was hypotensive with increasing abdominal distension. A point of care HgB revealed that patient had severe anemia with symptoms of shock. She was transfused and underwent a laparotomy revealing hemoperitoneum and an encapsulated liver hematoma. She was transferred to our hospital for ongoing treatment. Vital signs on arrival were HR 104 and BP 156/88. She was mechanically ventilated and sedated. Heart was regular and tachycardic. Lungs were clear. Abdomen with wound vacuum in place with bloody drainage. Her laboratory showed an AST 7429, ALT 345, LDH >12000, Cr 1.8, WBC 18700, HgB 10.6, plt count 79.000, Fibrinogen 173, PT 16.6, and D-dimer >3000. CTA abdomen and pelvis showed a large right hepatic subcapsular hematoma with active arterial extravasation. After an emergent surgical consult, patient was initially sent to interventional radiology for embolization followed by exploratory laparotomy with unroofing of the hepatic capsular hematoma. She received multiple transfusions of PRBCs, fresh frozen plasma, platelets, and prothrombin complex concentrate intraoperatively and was transferred to the ICU. Given her liver function test abnormalities, low platelets and high LDH she was diagnosed with HELLP syndrome and DIC complicated by SLH. Patient was extubated on postoperative day 1 and was stable for discharged to home on day 5.

IMPACT/DISCUSSION: SLH is associated with less than 2% of pregnancies complicated by HELLP. Incidence of rupture in pregnancies varies from 1/40000 to 1/250000. Rupture can lead to life threating complications such as DIC, acute liver failure and kidney failure. Mortaliy associate with rupture is 18-86%, Symptoms can be non-specific and include epigastric or right upper quadrant pain, nausea, vomiting, anorexia and dyspnea. Rupture presents with signs of hypovolemic shock and hemodynamic compromise. Ultrasound, CT and MRI can be used for diagnosis. Hemodynamic and coagulation parameters should be followed and patients are evaluated with serial imaging, avoidance of liver manipulation and replacement of blood products as needed. Medical treatment is first line for stable patients; however, surgical management is indicated for hemodynamically unstable patients in addition to ICU level supportive care.

Overall, SLH is a rare severe complication of HELLP in pregnancy that required expertise in diagnosis, medical and surgical management to assure optimal outcomes.

CONCLUSION: SLH with HELLP syndrome is a rare complication of preeclampsia.

Clinical clues include right upper quadrant pain, nausea, vomiting and anorexia or hemodynamic instability. SLH carries a high mortality if not recognized and treated with combined medical, obstetrical, radiology and surgical team.

SUBCUTANEOUS EMPHYSEMA A WHOLE LOT OF AIR

Michael L. Setteducato, Margaret C. Lo, Amy J. Sheer. Department of Internal Medicine, University of Florida, Gainesville, FL. (Control ID #3391872)

LEARNING OBJECTIVE #1: Identify the clinical and diagnostic features of subcutaneous emphysema

LEARNING OBJECTIVE #2: Know the risk factors and management of subcutaneous emphysema

CASE: A 66-year-old woman with end-stage COPD, bronchiectasis, RA with associated ILD and HFrEF (EF 35%) presented with facial swelling and diffuse chest pain radiating to the neck. Exam noted severe tachypnea and tachycardia but no hypotension or hypoxia. Cardiopulmonary exam found a tachycardic rate, regular rhythm, no murmurs, rubs or gallops, increased breathing effort, bibasilar crackles, and subcutaneous crepitus over chest. ABG revealed compensated respiratory acidosis. CBC, CMP, and EKG were unremarkable. CXR showed diffuse subcutaneous emphysema in the chest and neck. Patient was intubated for airway protection. CT Chest showed subcutaneous, mediastinal, subpleural and peritoneal free air without pneumothorax. Small subcutaneous incisions on the chest and subcutaneous angiocatheter placement helped to relieve the patient's pressure and pain. Patient's respiratory status slowly improved. She was successfully extubated and discharged to a rehabilitation facility

IMPACT/DISCUSSION: This case teaches the value of physical exam findings, and the importance of understanding risk factors for subcutaneous emphysema. Subcutaneous emphysema presents as stabbing chest pain and swelling of the chest, neck, and face. Patients have auditory crackles with breathing and crepitus when pressing on the skin. Leukocytosis and fever may be present, and ECG may show low voltage and axis shifts. Our patient likely suffered from barotrauma due to her chronic

bronchiectasis and end-stage COPD. This caused air to leak from the ruptured alveoli to the surrounding fascial planes. Other common causes of subcutaneous emphysema include trauma, infection from gas-forming microorganisms, GI trauma, or iatrogenic origins. Risk factors are extensive and common ones include pulmonary insults (asthma, pneumonia, tuberculosis, mechanical ventilation), seizures, diabetic ketoacidosis, GI abnormalities (colon cancer, ulcer perforation), and factious events (injection of air under skin). CXR or chest CT will reveal radiolucent linearities in subcutaneous tissues representing free air. Patients should be closely monitored in the hospital given the high risk for cardiovascular and respiratory instability from air compressing the great vessels or trachea. Treatment is supportive, occasionally requiring surgical intervention in trauma-related cases. Placement of chest tubes, performing tracheostomy or inserting mediastinal drains is not advised, although in our patient it aided in her recovery. Clinicians should have a low threshold for intubation for airway protection

CONCLUSION: When subcutaneous crepitus is noted on the cardiopulmonary exam, always get a STAT CXR to assess for subcutaneous emphysema and pneumothorax. Reassure patients that once the causative condition is identified, subcutaneous emphysema is a self-limited process but requires close monitoring and supportive treatment

SUCH VARIABLE BLOOD PRESSURE (BP) READINGS!

Mahmuda Akhter[1]; Jithu Pradeep[1]; Raman Singhal[2]. [1]Internal Medicine, Montefiore Medical Center- Wakefield Campus, Astoria, NY; [2]Internal Medicine, Montefiore Medical Center, Bronx, NY. (Control ID #3389531)

LEARNING OBJECTIVE #1: Recognize the pathophysiology of orthostatic hypotension/supine hypertension (OH/SH) syndrome in uncontrolled diabetes mellitus (DM).

LEARNING OBJECTIVE #2: Understand the management options for OH/SH syndrome in uncontrolled DM.

CASE: A 47-year-old man with uncontrolled insulin dependent DM presented with lightheadedness. He has had multiple falls resulting in head trauma. Prior to falling, he feels lightheaded and shaky with visual darkening. Generally, symptoms worsen when he stands from a seated position. Vital signs revealed supine blood pressure (BP) 120/67, pulse 85 and standing BP after 2 minutes 57/47, pulse 75. He had multiple admissions for syncope; all cardiac and neurologic work ups were negative except head up tilt table testing, which was positive for orthostatic hypotension without reflex tachycardia, consistent with dysautonomia. He was treated with fludrocortisone, midodrine and compression stockings with improvement of symptoms. Four months later, he had standing BP 87/67 and supine BP 175/110. Twenty four-hour BP monitoring was diagnostic for supine hypertension (HTN). Even with beta blocker therapy, ambulatory BP monitoring continued to reveal supine HTN up to 204/130. After discussing the pathophysiology, therapeutic goals to prevent end organ damage due to supine HTN, and improving quality of life with controlling orthostatic hypotension, he decided to pursue pharmacologic intervention for orthostatic hypotension and lifestyle modifications for supine hypertension, which improved his supine and postural BP.

IMPACT/DISCUSSION: Long-term uncontrolled DM can result in autonomic neuropathy, which can manifest in several different organ systems. From cardiovascular point, sinus tachycardia is often the first sign of autonomic neuropathy. Orthostatic hypotension may also develop, due to a blunted sympathetic response to the gravity-dependent decrease in BP upon standing from a seated position. Furthermore, the normal diurnal rhythm can be reversed in these cases, such that blood pressure often rises at night and falls in the morning. The OH/SH syndrome poses a difficult therapeutic dilemma – treating one aspect may worsen the other. Lifestyle changes which may help include lying in head up tilt position and wearing compression stockings. Pharmacotherapy includes volume expanders and sympathomimetics, but these may exacerbate supine HTN. This syndrome is often overlooked, as seated BP readings in the office may not reveal the whole story. It is important to be aware of OH/SH, so as to identify patients that should be screened for this disorder. Early detection will allow for a patient-centered discussion about treatment options, and can decrease morbidity.

CONCLUSION: OH/SH syndrome should be considered in patients with diabetes and signs of autonomic dysfunction. Discussing therapeutic goals with the patient can be helpful in controlling symptoms and improving overall outcome.

SURGERY OR NO SURGERY - THIS IS THE QUESTION: A CASE OF SUPERIOR MESENTERIC ARTERY SYNDROME (SMAS)

Altaib Al Yassin, Monica Tawadros, Matthew Greenwood, Joshua Lee, Nancy Lee. Internal Medicine, University of Massachusetts Medical School, Worcester, MA. (Control ID #3373723)

LEARNING OBJECTIVE #1: Failure to diagnose and treat SMAS can carry morbidity and mortality

LEARNING OBJECTIVE #2: Early surgical intervention should be considered

CASE: A 79-year-old man with no significant medical history presented with abdominal discomfort, nausea, dark brown emesis, and significant weight loss. On physical exam, patient was cachectic. The abdomen was soft and diffusely tender upon palpitation with positive bowel sounds. He was found to have hypokalemia, hypomagnesemia, hypophosphatemia, and metabolic alkalosis with prealbumin level of 13 mg/dL. The CT scan of the abdomen and pelvis showed a moderate to severe grade bowel obstruction with the transition point at the third duodenal segment. There was also dilation of the first and second duodenal segments, stomach and distal esophagus. Upper gastrointestinal endoscopy revealed a dilated first and second portion duodenum with solid, undigested food present within the stomach and intestines, with no intraluminal pathology. Clinical presentation and imaging suggested that this patient has SMA syndrome. A nasogastric tube was placed to decompress the stomach and the patient was not given anything by mouth. A peripherally inserted central catheter was placed for total parenteral nutrition. Surgery was consulted; no intervention was recommended. The patient's symptoms slowly improved so he was advanced to clears which he tolerated well. The patient was given dietary recommendations and discharged home with outpatient surgery follow up.

IMPACT/DISCUSSION: SMAS is a rare disease with incidence of 0.1% to 0.3%. The disease is caused by loss of the fat pad surrounding the SMA, decreasing the aortomesenteric angle to less than 25° (Normal aortomesenteric angle is 28–65°), and allowing the artery to press the small bowel against the aorta, narrowing the lumen of the intestines. Therefore, this disease should be suspected in patients who have a recent history of severe weight loss. Patients present with symptoms similar to small bowel obstruction. SMAS diagnosis is challenging. CT or MR angiography enable visualization of the vascular compression of the duodenum and precise measurement of the aortomesenteric angle. Conservative treatment usually comes first, which includes nutritional support and electrolyte correction. Failure of conservative management warrants surgical intervention. Historically, patients fail conservative treatment and develop serious complications, including gastric atony and gastroparesis. Lee et al followed 80 patients with SMAS and reported a greater success rate in patients treated surgically than in patients treated medically both in terms of outcome and recurrence. For these instances, an early surgical correction should be considered.

CONCLUSION: SMA Syndrome can be easily missed due to vague symptoms but is a crucial diagnosis due to associated high morbidity and mortality. Early surgical intervention rather than conservative management should be considered.

SUSPECTED GASTRINOMA WITH NO KNOWN PRIMARY: FURTHER WORK-UP AND MANAGEMENT

Jacob Lui[1]; Jaime De La Fuente[2]; Randall K. Pearson[2]. [1]Alix School of Medicine, Mayo Clinic - Rochester, Rochester, MN; [2]Internal Medicine, Mayo Clinic, Rochester, MN. (Control ID #3373781)

LEARNING OBJECTIVE #1: Diagnose suspected gastrinoma with negative conventional imaging

LEARNING OBJECTIVE #2: Management of metastatic gastrinoma with an unknown primary tumor

CASE: A 63-year-old Caucasian woman presents for outpatient evaluation of chronic abdominal pain and diarrhea. Her history is significant for gastroesophageal reflux disease (GERD), upper gastrointestinal bleeding, and persistent abdominal pain despite a cholecystectomy for suspected biliary colic a year prior.

Evaluation with esophagogastroduodenoscopy (EGD) revealed severe esophagitis, multiple duodenal ulcers, and negative gastric biopsies for *H. pylori*. She denied the use of non-steroidal anti-inflammatory drugs. Computed tomography (CT) and endoscopic ultrasound (EUS) demonstrated mild duodenal inflammation and benign hepatic cysts. Despite the use of proton-pump inhibitor (PPI) therapy, she continued to have 10 loose bowel movements a day.

At our tertiary center, Zollinger-Ellison Syndrome (ZES) secondary to gastrinoma was suspected. After holding PPI, gastrin levels measured at 1967 pg/ml and a stomach pH of 4. Repeat EUS was equivocal for primary tumor. Eventually, a Gallium Ga-68 DOTATATE scan demonstrated tracer uptake in the liver and peripancreatic lymph nodes. Liver biopsy, fine needle aspiration and subsequent immunohistochemistry were consistent with a metastatic gastrinoma.

Despite another negative repeat EUS for identification of the primary tumor, the patient proceeded with cytoreductive surgery of the metastatic tumor and hepatoduodenal lymph nodes. A 1cm primary duodenal mass was discovered perioperatively and was resected.

Since surgery, the patient's symptoms of reflux, abdominal pain, and diarrhea have greatly improved with reduced daily PPI use.

IMPACT/DISCUSSION: Although rare, ZES should be considered on the differential for patients with recurrent peptic ulcers, esophagitis, and diarrhea. Primary gastrinomas are often missed on preoperative imaging such as CT and EUS, and may go years without a diagnosis. This has been further complicated by the ubiquitous use of PPIs. Early detection of ZES is imperative to avoid metastatic disease and a poor prognosis.

This case demonstrates how specialty imaging like Gallium Ga-68 DOTATATE may be required for initial diagnosis of neuroendocrine tumors. It also suggests treatment recommendations for metastatic gastrinomas, which currently lack randomized data. Due to the uniquely insidious and slow-growing nature of gastrinomas, surgery may lead to better symptomatic control, primary tumor identification, and a potential prolongation of survival.

CONCLUSION: Gastrinoma is a rare and difficult diagnosis to make. With adequate pre-test probability, clinicians should continue diagnostic evaluation, even if costly testing is required.

Contrary to management in many other malignancies, early surgical intervention in metastatic gastrinoma may help with symptoms, survival rates, and identification of an unknown primary tumor.

SYMPTOMATIC ACUTE HEPATITIS C IN A HIV PATIENT

Taha Ashraf, Ahmed Elbanna. Internal Medicine, Henry Ford Hospital, Detroit, MI. (Control ID #3390249)

LEARNING OBJECTIVE #1: Recognize HIV patients are at increased risk for symptomatic Acute Hepatitis C

LEARNING OBJECTIVE #2: Recognize that Acute Hepatitis C in HIV patients should be treated early

CASE: A 36-year-old male with past medical history of HIV on therapy presented to our hospital with intractable abdominal pain, nausea, and vomiting.

Three weeks prior to presentation, he was evaluated for acute abdominal pain. At that time, evaluation was only remarkable for elevated transaminases (AST 106, ALT 108). Notably, viral hepatitis serologies were negative, CD4 count was 731 and HIV viral load <20. Abdominal CT demonstrated bowel wall thickening. Patient was diagnosed with acute colitis and treated with a course of ciprofloxacin and metronidazole.

Over the next month, the patient developed worsening abdominal pain, vomiting, and nausea with associated pale colored stools and dark urine. He denied recent travel, sick contacts, fevers, alcohol, or intravenous drug use. He was sexually active with 3 male partners over the past year without regular barrier contraception.

On presentation, examination was notable for scleral icterus; however, mentation was intact without asterixis. Lab tests showed ALT 1607, AST 1456, total bilirubin 19.0, direct bilirubin 13.8 and INR 1.2. Acetaminophen levels were undetectable. HCV antibodies detected with HCV RNA PCR 45,435,994 IU/mL, genotype 1a. Our Hepatology service advised to rule out drug induced liver injury given recent ciprofloxacin use and timeline of symptomatology. Liver biopsy was consistent with acute hepatitis C infection. Patient was discharged after a period of observation and started on Sofosbuvir 400 mg / Velpatasvir 100mg for 12 weeks. Four weeks into therapy, his HCV RNA PCR fell to less than 15 IU/mL and his symptoms had largely resolved.

IMPACT/DISCUSSION: The majority of acute hepatitis C infections are asymptomatic and often unrecognized, with only 15% of cases presenting with jaundice.

Our case highlights how patients may present during the acute phase with negative HCV-specific antibodies. These are often missed as seroconversion takes 20-150 days, therefore, physicians must have a low threshold for re-testing in order to make the diagnosis.

The HIV-positive population are more likely to present with symptomatic acute HCV infection than negative patients. Although an uncommon mode of transmission, men who have sex with men are at particularly increased risk. A 2019 study of HIV coinfected patients in Austria identified 100% cure rates following direct acting antiviral therapy in early HCV infection. Studies in these populations also demonstrate spontaneous clearance in only 4-11%, highlighting the importance of early recognition and treatment.

CONCLUSION: Acute symptomatic hepatitis C and its association with HIV is an important entity to identify. The serological window period can mislead the physician into missing the diagnosis. A high index of suspicion in this population can confer early treatment that is effective and prevents chronic disease.

SYMPTOMATIC RESPONSE OF PULMONARY ADENOCARCINOMA TO CORTICOSTEROIDS

Gaurang Prabhu[1]; Byung Yoo[2]; Muhammad Ibrar Islam[2]; Aaron Mills[1]. [1]Internal Medicine, Eastern Virginia Medical School, Norfolk, VA; [2]Internal Medicine, Eastern Virginia Medical School, Norfolk, VA. (Control ID #3392236)

LEARNING OBJECTIVE #1: Distinguishing between steroid responsive lung diseases and symptomatic improvement with steroids in patients with primary pulmonary malignancies.

CASE: A 59 year old female with a history of COPD and tobacco abuse presented with SOB, tachycardic, tachypneic with oxygen saturation ranging 88-92% on 2 litres of oxygen. Physical exam was unremarkable. She had an elevated d-dimer and proceeded with CTA demonstrating multiple bilateral subsegmental pulmonary embolism along with extensive alveolar infiltrates and bulky perihilar lymphadenopathy. She was started on anticoagulation.

Workup for pulmonary infiltrates and lymphadenopathy was negative for autoimmune, vasculitis, HP and infectious etiologies. Pulmonology was consulted for biopsy of the mediastinal lymphadenopathy but felt further optimization was required before bronchoscopy. She had deteriorating respiratory status and increasing oxygen requirements. Subsequently she was started on steroids for symptomatic control while waiting for EBUS and biopsy for definitive diagnosis. Her clinical picture and infiltrates on chest x-ray improved while on steroids, and she was considered to have an unknown steroid responsive disease, likely sarcoidosis. Steroids were continued while waiting for clinical improvement before further procedures. Although the patient showed steroid responsiveness for 2 weeks, she expired due to sudden deterioration of respiratory status despite intubation and ECMO. Her autopsy showed adenocarcinoma of both lungs with extensive lymphangitic spread and metastases to liver, bilateral adrenal glands and kidneys.

IMPACT/DISCUSSION: As internists we come across categorizing lung disorders as either steroid responsive or steroid non-responsive. Steroids have proven benefit in the treatment of Asthma, COPD, ILD, pneumonitis, and sarcoidosis. While steroids do not reduce the progression of lung malignancies, they have shown to have symptomatic benefits in patients who have active lymphangitic spread. The benefit of steroids is likely due to a decrease in angiogenic growth factors like VEGF and PDGFR which leads to decrease in tumor expansion and inflammation.

This symptomatic improvement can be misinterpreted for an improvement in the progression of the disease and can mislead clinicians when the underlying diagnosis in unknown and delay the diagnosis, as in our patient. Although patients may show an improvement in symptoms on steroids, full work up for a definitive diagnosis should not be delayed as a result of symptomatic improvement.

CONCLUSION: 1) While steroids may not alter the disease progression, it can lead to symptomatic improvement in the patient's respiratory status.

2) Steroid responsiveness of a disease should not limit our differential diagnosis or detract from the need for diagnostic procedures to find the definitive diagnosis.

SYNCHRONOUS GASTRIC AND PANCREATIC NEUROENDOCRINE TUMORS IN A PATIENT WITH UNEXPLAINED WEIGHT LOSS

Brian M. Fung[1,2]; Simi Singh[3]. [1]Department of Medicine, Olive View-UCLA Medical Center, Sylmar, CA; [2]Department of Medicine, David Geffen School of Medicine at UCLA, Los Angeles, CA; [3]Vatche and Tamar Manoukian Division of Digestive Diseases, David Geffen School of Medicine at UCLA, Los Angeles, CA. (Control ID #3355976)

LEARNING OBJECTIVE #1: Recognize the possibility of gastrointestinal malignancy in patients with unintentional weight loss.

CASE: A 53-year-old male with diabetes mellitus was referred to our gastroenterology office for unintentional weight loss. He denied nausea, abdominal pain, or changes in bowel habits. A colonoscopy 4 years prior was normal. He reported no family history of gastrointestinal disease. Physical exam was unremarkable, and annual laboratory results were normal except for a hemoglobin of 13.4 g/dL.

An esophagogastroduodenoscopy (EGD) and colonoscopy were performed. A sessile 5-mm gastric body polyp was found and removed with cold snare polypectomy. Colonoscopy revealed a small benign sessile polyp. However, pathology of the gastric polyp revealed scattered nests of infiltrating well-differentiated NET cells extending to the edges of the biopsy. Endoscopic ultrasound (EUS) was performed for further resection, but the gastric body polyp was gone. A 4-mm submucosal lesion in the antrum was found and removed with ligation-assisted endoscopic mucosal resection (EMR), and a porta hepatis lymph node was biopsied with fine needle aspiration (FNA). The node, submucosal lesion, and mapping biopsies were all negative for malignancy. Fasting gastrin, chromogranin A, neuron-specific enolase, vitamin B12, 24-hour urine 5-hydroxyinoleactic acid, and serum serotonin were all normal. Parietal cell and intrinsic factor antibodies were not detected. Computed tomography (CT) of the head, chest, abdomen, and pelvis did not reveal metastatic disease. A positron emission tomography-CT (PET-CT) with gallium-68 dotatate did not show activity in the stomach but demonstrated increased activity in the head/body of the pancreas. EUS/FNA was performed on the 1.5-cm mass, and pathology showed a well-differentiated NET. After interdisciplinary consultation and shared decision making, the patient opted for middle pancreatectomy, somatostatin analog therapy, and regular interval EGD, EUS, and PET-CT gallium scans for surveillance.

IMPACT/DISCUSSION: In this case, we present a patient who was found to have a type III gastric NET that "disappeared" after polypectomy and subsequently was found with a primary NET in the pancreas. The occurrence of two NETs in the same patient is rare. Although type III gastric carcinoids are generally treated aggressively with at least partial gastrectomy, each case requires careful consideration. In our patient, a smaller lesion at diagnosis and subsequent negative imaging allowed for careful surveillance with monthly lanreotide injections rather than aggressive therapy. However, the patient opted for surgery given the chance of cure with surgical resection.

CONCLUSION: - NETs are rare heterogenous cancers that arise from neuroendocrine cells. While most occur in the lung and small intestine, NETs also occur in the pancreas and stomach.

- NETs are frequently not seen with traditional CT imaging and may require functional imaging.

- Unexplained weight loss should never be overlooked.

SYPHILIS IN THE MODERN ERA: STILL A GREAT MASQUERADER

Sabin Parajuli[1]; Paru Khadka[2]; Sheena K. Ramdeen[1]. [1]Internal Medicine, Medstar Washington Hospital Center, Washington, DC; [2]B.P. Koirala Institute of Health Sciencesa, Dharan, Nepal. (Control ID #3391663)

LEARNING OBJECTIVE #1: Rule out syphilis in an elderly non-HIV patient with systemic manifestations

LEARNING OBJECTIVE #2: Diagnose atypical neurosyphilis with parkinsonism

CASE: A 74-year-old male with diabetes, hypertension and bilateral hearing loss was admitted to the CCU for complete heart block noted in the setting of dyspnea and fatigue for four days. He was briefly confused, oriented to time and person only and behaved inappropriately with staff. Five months prior, he was seen by a neurologist for flat affect, abnormal gait, multiple falls and occasional confusion for four months. On exam at that time, he had a mild right hand fine resting tremor, mild rigidity in the right hand and bilateral lower extremities and a narrow-based shuffling gait. He was diagnosed with early Parkinson's disease and prescribed levodopa-carbidopa without any improvement. Prior CT imaging also

showed mild ascending aortic dilatation and several granulomas in the lungs, liver and spleen.

In the CCU, evaluation revealed an RPR titer of 1:64 and reactive serum Treponema pallidum enzyme immunoassay. To our knowledge, he had no prior syphilis testing. On further history, he reported multiple sex partners in the past six months with inconsistent condom use. A lumbar puncture (LP) revealed 80 white blood cells per mm3, 66% lymphocytes, normal protein and VDRL titer 1:8, confirming neurosyphilis. A serum HIV Ag/Ab test was nonreactive. He completed 14 days of intravenous penicillin G with improvement in his mental status and gait.

IMPACT/DISCUSSION: The patient had hearing loss, mild aortic dilatation, and complete heart block, which were attributed to age related changes without prior syphilis screening. With the additional findings of systemic granulomas and neurologic symptoms, syphilis was the likely etiology. Neurosyphilis can occur at any stage and can rarely cause parkinsonism without more typical features, even in HIV seronegative patients. Neurologic exam and LP should be performed three to six months after treatment and every six months thereafter until the CSF is normal and the CSF-VDRL is non-reactive. Complete heart block due to syphilis has been reported and has typically been diagnosed with the postmortem finding of gummas in the cardiac conduction system. It is important to keep a high index of suspicion for this great masquerader as it can be easily diagnosed and readily cured to prevent the onset of irreversible sequelae.

CONCLUSION: Consider syphilis on the differential of elderly patients presenting with hearing loss, aortic dilatation, complete heart block and/or non-specific granulomatous disease. It is a great imitator.

Consider neurosyphilis on the differential of parkinsonism and acute encephalopathy.

SYSTEMIC MANIFESTATIONS OF STEROID UNRESPONSIVE HYPEREOSINOPHILIC SYNDROME TREATED WITH IMATINIB

Alexander Khodak, Ava-Dawn Gabbidon. Medicine, North Shore University Hospital, Brooklyn, NY. (Control ID #3372783)

LEARNING OBJECTIVE #1: To understand the diagnosis and systemic manifestations of hypereosinophilic syndrome

LEARNING OBJECTIVE #2: To recognize that hypereosinophilic syndrome not responsive to treatment with steroids and hydroxyurea can potentially be treated with imatinib

CASE: 32 year old female with no relevant PMH presented with a complaint of headache and many episodes of diarrhea. Physical exam was notable for a mobile mass in right axilla and hepatomegaly. Labs revealed WBC 26.99, absolute eosinophil count (AEC)10870, 40.3 % eosinophils (EOs). CTA head/neck was negative, but CT abdomen showed hepatosplenomegaly and extensive lymphadenopathy. Bone marrow biopsy showed hypereosinophilia with negative PDGFRA; lymph node biopsy was negative for lymphoma. Other negative work up included: lumbar puncture, BCR-ABL, JAK2, T-cell gene rearrangement, flow cytometry, karyotype analysis, IgE, stool ova/parasites, strongyloides Ab. PR3 and pANCA were positive. The patient was discharged after symptomatic improvement but was later readmitted due to worsening leukocytosis/eosinophilia and recurrent abdominal pain despite completing a week's course of empiric steroids as an outpatient. Repeat CT abdomen showed superior mesenteric vein thrombosis, which was treated with heparin gtt and then Eliquis. Colon biopsy showed eosinophilic infiltrate. CT chest showed bilateral opacities. Lung biopsy via VATS was positive for eosinophilic pneumonitis, but negative for vasculitis/granulomatous inflammation, helping to rule out eosinophilic granulomatosis with polyangiitis. The patient was treated with IV solumedrol and hydroxyurea for suspected hypereosinophilic syndrome, without a significant decrease in eosinophil count. The patient did respond to the subsequent initiation of imatinib, leading to a significant decrease in WBC to 9.79, AEC to 2710, 27.7% EOs and further symptomatic improvement prior to discharge.

IMPACT/DISCUSSION: This patient meets the criteria for hypereosinophilic syndrome due to AEC>1500 on more than two occasions, documented eosinophil multi-organ infiltration and eosinophil mediated organ damage. While most patients respond to initial steroid therapy, she experienced persistence of symptoms/eosinophilia despite steroid and hydroxyurea therapy, requiring the addition of imatinib. Imatinib is typically used in PDGFRA positive patients since they have an imatinib sensitive tyrosine kinase. Prior studies showed poor response rates in PDGFRA negative patients. However, our patient experienced a significant response despite being PDGFRA negative, which highlights the possible utility of the agent in this patient population.

CONCLUSION: Idiopathic hypereosinophilic syndrome is a rare condition which can have severe systemic manifestations and requires prompt identification and collaborative treatment by internists and hematologist-oncologists. Patients who are initially steroid unresponsive may respond to imatinib, even if they are PDGFRA negative and lack sensitivity to the tyrosine kinase traditionally targeted by the therapy.

TAFRO: THE IMPORTANCE OF EARLY RECOGNITION AND INTERVENTION

Xiao Li, Jamil O. Alexis, Vinodh Mechery, Edwin Mathieu. Internal Medicine, Northwell Health, Manhasset, NY. (Control ID #3392463)

LEARNING OBJECTIVE #1: Recognize clinical features associated with severe idiopathic multicentric Castleman disease.

LEARNING OBJECTIVE #2: Learn appropriate initial medical therapy for a patient with a severe Castleman's disease exacerbation.

CASE: A 54-year-old male with Castleman disease (CD) and obstructive sleep apnea was admitted to the medical intensive care unit for hypercapnic and hypoxic respiratory failure. The patient was brought in after his concerned son called the ambulance as the patient had refused to move from a proned position for over two weeks. On presentation, he was afebrile, normotensive, and tachycardic. Physical exam was notable for morbid obesity and anasarca. Initial chest X-ray revealed pulmonary edema and a patchy right upper lobe opacity. Laboratory results showed thrombocytopenia, elevated sedimentation rate and c-reactive protein, low albumin, and acute kidney injury. The patient was initially evaluated and treated for infectious etiologies. He received a course of ceftriaxone and azithromycin for community acquired pneumonia with minimal clinical improvement. Cultures including blood, urine, and abdominal cytology were all negative. He was progressively diuresed with lasix; with further escalation of therapy to a bumetanide infusion with intermittent paracentesis. At times, vasopressor support was required to maintain an adequate blood pressure. Additional laboratory testing was performed: HHV-8 was negative; IL-6 and sIL-2 were markedly elevated.

Patient met the criteria for Thrombocytopenia, Anasarca, Fibrosis of the bone marrow, Renal dysfunction and Organomegaly (TAFRO) syndrome and received a dose of siltuximab, allopurinol daily and a steroid taper. Inflammatory markers and albumin improved initially, however his clinical status worsened. Patient's hospital course was further complicated by multiorganism bacteremia and eventually expired.

IMPACT/DISCUSSION: Castleman disease is a hematologic disorder that involves a single or multiple lymph node stations which show plasmacytic, hyaline vascular or mixed overgrowths. TAFRO is a variant in the idiopathic multicentric Castleman disease (iMCD) associated with HHV-8 negative has more severe presentations and poorer outcome.

Severe iMCD is classified as meeting two or more of the following criteria: Eastern Cooperative Oncology Group performance score ≥2, hemoglobin ≤8g/dL, pulmonary involvement, stage IV renal dysfunction and anasarca/ascites/pleural/pericardial effusion. Given the poor outcome of severe iMCD, treatment with high dose methylprednisone and weekly dosage of siltuximab should be initiated as soon as possible in critical ill patients. Clinical improvement is usually expected after 1 month of therapy. Patients with delayed or failed response to siltuximab would require early adjunctive chemotherapy treatment.

CONCLUSION: It is important to recognize the clinical presentation of severe Castleman disease and initiate early treatment in critical ill patients.

TAKOTSUBO CARDIOMYOPATHY (TC) PHYSIOLOGY IN THE SETTING OF METASTATIC PHEOCHROMOCYTOMA: A UNIQUE CASE TO ILLUSTRATE THE MECHANISM OF TC

Meaghan Costello, Zachary Yetmar, Thomas J. Beckman. Internal Medicine, Mayo Clinic, Rochester, MN. (Control ID #3391754)

LEARNING OBJECTIVE #1: Demonstrate a unique case of Takotsubo cardiomyopathy physiology

LEARNING OBJECTIVE #2: Address the proposed mechanism of TC physiology

CASE: A 39 year old female with known metastatic pheochromocytoma on terazosin and bisoprolol, hypothyroidism on levothyroxine, and insulin-dependent diabetes presented with severe chest and back pain, blood pressure 200/110, and heart rate 128. Laboratory studies revealed troponin 90. EKG showed sinus tachycardia without evidence of ischemia. CT angiogram of chest/abdomen was concerning for TC (otherwise known as stress-induced cardiomyopathy) with sluggish flow in left ventricle, reduced left ventricular ejection fraction (LVEF), and normal coronary arteries; as well as widely metastatic disease to the lung, mediastinum, pericardium, liver and left upper quadrant/adrenal gland. Transthoracic echocardiogram (TTE) demonstrated LVEF 27% with regional wall motion abnormalities. Plasma free normetanephrines were elevated at 102 (normal < 0.9). The tumor burden and normetanephrine elevation were so significant that phenoxybenzamine 40mg TID, metoprolol tartrate 200mg BID, and diltiazem 90mg QID were required to obtain blood pressure and heart rate control. With improvement in vital signs, the LVEF recovered to 56%, but regional wall motion abnormalities persisted. Subsequently, metyrosine and pazopanib were initiated as chemotherapy for medical management of the widespread metastasis. As plasma normetanephrines were better controlled, the regional wall motion abnormalities resolved. Follow-up studies revealed plasma free normetanephrines of 5.3, as well as TTE showing LVEF 69% and normal wall motion.

IMPACT/DISCUSSION: This case – involving massive catecholamine release in the setting of metastatic pheochromocytoma – provides an unusual and striking example of how excessive adrenergic stimulation may precipitate TC physiology. The syndrome of TC was initially described in 1990, with case series highlighting the common precipitant of extreme emotional stress, often among women. Coronary artery dysfunction has also been implicated; however, coronary artery angiography in patients with TC usually demonstrates no obstructions or evidence of vasospasm. In support of this, the Mayo Clinic Diagnostic Criteria for TC includes the absence of obstructive coronary disease or plaque rupture. In our patient, treatment for metastatic pheochromocytoma with chemotherapy resulted in drastic reductions in catecholamines, with resulting normalization of heart rate, blood pressure, and LV function. Therefore, this case provides a useful illustration of the catecholaminergic mechanism of TC.

CONCLUSION: Excessive adrenergic stimulation, including both pathologic and physiologic stress responses, can precipitate TC physiology.

TB OR NOT TB: A NOT SO SIMPLE CASE OF MONOARTICULAR TUBERCULOSIS OF THE KNEE

Steven Coffin[1]; miguel s. montana fernandez[2]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Internal Medicine, Boston University, Boston, MA. (Control ID #3359104)

LEARNING OBJECTIVE #1: Consider a broad differential in patients with unspecified knee effusion-proper workup almost always requires arthrocentesis

LEARNING OBJECTIVE #2: Recognize extra pulmonary tuberculosis (TB) is common and can present as monoarticular knee arthritis

CASE: A 33 year old male from Afghanistan with no past medical history presented for his first refugee health appointment. He reported right knee pain and swelling. He is a grocery store clerk who plays soccer in his spare time. He moved to Boston 3 months prior.

One month ago he underwent an arthrocentesis at an outside hospital. The arthrocentesis yielded clear yellow inflammatory fluid (<1000 RBC/ul, 9,300 nucleated cells/ul-58% PMN, 23% lymph,18% mono- and no crystals). Standard cultures had no growth for 5 days. Ibuprofen helped with discomfort, but swelling and pain recurred gradually. He denied history of knee trauma, weight loss, fevers, night sweats, cough and any other symptoms except mild fatigue for years.

On exam, the right knee was warm, swollen, with a palpable effusion, but non-tender. ROM and gait were normal. Physical exam was otherwise unremarkable. Laboratory studies showed: hemoglobin of 12.6g/dl, no leukocytosis, ESR of 104 and CRP of 20.2. X-ray showed mild patellofemoral degenerative change and a small joint effusion. Quantiferon gold, ordered as part of his immigrant health screening, was positive. MRI showed a moderate-sized knee joint effusion, capsular thickening, and synovitis.

One month later the patient returned for his second refugee health visit, with worsening knee pain, large effusion, and mildly reduced ROM. Arthrocentesis yielded cloudy red inflammatory fluid (99,000 RBC/ul, 3118 nucleated cells/ ul-42% PMN, 41% lymph, 17% mono- and no crystals). It was sent for standard, fungal, and mycobacterial cultures. Cultures grew M. Tuberculosis.

IMPACT/DISCUSSION: Chronic knee pain (6 weeks or longer) affects up to 25% of adults. Its presentation varies widely, and a differential diagnosis is developed largely based on history and exam. Our case highlights the importance of evaluating effusions with arthrocentesis.

Monoarticular knee involvement amongst all patients with TB is rare (0.1-0.3%). Most cases share the following features: years of persistent knee pain, false negative or inadequate initial cultures, unremarkable standard cytological and biochemical analysis of synovial fluid, and confusion for more common autoimmune or rheumatologic diseases.

CONCLUSION: Persistent knee pain with effusion carries a very broad differential. Physicians should consider imaging to investigate extent of possible joint damage. If there is evidence of effusion it is critical to obtain synovial fluid, send for broad scope of cultures, and in some cases even refer for surgical debridement to prevent further joint destruction and obtain definitive diagnosis. This is especially important in patients with or who are at risk for latent TB.

TB OR NOT TB?: CHALLENGES IN DIAGNOSING TB IN THE AMBULATORY SETTING

Audrey K. Thorp[1]; Eliana Hempel[2]. [1]Internal Medicine, Penn State Hershey Medical Center, Ephrata, PA; [2]Medicine, Penn State Health, Hershey, PA. (Control ID #3389348)

LEARNING OBJECTIVE #1: Atypical presentations of Mycobacterium Tuberculosis (MTB) can lead to delays in diagnosis and treatment. Maintaining a high clinical suspicion when treating patients from endemic areas is critical to early diagnosis.

CASE: A 43-year-old Filippino woman presented to an internal medicine residency clinic to establish care three years after immigrating to the United States. Past medical history notable for endometriosis, and a recent history of right-sided lower back mass. The mass was initally thought to be a lipoma when evaluated previously by rural primary care physician. Inital evaluation with x-ray revealed incidental findings of pulmonary nodules in the right lower lobe of her lung. A follow-up CT thorax showed multiple lung lesions, and masses within chest wall musculature. The suspected lipoma was excised and a collection of milky-white exudate was drained. Culture of the purulent material was unrevealing. Initial blood work notable for thrombocytosis. She was then referred to our quaternary care center for further evaluation.

On presentation to our clinic, she denied shortness of breath, hemoptysis, sputum production, or fevers. Her physical exam was only remarkable for healed 1cm scar over right posterior lumbar spine. Due to continued uncertainty about the etiology of her multiple masses, she scheduled for an ultrasound-guided biopsy of one of the chest wall masses. Anaerobic, fungal, gram stain and smear, and acid-fast bacilli (AFB) cultures of the aspirate were initially negative. Positive AFB cultures resulted two weeks later. DNA probe isolate sent to the Department of Health (DOH) were positive for MTB and negative for mycobacterium avium complex. At the time of diagnosis, care was transitioned to the DOH. Rifampin, isoniazid, pyrazinamide, and ethambutol (RIPE) therapy was started. All three of the collected sputum samples were negative, and the patient remained symptom-free. Due to the positive AFB cultures, she was diagnosed as active TB. She completed RIPE therapy, and moved toward continuation phase therapy.

IMPACT/DISCUSSION: Strategies for preventing and controlling MTB in the United States include, early identification and prevention of transmission. Screening of asymptomatic individuals is often limited to healthcare workers and large communal settings, and aim to detect latent MTB. Early detection of active MTB, occurs when individuals from endemic areas present with classic clinical findings suggestive of disease, and high suspicion leads to investigation.

CONCLUSION: Our case represents a gray area as our patient did not present classically, but is actively infected and contagious. Three months elapsed between initial presentation in our office and diagnosis of active TB with resultant self-quarantine and initiation of treatment. As the consequences of MTB infections can be grave and widespread, clinicians should maintain high clinical suspicion and consider early intervention in all patients from endemic regions who present with pulmonary symptoms or findings.

TERMINATING THE PROVIDER-PATIENT RELATIONSHIP DUE TO PATIENT NON- ATTENDANCE

Aditya A. Kulkarni[1]; Kelly A. Kieffer[2]. [1]Internal Medicine, Dartmouth-Hitchcock Medical Center, Lebanon, NH; [2]Medicine, Dartmouth-Hitchcock Medical Center, Lebanon, NH. (Control ID #3388340)

LEARNING OBJECTIVE #1: Recognize the impact of non-attendance on the clinic and termination of patient-provider relationship on the patient

CASE: A 53 year-old female with history of depression and prior suicide attempt, borderline personality disorder, PTSD, alcohol use disorder in remission, obesity, sexual assault, and intimate partner violence presented with recent homelessness and worsening depression with active suicidality. She was admitted to inpatient psychiatry.

After discharge, she had poor follow up, failing to arrive to 4 appointments. The policy of the clinic is that the PCP may terminate the provider-patient relationship if the patient "no-shows" to 4 or more appointments within a year. Patients are notified of the policy by letter after each no-show. Notification letters, pre- appointment calls, and email reminders did not improve her attendance. After the fourth no-show, her PCP was asked whether to terminate the relationship. Noting 4 additional ED visits, including 1 admission, the PCP elected to continue the relationship due to concern for loss of care continuity, adverse health outcomes, and increased expenses. A multi-disciplinary team including primary care and community mental health providers discussed the patient and identified transportation issues as a barrier to access. Social workers helped the patient find insurance-provided transportation and her attendance improved. This allowed for better control of her depression, which improved her engagement in treatment plans, and ultimately helped avoid additional ED visits and hospitalizations.

IMPACT/DISCUSSION: Patient "no-shows", or non-attendance, occur when a patient schedules an appointment and does not appear or cancel. Non-attendance rates in primary care vary from 5% to 55%. For providers, non-attendance results in inefficiency and redundancy. Missed appointments reduce access for other patients and create extra documentation, rescheduling work, and revenue loss. For patients, decreased access to primary care increases the cost and number of ED visits, and poor care continuity is associated with higher costs, increased hospitalizations, and poorly controlled chronic conditions.

Healthcare organizations have tried various strategies to reduce no-shows, including open-access scheduling; exit interviews; telephone, email, and/or text message reminders; and a provider-patient relationship termination policy. These strategies decrease patient non-attendance by 10%-15%. Guidelines recommend patient dismissal be a last resort after efforts to address drivers of non-attendance. Common drivers include transportation issues (29%), scheduling problems (19%), forgotten appointments (18%), caregiver responsibilities (10%), childcare issues (10%), and financial problems (4%).

CONCLUSION: Social determinants of health including transportation and financial barriers can contribute to non-attendance. This case demonstrates that patient outcomes can be improved by engaging a multidisciplinary team to identify underlying causes of non-attendance.

TEXTING TOE-TALLY CHANGED CARE FOR OUR STUDENT FREE CLINIC LUPUS PATIENT

Diana He[1]; Daniel C. Lai[1]; Amanda H. Ceravolo[1]; Pamela Charney[2]. [1]Weill Cornell Community Clinic, Weill Cornell Medicine, New York, NY; [2]Internal Medicine, Weill Cornell Medical College, New York City, NY. (Control ID #3379239)

LEARNING OBJECTIVE #1: Manage urgent clinical situations in uninsured patients through the use of technology in a Continuity of Care (CoC) program

LEARNING OBJECTIVE #2: Recognize the clinical features of vasculitis of the digital arteries in a systemic lupus erythematous (SLE) patient

CASE: Our 20-year-old uninsured patient was diagnosed with SLE at Weill Cornell Community Clinic (WCCC), a student-run primary care free clinic, and then assigned a CoC student—a medical student who attends all medical appointments as the patient's advocate and point person. Three months prior to this presentation, the patient was diagnosed with SLE (positive ANA, dsDNA, Sm, RNP, hypocomplementia; arthralgias, nasal ulcers, phototoxicity, fatigue) and referred to a rheumatologist at Hospital for Special Surgery, where she received free medical care with prednisone, azathioprine and hydroxychloroquine. The patient noted one

evening that her painful toes had "turned blue". She texted a photo to her CoC student, who swiftly alerted her providers. The patient was advised to go to the ED and received prednisone, aspirin and amlodipine, and then discharged. Two weeks later she returned to the ED for worsening symptoms, and was treated with IV steroids and anticoagulation. The toe discoloration and pain has since resolved.

Exam: Dusky distal left 1st and 2nd toes.

Positive ANA, dsDNA, Sm, RNP, cardiolipin and hypocomplementia.

MRI/MRA: Segmental enhancement of digital arteries suggestive of periadventitial disease seen with vasculitis. Poor visualization of arteries likely due to peripheral vasospasm.

IMPACT/DISCUSSION: Uninsured SLE patients have significantly fewer physician visits than Medicaid and privately insured patients, and often lack continuity in health care providers. A CoC student combats this disjointedness by serving as the consistent first contact for the patient and attending all medical appointments. In this case, the patient first reported her toe pain via text message to her CoC student, who then directed the patient to the ED. Because of her relationship with her CoC student, and the use of technology, this uninsured patient received prompt treatment in this urgent situation.

Vasculitis of the digital arteries in this SLE patient presented as toe discoloration and pain, and was supported by MRI/MRA. Vasculitis prevalence in SLE is between 11% and 36%, with nearly 90% of cases involving small vessels of the extremities. SLE patients with vasculitis can present with cutaneous features, including urticaria, ulcers and digital infarcts, and have a higher frequency of anemia and hypocomplementemia. Small vessel vasculitis can be confirmed via histologic or angiographic methods.

CONCLUSION: A Continuity of Care program that pairs a student with a patient helps deliver prompt care to an uninsured patient. Our use of technology improved the medical care provided.

Clinical features of SLE vasculitis include cutaneous lesions of the extremities with positive immunologic findings, and vasculitis can be confirmed via histologic or angiographic methods.

THE BLIND MEN AND AN ELEPHANT: A DIAGNOSIS LOST IN MULTI-ORGAN MANIFESTATIONS

Kencee K. Graves, Ben Berger. Internal Medicine, University of Utah, Salt Lake City, UT. (Control ID #3375815)

LEARNING OBJECTIVE #1: Examine the pathophysiology of Systemic Sclerosis

LEARNING OBJECTIVE #2: Develop a holistic approach to diagnoses with multiple organ system involvement

CASE: In an Indian fable, a group of blind men attempt to identify an animal by feeling different parts. Each describes a single component of the unseen elephant, mistakenly characterizing it due to isolated perspectives.

A 58-year-old man with Raynaud's, GERD, and hypertension presented with renal failure. His course was complicated by a perforated duodenal ulcer, respiratory failure, and 3 readmissions for cardiac arrest. The patient was transferred to our medical center for evaluation.

Vital signs showed hypoxemia and BP 160/90 despite 3 oral meds. Physical exam showed cachexia and diminished breath sounds.

Lab studies showed ANA of 1:1280. The patient had a renal biopsy, which was consistent with thrombotic microangiopathy (TMA). Cardiac amyloid scan was negative. Right heart catheterization revealed pulmonary hypertension, and CT chest showed ground-glass opacities.

Anti-RNA polymerase III antibodies returned positive, and the patient was diagnosed with Systemic Sclerosis (SSc), diffuse cutaneous subtype. Ten percent of patients with SSc carry this autoantibody, which confers an elevated risk of Scleroderma Renal Crisis (SRC).[3] This patient was started on lisinopril, but succumbed to his illness a few months later.

IMPACT/DISCUSSION: Systemic Sclerosis is a disorder of dysregulated connective tissue repair which presents with variable involvement of dermatologic, pulmonary, gastrointestinal, cardiac, and renal systems.

This patient displayed several manifestations of SSc: pulmonary arterial hypertension, interstitial lung disease, heart block, sclerodactyly, Raynaud's, ulcer and perforation, dysphagia, and SRC.

This patient's presentation is analogous to the exploration of the elephant by the blind men in the fable. One man, feeling the tail, concluded that the animal must be a horse. Another, feeling its trunk, asserted that it must be akin to a snake. Similarly, physicians focusing on this patient's heart block speculated that he suffered from amyloidosis. Others, concentrating on the renal biopsy, thought that he suffered from a TMA with systemic effects of renal failure.

The patient's heart disease was likely myocardial fibrosis, observed in half of patients with SSc.[2] Findings on the renal biopsy showed SRC, in which intimal fibrosis leads to endothelial cell damage.[3] Similarly, the patient's pulmonary and gastrointestinal illnesses were likely due to SSc processes.

CONCLUSION: Ultimately, discovering the true nature of the elephant – making the diagnosis – required a comprehensive evaluation of the patient's problems. This vignette compels clinicians to take a step back when approaching diagnoses, ensuring that they broaden their perspectives to avoid the availability bias of the ancient blind men.

THE BLOOD UNDER MY SKIN: THROMBOTIC THROMBOCYTOPENIC PURPURA AS THE FIRST MANIFESTATION OF SYSTEMIC LUPUS ERYTHEMATOSUS

Giordano F. Cittolin Santos, Marc Heincelman. Internal Medicine, Medical University of South Carolina, Charleston, SC. (Control ID #3391956)

LEARNING OBJECTIVE #1: Identify Thrombotic Thrombocytopenic Purpura (TTP) as a possible first manifestation of Systemic Lupus Erythematosus (SLE)

LEARNING OBJECTIVE #2: Recognize the importance of making the presumptive diagnosis of TTP and initiating treatment while waiting for the confirmatory test result.

CASE: A 23-year-old female presents with 2 days of urine darkening, eye discoloration, and fever up to 39C. She also had a rash on her forearms for 3 months. On exam she had a temperature of 38.5C but was otherwise hemodynamically stable. She had scleral icterus, pale conjunctiva, and hyperpigmented papules over her forearms. CBC revealed hemoglobin 7.9 g/dL (MCV 84) and platelets 5/mL. CMP revealed creatinine 1.5mg/dL, total bilirubin 4.5mg/dL, and direct bilirubin 1.5mg/dL. She had an undetectable haptoglobin, LDH >3000 U/L, fibrinogen 550 mg/dL, D-dimer 4.3mg/dL, normal iron studies, and APTT/INR. Urinalysis was positive for blood with RBC. Of note, she had normal baseline labs from 3 months prior. Peripheral smear showed schistocytes. She was diagnosed with microangiopathic hemolytic anemia (MAHA). On the second day of hospitalization, her hemoglobin decreased, and she required two units of transfused blood. Furthermore, her work up was remarkable for positive ANA (1:1280, speckled pattern), anti-smith antibodies, dsDNA, low C4, ESR > 100 mm/hr, and CRP 6.5 mg/L. She developed altered mentation with negative head MRI. We made the presumptive diagnosis of TTP and SLE. She was started on pulse dose steroids, hydroxychloroquine and plasmapheresis. Her mentation improved and her hemoglobin and platelet count improved. ADAMTS13 activity returned < 5%. At the time of

discharge, she had near-normal hemoglobin and platelets. Her ADAMTS inhibitor antibody resulted positive, confirming the diagnosis of TTP.

IMPACT/DISCUSSION: TTP is a type of thrombotic microangiopathic anemia primarily caused by ADAMTS13 deficiency due to autoantibodies, causing platelet activation, microvascular thrombosis, and vascular injury. Presumptive diagnosis is based on findings that include fever, neurologic changes, acute kidney injury, MAHA, and thrombocytopenia. Confirmatory tests include severe deficiency of ADAMTS13 activity and positive autoantibodies. It is important to have a high suspicion of TTP in order to start plasmapheresis and steroid therapy as early as possible. Starting treatment before confirmatory testing increases the survival rate from 10% to 75-92%. Patients with TTP that receive platelets have increased risks of arterial thrombosis and mortality and thus, platelets should be avoided. The association of TTP and SLE is incredibly rare, but TTP has been recognized as one of the initial manifestations of SLE in several case reports. Hospitalists and internists should consider SLE as an underlying association with TTP. **CONCLUSION:** -The association between TTP and SLE is rare but should be considered in patients with SLE that present with MAHA.

- Starting the treatment for TTP before confirmatory testing dramatically improves outcomes.

THE CANARY IN THE COAL MINE

Swarn V. Arya[1]; Nitesh Gandhi[2]; Rawan Hammoudeh[3]. [1]Internal Medicine, Henry Ford Hospiatl, Detroit, MI; [2]Internal Medicine, Henry Ford Hospital, Detroit, MI; [3]Internal Medicine, Henry Ford Hospital, Detroit, MI. (Control ID #3392486)

LEARNING OBJECTIVE #1: Diagnose SLE using the new EULAR/ACR 2019 criteria

LEARNING OBJECTIVE #2: Identify SLE by gathering proper medical history and ordering the appropriate workup

CASE:

The patient is a 32-year-old Asian male with PMH of ERSD secondary to minimal change disease (diagnosed at age 26) presented for acute onset shortness of breath, lower extremity edema, and abdominal distension.

He underwent CTPE which showed large left pleural effusion, moderate pericardial effusion and as well as ascites. Transthoracic ECHO showed moderate to large pericardial effusion with evidence of tamponade physiology. The patient underwent emergent pericardiocentesis and placement of a pericardial drain. The pericardial fluid was bloody in appearance, fluid studies showed RBC 2047709, cytology negative malignancy and culture showing no growth. The patient also underwent left-sided thoracentesis with the removal of 1L bloody fluid with the placement of a left-sided pleural drain. Pleural fluid studies showed RBC 30803, cytology negative for malignancy and culture showing no growth. Furthermore, paracentesis was done with the removal of 800cc peritoneal fluid with bloody appearance. Fluid studies showed RBC 112577 and cytology negative for malignancy, negative cultures. Hemoglobin was around 8, platelets 102, CRP 18 and sed rate 53. ANA 1:640 speckled pattern, low C3 and C4, negative ANCA, RF, CCP, RNP, Smith ds DNA, SSA, SSB, C3 low and C4 normal (both initially low). He met 4/11 SLICC criteria for SLE including serositis, +ANA, anemia/thrombocytopenia and low complements, history of MCD. He was started on methylprednisolone resulting in the improvement of anemia/thrombocytopenia. Then transitioned to oral prednisone with a taper and was also started on plaquenil and imuran.

IMPACT/DISCUSSION: To date, the association of SLE with MCD has been described only in isolated case reports. Initially, the etiology of the patient's MCD was unclear. He had no history of lupus nephritis and no known causes for secondary FSGS, but failed to recover renal function and ultimately progressed to ESRD. His dramatic presentation suggests that MCD was a harbringer of SLE—the metaphorical canary in the coal mine. In the context of his past medical history and his particular demographic, initial clinical suspicion for SLE was low. This case contributes to the body of literature supporting early consideration of SLE as a potential etiology for MCD and acute pericarditis.

CONCLUSION: SLE is an autoimmune disorder with a wide spectrum of manifestations. Acute pericarditis is an important and potentially a life threatening complication of the disease. According to the most recent EULAR/ACR 2019 SLE criteria, acute pericarditis scores 6 points. A total of 10 points is required to diagnose SLE, thus recognizing SLE as a potential underlying cause in a newly diagnosed acute pericarditis or cardiac tamponade is crucial to initiate treatment and improve outcomes. A relevant association may exist between SLE and MCD

THE CRYOGLOBULINS STRIKE BACK: RECURRENT CRYOGLOBULINEMIA FOLLOWING HEPATITIS C TREATMENT

Justin Nichols[1]; Manthodi Faisal[2]. [1]Medicine/Pediatrics Residency Program, Christiana Care Health System, Philadelphia, PA; [2]Christiana Care, Newark, PA. (Control ID #3391919)

LEARNING OBJECTIVE #1: Describe recurrence risk of cryoglobulinemia despite treatment of hepatitis C.

LEARNING OBJECTIVE #2: Understand the diagnosis and treatment of mixed cryoglobulinemic glomerulonephritis.

CASE: A 69 year old male with a history of cured hepatitis C presented to the emergency department with one week of bilateral lower extremity rash, lower extremity edema and decreased urine output. The patient exhibited non-blanching, confluent palpable purpuric lesions extending from his toes to his knees bilaterally. Labs showed a creatinine of 3.09 from baseline 1.6 with low C3, C4 and CH50 levels; urinalysis demonstrated white blood cells and hyaline casts.

In 2015, the patient had hepatitis C-associated mixed cryoglobulinemic glomerulonephritis requiring plasma exchange, rituximab and two weeks of dialysis with return of renal function and resolution of cryoglobulins.

He underwent ledipasvir/sofosbuvir treatment of hepatitis C in 2015 with cure. Interval monitoring showed clearance of cryoglobulins, normal C3 and persistently low C4.

Cryoglobulin levels at current admission were found to be positive for type II (mixed) cryoglobulinemia. Renal biopsy showed diffuse type II (mixed) cryoglobulinemic proliferative glomerulonephritis similar to his 2015 biopsy. He was discharged on rituximab therapy; however, one month later, he developed worsening renal function requiring hemodialysis and plasma exchange therapy. His renal function improved; he was discharged with prednisone off dialysis.

IMPACT/DISCUSSION: Cryoglobulinemic glomerulonephritis is a known consequence of hepatitis C infection. Hepatitis C viremia induces B cell production of IgM antibodies which form precipitating immune complexes leading to glomerular deposition and damage. Data are limited regarding hepatitis C-associated cryoglobulinemia in the era of interferon-free treatment regimens for hepatitis C. It is hypothesized that the direct-acting antiviral agents do not have the same immunomodulating effects as interferon based regimens. Thus, patients may continue to have complications from cryoglobulinemia after hepatitis C cure. Presentation of cryoglobulinemia includes skin findings such as palpable purpura or livedo reticularis, peripheral neuropathies, nephrotic/nephritic syndromes and acute renal failure. Patients with acute renal failure require biopsy to distinguish from other forms of nephritis. This case provides evidence that despite hepatitis C cure and four years of remission from cryoglobulin-

related disease, recurrence and relapse are an ongoing risk and continued surveillance is indicated. Rituximab and plasma exchange can be effective therapies to induce remission in cryoglobulin disease.

CONCLUSION: High index of suspicion for cryoglobulin-related disease must be maintained even years after hepatitis C cure. Remission can be induced with rituximab and plasma exchange with avoidance of long term dialysis if remission is maintained.

THE CURIOUS CASE OF Q FEVER AND COXIELLA

Rosalyn Ortiz Manso[1]; Leigh K. Hunter[2]. [1]Internal Medicine, Methodist Health System Dallas, Dallas, TX; [2]Infectious Diseases, Methodist Dallas Medical Center, Dallas, TX. (Control ID #3348064)

LEARNING OBJECTIVE #1: Characterize Q fever in the setting of hepatitis

LEARNING OBJECTIVE #2: Diagnose and treat *Coxiella burnetti* infection

CASE: A 30 year old Egyptian man with past medical history of hyperhidrosis presented to the emergency department with persistent fever, chills, sweats, weight loss and neck tenderness associated with frontal pressure-like headache. His only pertinent epidemiologic association was travel to U.S. from Egypt and remote exposure to sheep. Social history was significant for cigarette smoking and a monogamous homosexual relationship.

Physical examination was unremarkable except for left sided lid lag and fever. Laboratory data showed elevated transaminases with normal acetaminophen levels. Fever of unknown origin evaluation included testing for*Plasmodium* species, endemic fungi, rickettsia, arboviruses, HIV, sexually transmitted infections, *Brucella*, mycobacteria, blood/urine cultures, chest/abdomen/pelvis CT, MRI orbit/brain, transesophageal echo, thyroid and autoimmune diseases, all of which were negative. The patient refused lumbar puncture, but elevated *Coxiella* IgM and IgG confirmed the diagnosis of acute Q fever. He was treated with doxycycline 100mg BID x 14 days with resolution of fever and hepatitis after 3 days.

IMPACT/DISCUSSION: Q fever is caused by *Coxiella burnetii*, which is typically found in livestock such as sheep, goats, and cattle. Transmission to humans occurs after inhalation of contaminated aerosols/dust or from ingestion of raw milk or fresh goat cheese. Most cases reported in the U.S. present in the acute phase with incidence in Texas being 0.7 per million. Acute Q fever can manifest with a wide spectrum of signs and symptoms such as self-limiting flu-like symptoms, pneumonia, respiratory failure, hepatitis, or acute endocarditis. Persistent/chronic infection can present with vascular infection, chronic endocarditis, or bone and joint infections.

The few case reports of Q-fever hepatitis show that it commonly presents with fever and elevation of transaminases with or without jaundice [6]. Liver biopsy typically shows fibrin ring (doughnut) granulomas [3]. While characteristic of Q fever, this finding is non-specific and can be seen in other diseases such as tuberculosis, CMV and EBV. Typically, diagnosis of acute Q fever is based on serology, however diagnosis of Q fever hepatitis is more challenging. PCR detection from formalin-fixed liver tissues appears promising to accurately diagnose Q fever hepatitis [4].

CONCLUSION: The prevalence of Q-fever hepatitis is undereported. Historically, it has been frequently confused with tuberculosis due to similar morphologies on liver biopsy [5]. Our case illustrates *Coxiella* hepatitis should be considered by internal medicine physicians in patients who present with fever of unknown origin and transaminase elevation. Furthermore, accurate diagnosis of Q fever hepatitis has important implications in duration of treatment, development of persistent infection, and potential mortality.

THE DEADLY TRIAD

Elliot G. Martin[1]; Matthew Lipinski[1]; Simran Grewal[1]; Kenneth N. John[1]; Anuj Mehta[2]; Ali Zebi[1]; Muhammad Zeeshan[1]. [1]Internal Medicine, Penn State Health Milton S. Hershey Medical Center, Middletown, PA; [2]Penn State College of Medicine, Milton Hershey Medical Center, Allentown, PA. (Control ID #3392070)

LEARNING OBJECTIVE #1: Recognize the manifestations of an illness in a timely manner.

LEARNING OBJECTIVE #2: Utilize atypical symptoms to a working diagnosis

CASE: A 56-year-old white male presented as a transfer for stage 3 acute kidney injury and new dyspnea. He also had conjunctivitis, cough with hemoptysis, and rhinorrhea. He recently underwent tympanostomy tube placement for ear fullness. Prior to hospitalization he worked with concrete and had no functional limitations. He had no new occupational exposures and lived at home with his healthy wife and kids. He did not smoke or use recreational drugs.

On presentation he was afebrile but tachypneic with SpO2 of 96-98% on 6L nasal cannula. On exam he was in no respiratory distress. His lungs were diffusely wheezy with left base crackles. He had left conjunctival injection. His labs showed WBC 13.2 K/uL, Hg 7.1 g/dL, Cr 5.1 mg/dL. Urinalysis showed gross and microscopic hematuria with an estimated urinary protein excretion of 1.1g/day. INR, lactic acid, and LFT were normal. Nasal swab showed he was positive for Rhinovirus. CT of the chest showed multifocal pneumonia. He was started empirically on vancomycin and cefepime.

The night after admission the patient's respiratory status acutely decompensated and he went into cardiac arrest requiring CPR followed by venous-arterial extracorporeal membrane oxygenation, vasopressors and continuous renal replacement therapy. During intubation it was noted that he had pink frothy secretions, suggestive of diffuse alveolar hemorrhage. On day 4 of admission, cytoplasmic antineutrophil cytoplasmic antibody titers returned positive and rheumatoid factor was elevated. Anti-glomerular basement membrane antibodies were negative. The findings were consistent with granulomatosis with polyangiitis (GPA). He was started Cyclophosphamide and underwent plasmapheresis. He was later transitioned to intermittent hemodialysis and extubated to room air. He slowly improved and was discharged to a rehab facility.

IMPACT/DISCUSSION: The clinical triad of GPA includes pathologic changes in the upper and lower airway as well as glomerulonephritis. Although this patient had evidence of all three, the presence of rhinovirus and multifocal pneumonia altered the decision making. With that in mind, it was sensible at the time to trend the clinical course with antibiotics. Unfortunately for our patient, the presumed etiology was not the primary insult which led to a complicated course.

In addition, he had uncommon manifestations of GPA, namely the aural fullness which required tympanostomy tubes. What is more likely is that his nasal congestion, which is frequently seen in GPA, caused a sensation of aural fullness. This further reinforces the need to become familiar with typical and atypical manifestations of dangerous diseases.

CONCLUSION: The acute worsening that this patient suffered is not uncommon for GPA, which warrants immediate recognition of this illness so that it can be treated with immunosuppression.

THE DISGUISE OF EOSINOPHILLIA

Zainab Shahid[1]; Justin B. Roy[2]; Nitasa Sahu[2]; Ravi Patel[2]; Reshma R. Golamari[4]; Rama R. Vunnam[2]; Dhirisha Bhatt[2]; Rohit Jain[3]. [1]Internal Medicine, LECOM, Erie, PA; [2]Internal medicine, Penn State Hershey, Hummelstown, PA; [3]Medicine, Hershey Medical Center, Cumberland, MD; [4]Internal Medicine, Penn State Health Milton S Hershey Medical Center, Hershey, PA. (Control ID #3385700)

LEARNING OBJECTIVE #1: Distinguish the various types of differentials for eosinophilia

LEARNING OBJECTIVE #2: Treatment for eosinophilic pneumonia

CASE: A 61-year-old female with past medical history for tobacco abuse and depression presented to the emergency department for shortness of breath. On presentation, she was found to have a blood pressure of 156/87mmHg, heart rate 80bpm, respiratory rate of 18 with oxygen saturation of 93% on ambient air, and temperature of 36.7C. The patient was recently treated for pneumonia with steroids and antibiotics without resolution. She underwent a CT scan of the chest which showed multiple areas of mild peribronchial cuffing, peribronchial nodularity and focal areas of ground-glass opacity predominantly in the lung bases. Labs were within normal limits except for eosinophil differentials of 88.5%. She was also found to have an IgE level 1456IU/mL. On physical examination she was found to have bilateral inspiratory crackles at the bases with mild hypoxia. Due to the concerns for eosinophilic pneumonia, she was started on IV steroids 40 mg and symptoms started improving. Infectious workup including respiratory virus panel and blood cultures were negative. The patient was found to have been on fluoxetine for the last 8 years for depression and was advised to taper fluoxetine as it could be a contributing factor to eosinophilic pneumonia. Additonally, the patient was counseled on tobacco cessation prior to discharge.

IMPACT/DISCUSSION: Idiopathic Acute Eosinophilic Pneumonia is a rare disorder in which the lungs rapidly accumulate eosinophils. IAEP may occur at any age, however, is found to occur more between ages 20-40 years old. Risk factors include certain medications such as daptomycin, gemcitabine, infliximab, ranitidine, sulfasalazine/mesalamine, and venlafaxine. In this case, we have suspicion that fluoxetine may have contributed.

CONCLUSION: - Failure to recognize and treat IAEP can result in respiratory failure due to the progressive nature

- Maintain a high index of suspicion in patients taking common medications associated with IAEP

THE GIST ABOUT GASTROINTESTINAL STROMAL TUMORS

Alexander G. Stavros[1]; Rachel Vanderberg[2]. [1]School of Medicine, University of Pittsburgh, Pittsburgh, PA; [2]Department of Internal Medicine, University of Pittsburgh, Pittsburgh, PA. (Control ID #3390748)

LEARNING OBJECTIVE #1: Construct an illness script for gastrointestinal stromal tumors (GISTs)

LEARNING OBJECTIVE #2: Employ an evidence-based diagnostic approach in evaluating undifferentiated mesenchymal gastrointestinal tract neoplasms

CASE: 63yoF presenting with a one day history of 10/10 epigastric abdominal pain, hematemesis and melena. Patient endorsed taking 500mg Naproxen daily. Prior to presentation the patient was feeling well and denied nausea/vomiting, weight loss, abdominal pain, early satiety, dysphagia, acid reflux, diarrhea/constipation. The patient had no prior history of GERD, PUD, GI bleeding, prior EGDs and no family history of abdominal neoplasms. Patient was initially admitted to an OSH where she received 4 units pRBCs for an initial Hgb of 7.4 from baseline of 12.5. EGD found 3cm erythematous and bleeding submucosal polyp prolapsing into the lumen in the lesser curvature in the cardia with a clean based 1cm ulcer on top of it, endoscopic biopsy was indeterminate. Patient was transferred for further evaluation. CT abdomen and pelvis with contrast showed a 3 cm well-defined submucosal gastric fundal mass. Patient underwent combined laparoscopic and endoscopic resection of the gastric mass. Specimen found to be a GIST with low mitotic index. Suspicion for metastasis was low given unremarkable CT imaging, location, size, and mitotic index. The patient was discharged home with a PPI and outpatient follow up.

IMPACT/DISCUSSION: GISTs are most commonly sporadic mesenchymal neoplasms, however they rarely can be associated with familial autosomal dominant syndromes (NF-1, Carney-Stratakis syndrome). The median age of diagnosis is 63 years old with a near equal female:male ratio. GISTs most often present with signs and symptoms of GI bleeding including hematemesis, melena, or occult blood loss with anemia. Less than 20% of GISTs are discovered as incidental findings or after endoscopic evaluation for non-specific pain, bloating, or early satiety. In some reports, GISTs have presented with paraneoplastic consumptive hypothyroidism.

Other mesenchymal GI tract neoplasms, like leiomyosarcomas, have a similar endoscopic and radiologic appearance to GISTs. Contrast enhanced CT imaging is recommended to evaluate tumor involvement and assess presence of metastatic disease. Submucosal lesions >2cm should be resected given risk of future metastasis. Endoscopic biopsy does not provide sufficient tissue for diagnosis, and endoscopic ultrasound with fine needle aspiration (EUS-FNA) is only necessary if metastatic disease is suspected or if neoadjuvant imatinib therapy can shrink locally advanced disease. GISTs < 5cm in the stomach with low mitotic indices are at less (2-3%) risk for metastasis.

CONCLUSION: GISTs are sporadic GI neoplasms that are often clinically silent until bleeding or mass effect occurs EUS-FNA is not necessary if a mesenchymal GI neoplasm is highly suspected and is resectable

GISTs > 2cm should be resected given risk of future metastasis

THE GIST OF IT: UNCOMMON PRESENTATION OF GIST IN A YOUNG MALE PATIENT

Ericka L. Charley[1]; Surabhi Uppal[2]; Erica Turse[1]; Binh T. Duong[3]; Abdul Nadir[1]; Kambiz Kadkhodayan[1]; Keng-Yu Chuang[1]. [1]Internal Medicine, St Joseph's Hospital and Medical Center, Phoenix, AZ; [2]Internal Medicine, St Joseph's Hospital and Medical center, Phoenix, AZ; [3]Internal Medicine, St. Joseph Hospital and Medical Center, Phoenix, AZ. (Control ID #3389941)

LEARNING OBJECTIVE #1: Recognize that gastrointestinal stromal tumors (GIST) are rare tumors that account for 1-3% of all gastrointestinal tumors.

LEARNING OBJECTIVE #2: Recognize that GIST may have an unusual presentation in young adults.

CASE: A 30-year-old African American man presented with left upper quadrant abdominal pain that started two days prior to presentation. Pain was described as dull and non-radiating, that was exacerbated by deep inspiration and worsened by eating. He denied having fever, nausea, vomiting, night sweats or unintentional weight loss. His medical history was significant for a prior positive purified protein derivative (PPD) test found during incarceration one year earlier. On admission, his vital signs were within normal limits. Physical exam revealed mild tenderness to palpation of the left upper quadrant with no appreciation of a definitive palpable mass. Peritoneal signs were absent. Laboratory workup revealed mild anemia with hemoglobin level of 12.3 g/dl. CT scan of the abdomen and pelvis revealed a complex, 2.3 x 2.1 cm, left-sided subphrenic soft

tissue collection with locules of extra luminal air, concerning for perforated gastric ulcer. In the absence of peritoneal signs, decision was made to proceed with endoscopy. An esophagogastroduodenoscopy (EGD) revealed a transmural defect in the greater curvature of the stomach, that appeared to communicate via a small tract with an extraluminal necrotic cavity, consistent with the findings of CT imaging. A CT-guided biopsy of the extra luminal gastric mass showed a stromal cell GIST which stained positive on immunohistochemistry for CD34, CD117 and DOG1. The patient was then started on neoadjuvant therapy with imatinib. He was then discharged in a stable condition with close outpatient follow-up.

IMPACT/DISCUSSION: Our patient's presentation is unique given his young age and unusual radiographic finding of an extraluminal mass communicating with the gastric lumen. This case is also interesting as the patient had a prior untreated PPD and the initial differential diagnosis included gastric tuberculosis; however, gastric biopsy did not show any evidence of TB. Our patient's clinical presentation can be explained by the high mitotic rates associated with GIST tumors causing the tumor to quickly outgrow the blood supply, thereby developing a necrotic core and increasing the risk of rupture, enteral communication and intraperitoneal hemorrhage. The current standard of care involves resection and neoadjuvant chemotherapy with a tyrosine kinase inhibitor such as imatinib.

CONCLUSION: GISTs can have variable presentations and diagnosis is often delayed due to its indolent course.

High mitotic rates associated with these tumors can often lead to rapid terminal growth and life-threatening complications.

THE GREAT MIMICKER: AN UNUSUAL PRESENTATION OF KLEBSIELLA PNEUMONIAE IN A MIDDLE-AGED MAN

Youssef Ghobrial[1]; Ammar Qureshi[1]; Joline De Castro[2]; Adewale Ajumobi[2]. [1]Internal Medicine, Eisenhower Medical Center, Palm Desert, CA; [2]Internal Medicine, Eisenhower Health, Palm Desert, CA. (Control ID #3392291)

LEARNING OBJECTIVE #1: Recognize hepatic and lung abscesses as a rare invasive syndrome of Klebsiella Pneumoniae

LEARNING OBJECTIVE #2: Demonstrate an understanding of clinical/radiographic similarities between Klebsiella Pneumoniae and malignancy

CASE: A 44-year-old male with a history of alcohol abuse presented to the emergency department complaining of generalized weakness, weight loss, nausea, vomiting, and bloody diarrhea for 2 weeks. About 2 ½ weeks prior to admission he underwent a tooth extraction where he was prescribed a short course of penicillin. One day later he began experiencing nausea and vomiting at which point he was assessed at another hospital and was prescribed Bactrim, but symptoms worsened with subsequent generalized weakness and dyspnea. He suffered an 8lb weight loss during this time. In the emergency department, he was tachypneic and saturating 92% on room air with a total bilirubin of 1.2, Alkaline Phosphatase of 105, WBC of 14.4, and normocytic anemia with a hemoglobin of 9.7. On exam, he had no tenderness to palpation of the abdomen and normoactive bowel sounds. Lungs were clear to auscultation. CT A/P without contrast was notable for multiple scattered hypodense nodules throughout the liver and lower lung bases concerning for metastatic disease. Repeat CT A/P with contrast showed a concurrent large multilocular lesion occupying most of the left hepatic lobe. The patient denied a personal or family history of cancer. He works as a border patrol agent and drinks 1-1.5 bottles of wine per day. Hepatitis B and C serologies were negative. FNA biopsy of one of the liver lesions was performed to explore the etiology of the mass. FNA biopsy cytology of the lesion showed no evidence of neoplastic cells, but the culture did grow moderate Klebsiella Pneumoniae. Blood cultures subsequently grew Klebsiella Pneumoniae in 2/2 bottles. The patient was started on IV ceftriaxone and clinically improved over the course of 5 days. He was continued on outpatient IV antibiotic therapy for a total of 2 weeks with repeat CT imaging showing resolution of the lesions in the liver and lungs. Outpatient colonoscopy with biopsy showed no evidence of dysplasia or active bleed.

IMPACT/DISCUSSION: This 44-year-old male with a history of alcohol abuse, symptoms with supporting lab findings worrisome for cancer, and imaging studies suggestive of metastatic disease turned out to have a curable invasive monomicrobial infection. This case highlights the importance of maintaining a broad differential and resisting the urge to succumb to anchoring bias in medical practice. It further showcases the rare and deceiving presentation of Klebsiella pneumonia as liver and lung abscesses which can easily be mistaken for malignancy.

CONCLUSION: Hepatic and lung abscesses are a rare invasive syndrome of Klebsiella pnuemoniae. As clinical and radiographic findings are similar to that of cancer, it is imperative that these patients undergo biopsy for a definitive diagnosis to guide appropriate management and treatment.

THE GROUND ZERO OF NAPROXEN-INDUCED THROMBOCYTOPENIA

Rohit Jain[1]; Justin B. Roy[1]; Ravi Patel[1]; Dylan Lee[1]; Rama R. Vunnam[1]; Dhirisha Bhatt[1]; Reshma R. Golamari[2]; Nitasa Sahu[2]. [1]Internal medicine, Penn State Milton S. Hershey Medical Center, Hershey, PA; [2]Internal Medicine, Penn State Health Milton S Hershey Medical Center, Hershey, PA. (Control ID #3388198)

LEARNING OBJECTIVE #1: Recognize Drug-Induced Thrombocytopenia as a cause from common medications

CASE: 41-year-old male with no medical history but with recent left ACL injury and left meniscal repair taking Naproxen for pain was seen in the orthopedic clinic earlier in the week and had an arthrocentesis performed which identified a large amount of blood revealing hemarthrosis but no infection. He was scheduled to follow-up again, however, went to the emergency department after having worse left extremity pain, hematuria, frequent bloody gums when brushing, and periods of epistaxis when blowing his nose. He was noted to be afebrile with normal vital signs. On exam, he was in no distress, no splenomegaly, no active bleeding was identified, but had multiple areas of petechiae across his body most notable in the lower extremities. On labs, he had a platelet count of 0 K/uL, with 2K/uL on confirmation without any other cell line abnormalities. He was noted to have baseline platelets of 209K/uL in 2017 and denied any blood thinner use. He was given multiple platelets with no change. DVT exam, HIT Antibody, HIV, HCV, TSH, B12, and Folate were all negative. His immature platelet fraction (IPF) was 11.6%. Naproxen was discontinued on admission and Hematology was consulted with recommendations to start dexamethasone for 4 days due to the possibility for an immune-mediated etiology. After 48 hours, the patient's platelets subsequently went to 9K/uL, 25KUL, and discharged with 111 k/ul.

IMPACT/DISCUSSION: Thrombocytopenia have many etiologies and rapid diagnosis is warranted as complications include life-threatening bleeding or thrombosis. Drug-induced thrombocytopenia is caused by drug-induced antibodies but often difficult to prove causing it to be easily overlooked, except for heparin antibodies. Testing for other medications are not widely available and can still be negative. As such, certain criteria were developed to help in diagnosis: 1. Use of the drug preceded development of thrombocytopenia and platelet recovery was sustained following drug discontinuation; 2. No other drugs were used prior to development 3. Other etiologies were eliminated 4. Re-exposure to the candidate

drug caused recurrent thrombocytopenia or drug-dependent antiplatelet antibodies. The presence of severe thrombocytopenia (<20K/uL) increases the likelihood for drug-induced thrombocytopenia as seen in our patient. Most common medications include Abciximab, Acetaminophen, Beta-lactams, Carbamazepine, Gold compounds, Heparin, Ibuprofen, Linezolid, Naproxen, Phenytoin, Piperacillin, Rantidine, Quinidine, Quinine, Rifampin, Sulfonamides, Trimethoprim-sulfamethoxazole, Valproic acid, and vancomycin. Treatment is generally discontinuing the drug. In severe thrombocytopenia, corticosteroids are often given but no evidence that they are helpful.

CONCLUSION: Clinicians should hold a high suspicion for drug-induced thrombocytopenia when there is an acute drop in the level after exposure for commonly implicated drugs.

THE IDENTITY OF THE MYSTERIOUS SIADH IN A PATIENT WITHOUT HEADACHE

Ryutaro Nagaya[1]; Takamasa Tanaka[3]; Mitsunori Iwase[2]. [1]division of integrated medicine, Toyota memorial hospital, Toyota-city, Aichi prefecture, Japan; [2]Cardiology, Toyota Memorial Hospital, Toyota, Aichi, Japan; [3]Internal Medicine, Toyota memorial hospital, Toyota-city, Japan. (Control ID #3389828)

LEARNING OBJECTIVE #1: Tuberculous meningitis may occur without headache.

LEARNING OBJECTIVE #2: Lumber puncture should be conducted against unknown SIADH.

CASE: The patient was a 70-year-old man with hypertension. He presented to our clinic with a chief complaint of fever with trunk pain for three days. His blood pressure was 122/58 mmHg, the pulse rate was 85 beats/min and the body temperature was 38.3 degrees. He had mild tenderness of the bilateral chest wall without any neurologic abnormality. Blood laboratory tests revealed decreased levels of sodium (127 mEq/L) and chloride (92 mEq/L). Levels of WBC and CRP were normal. Levels of urine sodium and potassium were also normal. There were no clinical findings of hypovolemia such as postural hypotension, tachycardia or dry mucous membranes. These results suspected SIADH. We followed him at clinic but fever and hyponatremia sustained for 14 days. Then he admitted for further examinations. Both plane trunk CT and head MRI were normal. We suspected SIADH was caused by malignant disorders, drugs and collagen diseases including SLE but could not find out any remarkable results. Then we conducted lumber puncture because CNS disorders are one of the frequent causes of SIADH. Cerebrospinal fluid (CSF) analysis revealed the elevated levels of WBC(189 cells/mm^3;mono cyte 97%), protein(155 mg/dL) and adenosine deaminase(ADA) (10.2 U/L) and decreased levels of glucose(45 mg/dl). Ziehl-Neelsen stain, culture and PCR for tuberculosis of the CSF were all negative. We immediately started anti-tuberculosis agents including isoniazid, rifampicin, pyrazinamide, and ethambutol. After the initiation of Tuberculous meningitis(TBM) treatment, his body temperature became normal within a week and levels of serum sodium recovered in two months. Then we diagnosed TBM clinically.

IMPACT/DISCUSSION: SIADH is caused by malignant disorders, pulmonary disorders, disorders of CNS, drugs and so on. About 10% of SIADH is caused by disorders of CNS. In this case, the patient didn't have headache, nausea, abnormal neurological findings and mental agitation that are commonly seen in TBM patients, and there were no specific imaging findings. But the patient had unknown SIADH, we can suspect disorders of CNS and eventually diagnose TBM by CNF examination. Actually, one study reported 44.7% of TBM patients had hyponatremia. And some TBM patients didn't have a headache, which leads to be difficult to diagnose it.

To diagnose TBM, CSF examination is important. One study (the study defined an elevated ADA as 9 U/L) estimated the sensitivity and specificity of ADA for diagnosis of TBM to be 79 and 91%, respectively. We should detect TBM as soon as possible because it is a fatal disease with a fatality rate of 14-28% even in developed countries.

If we meet unknown SIADH, we should conduct lumber puncture to detect TBM even though the patient has no any clinical symptoms of meningitis.

CONCLUSION: If we meet an unknouwn cause of SIADH, we should conduct lumber puncture to detect meningitise even in a patient lacking headache.

THE IMPACT OF PROVIDER BIAS IN TREATING PATIENTS WITH SICKLE CELL DISEASE

Hannah S. Lichtsinn[1,2]; Brittany Kimball[1]. [1]Internal Medicine and Pediatrics, University of Minnesota, St Paul, MN; [2]Internal Medicine and Pediatrics, HealthPartners, Saint Paul, MN. (Control ID #3342877)

LEARNING OBJECTIVE #1: Diagnose and treat vaso-occlusive crisis (VOC) in Sickle Cell Disease (SCD)

LEARNING OBJECTIVE #2: Reduce bias in opiate prescribing in SCD

CASE: A 21-year-old woman with SCD (Hgb S/A$\gamma\delta\beta^0$-thalassemia) was admitted for pain in her right arm. She had a history of avascular necrosis of the right shoulder, pulmonary necrosis of the right lung, and repeated VOC of the right humerus. Pain had progressed over two days despite use of naproxen and oxycodone. Admission labs showed hemoglobin of 12.5 mg/dl and evidence of hemolysis. Her baseline hemoglobin was 12 and hemoglobin F was 20-25%, not on hydroxyurea. She was treated with IV fluids and fentanyl with improvement in pain prior to conversion to oxycodone. At discharge, the attending physician documented his reluctance to prescribe outpatient opiates, saying: "The question is, how much pain should a patient like this [Hgb S heterozygote] have?...I do know we have a national epidemic with opiates and we should be cautious in giving opiates at discharge." He documents speaking to a pathologist, however, did not contact the patient's hematologist or primary care doctor. He did not provide opiates at discharge.

IMPACT/DISCUSSION: SCD affects approximately 100,000 people in the United States (US), and one in twelve people of African descent are carriers. It leads to significant morbidity and early mortality. It is characterized by frequent episodes of severe pain, often requiring high dose intravenous opiates. The NHLBI guidelines recommend diagnosing VOC by the patient's report of pain severity, as no laboratory or imaging tests are reliable in diagnosis. Pain should be controlled using escalating doses of opiates. Many patients have significant opiate tolerance and require higher than typical doses of opiates to control pain. Once pain is controlled opiates should be converted to an oral equivalent with a slow taper to avoid withdrawal.

Patients with SCD face bias within the medical system. Many states lack comprehensive SCD programs for adults. Further, patients with SCD are often labeled as opiate dependent or "drug seeking" because of opiate use. This bias has been amplified in the setting of the opiate crisis in the US. However, patients with SCD have been shown to have low rates of addiction compared to other patients with chronic disease.

Various genotypes can lead to SCD, most commonly, Hgb S/S and Hgb S/β^0. Hgb S/ A$\gamma\delta\beta^0$ is a rare genotype that is associated with higher than average hemoglobin F and baseline hemoglobin, however reports in the literature show that patients with Hgb S/ A$\gamma\delta\beta^0$ have a particularly severe disease course.

This case highlights the difficulty that patients with SCD have in obtaining evidence-based care because of bias from their providers. It provides insight into the negative impact of the opioid crisis on patients with SCD.

CONCLUSION: Treatment of VOC should be guided by patient's report of pain

Patients with SCD have significant barriers to care because of provider bias and lack of knowledge.

THE MANY FACES OF VITAMIN B12 DEFICIENCY: AN INTRIGUING CASE HIGHLIGHTING BROAD SYMPTOMATOLOGY AND TREATMENT COURSE EXPECTATIONS

Jessica Koontz[1]; Patrick Autruong[2]; Mark Simon[3]; Jessica Camacho[4]. [1]Internal Medicine and Pediatrics Residency Training Program, University of Colorado, Denver, CO; [2]Colorado University SOM, Aurora, CO; [3]Denver Health Residency in Emergency Medicine, Denver, CO; [4]University of Colorado Hospital, Aurora, CO. (Control ID #3375451)

LEARNING OBJECTIVE #1: Recognize the diverse presentations of vitamin B12 deficiency, including the rarer neurologic and hematologic manifestations

LEARNING OBJECTIVE #2: Promptly diagnose and treat vitamin B12 deficiency in order to relieve reversible symptoms in the expected timeline and avoid irreversible outcomes

CASE: A 65 year-old female with a history of Grave's disease presented for "failure to thrive," accompanied by symptoms of poor oral intake, intermittent diarrhea, bleeding gums, altered sense of taste, and a 30-pound weight loss. Neurologically, she had experienced increasing falls, urinary and bowel incontinence, altered sleep pattern, and abnormal behavior. Physical exam demonstrated poor memory, impaired concentration, disorientation, akathisia. A complete blood count showed pancytopenia with WBC of 0.8x10^9 cells/L, hemoglobin of 5.4 g/dL, MCV of 121 fL, and platelets of 59 x10^9 cells/L. She was neutropenic with an ANC of 196 cells/uL. The reticulocyte index was hypoproliferative. A peripheral blood smear showed segmented neutrophils, macrocytic anemia, and schistocytes. Hemolysis labs revealed LDH 682 U/L (high), haptoglobin <10 mg/dL, fibrinogen 92 mg/dL (low), d-dimer 2890 FEU (high), total bilirubin 3.9 mg/dL consistent with active hemolysis. Her vitamin B12 was 150 pg/mL (ref range 211-946 pg/mL), homocysteine was >50 umol/L, and MMA was high at 37.68 umol/L. She was treated with Vitamin B12 1000 mcg intramuscularly daily for nine days. On discharge, her CBC was much improved. Reticulocyte index was adequate. Neurologically, her abnormal movements were only rarely noted. She demonstrated orientation to person, place, time, and condition.

IMPACT/DISCUSSION: Given vitamin B12's role in a wide array of reactions, clinical manifestations of deficiency affect many organ systems and are highly variable. The most common manifestations of B12 deficiency are macrocytic anemia, hypersegmented neutrophils, polyneuritis, and ataxia. Rarer manifestations include pancytopenia, optic neuritis, bowel and bladder incontinence, hemolytic anemia, and thrombotic microangiopathy. Neuropsychiatric symptoms are highly variable. Abnormal movements are a rare manifestation and are seen more often in pediatric presentations. Early recognition of B12 deficiency is crucial for reversal of symptoms, especially the life threatening hematologic manifestations which always resolve with repletion. Neurologic manifestations are less likely to reverse and residual neurological abnormalities persist in most cases. Prompt treatment yields better results as irreversible changes in the brain may occur if left untreated. Hematologic improvements are rapid and occur within days to weeks. The timeline for neurologic improvement is more variable with maximum response at 6 months.

CONCLUSION: Given the importance and efficacy of early treatment in securing the best possible outcomes, it is imperative that internists consider a diagnosis of vitamin B12 deficiency in patients with hematologic and neurologic manifestations.

THE MEDICAL COMPLICATIONS OF EATING DISORDERS: WHAT INTERNISTS SHOULD KNOW

Margherita Mascolo[1,2]. [1]Department of Medicine, University of Colorado Health Sciences Center, Denver, CO; [2]Chief Medical Officer, Alsana, Thousand Oaks, CA. (Control ID #3347490)

LEARNING OBJECTIVE #1: Recognize the prevalance of eating disorders in the United States and review diagnostic criteria

LEARNING OBJECTIVE #2: Identify and manage the medical complications of starvation and refeeding based on evidence and best practice

CASE: HPI: 24 yr female with history of irritable bowel syndrome presents with fatigue, near syncope, and constipation. She endorses early satiety, nausea, and abdominal bloating which has been worsening over the past two weeks. She reports last bowel movement about 1 week ago; stool was hard to pass but normal. Reports no fevers, chills, emesis, or shortness of breath. Increasing fatigue is affecting her job performance and two days ago, she had a near syncopal event when she stood up. No loss of consciousness, palpitations, or other warning signs. She has had several similar episodes in the past few months. Over the past 6 months she has lost 20 lbs.

Past Medical Hx: irritable bowel syndrome, amenorrhea

Family Hx: mother with anxiety, history of binge eating disorder, and hypothyroidism. Father with depression and OCD.

Social Hx: she does not smoke tobacco, drink alcohol, or use illicit drugs (does not use THC).

Medications: multivitamin, bisacodyl prn

Physical Exam: Wt: 86lbs Ht: 5'3" Temp 35.9 Heart rate: 48 BP: 97/60 (no orthostatic changes) RR 12 Pulse ox: 100% RA. Bitemporal wasting, cool extremities with acrocyanosis, scaphoid abdomen with normal bowel sounds, no edema.

Labs: CBC with pancytopenia; normal chemistry; AST/ALT: 400/405; nl TSH; glucose 48

Patient sent to the emergency room. Admitted to gen med floor on telemetry. Started D5 and dietitian placed her on 2000 daily calories; patient not compliant. HOD # 3 persistently hypoglycemic with a phosphorus of 1.8. Treatment for refeeding syndrome started.

IMPACT/DISCUSSION: It is crucial to understand the pathophysiology of starvation and refeeding in order to correctly diagnose and treat starved patients. In addition, it's important to recognize the psycholigical milieu of patients with eating disorders in order to properly differentiate between organic, psychological, and somatic manifestations of medical complications. Nourishing a starved patient is associated with physical discomfort and a host of medical complications including the potentially deadly refeeding syndrome which is preventable when recognized. In addition to medical care, these patients require psychological care to reduce anxiety and fear that contribute to somatization and exacerbation of physical symptoms. In this clinical vignette we will identify pathophysiologic changes that occur with starvation as well as refeeding and address the management of such complications.

CONCLUSION: Eating disorders have the second highest mortality of any psychiatric illness, affect 30 million Americans, and are associated with a plethora of complications-from cardiac anomalies and functional gastrointestinal issues to severe psychiatric distress. It's critical for physicians to recognize eating disorders and aggressively treat their medical and psychiatric complications.

THE MONSTER INSIDE ME: THE CASE OF A DISSEMINATED PARASITIC INFECTION

Chris G. Pasvantis, Mary Gadalla, Joy Underwood. Internal Medicine, University of Tennessee Nashville, Nashville, TN. (Control ID #3387584)

LEARNING OBJECTIVE #1: Recognize the need to keep a wide differential in immunocompromised patients.

LEARNING OBJECTIVE #2: Exclude potential invasive infections before ordering immunosuppressive therapy in patients from endemic areas.

CASE: A 45-year old male, originally from Ethiopia, presented to the hospital after 10 days of polyuria, anorexia, abdominal pain, fatigue, and shortness of breath. His medical history was significant for idiopathic membranous nephropathy on six weeks of oral prednisone with secondary hyperglycemia. Physical exam was significant for distended abdomen with diffuse tenderness. CT revealed obstruction at the level of the mid-ileum but no obvious obstructing mass. He had marked eosinophilia, E. coli and Klebsiella bacteremia, and was started on Unasyn. Gastrointestinal TB was high on the differential diagnosis, and IGRA was sent. HIV was negative. During intubation for progressing tachypnea and tachycardia, copious bloody secretions were seen, consistent with pulmonary hemorrhage, and he was placed on IV steroids. Endoscopy was performed. Stomach and jejunal biopsies were consistent with nematode infestation. Strongyloides stercoralis treatment was initiated with albendazole and ivermectin; ivermectin was continued for the duration of his hospitalization. His IGRA returned positive for latent TB, however GI pathology did not reveal tuberculous granulomas. He was eventually extubated, his abdominal pain resolved, and he was weaned off of steroids.

He was discharged and completed his course of ivermectin, as well as isoniazid and pyridoxine outpatient. A three month follow-up colonoscopy showed small bowel normal architecture and no histopathological changes. Follow-up nephrology visit confirmed resolution of his nephrotic syndrome with proteinuria less than 2 grams per day, correction of hypoalbuminemia, and resolution of his symptoms.

IMPACT/DISCUSSION: Strongyloidiasis is a parasitic infection secondary to Strongyloides stercoralis that affects 30-100 million people worldwide. Presentation ranges from asymptomatic to a disseminated fatal hyperinfection in mostly immunocompromised hosts. In this case, the patient's country of origin was a risk factor for this infection, which was worsened by his exposure to high-dose steroids. Additionally, this patient had idiopathic nephrotic syndrome. Strongyloides has been reported to cause nephrotic syndrome in a rare manifestation of unknown pathophysiology. Since disseminated disease is fatal in up to 80% of cases, it is important to exclude asymptomatic strongyloidiasis before prescribing steroids or immunosuppressive therapy in patients from endemic areas.

CONCLUSION: Strongyloidiasis is a disseminated parasitic infection occurring in immunocompromised hosts worldwide and can be a rare and overlooked cause of nephrotic syndrome. Early recognition of Strongyloidiasis and initiation of appropriate treatment is essential to prevent early mortality.

THE MONSTERS INSIDE US: PARASITES AS A CAUSE OF SYSTEMIC SYMPTOMS

Alexandra L. Solomon[1]; Ricardo Cruz[2]; Pranay Sinha[3]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]General Internal Medicine, Boston Medical Center, Boston, MA; [3]Infectious Disease, Boston Medical Center, Boston, MA. (Control ID #3369179)

LEARNING OBJECTIVE #1: Diagnose parasitic infection in a patient from an endemic region with systemic symptoms and peripheral eosinophilia.

LEARNING OBJECTIVE #2: Recognize Löffler syndrome.

CASE: 51 year-old Ethiopian woman reporting new dyspnea on exertion, productive cough, chest and abdominal pain of one-month duration. Past medical history of hypertension and chronic low back pain. Cough productive of yellow sputum and shortness of breath worse with stair climb. Exertional, substernal chest pain was relieved by rest. Abdominal pain associated with nausea and bloating, worse with eating. Most recent travel to Ethiopia 1 year ago, no sick contacts. Physical exam of lungs and abdomen was unremarkable. Cardiac exam significant for a grade II/VI systolic murmur best heard at the RUSB and trace lower extremity edema. Lab studies showed a WBC 10.9, eosinophils 13% (absolute eosinophils 1.4), ALP 141 (previously normal), ESR 46, and CRP 5.6. ECG and chest x-ray were normal. Given that the patient was from Ethiopia, a parasite screen was sent, the results of which were notable for *Schistosoma mansoni* ELISA 42 (<10) and *Strongyloides stercoralis* antibody EIA 42.55 (<1.7). Treatment with Ivermectin and Praziquantel therapy completely resolved her symptoms.

IMPACT/DISCUSSION: This patient presented with cardiopulmonary and gastrointestinal symptoms, leading to a broad differential. However, given her history of living in Ethiopia, along with peripheral eosinophilia on initial testing, a parasite screen was an appropriate next step for evaluation. Of note, one study from Boulware, et al (2007) showed that only 9% of US resident physicians recognized the need for parasite screen in a patient presentation similar to that of ours, which highlights the importance of maintaining suspicion for parasitic infection in these patients, in order to reduce morbidity and mortality related to misdiagnosis. Most concerning is the potential for lethal hyperinfection syndrome seen in immunocompromised patients with *Strongyloides* (up to an 87% mortality rate).

While the rate of co-infection of *Strongyloides spp.* and *Schistosoma spp.* is unknown, between 30-80% of all parasitic infections are co-infections. Of note, Sub-Saharan Africa experiences a relatively high seroprevalence of *Strongyloides* and *Schistosoma.*

Furthermore, the patient's cardiopulmonary and gastrointestinal symptoms over a one-month period, along with the peripheral eosinophilia, are consistent with Löffler syndrome. Löffler syndrome refers to the rare and transient constellation of systemic symptoms, peripheral eosinophilia, and possible radiographic evidence of pulmonary eosinophilia, which are representative of the lifecycle of parasitic larvae. While this patient's chest x-ray was unremarkable, she exhibited the commonly-observed systemic symptoms and peripheral eosinophilia.

CONCLUSION: Suspect parasitic infection in a patient from an endemic region with cardiopulmonary and gastrointestinal symptoms with peripheral eosinophilia and appreciate the high prevalence of parasitic co-infection.

THE NEW STI ON THE BLOCK

Brandon Bunol[1]; Alexander Katz[1]; Deepa Bhatnagar[2]. [1]Internal Medicine, Tulane University, New Orleans, LA; [2]Medicine, Tulane University, New Orleans, LA. (Control ID #3373122)

LEARNING OBJECTIVE #1: Recognize the transmission of Shigella in high risk populations

LEARNING OBJECTIVE #2: Demonstrate the impact of a through history on the differential diagnosis

CASE: A 33-year-old man with past medical history of HIV/AIDs (CD4 count 33) presented with diarrhea and fever for 14 days. Over the preceding 48 hours he began to have "watery gel" bloody bowel movements up

to 5 times a day. There was associated nausea, vomiting, and left lower quadrant abdominal pain. He denied sick contacts, recent antibiotic use, or recent travel. He was recently diagnosed with acute hepatitis A as an outpatient. Exam demonstrated a distended abdomen with no rebound tenderness or guarding.

Intravenous fluids and antibiotics were initiated due to prolonged history of diarrhea. Clostridium difficile testing and blood cultures were negative. GI PCR positive for Shigella. Diarrhea began to resolve after 48 hours and was subsequently discharged home.

After being discharged his stool culture grew shigella species. His primary care provider communicated further information about the patient's occupational history; the patient was a sex worker and engaged in sexual encounters with male clients.

IMPACT/DISCUSSION: Shigella is a well-known cause of bacterial dysentery; however, its infectious spread has more to show. Research was conducted in the mid-1970's studying shigella outbreaks among men who have sex with men (MSM). These outbreaks raised the concern of shigella being sexually transmitted. In developing countries, Shigella is transmitted via contaminated food or water(Goldberg, 2018); however, in developed countries it is more common to see transmission through direct person-to-person spread by fecal oral route (Goldberg, 2018). A very small inoculum of Shigella is able to cause disease; therefore, contact with even a miniscule amount of fecal matter during sexual activity could lead to an infection.

Another major factor of infection is immune status, particularly those who are HIV positive. These individuals can have prolonged symptomatic infection or even be asymptomatic carriers. Outbreaks may be accredited to reduced sex hygiene in the form of high-risk behavior, such as multiple partners, creating endemicity for shigellosis among some groups of MSM (Daskalakis & Blaser, 2007).

HIV negative men are also not safe. Contributing factors for the spread of Shigella among people who are HIV negative is the concept of strategic positioning. Where HIV negative men avoid open sex with men who are HIV positive, they may partake in sexual activities that are thought to be low risk (Daskalakis & Blaser, 2007). Though immunocompetent individuals are at lower risk of infection, the spread of shigella still occurs because of the low inoculum needed to infect.

CONCLUSION: High-risk individuals may contract Shigella through sexual transmission. Thorough acquisiton of social history may assist in understanding the risk factors for disease and guide patient education on the transmission and prevention of disease.

THE NOTORIOUS BCG: DISSEMINATED MYCOBACTERIUM BOVIS CAUSING MYCOTIC ABDOMINAL AORTIC ANEURYSM, EPIDURAL ABSCESS AND DISCITIS

Caelie Kern[1]; Michael Miller[2]; Andrew Lutz[2]; Danica Smith[1,2]; Michael G. Simonson[1,2]. [1]University of Pittsburgh School of Medicine, Pittsburgh, PA; [2]UPMC Presbyterian-Shadyside, Pittsburgh, PA. (Control ID #3364075)

LEARNING OBJECTIVE #1: Identify disseminated mycobacterial infection as a rare complication of intravesical BCG treatment

LEARNING OBJECTIVE #2: Recognize mycotic aneurysm and spinal abscess as a manifestation of disseminated mycobacterial infection

CASE: A 77-year-old male presented with left leg numbness and weakness. Prior medical history included abdominal aortic aneurysm (AAA), L4 discectomy one year prior, and non-muscle invasive bladder cancer (NMIBC) treated with transurethral resection (TURBT) and intravesical Bacillus Calmette-Guérin (BCG) 7 months prior. The patient was afebrile with 4/5 strength in the left leg, hypoesthesia and 1+ patellar reflex. Lab studies were notable for WBC $6.7x10^9$cells/L, Hgb 7.5g/dL and CRP 1.7mg/dL. CT and MRI revealed L3-L4 osteomyelitis with concurrent epidural abscess and a paravertebral abscess with adjacent 6cm saccular aortic aneurysm. The paravertebral abscess was drained and AFB cultures of this fluid grew Mycobacterium bovis. The patient underwent endovascular repair of the AAA with a rifampin-soaked graft without complication. Recovery was uneventful, and the patient was discharged to complete 6 months of anti- mycobacterial treatment with isoniazid, rifampin, ethambutol, and pyridoxine.

IMPACT/DISCUSSION: Intravesical BCG therapy after TURBT is the gold standard for patients with intermediate to high risk NMIBC. Used for four decades, it is the only agent shown to reduce progression to muscle-invasive disease. BCG is a live attenuated M bovis, thought to infect malignant urothelial cells and initiate a complex immune cascade of antitumor activity via $CD4^+$, $CD8^+$, natural killer cells, neutrophils, and macrophages.

Side effects of BCG are usually local (cystitis, hematuria, and dysuria) while disseminated disease occurs in <5% of patients. Mycotic aortic aneurysm (MAA) is an exceedingly rare complication with only 30 or so case reports of M bovis-associated MAA. It often goes unrecognized as most develop months to years after BCG therapy. The most common symptoms are abdominal pain, lower back pain, and low-grade fever, but more than half present with MAA rupture. While MAA due to BCG therapy is rare, BCG discitis with contiguous mycotic aneurysm is even rarer; our search identified only two case reports.

In this patient, the MAA was likely due to disruption of the aortic intima by the pre-existing AAA allowing for bacteremic seeding, although contiguous spread from the paravertebral abscess cannot be ruled out. The discitis was likely due to bacteremic seeding of the prior surgical site.

CONCLUSION: Here, we present a case of mycotic abdominal aortic aneurysm, epidural abscess, and discitis caused by disseminated M bovis infection. It is important to be aware of these rare complications of intravesical BCG therapy in patients treated for bladder cancer. Management of these patients is challenging and requires prolonged antimicrobial therapy often with surgical intervention.

THE OUTSIDE HOSPITAL TRANSFER AND ANCHORING: A CASE OF UNDIAGNOSED CHOLANGIOCARCINOMA

Abirami Thiyagarajan. Internal Medicine, University of Alabama Medical Center, Birmingham, AL. (Control ID #3391779)

LEARNING OBJECTIVE #1: Recognize anchoring bias especially when working up a patient who already carries a preliminary diagnosis.

LEARNING OBJECTIVE #2: Recognize similarities in clinical presentation between cholangiocarcinoma and drug-induced liver injury secondary to Augmentin.

CASE: The patient is a 62 year old Caucasian male with a history of NASH cirrhosis, CAD, and right lower lobe lung nodule who was admitted to an outside hospital with dark urine output, abdominal pain and fullness, worsening pruritus and jaundice after starting Augmentin for a sinus infection. A diagnosis of drug- induced liver injury secondary to Augmentin was made and he was transferred for expedited liver transplant work-up given acute on chronic liver disease.

On admission, the patient's physical exam was notable for generalized jaundice, icteric sclera and distended abdomen. Laboratory work up was notable for total bilirubin and direct bilirubin elevated to 23.4 and 18.5 mg/dL respectively (normal values 0.3-1.4 mg/dL and 0.0-0.3 mg/dL). Liver enzymes were elevated from baseline. Alkaline phosphatase was 225 (normal: 37-117 Units/L), AST was 172 (normal: 12-39 Units/L), ALT was 135 (normal: 7-52 Units/L). Ultrasound of the abdomen showed hepatic cirrhosis without focal lesion, splenomegaly, small ascites and

cholelithiasis without evidence of cholecystitis, no intrahepatic biliary ductal dilatation and common bile duct measuring 3 mm.

A CT of the chest was obtained to further evaluate the lung nodule seen on previous imaging as part of transplant work-up and was concerning for malignancy or metasteses. The CT also noted marked worsening of intrahepatic biliary ductal dilatation. An ERCP showed a malignant appearing stricture in the common hepatic duct and pathology showed adenocarcinoma, possibly cholangiocarcinoma. Because of his diagnosis of cholangioarcinoma, he was not eligible for liver transplant. Palliative medicine was consulted and the patient and his family decided to pursue comfort care.

IMPACT/DISCUSSION: Anchoring bias refers to the cognitive behavior in which physicians tend to rely on the first impression. Starting fresh from a diagnostic standpoint is essential to ensure that an alternative diagnosis is not missed. While this patient's clinical picture was consistent with liver injury secondary to Augmentin as diagnosed by the outside hospital, his underlying undiagnosed cholangiocarcinoma also presented with similar symptoms and biochemical markers. Developing a broad differential for mixed cholestatic and hepatocellular liver injury would have allowed earlier diagnosis of cholangiocarcionma.

CONCLUSION: Always start from scratch when admitting a patient in order to avoid ancoring bias, especially when they may already carry a diagnosis.

Cholangiocarcinoma and Augmentin related liver injury can present with a similar clinical picture.

THE PERFECT STORM: A CASE OF INFECTED CALCIPHYLAXIS IN RENAL FAILURE

Stephanie Tutak[1]; Priya Nori[2]. [1]Internal Medicine, Montefiore Medical Center, Bronx, NY; [2]Medicine, Montefiore/Einstein, Bronx, NY. (Control ID #3392292)

LEARNING OBJECTIVE #1: Identify risk factors for calciphylaxis.

LEARNING OBJECTIVE #2: Recognize superimposed infection as a common complication of calciphylaxis.

CASE: A 45 year-old obese woman with lupus nephritis on peritoneal dialysis and antiphospholipid syndrome presented with two weeks of drainage from a right breast wound. Four months ago she had a painful, stellate ulcer over the lateral side of the breast with eschar formation concerning for calciphylaxis. Mammogram displayed microvascular calcifications, and core biopsy revealed subcutaneous vascular thrombi and calcification. Her medications included Warfarin, which was switched to Apixaban two months ago. White blood cell count was 15.3 k/uL, serum calcium was 9.3 mg/dL, and serum phosphorus was 6.2 mg/dL. Empiric intravenous Vancomycin was started and transitioned to Linezolid and Cefepime after wound cultures grew Enterococcus faecalis and Serratia. She was transitioned to hemodialysis and started sodium thiosulfate and Cinacalcet.

IMPACT/DISCUSSION: Calciphylaxis is a rare and under-recognized condition characterized by microvascular calcification in the subcutaneous adipose tissue and dermis that results in ischemic skin lesions. The disorder typically affects patients with end-stage renal disease, and prognosis is poor, with a 1-year mortality of 45 to 80%. While biopsy is the standard confirmatory test, there is risk of provoking new, non-healing ulcers. Therefore, biopsy is not necessary in patients with renal insufficiency that present with classic necrotic ulcers. Known risk factors for calciphylaxis include obesity, diabetes mellitus, female sex, and dialysis dependence. Elevated phosphate and calcium levels increase the risk of subsequent calciphylaxis in patients undergoing dialysis. Vitamin K antagonists like Warfarin increase the risk of calciphylaxis by a factor of 3 to 13. There is no approved therapy for calciphylaxis, however an interdisciplinary approach with local wound care, elimination of risk factors such as hypercalcemia and hyperphosphatemia through calcimimetic agents or parathyroidectomy, intensified hemodialysis, and the addition of sodium thiosulfate is recommended. The most common cause of mortality in patients with calciphylaxis is sepsis, therefore clinicians should maintain a high index of clinical suspicion for superimposed infection. Treatment of suspected wound infection includes surgical debridement and antibiotics with empiric coverage against streptococci, Methicillin-resistant Staphylococcus aureus, aerobic Gram-negative bacilli, and anaerobes. In most patients, a specific organism is not identified, and superficial swabs of the wound are not reliable for diagnosing an infection.

CONCLUSION: Calciphylaxis is a fatal, under-recognized condition in end-stage renal disease.

Vitamin K antagonists significantly increase risk of calciphylaxis and should be avoided in chronic kidney disease. The most common cause of death in patients with calciphylaxis is sepsis from superimposed infection.

THERE'S NO SUCH THING AS A FREE LUNCH: COMPLICATIONS AFTER SUCCESSFUL EMBOLIZATION OF LOWER GI BLEED

Laurie Edelman, Rachel Solomon. Medicine, Mount Sinai Medical Center, New York, NY. (Control ID #3391997)

LEARNING OBJECTIVE #1: Identify patients who warrant angiographic embolization to control gastrointestinal bleeding (GIB).

LEARNING OBJECTIVE #2: Recognize clinical features concerning for clinical complications post intervention for GIB.

CASE: An 89-year-old woman with a history of diverticular disease, hemorrhoids, paroxysmal atrial fibrillation, patent foramen ovale and TIA on rivaroxaban, presented to the emergency room with presyncope and one episode of bright red blood per rectum. Her last screening colonoscopy, 15 years ago, was free of polyps. On arrival, her blood pressure was 105/56 and her heart rate 85. She appeared well, had mild left lower quadrant tenderness, no rebound or guarding. Hemoglobin was 12.6 mg/dL, platelets 224K, PT 16.7, INR 1.9, PTT 34.2. She continued to have episodes of hematochezia. Hemoglobin levels dropped below 7 mg/dL. She required blood transfusions to maintain hemodynamic stability. CT Angiogram (CTA) of the abdomen revealed acute arterial hemorrhage of the small bowel. Angiography of the superior mesenteric artery demonstrated extravasation of a jejunal artery branch. Glue embolization effectively stopped the bleeding. However, day 2 post-procedure she continued to have mild upper abdominal pain and became febrile. Leucocyte count rose to 20K. CT scan obtained with suspicion for mesenteric ischemia instead showed 7.4 cm of gas adjacent to the embolized arteries in the left upper quadrant suggestive of perforation. She underwent emergent laparoscopic bowel resection for a full-thickness perforation with intra-abdominal abscess and recovered completely.

IMPACT/DISCUSSION: Lower gastrointestinal bleeding occurs frequently. Most patients will stop bleeding spontaneously. However, a subset of patients with persistent bleeding requires transcatheter angiographic embolization with coils, liquid agents or polymer beads. Our patient met the criteria for embolization given active bleeding identified by CTA and hemodynamic instability on a direct oral anticoagulant. While these interventions are effective in controlling bleeding, there remains the risk for post- procedure rebleeding, bowel infarction and less commonly perforation.

CONCLUSION: Transcatheter embolization is an effective way to control severe lower GI bleeding but carries risks of re-bleeding, bowel ischemia, and perforation.

Though rare, perforation is associated with high morbidity and mortality.

Clinicians should have a low threshold to reimage patients with persistent abdominal pain post-procedure, even in the setting of stable hemoglobin and down-trending lactate.

THE RELATIONSHIP IS THE MEDICINE: BEING TRAUMA INFORMED WHEN CARING FOR UNDERSERVED POPULATIONS

Farhana Chowdhury[1]; Jill Allenbaugh[2]. [1]Internal Medicine, Temple University Hospital, Philadelphia, PA; [2]General Internal Medicine, Temple University Hospital, Philadelphia, PA. (Control ID #3385759)

LEARNING OBJECTIVE #1: Recognize trauma as a barrier to medical care

LEARNING OBJECTIVE #2: Illustrate provider behaviors to gain patient's trust in the medical system

CASE: A 63-year-old female with hypertension, treated hepatitis C virus, left knee osteoarthritis, obesity presented to the outpatient clinic complaining of generalized fatigue. Physical exam revealed elevated blood pressure of 159/95, BMI 38.23, apprehensive and tense affect. Labs were significant for elevated cholesterol 278, hemoglobin A1c 5.8 and normal basic metabolic panel.

Although she was prescribed anti-hypertensive medications for over 5 years by her previous primary care physician, she stated she was able to treat her elevated blood pressure with homeopathic remedies. She repeatedly refused to take medications for both hypertension and depression, citing she experienced side effects which were intolerable. Despite her lack of medication compliance, she did follow up closely in clinic. After months of establishing a relationship and building rapport, she suddenly utilized a visit to reveal her long history of repeated trauma. She disclosed a childhood rape, a relationship with severe domestic violence and multiple losses of close family and friends to gun violence. She cited her trauma as her barrier to medication compliance and distrust in the medical system. She was offered resources for therapy and counseling along with medications, however she refused noting treatment for her trauma would feel like failure of character.

Over the next few months, she was scheduled for frequent visits to continue to monitor her health and assess her trauma. Even in short, 15-20-minute visits, she continually opened up and shared her fears. She started responding positively to the human touch, and even got in habit of hugging at the end of her visits. Finally, she felt she could trust the health care system again, and started to take her blood pressure medications.

IMPACT/DISCUSSION: Many patients have been affected by trauma; with the population we serve having an adverse childhood event rate of 70%. These are often not disclosed, and clinic time pressures are a common hurdle to exploring barriers to appropriate medical care. Instead, patients are labeled as noncompliant, and passed over. However, true trauma informed care, recognizes these barriers, and with compassion destroys the walls of fear and uncertainty that separates patients and physicians. In this case, recognizing her aversion to medication as a trust issue, rather than a compliance issues, allowed for a feeling of security by the patient, and a better medical outcome.

CONCLUSION: Trauma informed care, when successfully implemented, improves the patient-physician relationship and outcomes. This is particularly important in general medicine, where patients often first disclose and may not want to repeat their traumatic past experiences with others in the health profession, generalists are often those who care for both medical needs as well as trauma and subsequent mental health issues.

THE RETURN OF THE GREAT MIMICKER

Moksha Patel, Gregory Misky. Internal Medicine, University of Colorado, Denver, CO. (Control ID #3378967)

LEARNING OBJECTIVE #1: Provide a diagnostic approach for vision changes in HIV patients

LEARNING OBJECTIVE #2: Recognize the risk factors and clinical features of ocular syphilis

CASE: 54-year-old man with untreated HIV and previously treated syphilis admitted for bilateral vision loss.

6 months prior, patient had developed complete loss of vision in his right eye, diagnosed as retinal detachment. Due to insurance issues, patient did not seek further care. Ten days before admission, patient developed blurry vision in his left eye, which progressed until he could only delineate light from dark. At an outside hospital, CT orbits showed bi-ocular inflammatory changes; patient was transferred to our hospital for specialty care.

Admission exam notable for: complete blindness in right eye, and only the ability to detect light in left eye. Ocular exam in operating room revealed bilateral pan-uveitis with right retinal detachment. Labs revealed leukopenia (3.4×10^9/L), thrombocytopenia (124×10^9/L), CD4 count of 234, HIV viral load of 30,600, serum RPR 1:16 and CSF VDRL 1:4.

A diagnosis of ocular neurosyphilis was made and patient was treated with IV Penicillin, intraocular steroids, and left eye pars plana vitrectomy, lensectomy, and cryotherapy with significant improvement in vision. Follow up showed left eye acuity had improved to 20/100.

IMPACT/DISCUSSION: Ocular disease affects up to 75% of patients infected with HIV, and is classified into: HIV-induced vascular disease, opportunistic infections, neoplasms, and drug toxicities. The most common cause of HIV ocular disease is microvascular retinopathy. Common ocular infections include CMV retinitis, Toxoplasmosis, TB, HSV/VZV, Syphilis, Pneumocystis and Cryptococcus. HIV-associated ocular neoplasms include CNS lymphoma, Kaposi Sarcoma, and HPV induced SCC. Finally, some drugs used to treat HIV are associated with ocular toxicities.

Syphilis, the great mimicker, is a commonly overlooked cause of ocular disease. High-risk patients include those with HIV, men who have sex with men, and blacks. Ocular syphilis affects one or both eyes and can involve nearly every structure in the eye. The most common manifestation is uveitis. Other manifestations include keratitis, iridocyclitis, retinal vasculitis, optic neuritis, and exudative retinal detachment. Exam findings depend upon which structures are affected. Serological testing should include a treponemal and non- treponemal test. CSF studies with elevated protein, over 5 white blood cells, and a positive VDRL support a diagnosis of neurosyphilis, although a negative test does not rule out disease.

Treatment is with Penicillin G for 10-14 days with some data on the use of concurrent steroids.

CONCLUSION: HIV can cause ocular disease due to vascular changes, infections, neoplasms, or drug toxicities.

Ocular syphilis causes inflammation to many ocular structures and can present in many ways, including with uveitis and retinal detachment. High risk patients include blacks, patients with HIV, and men who have sex with men.

THE REVENGE OF RAW OYSTERS

Andrew Vegel, Carmen Lopez, Christopher Kontoghiorghes, Katherine Boland. Internal Medicine, Tulane University School of Medicine, New Orleans, LA. (Control ID #3392022)

LEARNING OBJECTIVE #1: Describe severe infectious diarrhea and sepsis caused by *Plesiomonas shigelloides*

CASE: A 52 year old male presented with greater than twenty episodes of pungent, watery diarrhea for four days. He endorsed generalized abdominal pains and light headedness but denied melena, hematochezia, nausea and vomiting. His history was otherwise notable for employment as an oyster shucker and eating raw oysters while at work.

Initially, he was tachycardic to 132, normotensive, and had a temperature of 100.3°F. His exam was notable for pains on palpation of his upper abdomen but it was otherwise unremarkable. He additionally had multiple watery bowel movements in the emergency room. On lab analysis, he had a leukocytosis ($17.3X10^3/\mu L$), an elevated lactic acid (3.2 mmol/L), and an acute kidney injury (creatinine of 1.5 mg/dL from baseline of 1.0 mg/dL). He was empirically started on ciprofloxacin and metronidazole for infectious gastroenteritis. Stool PCR detected *Plesiomonas shigelloides*. His initial blood cultures grew *P. shigelloides*, with subsequent blood cultures negative for growth. Stool culture then began growing *Campylobacter*. Metronidazole was discontinued and azithromycin was begun. His diarrhea began improving, and he was discharged with instruction to complete the 10 day course of ciprofloxacin as an outpatient.

IMPACT/DISCUSSION: *P. shigelloides* is a gram negative bacterium that is primarily found in freshwater and estuarine ecosystems, favorable for oysters. Poor sanitation and sewage contamination are risk factors for growth of *P. shigelloides*. The bacterium commonly colonizes freshwater fishes, crustaceans, and shellfish; as well as other mammals, birds, or amphibians in these ecosystems.

Internationally, it is a known pathogen causing gastroenteritis; however, *P. shigelloides* is thought to cause less than 1% of the bacterial gastroenteritis within the United States. Risk factors for acquiring this infection include consuming raw seafood, travelling to underdeveloped areas, drinking non-treated water, and being immunocompromised. Extent of illness ranges from secretory diarrhea to dysentery; as well as skin and soft tissue infections, bacteremia, or other severe systemic infections. Co-infections with other pathogens may lead to more severe disease. Often, the diarrheal illness is self limiting; however, antibiotics are warranted in more severe cases. *P. shigelloides* is sensitive to many antibiotics but resistant to many penicillins as it expresses a beta-lactamase. For adults, azithromycin or ciprofloxacin are the first line of antibiotics. **CONCLUSION:** *P. shigelloides* is a common cause of gastroenteritis worldwide associated with seafood consumption in United States and contaminated water in underdeveloped areas

P. shigelloides is usually a self limited infection, but for more severe episodes of gastroenteritis or other sources of infection, a wide array of antibiotics are available

THERE'S NO PLACE LIKE HOME, TECHNICALLY

Corinna D. Falck-Ytter. Internal medicine, VA Medical Center Cleveland, Cleveland, OH. (Control ID #3390386)

LEARNING OBJECTIVE #1: Recognize clinical situations where video-to-home visits are appropriate

LEARNING OBJECTIVE #2: Assess the social environment for readiness and support

CASE: Mr. S is a 76-year-old veteran who was diagnosed with stage 2 colon cancer in 2017. He has a prior history of HTN, and a gunshot wound to the spine, which left him with leg weakness and chronic back pain. Mr. S refused surgery and hospice care (patient is DNR). The patient's stated goals are to be at home and to have good pain control. His last in person visit was in November 2018. Due to his underlying conditions the patient became increasingly immobile. He lives in a small home with a second-floor bedroom and transport to the ambulance is very difficult. At the last in person visit a video-to-home option for follow up was offered. His daughter had a video capable phone and was willing to learn the video connect process. The patient's daughter and wife have been present for all video-to-home appointments.

The visits are structured like a face-to-face visit: chief complaint, usually pain control and general well-being, ROS and vital signs (obtained at home) and medications are reviewed. A quasi physical exam is done, e.g. veteran often has difficulties with abdominal distension and alternating diarrhea and constipation. Patient's wife will focus phone's camera on patient's abdomen and palpate it with Mr. S reporting if there is any pain or discomfort. An assessment and plan are formulated and follow up visit planned. The patient and his family express at each visit deep gratitude that he does not have to leave his house for his visits.

IMPACT/DISCUSSION: Care at the end of life should be tailored to the patient's wishes, in this case to be at home and have good pain control. Nevertheless, ongoing evaluation and assessment is necessary. Video-to-home technology allowed patient care to continue without the patient having to leave his home. Mr. S has had no ED visits or admissions to the hospital. For providers in the VA system Video-to-home visit are equal to face-to-face visits (workload and time). There is some literature available on video health services, however one systematic review conducted in 2019 for telehealth services in palliative care stated that there is a lack of evidence and conclusions regarding this application in palliative care cannot be drawn. Despite that, adoption of this technology will likely continue, due to the benefits to patients. Integration into the provider's clinical duties, workload recognition and adequate technological support are essential.

CONCLUSION: Video-to-home enabled our patient to fulfill his wishes to be cared for at home with good pain control. When fully integrated into ambulatory care it is a patient centered technology tool for primary care providers.

THERE'S NO STOPPING IT ONCE IT GETS GOING

SACHI TAKAOKA[1]; Akira Ryu[2]; Wataru Uegami[3]; Koichi Honma[3]; Sandra Moody[4]. [1]General Medicine, Awa Regional Medical Center, Tateyama, Japan; [2]Inernal Medcine, Kameda Medical Center, Kamogawa, Japan; [3]Diagnostic Pathology, Kameda Medical Center, Kamogawa, Japan; [4]Professor in Residence, Kameda Medical Center, Kamogawa, Japan. (Control ID #3347950)

LEARNING OBJECTIVE #1: Recognize that coagulopathy due to cancer in patients can progress rapidly and lead to early death.

LEARNING OBJECTIVE #2: All patients with malignancy should be assessed for the risk of thrombosis and considered for anticoagulant therapy.

CASE: A 55-year-old man with no previous history was referred by his family doctor, because of fever and right homonymous hemianopsia (RHH) that was noted the day before. One day before admission, he noticed he could not see one side. He went to his doctor immediately and was noted to have a fever and RHH. Thus, he was referred to our hospital for further evaluation. On physical examination, he appeared slightly jaundiced. His temperature was 38.0°C. Brain magnetic resonance imaging showed multiple high intensity areas in both cerebral hemispheres and the right occipital lobe, indicating multiple infarctions. Abdominal computed tomography showed multiple low-density areas in the liver, pancreatic tail and spleen. At first, septic emboli were suspected, however, abdominal ultrasound showed an irregular mass in the pancreatic tail, obfuscation of the boundary between the spleen and pancreas, and multiple masses with a halo in the liver, suggestive of multiple metastases of the liver and spleen. Trousseau's syndrome was considered. Intravenous heparin was started on the third day. On day 6, dyspnea and hypoxia developed, and pulmonary thromboembolism was suspected. On day 11, right kidney infarction was noted. On day 12, heparin was changed to fondaparinux, and then to edoxaban on day 16. On day 19, jaundice progressed rapidly and his D-dimer increased to 94.5 μg/mL. On day 26, he died. An autopsy revealed increased pancreatic mucin and nonbacterial thrombotic endocarditis. The specimens also showed both thromboembolic and tumor embolic lesions to various organs.

IMPACT/DISCUSSION: In patients with cancer, tumor cells have various mechanisms of thrombosis formation. Risk factors for thrombosis are grouped into the three categories: patient-related features, treatment-related features and cancer-related features (histology, site, and stage). Mucin is a known substance that leads to hypercoagulable state, and its presence indicates rapid dissemination from one organ to another. Examination of the pancreas and other organs on autopsy revealed massive emboli due to thrombosis and tumor cells. In this case, rapidly developing thromboses led to rapid worsening of his condition.

In general, the risk of cancer-associated thrombosis should be assessed and early anticoagulant therapy considered. In 2019, several clinical trials showed that direct oral anticoagulants as thromboprophylaxis in patients with cancer can offer important advantages, including shorter hospital stay, convenience, and cost. However, in Japan, there is no clear consensus on anticoagulant therapy for patients with malignancy.

CONCLUSION: Thromboembolism due to cancer can progress rapidly. All patients with malignancy should be assessed for risk of thrombosis and considered for early anticoagulant therapy.

THE SUGAR DANCE: A CASE OF HYPERGLYCEMIA-INDUCED CHOREA

Elizabeth Cummings. Internal Medicine, UCSF, San Francisco, CA. (Control ID #3389867)

LEARNING OBJECTIVE #1: Recognize nonketotic hyperglycemia as a possible cause of chorea, athetosis, and ballism

CASE: A 57-year-old man with history of inadequately controlled Type II diabetes and schizophrenia complicated by drug-induced parkinsonism presented to the ED with one week of strange left-sided movements.

He reported subacute onset of intermittent involuntary "twisting" movements of his left arm and leg. His home insulin regimen had recently been stopped because of intermittent adherence leading to hypoglycemia at home. He was on quetiapine for schizophrenia, with no recent medication changes.

Exam was notable for involuntary writhing movements of the left hand and foot, and for left hemiballism when the extremities were held up against gravity. Labs showed glucose 450 with normal anion gap. The patient was unable to get MRI Brain because of shrapnel from a previous injury lodged in his orbit.

He was started on medical management for possible stroke, and glycemic control was achieved by titrating an inpatient insulin regimen. Several days after glycemic control was achieved, the patient's abnormal movements resolved. His chorea was thought to be due to nonketotic hyperglycemia rather than a vascular cause. He was discharged with insulin, and his movements have not recurred.

IMPACT/DISCUSSION: Chorea, athetosis, and ballism frequently coexist in the same patient and are together thought of as the choreiform spectrum. They result from an imbalance in basal ganglia pathways causing excessive dopaminergic activity. Chorea usually affects the distal limbs, and can also affect the face. It is usually present at rest and can increase with movement or with distraction, but disappears in sleep. Patients are often unaware of the movements, and they are frequently noticed by family members.

Most common causes of choreiform movements in US adults are vascular (basal ganglia stroke), metabolic (sodium, magnesium, and calcium disorders, as well as uremia, hyperthyroidism, and B12 deficiency), drug-induced (e.g. levodopa-induced dyskinesia in patients with parkinsonism), genetic (e.g. Huntington's), infectious (e.g. AIDS), autoimmune/inflammatory (including Sydenham's chorea, very common in children), paraneoplastic, & toxin-induced.

Nonketotic hyperglycemia is the second most common reported cause of acquired hemiballism after stroke. There is usually slow remission of abnormal movements when glycemic control is achieved, but the movements can persist up to a year.

In addition to treatment of underlying causes, chorea can be treated with second-generation antipsychotics (dopamine receptor blockade). VMAT inhibitors (e.g. tetrabenazine) can also be considered, but can cause depression.

CONCLUSION: - Nonketotic hyperglycemia is the second most common cause of choreiform movements after stroke.

- In hyperglycemia-induced chorea, glycemic control can result in resolution of chorea. Chorea can be delayed in resolving for up to one year once blood sugars are controlled.

THE TRENDING INJURY: E-CIGARETTE AND VAPING ASSOCIATED LUNG FINDINGS

Manasa Jasti, Umer Farooq, Paola Sanchez, Krupa Shingada, Christine Junia. Internal Medicine, Loyola Medicine-MacNeal Hospital, Berwyn, IL. (Control ID #3392461)

LEARNING OBJECTIVE #1: 1) Timely recognition and preventing delay in diagnosis of E-cigarette or vaping product use associated lung injury (EVALI)

LEARNING OBJECTIVE #2: 2) Challenging decision making for steroid use in EVALI patients

CASE: A 19-year-old man with a one-year history of vaping was evaluated for acute gastroenteritis. In the hospital, he was noted to have asymptomatic hypoxia with a PaO2 of 65 mmHg. Physical examination revealed good air movement without any crackles, rales, rhonchi or use of accessory muscles. Shallow breathing was noticed with a mild decrease in chest expansion during respiration. A chest CT scan was ordered and revealed bilateral diffuse nodular pattern of infiltrates similar to miliary tuberculosis. An infectious workup including Streptococcus and Legionella urinary antigens, HIV screening and Quantiferon testing were negative. He underwent bronchoscopy with bronchoalveolar lavage and bacterial and fungal cultures were negative. He was initially empirically treated for bacterial and fungal infection but showed minimal improvement. Systemic steroids were eventually added with the guidance of the Pulmonary and Infectious Disease service after which patient's oxygen saturations started to improve. Antibiotic therapy was discontinued given his lack of respiratory symptoms and after receiving a negative microbiologic workup.

His hypoxia continued to improve with systemic steroids, which he continued upon discharge on a tapering regimen.

IMPACT/DISCUSSION: 1) EVALI is a diagnosis of exclusion, and unfortunately as highlighted in this case, may produce clinically silent but severe lung injury.

2) Clarifying the use of vaping while taking a social history is critical due to the lack of emphasis in media of health hazards associated with vaping. Patients may not volunteer to provide the information which could delay diagnostic workup.

3) Timely diagnosis and appropriate management can reduce the need for ICU admission, intubation, and overall cost of care.

4) Empiric antibiotics should be initiated in parallel with obtaining a microbiological workup and discussion with specialists on the proper timing of steroid therapy.

5) There is a wide range of steroid dosing in current studies. Physicians should always consider treating with lowest dose possible depending on the patient's clinical response, in order to limit medication adverse effects.

CONCLUSION: 1) In vaping patients who present with non-specific symptoms, we should maintain a high suspicion for EVALI. A thorough assessment can prompt early diagnosis and intervention.

2) A patient's pulmonary symptoms may not correlate to radiological lung findings.

3) In the limited published literature available on EVALI, empiric antibiotics coupled with appropriate use of systemic glucocorticoids have shown to result in favorable outcomes.

THE UNCOMMON COLD

Jaeda M. Roth. Internal Medicine, Mayo Clinic, Rochester, MN. (Control ID #3391452)

LEARNING OBJECTIVE #1: Recognize when a patient's clinical picture is not improving as expected

CASE: A 50-year-old female with past medical history of breast cancer on active neoadjuvant chemotherapy with doxorubicin and cyclophosphamide was admitted with shortness of breath, cough and fevers. She was hypoxic requiring 2L of oxygen and febrile to 39.0°C. Labs revealed a WBC of 12.0 x 10^9/L (4.5-11.0 x 10^9/L) with mild lymphopenia, hemoglobin of 9.2 g/dL (12.0-16.0 g/dL), lactate of 2.3 mmol/L (<1.0 mmol/L), elevated D-dimer and a respiratory pathogen panel positive for rhinovirus. CT chest showed a tiny non-occlusive sub-segmental pulmonary embolism for which anticoagulation was started and bibasilar atelectasis with surrounding consolidation in the left lower lobe. She was treated with piperacillin-tazobactam for a superimposed pneumonia.

Despite antibiotics and aggressive pulmonary hygiene, the patient continued to fever and had increasing oxygen requirements. Repeat chest x-ray showed worsening bilateral opacities so antibiotics were broadened to vancomycin, cefepime and azithromycin on hospital day 3. Despite this, she continued to deteriorate. Further questioning revealed that the patient was receiving high doses of dexamethasone prior to chemotherapy for nausea prevention. A bronchoscopy was then performed which revealed a positive PJP smear. Trimethoprim-sulfamethoxazole and oral Prednisone were started while other antibiotics were discontinued. Within 48 hours of trimethoprim-sulfamethoxazole initiation, her fevers resolved and her respiratory status improved significantly.

IMPACT/DISCUSSION: This patient presented a unique diagnostic and therapeutic challenge. She was immunocompromised from chemotherapy, but initial workup yielded a reasonable diagnosis of rhinovirus with superimposed bacterial pneumonia. Given her immunocompromised state, we anticipated it may take her longer than usual to recover from a common viral infection or pneumonia. Her lack of improvement and frank worsening of her respiratory status prompted us to investigate further as it did not seem reasonable to attribute her deterioration to rhinovirus. This led to further questioning that revealed her significant steroid use, raising concern for PJP pneumonia. A bronchoscopy was then performed which revealed the diagnosis leading to successful treatment and a positive patient outcome.

CONCLUSION: - As general internists or hospitalists, it is important to recognize when patients are not improving as expected. Most illnesses have an anticipated course and we need to recognize when a patient's course is not following the expected trajectory.

- Physicians should not necessarily add on an extensive workup when the expected clinical course is not followed but instead should pause to ask, "What could we be missing?"

- In this case, further focused questioning identified risk factors for atypical infection, which led to the testing that correctly identified the pathogen.

THE UNUSUAL SUSPECTS WAS IT CARBIDOPA/LEVODOPA ALL ALONG

Callie Marshall, Megan Lewis, Sheena Grant. Internal Medicine, UT Health Science Center San Antonio, San Antonio, TX. (Control ID #3391969)

LEARNING OBJECTIVE #1: This case's temporal and possibly etiologic relationship to Carbidopa/Levodopa adds to a small yet significant body of literature describing drug-induced leukocytoclastic vasculitis.

LEARNING OBJECTIVE #2: Leukocytoclastic vasculitis can cause significant pain and must be kept on the differential for a purpuric rash.

CASE: A 59 year-old female with recently-diagnosed parkinsonism presented with two weeks of a painful rash that began on her legs. She had begun Carbidopa/Levodopa two weeks prior to the onset of the rash, but denied any additional recent lifestyle or medication changes. On physical exam, she had palpable purpura on the bilateral lower extremities, some of which had tense bullae in the center. Laboratory studies, including an autoimmune panel, were only notable for a CRP of 17. Biopsy revealed polymorphonuclear invasion of the vessel walls with signs of fibroid necrosis and neutrophil death manifested as leukocytoclasia. The patient began topical clobetasol/triamcinolone and a 15 day prednisone taper with improvement of her symptoms.

IMPACT/DISCUSSION: Leukocytoclastic vasculitis (LCV) is a small vessel vasculitis that typically targets dermal postcapillary venules. Up to 50% of cases are idiopathic. There is only one reported case of Carbidopa/Levodopa associated purpura. The case presented here details an incidence of purpura following Carbidopa/Levodopa administration with biopsy confirmed LCV.

CONCLUSION: Leukocytoclastic vasculitis can cause significant pain and must be kept on the differential for a purpuric rash. Although palpable purpura and petechiae are the major clinical findings, biopsy evidence of LCV has also been seen in urticarial rashes. Inciting factors for this skin condition include medications, viral and bacterial infections, malignancy and autoimmune diseases. A 2015 article on drug-induced vasculitis described TNF inhibitors, cocaine, Rituximab and statins as known culprits of leukocytoclastic vasculitis. Cases of Dagibatran, Glyburide, Pyridostigmine and Propylthiouracil have also been reported as causing LCV.

This case's temporal and possibly etiologic relationship to Carbidopa/Levodopa adds to a small yet significant body of literature describing drug-induced LCV. While identifying the cause of LCV is challenging, as up to 50% of cases are described as "idiopathic," 50% of cases are thought to be the result of a particular offending agent/incident. The process of understanding its etiology is made more challenging by the sparsity of cases, estimated to be about 45 per million. Further research is needed to bolster evidence for or against Carbidopa/Levodopa as a definitive cause of LCV and add to the existing knowledge base of medications that can lead to this rare dermatologic complication.

THIRD DEGREE BURNS: A COMPLICATION OF TRANSCUTANEOUS PACING

Jonathan Mayl[1]; Kevin Smith[1]; Steven Delaney[1]; Octavia Rangel[2]; Adam Pflum[2]. [1]Internal Medicine, Wake Forest Baptist Health, Winston-Salem, NC; [2]Cardiology, Wake Forest Baptist Health, Winston-Salem, NC. (Control ID #3389853)

LEARNING OBJECTIVE #1: Recognize that burns can be a complication of transcutaneous pacing

CASE: We present a 66-year-old male with medical history of CAD, ischemic heart failure, and first degree atrioventricular (AV) block who

arrived as a transfer from a referring hospital with complete AV block. He reported fatigue which started 5 days prior associated with intermittent nausea, vomiting, shortness of breath, and orthopnea.

At the outside hospital, his ECG showed third degree AV block with ventricular escape beats at a rate of twenty. Transcutaneous pacing was initiated at 50 milliamps prior to the patient being transferred to our institution for tertiary cardiac care. On arrival, his pacing rate was increased from 60 to 80 beats/minute for hemodynamic support.

Temporary transvenous pacemaker implantation was attempted but aborted secondary to concomitant respiratory distress. The patient was subsequently intubated and transcutaneously paced overnight for approximately 10 hours before a dual chamber pacemaker could be successfully placed. Upon removal of the transcutaneous pacemaker pads, the patient was noted to have full-thickness third-degree electrical burns covering <1% of his body (image 1-2). His respiratory status improved after placement of dual chamber pacemaker and he was extubated and discharged with appropriate follow-up.

IMPACT/DISCUSSION: This case highlights a rare but significant complication of transcutaneous pacing. To date, there are only three other cases of burns caused by transcutaneous pacing reported in the literature. In this case, due to inability to place a transvenous pacemaker overnight, the patient was paced transcutaneously for longer than is standard. There is uncertainty whether the burns were present from the onset of transcutaneous pacing or due to the cumulative effect of prolonged transcutaneous pacing. Assuming the pacemaker was functioning correctly it would be reasonable to suspect the risk injury is proportional to the amount of time, current amperage, and the rate of transcutaneous pacing. Depending on the device, pacer pads may also need to be replaced as degradation of the adhesive on the pads can occur increasing the risk of burns. In general, pacemaker pads should be changed. In our patient, the pacer pads were not replaced for the duration of continuous transcutaneous pacing.

CONCLUSION: -All reasonable attempts should be made to facilitate implantation of a temporary transvenous pacemaker in those who are actively transcutaneous paced to minimize the risk of burns.

- In patients who complain of chest pain with transcutaneous pacing despite analgesia, consideration and evaluation should be performed given the risk of electrical burns.

- Consider changing pacemaker pads more frequently in patients who require prolonged transcutaneous pacing and preform skin checks in patients who cannot communicate discomfort.

THIS PAIN IS GIVING ME BAD BLOOD: A CASE OF ACUTE MYELOID LEUKEMIA (AML) PRESENTING AS HIP PAIN

Christopher C. Marino, Brent W. Thiel. Internal Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3386832)

LEARNING OBJECTIVE #1: Recognize the musculoskeletal clinical manifestations of acute myeloid leukemia (AML) in a young adult.

CASE: A 30-year-old woman with no significant past medical history presented to the clinic with three weeks of severe right lateral hip pain radiating to her groin and anterior thigh with no preceding inciting event. Physical exam demonstrated prominent tenderness of the groin and pain with flexion and internal rotation of the hip. Complete blood count and inflammatory marker values were within normal limits. X-ray and CT imaging were unremarkable. MRI demonstrated a T2 hyperintense lesion occupying the right iliac intramedullary space with associated periosteal edema concerning for a marrow infiltrating process. Bone scintigraphy showed increased uptake in the same location with no skeletal abnormalities elsewhere. Two weeks later, she developed fever and had new pancytopenia with a predominance of blasts on peripheral blood smear. Bone marrow biopsy demonstrated hypercellular marrow with 92% blasts and cytogenetic testing compatible with acute myeloid leukemia (AML) with myelodysplastic features. She was treated with cytarabine plus daunorubicin 7+3 induction chemotherapy and had complete resolution of her musculoskeletal pain. Follow up bone marrow biopsy demonstrated no recurrence of AML blasts and consolidation chemotherapy was initiated.

IMPACT/DISCUSSION: This case demonstrates the challenge of diagnosing AML in a young woman presenting with non-specific musculoskeletal pain. The incidence of AML is highest between age 65-74 years but can develop at any age. While musculoskeletal pain is a well described presenting symptom of acute leukemia, particularly acute lymphocytic leukemia (ALL), in children, it does not commonly present in adults with AML. One study estimated that 4% of adults with acute leukemia present with musculoskeletal symptoms. AML can manifest as severe bone and joint pain and lead to rare complications of bone marrow necrosis, avascular necrosis, and intraarticular hemorrhage. Musculoskeletal symptoms often precede abnormal hematologic values and have been associated with diagnostic delay in the pediatric literature. Bone pain results from expansion of the medullary cavity by proliferating blasts and is most common in the long bones of the extremities. Joint pain results from synovial infiltration and most often presents as an asymmetric large joint arthritis but can also present as a migratory or symmetric polyarthritis mimicking reactive arthritis and rheumatoid arthritis. Leukemia-associated osteoarticular pain is commonly out of proportion to exam and poorly responds to NSAIDs and corticosteroids though generally improves with treatment of the underlying malignancy.

CONCLUSION: Musculoskeletal pain can be an initial manifestation of AML even in the setting of normal peripheral blood lab values. Acute leukemia should be considered in cases of unexplained musculoskeletal pain in the absence of an inciting event in order to not delay diagnosis.

THROMBOCYTOPENIC PURPURA OR HELLP - A CHALLENGING CASE OF THROMBOTIC THROMBOCYTOPENIC PURPURA AND HELLP SYNDROME IN PREGNANCY

LAKENE RAISSA DJOUFACK DJOUMESSI[2,1]; Mahnoor Mir[1]; Karla Avila[4]; Elena Jimenez Gutierrez[3]. [1]Internal Medicine, University of Texas Health Science Center San Antonio, San Antonio, TX; [2]INTERNAL MEDICINE, UTHSCSA, San Antonio, TX; [3]Department of Medicine, The University of Texas Health Science Center at San Antonio, San Antonio, TX; [4]University of Texas Health Science Center San Antonio, San Antonio, TX. (Control ID #3390797)

LEARNING OBJECTIVE #1: Distinguishing TTP and HELLP syndrome in pregnancy

CASE: A healthy 27-year-old woman, G1P0 presented at 29 weeks gestation with complaints of three days of headaches, intermittent confusion, blurry vision, vomiting, shortness of breath with hypertension and petechial rash on extremities. Labs showed hemoglobin of 5.9 g/dL, platelets 11,000 K/mcL, schistocytes on peripheral smear, Cr 2.2, AST 83, ALT 35, T bilirubin 2.7, LDH 1670 U/L, undetectable haptoglobin, urinalysis +3 proteinuria, negative direct Coombs test and coagulation panel. She was started on treatment for Thrombotic Thrombocytopenic Purpura (TTP) and HELLP (Hemolysis, Elevated Liver enzymes, Low Platelets) with FFP, corticosteroids, RBC transfusions, magnesium for seizure prophylaxis and daily plasma exchange (PLEX). On day 4 of admission, she underwent a successful emergent C-section for worsening HELLP. ADAMTS 13 activity level resulted after delivery at less than 5 % without detection of ADAMTS13 inhibitor which confirmed TTP. Postpartum course was notable for improving transaminitis with two relapses of TTP on day 10 and day 25, treated successfully with PLEX. She declined Rituximab due to concerns for adverse effects, discharged home on low dose aspirin

IMPACT/DISCUSSION: Thrombotic microangiopathies (TMA) include but are not limited to TTP (hereditary:10% and acquired:90%) and HELLP. Up to 5% of thrombocytopenia in pregnancy is related to TTP and the prevalence of HELLP syndrome is about 1%. Both conditions are triggered by pregnancy and present with microangiopathic hemolytic anemia and thrombocytopenia. The diagnosis of HELLP requires elevated liver enzymes whereas the diagnosis of TTP requires ADAMTS13 activity less than 10%. The case we described fulfills the criteria for both conditions. Very high transaminases are very unusual in TTP. The patient scored 7/7 on the Plasmic score, which is a recently validated tool used to support the diagnosis of TTP in TMAs and initiation of PLEX. ADAMTS13 activity is usually delayed; therefore platelet transfusions should be thoughtfully discussed as transfusions can worsen disease course. Despite PLEX, the patient had continued elevation of liver enzymes, which improved after delivery. This finding further supports the co- occurrence of both conditions. Up to 66% of women who have their first episode of TTP during pregnancy are diagnosed with late-onset hereditary TTP. Although genetic studies are missing the absence of an inhibitor and the initial presentation during pregnancy support the diagnosis of hereditary TTP. If TTP and HELLP are suspected, clinicians should have a low threshold to initiate PLEX for treatment of TTP as well as emergent C-section for HELLP based on clinical grounds

CONCLUSION: Hospitalists are often confronted with the management of medical conditions in pregnant women. TTP and HELLP are rare conditions, making an accurate and timely diagnosis is of utmost importance to ensure better feto-maternal outcomes and appropriate subspecialty follow up.

THYROID INDUCED REVERSIBLE CARDIOMYOPATHY

Zunair Mushtaq[1]; Aazib Khan[2]; Zoraiz Mushtaq[3]; Aisha Kanwal[4]; Faraz Fiazuddin[1]. [1]Internal Medicine, University of Texas Health Science Center - San Antonio, San Antonio, TX; [2]Cardiology, UTHSCSA, San Antonio, TX; [3]Medicine, King Edward Medical University, San Antonio, TX; [4]Allama Iqbal Medical College, Lahore, Pakistan. (Control ID #3341578)

LEARNING OBJECTIVE #1: Assessing the Thyroid function in patients with signs of heart failure to rule out a potentially reversible cause of cardiomyopathy.

LEARNING OBJECTIVE #2: Recognizing symptoms concerning for a late-onset Sheehan Syndrome in females with a remote history of postpartum hemorrhage.

CASE: A 39-year-old female presented with acute shortness of breath and severe dyspnea on exertion. She endorsed fatigue, weakness, cold intolerance and feeling unwell in general for 1-2 weeks. She was hypotensive (80s/60s) and her physical exam showed a raised JVD, B/L crackles on auscultation and lower extremity edema. Labs revealed critically low thyroid hormone levels (Free T4: 0.2), low blood glucose of 34, Hemoglobin of 7.4 with normal MCV and an elevated ferritin at 691. She had a past medical history of Stage 2 Cervical Cancer (now in remission) treated with chemoradiation (Cisplatin) 3 years ago. She was lost to follow up after that and was currently not on any medications. TTE revealed a severely depressed Ejection Fraction of less than 10% showing akinesis of lateral and inferior walls with hypokinesis of the remaining and dilated left ventricle. Patient denied any chest pain and had no risk factors for ischemic heart disease. Her constellation of symptoms prompted a STIM test which revealed a suboptimal cortisol response (cortisol level: 2.8 at 60 minutes) leading to a diagnosis of adrenal insufficiency. She had no prior history of steroid use. Endocrinology recommended a Pituitary MRI which showed Pituitary atrophy consistent with Sheehan Syndrome. Patient's last pregnancy was 17 years ago, which of note was complicated by severe postpartum hemorrhage. Patient was diagnosed with a late-onset Sheehan Syndrome. Her overt heart failure/DCM was attributed to undiagnosed chronic hypothyroidism leading to a stark decline in her cardiac function and decision was made not to pursue an ischemic workup. Patient was managed with corticosteroids, thyroid hormone supplementation and diuretics with significant improvement in her symptoms prior to being transferred to a nursing home for further care.

IMPACT/DISCUSSION: Hypothyroidism is the most common hormone deficiency in the U.S. population with a prevalence of over 13%. There has been emerging evidence of association of chronic hypothyroid state with the development of DCM and subsequent heart failure. Hypothyroidism can produce clinical phenotype of heart failure from a number of diverse mechanisms including changes at genetic and molecular levels resulting in impaired cardiac muscle relaxation, decreased heart rate and reduced stroke volume, ultimately leading to heart failure.

CONCLUSION: DCM is usually idiopathic disease with progressive and irreversible poor prognosis outcome. In contrast, in some cases, DCM can be secondary to various causes such as hypothyroidism and hormonal treatment with L thyroxin can significantly improve myocardial function. Hence, thyroid function tests should be systematically performed in all patients with DCM in order to rule out hypothyroidism.

THYROID STORM WITH MILD BIOCHEMICAL HYPERTHYROIDISM: A MIMICKER OF SEPTIC SHOCK

Samantha M. Siskind[1]; Tara Bylsma[1]; Katherine L. Modzelewski[2]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Endocrinology, Diabetes and Nutrition, Boston Medical Center, Boston, MA. (Control ID #3390723)

LEARNING OBJECTIVE #1: Recognize signs and symptoms of thyroid storm that often mimic other pathologies in critically ill patients

LEARNING OBJECTIVE #2: Identify thyroid storm as a clinical diagnosis that may occur despite only mild abnormalities in thyroid hormone levels and utilize clinical tools to aid in diagnosis

CASE: A 30-year-old woman with type 1 diabetes mellitus presented to the emergency department after being found unresponsive at home. She was febrile, tachycardic, hypotensive, and tachypneic on arrival. Labs showed blood glucose 567 mg/dL, pH <7.00, HCO3 <5 mmol/L, WBC 26.1 K/UL, and 4+ ketonuria. The patient was intubated and started on intravenous fluid, vasopressors, an insulin infusion, and broad-spectrum antibiotics. She was admitted for diabetic ketoacidosis (DKA) and presumed septic shock.

Later that day, the patient's TSH resulted <0.01 mIU/mL. T3 and free T4 were only mildly elevated at 186 ng/dL and 1.93 ng/dL respectively, but her Burch-Wartofsky score was calculated to be 75, highly suspicious for thyroid storm. Stress-dose steroids, beta blockade, and methimazole were initiated and the patient improved. Infectious work up was ultimately negative and antibiotics were discontinued. Once extubated, the patient reported a history of Graves' disease, further supporting the diagnosis of thyroid storm.

IMPACT/DISCUSSION: Thyroid storm is a clinical diagnosis based on a constellation of severe and life- threatening symptoms in patients with biochemical hyperthyroidism. This patient presented with signs and symptoms suggestive of septic shock, but infectious workup was negative. She was ultimately diagnosed with thyroid storm, likely precipitated by DKA.

Thyroid storm can be challenging to diagnose, as it is rare and its signs and symptoms (e.g. fever, tachycardia, volume overload, CNS dysfunction) mimic common pathologies including sepsis, heart failure, and meningitis. While thyroid function tests help make the diagnosis and should be measured if there is suspicion for thyroid storm, the degree of

hyperthyroidism does not correlate with the illness severity and is not a diagnostic criterion. This patient had only mild elevation of T3 and free T4 despite critical illness.

There are no universally accepted diagnostic criteria for thyroid storm, but the Burch-Wartofsky and Akamizu scoring systems are often used in diagnosis. Both use clinical signs and symptoms to stratify patients by degree of suspicion for thyroid storm. While alternative diagnoses should be considered, clinicians must consider thyroid storm in patients with abnormal thyroid function and critical illness, as a missed or delayed diagnosis can result in multiorgan failure and death.

CONCLUSION: Thyroid storm can be challenging to diagnose, as it can mimic other pathologies. Its morbidity and mortality may be compounded by delayed diagnosis. Clinicians should maintain a high index of suspicion in critically ill patients with abnormal thyroid function. The Burch-Wartofsky and Akamizu scoring systems can aid in its diagnosis.

TIME WILL TELL: ACUTE ARTHRITIS DIAGNOSED TEN MONTHS FOLLOWING PRESENTATION

Carrie Stallings[2]; Michele McAmis[1]. [1]Dept. of Internal Medicine/Pediatrics, University of Tennessee Health Science Center, Memphis, TN; [2]Hospice & Palliative Medicine, University of Tennessee Health Science Center, Memphis, TN. (Control ID #3390822)

LEARNING OBJECTIVE #1: Assess for systemic manifestations of sarcoidosis with cutaneous lesions.

LEARNING OBJECTIVE #2: Recognize the need for continued follow-up after symptom resolution with uncertain underlying diagnosis.

CASE: A 29 year-old obese, otherwise healthy Caucasian woman presented with acute onset bilateral knee, ankle, elbow, and hip pain with concurrent eruption of skin lesions on the lower extremities and forearms.

Review of systems noted fever and chills; bilateral heel pain; and facial flushing. Affected joints had full range of motion without effusion. Punch biopsy confirmed panniculitis consistent with erythema nodosum. Laboratory studies noted markedly elevated C-reactive protein, microcytic anemia, and normal white blood cell count and differential with negative antistreptolysin O and antinuclear antibody titers. Chest X-ray showed no hilar adenopathy or lesions. A working diagnosis of idiopathic erythema nodosum was made in the absence of additional symptoms. Joint pain resolved within four weeks. Ten months following initial presentation, a cutaneous biopsy revealed granulomatous dermatitis, sarcoidal type. She remained asymptomatic. Repeat chest X-ray, pulmonary function testing, echocardiogram, and Holter monitor were within normal limits. High-resolution CT scan of the chest revealed hilar adenopathy and diffuse micronodules consistent with pulmonary sarcoidosis.

IMPACT/DISCUSSION: Sarcoidosis is a multisystem granulomatous disorder with diverse presentations. Up to 50% of patients are asymptomatic at diagnosis. Cutaneous manifestations affect approximately 25% of patients and include both specific (granulomatous) and nonspecific findings such as erythema nodosum, Sweet syndrome, and calcinosis cutis. In patients presenting with cutaneous sarcoidosis, the risk for involvement of other organs is unknown but estimated at 30-85%. Evaluation for systemic disease begins with history and physical exam and includes metabolic profile, blood counts, urinalysis, chest imaging, pulmonary function testing, electrocardiogram, and ophthalmologic exam. Transthoracic echocardiogram and Holter monitoring may also be considered. Lofgren syndrome is typically defined as erythema nodosum, acute polyarthritis, and hilar adenopathy and has a 95% specificity for sarcoidosis. This patient's presentation likely represents Lofgren syndrome with adenopathy not evident on chest X-ray but visible on high- resolution CT. The patient will be followed by the sarcoidosis clinic for continued surveillance. This case emphasizes the need for continued follow-up for patients with unclear etiology of symptoms and the importance of thorough history and physical exam.

CONCLUSION: Sarcoidosis can have a variety of presentations and should be considered in the differential diagnosis of acute arthritis. Patients presenting with cutaneous sarcoidosis are at risk for systemic illness and warrant evaluation for involvement of other organs. Any patient with unexplained symptoms should be followed closely even if symptoms resolve.

TKI-RELATED CARDIOTOXICITY: A HEARTTHROB

Anuj Mehta[1]; Brent Dembo[2]; Ryan Wilson[2]. [1]Penn State College of Medicine, Milton Hershey Medical Center, Allentown, PA; [2]Cardiology, Milton Hershey Medical Center, Hershey, PA. (Control ID #3391972)

LEARNING OBJECTIVE #1: Recognize Tyrosine Kinase Inhibitor (TKI) related cardiac toxicity

LEARNING OBJECTIVE #2: Understand the workup for patient on TKI presenting with chest pain

CASE: 33-year-old female, with PMH of Ph+ chronic myelogenous leukemia on Dasatinib, presents to the ED with acute chest pain. Pain began at rest while supine and worsened with movement, inspiration, and exertion. Previously she had been feeling well with no viral prodrome.

Upon arrival, patient's vital signs were stable and she was administered Aspirin 325mg and Nitroglycerin 0.4mg with no relief. All parts of her physical exam were within normal limits. Lab work was drawn showing elevated D-dimer troponin ESR and CRP. CT showed no signs of PE. ECG showed sinus tachycardia, minor diffuse ST elevations in the inferior and lateral leads. Her symptoms self-resolved 2 hours after presentation. The patient's troponins were trended showing a progressive rise and fall. TTE was performed showing no abnormalities with EF of 60%. Given rising troponin levels patient underwent cardiac catherization which showed no evidence of occlusion. Given the presentation and diffuse ST segment changes on ECG she was diagnosed with myopericarditis. She was started on guideline directed therapy for pericarditis with Ibuprofen 800mg TID and Colchicine 0.6mg BID with resolution of her symptoms and improvement in her lab work on outpatient follow.

IMPACT/DISCUSSION: Dasatinib is a tyrosine kinase inhibitor (TKI) approved for use in Ph+ CML. Although effective in the treatment of CML, there are known associations between TKI and cardiotoxicity, but there is little data characterizing this relationship. A 2019 study showed TKI therapy to significantly increase cardiovascular related mortality compared to general population.

Based on the presentation in our case of positional pleuritic chest discomfort, diffuse ST segment changes, increased inflammatory markers, and positive troponins the diagnosis of myopericarditis was made. Given no other preceding illnesses or other potential etiologies for this young patient to develop myopericarditis, our assumption would be this is secondary to Desatinib. To our knowledge, this is the first reported study showing acute myopericarditis secondary to Dasatinib therapy.

Although it appears to be a rare, it is important to recognize myopericarditis as a potential complication of someone presenting with chest pain while receiving TKI therapy. Due to its rare presentation, a high index of suspicion, along with appropriate testing, should be utilized in the workup. T2 weighted cardiac MRI or endomyocardial biopsy can also be used to confirm the diagnosis of myocardial inflammation.

CONCLUSION: In Summary, patients on chronic TKI therapy presenting with acute onset chest pain with elevated troponin markers should be worked up for ACS. Furthermore, there should be suspicion for TKI related myopericarditis.

TO BE SEEN BUT NOT EXAMINED: A CASE OF "GASTROENTERITIS" IN A HALLWAY BED PATIENT

Xiaohui Wang. Medicine, NewYork-Presbyterian Weill Cornell Medical Center., New York City, KY. (Control ID #3391806)

LEARNING OBJECTIVE #1: To recognize the importance of a thorough physical exam including sensitive areas when clinically relevant

LEARNING OBJECTIVE #2: To illustrate how the lack of privacy in a hallway bed can impact patient care

CASE: 53 year-old man with no past medical history presented to the office with fevers, abdominal pain, diarrhea and the onset of a rash. He had been in his usual state of health until 5 days ago but developed GI symptoms and fever after eating at a seafood buffet. On day 4 of symptoms, a rash developed on his buttock, so he sought care in the emergency room. There, he was triaged to a hallway bed. Initial labs and abdominal ultrasound in the ER were overall unremarkable, except for new hematuria. Given that the patient had minimal symptoms, further exam and evaluation for presumed renal stones were deferred to the outpatient setting and the patient was discharged.

He presented to our office the day after discharge from the ER. Pt reported resolution of fever and diarrhea but persistence of rash.

Medication: none

Physical Exam: abdomen soft and non-tender. Large round purpura on bilateral gluteal cheeks with several

Overlying flaccid vesicles.

Labs:

BMP/CBC normal

UA 2-5 RBC, trace protein

IgA 787 (70-400)

Based on his clinical presentation, he was diagnosed with henoch-schönlein purpura (HSP).

IMPACT/DISCUSSION: HSP is a clinical diagnosis characterized by lower extremity purpura or petechiae in the presence of one of the following: abdominal pain, histopathology, arthralgia, or renal involvement. This patient had palpable purpura with abdominal pain and new hematuria and proteinuria. His elevated IgA level is found in 70% of HSP cases. The fact that this patient's buttock rash was not appreciated on the ER exam may have changed the framing of his presentation and thus lead to a missed diagnosis. The finding of the purpura was the linchpin for the diagnosis of HSP, therefore the skin exam was essential in his case.

The patient's triage to a hallway bed, with its inherent lack of privacy, likely contributed to the incomplete physical exam. Either the medical team, or the patient, or both may have felt uncomfortable. In a cross- sectional survey of 409 emergency physicians regarding their patient encounters in the hallway setting, 78% endorsed deviation from standard history-taking, 90% endorsed alteration in their standard physical exam. Moreover, clinicians who had more frequent patient encounters in the hallway were more likely to report delays or diagnostic-error related to altered history-taking (OR 2.34, 95% CI 1.33-4.11). Unsurprisingly, the most common organ system linked to a delayed or diagnostic error was the genitourinary system.

CONCLUSION: One should recognize that the mere assignment of a patient to a hallway bed can consciously or unconsciously create barriers to optimal care. Therefore, vigilance and effort should be taken to interview and examine the patient privately when relevant.

TOO HIGH, TOO LONG

Amitha Avasarala[1]; Rahul R. Bollam[2]. [1]Internal Medicine, UPMC Mercy, Pittsburgh, PA; [2]Department of Internal Medicine, UPMC Mercy, Pittsburgh, PA. (Control ID #3387807)

LEARNING OBJECTIVE #1: Recognize the importance and lack of screening for hypertension in otherwise young healthy individuals.

CASE: A 40-year-old Asian male with no known past medical history presented to the emergency department complaining of a severe headache, progressive over 3 days resulting in loss of consciousness. He was hypertensive (BP 230/120mm Hg) and tachycardic (HR 120) on presentation. Initial neuroimaging showed diffuse white matter disease and microhemorrhages. He was also found to have left ventricular hypertrophy on EKG and elevated creatinine. He was admitted to the ICU for strict blood pressure control, where he was subsequently intubated due to neurological decompensation with worsening mental status. Further imaging was revealing for a left-sided intraparenchymal hemorrhage. ECHO showed biatrial enlargement and severe left ventricular wall thickening. Over the course of three days, the patient progressed to anuric renal failure requiring hemodialysis. Secondary workup for hypertension including plasma aldosterone and renin, metanephrines and duplex renal ultrasound was unrevealing. The serologic workup for vasculitis was also unyielding. Ten days after the initial presentation his mental status improved and the patient was extubated. His neurological exam at that time was notable for slow, dysarthric speech and confusion. He was subsequently transferred to inpatient rehabilitation for further care.

IMPACT/DISCUSSION: Undiagnosed hypertension resulted in devastating sequelae in the above- mentioned patient, who had not been to a physician's office in over twenty years. Hypertension has a prevalence of 7.3 % in persons aged 18 to 39 years. The USPSTF recommends ambulatory blood pressure monitoring every three to five years in adults aged 18 to 39 years with no risk factors. For a young healthy individual, who is part of the general workforce, a pre-employment physical or insurance incentives may be one of the few opportunities for monitoring of high blood pressure. Hypertension screening is a ubiquitous, essentially harmless and inexpensive answer to an insidious malady.

CONCLUSION: There is a large gap in blood pressure screening amongst young healthy individuals. Patients will often have an initial presentation with irreversible hypertensive stigmata. Universalizing blood pressure monitoring can be a powerful weapon in our armamentarium to combat this very common but potentially catastrophic condition.

TOO HIGH TO HEAD HOME? DISPOSITION OF A PATIENT WITH A BLOOD PRESSURE OF 200/100 IN PRIMARY CARE CLINIC

Iniya Rajendran[1]; Emily Jones[1]; Julie Crosson[2]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Boston University School of Medicine, Boston, MA. (Control ID #3391678)

LEARNING OBJECTIVE #1: Recognize that patients with acute severe hypertension do not always need emergency department assessment and hospitalization

LEARNING OBJECTIVE #2: Manage acute severe hypertension in the outpatient setting in patients with chronic hypertension

CASE: Mrs. C is a 76-year-old female who presented to her primary care provider (PCP) for a physical examination. Her past medical history is notable for hypertension, type 2 diabetes, hyperlipidemia, stage III CKD and hyperparathyroidism. Her initial blood pressure reading was 200/100. She felt well and had no complaints; she denied headache, visual disturbances, chest pain, shortness of breath or leg swelling. Of note, her

antihypertensive regimen included lisinopril 40mg and atenolol 25mg, and she reported not taking these prior to this appointment. Physical examination including fundoscopy was unremarkable. On repeat manual check, her blood pressure was 202/108 and the PCP deliberated if this patient should be evaluated in the emergency department for hypertensive urgency and blood pressure reduction.

IMPACT/DISCUSSION: Acute severe hypertension is a common condition seen by PCPs and accounts for an estimated 4.6% of emergency department visits. Although this condition, if left untreated, has long term implications such as cerebrovascular and cardiovascular mortality, it is not associated with negative short- term outcomes. Studies comparing disposition to either home versus hospital have shown that rates of adverse cardiovascular events in both groups were low with no significant differences up to six months. As in this patient, most patients presenting with this condition have a known diagnosis of hypertension, with non- adherence being a common precipitant along with excessive salt intake, drugs such as cocaine or NSAIDs, and anxiety. Patients with mild symptoms such as headache, dyspnea, atypical chest pain or epistaxis may be treated with short acting antihypertensive agents such as clonidine or labetalol in the outpatient setting. Non- adherent patients, such as Mrs. C, should resume home medications and return for close follow-up. Adherent patients presenting like this may have their anti-hypertensive treatment adjusted or be provided with an ambulatory BP monitor.

As this patient was asymptomatic with a normal examination and a likely precipitating factor, she was advised to return home and take her medications. To the PCP's relief, she called the clinic a few hours later with a BP measurement of 162/94. She returned to clinic the following day (having taken her medications) and her BP was 136/84.

CONCLUSION: Asymptomatic or mildly symptomatic acute severe hypertension may be safely treated in the outpatient setting. Despite the lack of evidence for immediate blood pressure lowering, outpatient providers are hesitant to send patients home with acute severe hypertension and we hope that this case encourages PCPs to help patients avoid potentially unnecessary and expensive trips to the hospital.

TOO MUCH OF A GOOD THING: HYPERVITAMINOSIS D-MEDIATED HYPERCALCEMIA

Laura Linville, Bhargava Chitti, Jillian S. Catalanotti. Division of General Internal Medicine, The George Washington University, Washington, DC. (Control ID #3392570)

LEARNING OBJECTIVE #1: Recognize the risks of hypervitaminosis-D particularly among patients with underlying primary hyperparathyroidism

CASE: A 90-year-old woman with history of inflammatory bowel disease, stage 3B chronic kidney disease and hypothyroidism presented with worsening weakness, nausea, confusion and constipation for months. In addition to levothyroxine, oral budesonide and zolpidem, she had been taking a commercial liquid formulation of vitamin D3 for one year. Each drop contained 1400 International Units (IU) of vitamin D3 and the patient took approximately 10 drops (14,000 IU) PO daily. Her physical exam was notable for mild confusion. Laboratory investigation revealed creatinine of 1.9 mg/dL (baseline1.4 mg/dL), potassium of 5.7 mmol/L, calcium of 12.8 mg/dL, phosphorus of 3.8 mg/dL, 25-OH-Vitamin D >126 ng/mL, parathyroid hormone (PTH) of 16.1 pg/mL, albumin of 4.2 mg/dL and TSH of 2.12 micro-international units/mL. She was treated with sodium chloride 0.9% fluid intravenously at 200 mL/hour, furosemide 20 mg IV once for mild hypervolemia, and calcitonin 4 mcg/kg SQ once. Her serum calcium returned to normal range after 24 hours, and her confusion, nausea and constipation improved. Upon discharge, her serum calcium was 8.7 mg/dL (corrected to 9.5 mg/dL) with a creatinine of 1.2 mg/dL. She was discharged with instructions to stop all vitamin supplementation.

IMPACT/DISCUSSION: This case of vitamin D-related hypercalcemia is particularly unique due to the patient's inappropriately normal PTH and phosphorus levels. Vitamin D is commercially available in widely variable and unregulated dosages. The adverse effects of supplemental vitamin D are often minimized because toxicity is rare. Consumption of very high levels of exogenous vitamin D has been shown to cause hypercalcemia by increasing intestinal absorption and bone mobilization of calcium. The increase use of Vitamin D supplementation may correspondingly increase the prevalence of vitamin D-mediated hypercalcemia, especially among patients with underlying parathyroid dysfunction. Typically, vitamin D-mediated hypercalcemia is PTH-independent, resulting in suppressed serum PTH and hyperphosphatemia. The patient's unsuppressed PTH and normal phosphate level suggest that she had primary hyperparathyroidism in addition to hypervitaminosis D causing hypercalcemia. A similar case has been published in the literature (Bala et al.) of a woman with iatrogenic hypervitaminosis D and an elevated PTH of 1464.9 pg/mL due to a parathyroid adenoma. For this patient, it is likely that undiagnosed primary hyperparathyroidism caused subclinical elevation of her serum calcium, which was exacerbated and finally unmasked by her excessive Vitamin D supplementation.

CONCLUSION: This case highlights potential risks of exogenous vitamin D supplementation. Among patients with primary hyperparathyroidism, vitamin D deficiency is protective against hypercalcemia while it may increase the baseline risk for developing hypervitaminosis D with high-dose supplementation.

TOO MUCH SUGAR CAN MAKE ONE DANCE – CHOREA HYPERGLYCEMIA BASAL GANGLIA SYNDROME

Gregory W. Malzberg[1]; Andrew Hartz[2]; Eonjung Kim[2]; Svetlana Chernyavsky[3]. [1]Psychiatry, Mt Sinai Beth Israel, New York City, NY; [2]Medicine, Mt Sinai Beth Israel, New York City, NY; [3]Medicine, Beth Israel Medical Center, New York, NY. (Control ID #3351785)

LEARNING OBJECTIVE #1: Diagnose Chorea Hyperglycemia Basal Ganglia Syndrome as a complication of uncontrolled diabetes

LEARNING OBJECTIVE #2: Recognize that acute MRI findings may not be reliable in C-H-BG patients with chronic basal ganglia infarcts

CASE: A 79-year-old male with type 2 diabetes mellitus presented after being found down by a neighbor. Patient reported generalized fatigue. On exam, he was not alert or oriented, but otherwise had a non-focal neurological exam. Glucose was 742 mg/dL, bicarb 15 mmol/L, anion gap 22.8 mmol/L, and beta- hydroxybutyrate 3.92 mmol/L. CT head was negative for acute findings, but notable for chronic infarcts at multiple lobes including bilateral basal ganglia. He was admitted on an insulin drip for DKA/HHS. HbA1c was 14.3%. On day 2, the patient's mental status improved, glucose level was 300 mg/dL, anion gap resolved, and he was transitioned to injectable insulin. On day 3, he developed high amplitude, non-rhythmic, asymmetric chorea/ballismus movements in bilateral upper and lower extremities. He was alert and aware during these bursts of involuntary movements, and expressed distress that the movements were not suppressible. MRI brain showed the previously known chronic lacunar infarcts in the basal ganglia and no acute changes. EEG was negative for seizure activity. Chorea Hyperglycemia Basal Ganglia Syndrome (C-H-BG) was suspected. With optimization of the patient's glycemia with insulin, he had complete resolution of his chorea within 2 days.

IMPACT/DISCUSSION: Uncontrolled diabetes can lead to a myriad of neurological disorders, including hyperglycemia-induced involuntary movement (HIIM). C-H-BG syndrome is a manifestation of HIIM. Proposed mechanisms of basal ganglia dysfunction in hyperglycemic and

hyperosmolar states include the shift to the anaerobic pathway in cellular metabolism resulting in the depletion of GABA, and hyperviscosity in the vasculature leading to disruptions at the blood-brain barrier.

C-H-BG syndrome has characteristic MRI findings of T1 hyperintensity in the basal ganglia. Given that our patient had chronic basal ganglia infarcts and negative acute MRI findings, the metabolic/vascular changes of hyperglycemia likely presented a second hit to the basal ganglia, explaining the uncommon presentation.

Treatment of C-H-BG syndrome consists of managing the hyperglycemia with insulin, with the addition of dopamine antagonists for symptomatic relief. In our patient the chorea completely resolved with hyperglycemic control.

CONCLUSION: Though differential causes of chorea are wide, the quick resolution of chorea with the optimization of blood glucose highlights the importance of considering metabolic causes of new, sudden onset chorea in a diabetic. T1 hyperintensities in basal ganglia are characteristic imaging findings in C-H-BG, but the absence of acute imaging findings does not exclude the diagnosis. Chorea is an uncommon manifestation of a common medical condition and early identification can reduce morbidity and unnecessary medical testing.

TO PE OR NOT TO PE: EXTENSIVE TUMOR THROMBUS MIMICKING PULMONARY EMBOLISM IN A PATIENT WITH A RENAL MASS

Jackson Clark, Katie Olsen. Internal Medicine, Baystate Medical Center, Springfield, MA. (Control ID #3391780)

LEARNING OBJECTIVE #1: Recognize the prevalence of tumor thrombus in renal cell carcinoma

LEARNING OBJECTIVE #2: Identify the need for a multidisciplinary approach in treating extensive tumor thrombus

CASE: An 82-year-old male with a past medical history significant for a known renal mass, coronary artery disease, chronic kidney disease stage IV, atrial fibrillation on apixaban, and heart failure with preserved ejection fraction who presented to the emergency room with a 2-week history of "lung pain," shortness of breath, and a non-productive cough. His pain was both positional and pleuritic. He was treated as an outpatient with a prednisone taper and an increase in his home diuretic, which did not improve his symptoms, so he presented to the hospital. Initial workup was significant for an acute kidney injury. He was noted to have left lower extremity swelling, and a Doppler showed a saphenous vein thrombosis close to the femoral vein, for which he was started on a heparin drip. There was still concern for pulmonary embolism given his symptoms. A CT angiogram of his chest was deferred given his renal function, and his chest x-ray showed pulmonary edema, precluding him from undergoing a ventilation perfusion (V-Q) scan; he ultimately underwent transthoracic echocardiogram that showed a dilated right atrium and a large (8.1 cm x 2.8 cm) mass in the right atrium, arising from the inferior vena cava (IVC), consistent with a large thrombus. The patient was subsequently transferred to an outside institution for possible vacuum extraction of this thrombus. Imaging done at the outside institution demonstrated a right renal mass with associated thrombus extending from the renal mass to the right renal vein into the IVC and right atrium. The surgical team evaluated the patient, but he declined any surgical intervention and instead was discharged home on palliative immunotherapy for his presumed renal cell carcinoma.

IMPACT/DISCUSSION: This case highlights the prevalence of tumor thrombus in certain cancers, particularly renal cell carcinoma (RCC), as well as the poor prognosis of untreated RCC with tumor thrombus; this patient had a known renal mass that was not worked up beyond serial imaging as a result of his poor surgical candidacy. Tumor thrombus can be present in RCC into the renal vein in up to 10% of cases, though less than 1% of cases extend to the right heart chambers. The definitive treatment of tumor thrombus in renal cell carcinoma is surgical with or without chemotherapy and immunotherapy, and the management of these patients involves a multidisciplinary approach. An additional point from this case include the challenge of diagnosing pulmonary embolism when there are contraindications to imaging modalities such as CT angiography or V-Q scanning.

CONCLUSION: Tumor thrombus is a relatively common complication of renal cell carcinoma and should be considered in patients presenting with signs of vascular involvement. The mainstay of treatment is surgical. If untreated, this locally advanced disease has a poor prognosis.

TOPICAL WINTERGREEN ESSENTIAL OIL AS A UNIQUE CAUSE OF SALICYLATE TOXICITY

Phillip J. Gross[1,2]; Swhaeb Shubair[1]; Yusuf Alimi[1]. [1]Hospital Medicine, Northeast Georgia Medical Center, Atlanta, GA; [2]Internal Medicine, Emory, Atlanta, GA. (Control ID #3391810)

LEARNING OBJECTIVE #1: Recognize the importance of obtaining a detailed medication history including prescribed medicines, herbal medicines, and supplements

LEARNING OBJECTIVE #2: Recognize the potentially fatal complications of a commonly used herbal medicine

CASE: A 30-year-old obese Caucasian female with history of MDD and ADD presented to ED with intractable nausea and vomiting, coffee ground emesis, generalized abdominal pain, diarrhea, and tinnitus for the past day. The patient was on a boat with her children the day prior and consumed a fully cooked burger. The next morning, she awoke nauseous and started to vomit. The vomiting was constant and associated with coffee ground emesis, generalized abdominal pain, and ringing in the ears. She recollected 7-8 episodes of watery diarrhea daily for the past 2-3 months. The patient denied eating undercooked or raw foods; known sick contacts or recent travel; tobacco, alcohol, illicit drugs, or chronic NSAID use; or SI or HI. No one else on the boat became sick. In the ED, vitals were remarkable for RR 22. On physical exam, she was obese in moderate distress, actively vomiting coffee ground emesis with generalized abdominal tenderness. An ABG revealed pH 7.49 and pCO2 17.7. Labs were significant for CO2 15, anion gap 3.0, Hgb 13.4, WBC 24.0, iron saturation 6%, positive FOBT, and salicylate level 103.9. CT abdomen/pelvis showed mild wall thickening of colon suggestive of mild colitis. Two large bore IVs were placed and IV fluids, pantoprazole 40 mg BID, and Zosyn were started. Gastroenterology and nephrology services were consulted. Georgia Poison Control was contacted and recommended repeating the salicylate level and checking urine pH. Patient was admitted to ICU and started on a bicarb drip. A Vas-Cath was placed and patient underwent emergent HD. Salicylate levels down trended to less than 30 and patient was transferred to floor. Hgb down trended to 7.9 and patient was transfused 1-unit pRBCs. GI performed EGD with findings of hemorrhagic gastritis and mild duodenitis with tissue biopsies showing mild, active chronic gastritis. Further history obtained, during which patient admitted to wintergreen essential oil use. She applied the undiluted oil topically on her hands, chest, and hair daily over a 3-4-month period totaling 10 bottles containing 15-mL wintergreen essential oil each. Georgia Poison Control confirmed it the likely cause. Patient's symptoms improved and she was discharged with recommendation to avoid the essential oil in future.

IMPACT/DISCUSSION: This is to our knowledge the first case report on topical toxicity of wintergreen oil, comprised of 98% methyl salicylate (MS). One teaspoon, or 5 mL, contains 7000 mg of MS or the equivalent of 90 baby aspirin tablets. This case emphasizes the importance of a detailed medication history and the potential toxicity of a commonly used herbal medicine when used improperly. It reinforces the need for reform of the outdated 1994 DSHEA law.

CONCLUSION: Recognize the importance of an herbal medicine and supplement history

TORSEMIDE INDUCED PALISADED NEUTROPHILIC AND GRANULOMATOUS DERMATITIS

Chukwudum Ufondu[1]; Douglas Grider[2]; Allen Blackwood[1]; Michael Wiid[1]. [1]Internal Medicine, Virginia Tech Carilion, Roanoke, VA; [2]Pathology, Virginia Tech Carilion, Roanoke, VA. (Control ID #3380250)

LEARNING OBJECTIVE #1: Recognize the clinical and histological features of palisaded neutrophilic and granulomatous dermatitis

LEARNING OBJECTIVE #2: Treat palisaded neutrophilic and granulomatous dermatitis

CASE: A 77-year-old man presented to the emergency department with an exacerbation of heart failure with preserved ejection fraction while on torsemide, On examination he had nontender, scaly pink papules coalescing into plaques on his arms, legs, and torso. Antinuclear antibody, anti-double-stranded DNA, and anti-histone antibody were positive resulting in a diagnosis of drug-induced lupus, presumably from Torsemide. Punch biopsies from his arms revealed a layered pattern of granulomas with focal central necrobiosis and neutrophils surrounded by multinucleated giant cells. Colloid iron with and without digestion showed increased dermal mucin in the granulomatous inflammation, especially the areas of necrobiosis.

Acid-fast bacilli, Fite, and Gomori methenamine silver-stained tissue sections were negative for organisms. The histopathologic results supported a diagnosis of palisaded neutrophilic and granulomatous dermatitis (PNGD).

IMPACT/DISCUSSION: PNGD is a very rare dermatological disorder. Case reports are sporadic, and few case series have been published. A literature review in 2008 identified only 97 reported cases. It is associated with systemic diseases including rheumatoid arthritis, inflammatory bowel disease and SLE as in our case. It is considered an immune complex disease found along a spectrum that includes Churg-Strauss granulomas, cutaneous extravascular necrotizing granuloma, rheumatoid papules, and superficial ulcerating rheumatoid necrobiosis. PNGD clinically presents with tender erythematous violaceous papules, plaques or nodules, usually affecting the extensor surfaces. The underlying pathogenesis remains poorly understood. It is thought that T-cell dysregulation and immune complex deposition play a key role in the formation of the skin lesions. Histologically, palisading granulomas with prominent neutrophils and collagen degeneration are usually evident. Treatment is usually tailored towards treating the underlying disease, in our case, stopping the offending torsemide. Steroids, dapsone, cyclosporine, and methotrexate have been used with varying success. With appropriate treatment, recovery is usually favorable. To our knowledge, this is the first case of torsemide induced lupus resulting in PNGD.

CONCLUSION: Torsemide is a mainstay drug in the management of congestive heart failure. Internists must be vigilant for skin eruptions that arise after initiating this medication.

PNGD is found along a spectrum of diseases and treatment usually requires discontinuing the offending agent or treating the underlying disease. Occasionally, immunosuppressants are necessary to achieve resolution.

TO TEE OR NOT TO TEE? LIMITING UNNECESSARY TESTING WHILE ACHIEVING IMPROVED PATIENT CARE OUTCOMES

Jon A. Torres[1]; Sneha Shah[2]. [1]School of Medicine, University of Colorado, Aurora, CO; [2]Department of Medicine, University of Colorado Hospital, Aurora, CO. (Control ID #3392491)

LEARNING OBJECTIVE #1: Recognize when tests or treatments will not affect clinical management and limit wasteful spending to achieve better patient outcomes.

LEARNING OBJECTIVE #2: Assess the value of invasive and expensive testing to the patient and treatment team.

CASE: An 86-year-old male with history of mitral valve replacement due to mitral valve prolapse and a non- MRI compatible permanent pacemaker implanted more than a decade ago presented to the emergency department with hypotension, weakness and fever. Physical exam revealed a holosystolic crescendo- decrescendo murmur loudest at the left-lower sternal border, and abdominal distention without tenderness to palpation, rebound, or guarding. Blood cultures quickly revealed sepsis due to *Enterococcus Faecalis* bacteremia. The patient was empirically treated with Vancomycin + Ceftriaxone. The difficulty in this case arose in the search for a source of patient's bacteremia. Cultures were again positive at 48 hours but revealed sensitivity to Ampicillin so therapy was narrowed to Ampicillin + Ceftriaxone. A transthoracic echocardiogram (TTE) demonstrated no obvious evidence of endocarditis. As cultures continued to remain positive at 96 hours, we needed to decide whether to pursue advanced and risky procedures like a trans- esophageal echocardiogram (TEE) or a pacemaker removal and lead culture. The patient was not a surgical candidate as the pacemaker would be difficult to remove given the number of years it had been in place in addition to his age and other comorbidities not aforementioned. At this point, we asked ourselves: if we are presuming endocarditis and/or pacemaker infection and patient would get lengthy antibiotic therapy nonetheless, were we practicing high value care to find one definitive source? If the TEE were negative, would we not treat for 6-weeks? Ultimately, in a multidisciplinary approach with infectious disease and cardiology, we determined that the highest value for patient was an empiric 6-week course of antibiotics with infectious disease follow up. Fortunately, cultures remained negative after the 6-day mark. At this point, with the patient improving on antibiotics, no more procedures were performed, and he was discharged from the hospital, with a 6-week course of intravenous antibiotics and appropriate follow-up.

IMPACT/DISCUSSION: In recent years, there has been a focus on eliminating waste in our healthcare system and providing high value care.[1] This case illustrates this challenge as although the patient had various plausible alternative sources of infection, appropriate restraint must be shown in ordering more expensive, invasive, and risky imaging or procedures – *especially* when they would not change management.

CONCLUSION: Cases of endocarditis are frequent. In this case, as in many others, a TEE may not always be necessary nor therapy-altering.

TOXOPLASMIC ENCEPHALITIS (TE)— ROLE OF EARLY EMPIRICAL TREATMENT IN DIAGNOSIS

Yiyun shi[1]; Amy Mathew[3]; Katrina Byrd[2]; Cheston Cunha[2]. [1]internal medicine, rhode island hospital, Providence, RI; [2]infectious disease, r'hode island hospital, Providence, RI; [3]Internal Medicine, Brown University, Providence, RI. (Control ID #3391995)

LEARNING OBJECTIVE #1: Recognition of opportunistic brain infections in patients with human immunodeficiency virus (HIV)

LEARNING OBJECTIVE #2: Therapeutic and diagnostic role of early empirical treatment for TE

CASE: A 29-year-old female with HIV, off antiretroviral treatment (ART), (CD4 count 63/microliter; HIV viral load 37482 copies/mL) presented with acute headache and confusion. Remaining exam was unremarkable. Magnetic resonance imaging (MRI) of the brain showed

13 x11 millimeter (mm) eccentric ring enhancing lesion at left temporal lobe. Lumbar puncture (LP) showed an opening pressure of 13- centimeter water column, 205/mm^3 nucleated cells with lymphocyte predominant, protein 84 milligram per deciliter (mg/dL), glucose 59 mg/dL. She was started on dexamethasone, ceftriaxone, vancomycin, ampicillin, and acyclovir as empiric therapy for meningitis/brain abscess and abacavir-dolutegravir- lamivudine for ART. After elevated serum toxoplasma Immunoglobin (Ig) G of > 900 international unit per milliliter (IU/mL) was found, treatment was changed to sulfadiazine, pyrimethamine, leucovorin. Her confusion improved significantly in 1 day. Additional workup including toxoplasma IgM, CSF culture, cytology, cryptococcal antigen, varicella and herpes polymerase chain reaction (PCR), positron emission tomography (PET), Tuberculosis QuantiFERON were all unremarkable. Follow-up MRI in 4 weeks showed the lesion decreased to 9 x 10 mm in size.

IMPACT/DISCUSSION: In general, when ring enhancing brain lesions are found, bacterial brain abscess is the most common concern. However, this case reminds us that in the HIV positive population, especially those individuals meeting acquired immunodeficiency syndrome (AIDS) criteria, Toxoplasma gondii infection should be higher on the differential and early empirical treatment is diagnostically important.

TE is the most common cause of brain mass in AIDS population followed by PCNSL in developed countries and tuberculoma in developing countries. The diagnosis is usually made presumptively, with 90% of probability in cases with CD4 count <100/microliter, positive serum anti-toxoplasma IgG, and ring enhancing lesion on imaging. 14% of TE has a solitary lesion on MRI, which would be difficult to distinguish with PCNSL, PET has very high of sensitivity and specificity for PCNSL, but may not be widely available. LP to demonstrate positive toxoplasma PCR is definitive but the sensitivity is low. On the other hand, response to appropriate antibiotic in TE is usually dramatic, with clinical improvement seen in about 3-7 days, and radiographic improvement in about 5-14 days. Thus, early empiric treatment with close follow up imaging is an important diagnostic tool when TE is suspected.

CONCLUSION: 1. Toxoplasmosis encephalitis should be on the differential for HIV/AIDS patients who present with altered mentation and focal brain lesion.

2. Treatment response is usually dramatic, which makes early empirical treatment diagnostically important.

TRANEXAMIC ACID UTILIZATION IN STEROID REFRACTORY ARB-INDUCED ANGIOEDEMA

Philip Sobash, Krishna Vedala, Gilbert-Roy B. Kamoga. Internal Medicine, White River Health System, Batesville, AR. (Control ID #3360751)

LEARNING OBJECTIVE #1: Treatment of steroid refractory angioedema

LEARNING OBJECTIVE #2: Tranexamic Acid utilization in ARB-Induced angioedema

CASE: We present the case of a 62-year-old Caucasian female with angioedema suspected to be secondary to Olmesartan use, which was relieved with tranexamic acid. Of note, this was the third time she had presented to the hospital with angioedema symptoms within in the past 6 months. Before this period, she states she had never had any angioedema like symptoms. On this hospitalization, it was noted that she was on Olmesartan for Hypertension and had been on it for many years. She had never been on an ACE-inhibitor prior to this. Her vital signs upon arrival were within normal limits, and her only initial laboratory values that were of note were leukopenia at 3.3 K/ul and hyponatremia at 134 mmol/L. A C1 esterase protein inhibitor was also ordered, to assess for possible heredity angioedema, and was slightly elevated at 42 mg/dL. Upon admission, Olmesartan was not restarted. She was started on steroids and given antihistamines with improvement in her symptoms. On second day of hospitalization she was kept for observation, with plans for discharge the next day due to her clinical improvement. That night, she developed angioedema and was treated again with IV steroids and antihistamines. Despite these IV medications, patient endorsed only stabilization but not full resolution of symptoms. It was then decided to try Tranexamic acid, as it has been reported to work for ACE- inhibitor induced angioedema. After administration, she had subsequent improvement of her symptoms but with better response than steroids and antihistamines alone.

IMPACT/DISCUSSION: ARB-induced angioedema has a significantly lower incidence than ACE-inhibitor induced. As with ACE- inhibitors, the management beyond removal of the offending agent is not clear, and there are no specific guidelines. Studies have shown that tranexamic acid may be used in emergent situations to provide treatment for these included angioedema episodes. Tranexamic acid works by blocking the activation of plasminogen to plasmin, which in turns leads to down-regulation of bradykinin which is implicated in angioedema. This case highlights Tranexamic acid use in ARB-induced angioedema not previously reported to the authors' knowledge. Given the relatively low incidence of ARB-induced angioedema, no studies have been conducted to assess any clinical utilization of treatment other than stopping the offending agent. Reports have shown use of tranexamic acid in use in idiopathic angioedema along with its potential use as a maintenance regimen for prophylaxis.

CONCLUSION: We postulate that tranexamic acid can be utilized in ARB-induced angioedema and is a viable option for angioedema resistant to steroids and antihistamines alone.

TRANSFUSION GONE WRONG: DELAYED HEMOLYTIC TRANSFUSION REACTION IN SICKLE CELL DISEASE

Jacqueline M. Visina[1]; Clare Cene-Kush[3]; Allie Dakroub[2]. [1]Internal Medicine, University of Pittsburgh School of Medicine, Pittsburgh, PA; [2]Internal Medicine/Pediatrics, University of Pittsburgh Medical Center, Pittsburgh, PA; [3]Internal Medicine, UPMC, Pittsburgh, PA. (Control ID #3387855)

LEARNING OBJECTIVE #1: Recognize the under-diagnosis of Delayed Hemolytic Transfusion Reaction (DHTR) in Sickle Cell Disease (SCD)

LEARNING OBJECTIVE #2: Consider IVIG if DHTR is suspected

CASE: 23 year old male with a history of sickle cell disease (Hgb SS) on hydroxyurea presented with worsening bilateral knee pain secondary to sickle cell crisis and received 2 units red blood cell (RBC) transfusion. He was re-admitted five days later for vaso-occlusive crisis and was found to have a hemoglobin (Hgb) of 8.0 g/dL (baseline 6-8 g/dL). Hgb subsequently down-trended to 4.5 g/dL resulting in transfer to our institution with concern for DHTR. Exam was notable for resting tachycardia, orthostatic hypotension and bilateral knee effusions. Labs showed Hgb 4.9 g/dL, white blood cell 9.1 k/uL, platelets 227 k/uL, lactate dehydrogenase 4819, total bilirubin 2.4 mg/dL, haptoglobin undetectable and reticulocyte production index (RPI) 0.9%. His blood type was O Rh positive with negative antibody screen. Direct and Indirect Coombs testing were negative. Hgb decreased to 3.5 g/dL despite intravenous fluids, dexamethasone, erythropoietin (EPO) and folic acid resulting in administration of IVIG. His Hgb and RPI then improved to 5.4 g/dL and 3.9% respectively with concomitant improvement in hemolysis labs and hemodynamics. He was discharged with instructions to consult with his hematologist prior to receiving future blood transfusions.

IMPACT/DISCUSSION: Patients with SCD are particularly susceptible to DHTR. Prevalence is likely under-reported due to a clinical

presentation which mimics sickle cell pain crisis. The mechanism of DHTR is controversial with theories including formation of alloantibodies against donor RBC, complement- mediated destruction of autologous RBC, and erythropoiesis suppression. This population undergoes numerous transfusions with resultant increased risk for alloimmunization, estimated to occur in as many as 47% of adult patients. Detection of alloantibodies is challenging as titers are often too low for pretransfusion testing. This delays recognition and treatment of a life-threatening reaction. Providers should maintain a high index of suspicion for DHTR in every SCD patient admitted for pain crisis, especially if the patient has received transfusions in the past month. Workup includes complete blood count, hemolysis labs, reticulocyte count, type and screen, and direct/indirect antiglobulin test. A negative antibody screen, as seen in this case, does not exclude diagnosis. No studies have defined optimal treatment of DHTR though case reports suggest benefit of steroids and IVIG. Our patient improved with high dose steroids, EPO, and IVIG (400mg/kg x 5 days). Strategies to prevent DHTR include judicious transfusions with extensive phenotypic matching when transfusion is vital.

CONCLUSION: 1.DHTR should remain on the differential for every SCD patient admitted for pain crisis even if antibody screen is negative

2. If DHTR is suspected, inquire about recent transfusions and treat promptly with high dose steroids, EPO, and IVIG

TRANSIENT ELEVATION OF TROPONIN IN DRUG-INDUCED RHABDOMYOLYSIS

MARIA T. GAMERO HUAMAN[1]; Asli S. Sucu[2]. [1]INTERNAL MEDICINE, MONTEFIORE MEDICAL CENTER, Bronx, NY; [2]Internal Medicine, Montefiore Medical Center, Bronx, NY. (Control ID #3390990)

LEARNING OBJECTIVE #1: Distinguish the causes of elevated troponin due to different clinical scenarios

LEARNING OBJECTIVE #2: Recognize the pathophysiology of elevated troponin in rhabdomyolysis **CASE:** A 66-year-old man with hypertension, diabetes mellitus and opioid use disorder presented with syncope after snorting heroin. He denied chest pain, shortness of breath. On admission, patient was hemodynamically stable, but found to have elevated creatinine kinase (CK= 35,609 U/L) and cTnT (0.11 ng/ml). His ECG was negative for myocardial infarction. Intravenous fluids were started with a progressive improvement of both CK and cTnT levels. This transient borderline increase in cTnT reverted to normal within 3 days after resolution of rhabdomyolysis.

IMPACT/DISCUSSION: Cardiac troponin (cTn), particularly troponin T (cTnT) and I (cTnI), are well- stablished biomarkers for diagnosing myocardial infarction (MI). However, elevated cTn is not pathognomonic for acute coronary syndrome, it can also be elevated in different non-coronary related conditions. Moreover, cTn assays are not entirely specific for myocardial injury, as it can have false-positive and negative. Hence, the correct interpretation of elevated cardiac biomarkers can be challenging, and will depend on the clinical scenario, electrocardiogram (ECG) and imaging.

MI is a term used for myocardial cell death secondary to prolonged lack of oxygen supply. Myocardial necrosis will have elevated cTn in addition to clinical symptoms, ECG changes and imaging findings of new loss of viable cardiac tissue or wall abnormalities. However, the challenge begins when abnormal levels of cardiac enzymes are found in an asymptomatic patient without ECG changes or imaging suggesting ischemia/infarction. It is important to understand that even though cTn are specific to the cardiac tissue, cTnT can be identified in embryonic skeletal muscles. Jaffe et al. found the phenomenon of cTnT elevation in 17 patients with skeletal myopathy and without cardiovascular disease. It has been suggested that exposure of TnT isoform in the regenerating muscle cell during rhabdomyolysis explain abnormal elevation of cTnT. In our case, transient elevation of troponins was found in an asymptomatic patient without cardiovascular risk factors. cTnT and CK levels peaked at the same time, suggesting a more regenerating process during the acute phase. However, experimental studies are needed to clarify this important but still controversial entity.

CONCLUSION: This case report highlights the importance of adequately interpreting an elevation of cTn considering the clinical scenario, ECG changes, and if required, other imaging. Doctors need to be particularly aware of possible false positive troponin elevation in different clinical scenarios, such as rhabdomyolysis.

TRANSVERSE PERICARDIAL SINUS HEMATOMA FROM TYPE A AORTIC DISSECTION MIMICKING ACUTE CORONARY SYNDROME: A DIAGNOSTIC CHALLENGE

Raed Qarajeh[1,2]; Kyle Lehenbauer[1,2]; Anthony Magalski[1,2]; Robert Tanenbaum[1,2]. [1]Internal Medicine Department, University of Missouri Kansas City, Kansas City, MO; [2]Saint Luke's Mid America Heart Institute, Kansas City, MO. (Control ID #3392391)

LEARNING OBJECTIVE #1: To have a high index of suspicion for aortic dissection

LEARNING OBJECTIVE #2: Diagnosis of transverse pericardial sinus hematoma can be very challenging

CASE: A 77-year-old man who underwent recent coronary artery bypass grafting (CABG) presented to the hospital with sudden-onset chest pain and dyspnea. He was hemodynamically stable. Cardiovascular examination was unremarkable.

Diagnostic studies revealed an elevated troponin value of 0.05 ng/ml that peaked at 8.83 ng/ml (normal range < 0.03), EKG with first degree heart block and non-specific ST changes in lateral leads, and chest x-ray consistent with pulmonary edema.

Patient was admitted for a presumed diagnosis of acute coronary syndrome (ACS) from graft occlusion. He received dual antiplatelet therapy (DAPT), heparin, and intravenous diuretic. He underwent coronary angiography which revealed patent left internal mammary artery (LIMA) and saphenous vein grafts (SVG). Transthoracic echocardiogram (TTE) revealed an extra cardiac structure compressing the left atrium. Patient continued to complain of dyspnea. Computed Tomography Pulmonary Angiogram (CTPA) showed no evidence of pulmonary embolism, however, there was a marked mass effect on the pulmonary trunk and right pulmonary artery, and a large ascending aortic aneurysm concerning for Stanford type A aortic dissection. Patient developed respiratory distress requiring transfer to the intensive care unit and intubation. Bedside transesophageal echocardiogram (TEE) revealed a proximal ascending aorta aneurysm and dissection. There was a defect consistent with contained aortic rupture and flow into the transverse pericardial sinus.

Hematoma was compressing the left atrium. A large hematoma in the transverse pericardial sinus was extracted in the operating room and revealed a posterior perforation of the ascending aorta that extended into the left atrium. The ascending aorta was repaired with a vascular graft. The left atrial tear was oversewn. After separating patient form bypass and instilling the heart with blood, the left atrial repair completely dehisced.

Atrial tissue was not viable enough to hold a suture. Patient had lost a significant amount of blood and, unfortunately, the patient was loaded with ticagrelor on presentation which contributed to exsanguination and was pronounced dead.

IMPACT/DISCUSSION: In our patient aortic dissection resulted in contained transverse pericardial sinus hematoma most likely due to adhesions from prior CABG surgery. Diagnosis was delayed by workup for more common causes of chest pain and dyspnea like ACS, PE and heart

failure. Hematoma was compressing the left atrium causing pulmonary edema. It was also compressing pulmonary artery causing severe dyspnea; mimicking pulmonary embolism.

CONCLUSION: Troponin can be high in conditions other than ACS. Hence, in patients with chest pain and elevated troponin, especially with refractory symptoms and normal coronaries, the index of suspicion for alternative diagnosis like aortic dissection should be high.

TREATMENT OF INFECTIVE ENDOCARDITIS ASSOCIATED WITH EXTENDED SPECTRUM BETA LACTAMASES (ESBL) PRODUCING E COLI

Umaima Dhamrah, Aisha Amin, Keely Johnson, Daria Ade, Joseph Lieber. Internal Medicine, Icahn School of Medicine at Mount Sinai - Elmhurst, Rego Park, NY. (Control ID #3373759)

LEARNING OBJECTIVE #1: Initiating empiric broad spectrum antibiotic therapy for a suspected case of Infective Endocarditis in a patient with recent prosthetic mitral valve placement and Extended Spectrum Beta Lactamases (ESBL) producing E Coli bacteremia

CASE: A 74 year old male with a recent history of Mitral Valve Replacement with a bioprosthetic valve, presented to the Emergency Room complaining of dyspnea, palpitations and chills at home for 1 day. Patient also reported noticing lower extremity edema for the past few days. On physical examination, Patient had decreased breath sounds up till middle lung zones, and 2 + pitting lower extremity edema. patient displayed no peripheral stigmata of infective endocarditis, no murmurs were appreciated. On initial labs, his white count was 18.1, with 97.9 % Neutrophils. Initial CXR with mild pulmonary congestion and mild symmetrical bilateral pleural effusions. Blood cultures collected at admission grew ESBL E. Coli. A Transthoracic and transesophageal echocardiogram showed an ejection fraction of 40 percent which was his baseline, however no signs of valve vegetation were seen. Because of a recent mitral bioprosthetic valve, we planned to treat our patient for infective endocarditis with Amikacin and a carbapenem for 6 weeks. Repeat cultures six days later showed clearance.

IMPACT/DISCUSSION: In situation in which the primary infection is not identified in either the urinary tract, or the biliary system, the primary locations in which ESBL E. Coli may be suspected to originate, we suggest that it is important to consider endocarditis as a primary source of infection in patients with a history of valvular replacement and ESBL E. Coli positive blood cultures. This case suggests that there may be a brief window in time in which medical management can be successful in full eradication of ESBL E. Coli endocarditis. As transthoracic echocardiography and transesophageal echocardiography may be inadequate for diagnosis of endocarditis with prosthetic valves, it is critical to carefully choose broad-spectrum empiric antibiotic therapy which carefully takes into consideration the antibiotic resistance of the communities in which the organism was acquired. In areas where there is high prevalence of carbapenem resistance, it may be preferable to treat primarily with aminoglycosides which have not been used in a while, in appropriate cases.

CONCLUSION: The antibiotic resistance levels present within the community must be considered when deciding on which empiric treatment may be appropriate in the treatment of ESBL E. Coli endocarditis despite negative Echocardiogram findings as to not lose the minute window of opportunity in which medical management may be possible.

TRUST, BUT ALWAYS VERIFY!

Mohamed Gabr[1]; Seth Koenig[2]. [1]Internal Medicine, Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, NY; [2]Medicine (Critical Care and Pulmonary), Montefiore Medical Center / Albert Einstein College of Medicine, Bronx, NY. (Control ID #3392131)

LEARNING OBJECTIVE #1: Recognize the role of a trusting patient-physician relationship

LEARNING OBJECTIVE #2: Acknowledge the importance of verifying information provided by patients

CASE: A 36 year-old woman with seizure disorder and schizophrenia was brought to the emergency department after being found unresponsive. Upon arrival, she was found to be lethargic with pin-point pupils. Labs revealed hypercapnia, lactic acidemia, rhabdomyolysis, and deranged liver tests. Her valproate level was sub-therapeutic. Computed tomography (CT) of the chest revealed bilateral pulmonary infiltrates. Infectious work-up was unremarkable. Patient was placed on non-invasive ventilation, and mental status improved gradually. She later reported that she may have had a seizure, as well as coughing up some blood. In addition, she reported occasionally smoking marijuana, but denied any other substance use or vaping. Urine toxicology screen returned positive for opiates, cocaine, and cannabinoids. In addition to seizure, polysubstance use was thus believed to account for the patient's presentation; hemoptysis from diffuse alveolar damage is a well-documented dangerous presentation of cocaine use, as well as hypercapnia due to opioids. All symptoms and signs improved within 24 hours. The patient was counseled regarding the importance of medication adherence, as well as abstinence from illicit drug use.

IMPACT/DISCUSSION: Communication and trust are essential components of the patient-physician relationship. Traditionally, the focus has been on patients' trust of physicians, which is necessary for shared decision-making and patient autonomy. In addition, it has been associated with positive patient experiences and higher quality of care. Nevertheless, physicians' trust of patients is also vital for more accurate and safer patient care. It is also crucial for better diagnosis, patient involvement, physician satisfaction, and building mutual trust. However, patients are not always easily forthcoming, which can be attributed to feelings of vulnerability, fear of judgment, or ineffective communication from providers that fails to establish a meaningful connection. Physicians must therefore be adept at setting the grounds for successful communication. Moreover, while they should trust information provided by patients, they must expend every effort to verify it. This includes medical history, medication adherence, living conditions, habits, as well as enlisting family and friends for collateral information. Often times, such information can prove beneficial in diagnosis or planning next steps of patient care. In this patient's case, verifying her habits served to provide a likely diagnosis and explain the findings seen on imaging, which would have otherwise led to further work- up and a different treatment strategy.

CONCLUSION: Patient-physician interaction and trust is a cornerstone of caring for patients. Yet, physicians should be aware of the importance of verifying information provided by patients to achieve better patient care and outcomes.

TUBERCULOSIS SEPSIS: AN UNCOMMON PRESENTATION OF MYCOBACTERIUM TUBERCULOSIS

Aline Zorian. Medicine, UCSF, San Francisco, CA. (Control ID #3390593)

LEARNING OBJECTIVE #1: Recognize the prevalence of extrapulmonary tuberculosis in HIV-infected patients

LEARNING OBJECTIVE #2: Evaluate for tuberculosis in the workup of sepsis in an HIV-infected patient

CASE: A 44-year-old man with a history of HIV not on anti-retroviral therapy presented with one week of lethargy and low appetite. On evaluation, he had temperature 39.8 C, blood pressure 79/47, pulse 152, and respiratory rate 18. On examination, he was cachectic and ill-appearing, with two tender, erythematous masses noted in his left neck. Initial

laboratory studies were notable for white blood cell count 3.6, hemoglobin 9.1, sodium 122, and creatinine 0.93 (baseline 0.6). Broad infectious work-up including blood, sputum, urine, and stool cultures was collected. Empiric therapy with cefepime and vancomycin was started. CT neck showed extensive necrotic cervical lymphadenopathy. Cervical lymph node aspiration was performed, and culture of the aspirate rapidly grew acid-fast bacilli. Soon after, all sputum AFB cultures returned positive for Mycobacterium tuberculosis. Empiric antibiotics were discontinued, and antituberculous quadritherapy was started. Further CT imaging revealed numerous scattered lung nodules, a soft tissue mass in the left sacrum, and hypodense lesions in the left kidney and liver, consistent with disseminated tuberculosis. His course was complicated by circulatory shock briefly requiring vasopressor therapy. However, he clinically recovered and was discharged home with plan to continue antituberculous and antiretroviral therapy.

IMPACT/DISCUSSION: The diagnosis of tuberculosis (TB) remains challenging as many patients present with few or atypical symptoms. Pulmonary TB remains the most common form of the disease, with extra-pulmonary TB occurring in only 15–20% of patients and disseminated TB in only 2–5% of patients. However, the clinical course of TB varies in immunocompromised and HIV-infected individuals, who are much more likely to have severe and extra-pulmonary disease. Disseminated tuberculosis has been identified in 38% of cases of HIV-TB co-infection. Moreover, while extra-pulmonary TB most commonly has a subacute or chronic presentation, acute and fulminant presentations may also occur in this population.

Though rare, tuberculosis septic shock has been associated with 79% in-hospital mortality. As in our case, the wide differential for sepsis in an HIV-infected patient, makes the diagnosis of tuberculosis sepsis particularly challenging, causing antimycobacterial therapy to be delayed. As with bacterial septic shock, early diagnosis and initiation of appropriate antimicrobials have been reported to significantly improve mortality.

CONCLUSION: Due to its variable and often non-specific presentation, a high index of suspicion is required for the diagnosis of tuberculosis. Given its potential for rapid progression and multi-organ involvement, disseminated tuberculosis should be considered early in the differential diagnosis for an HIV-positive patient with undifferentiated sepsis.

TUMOR LYSIS SYNDROME IN POST-POLYCYTHEMIA VERA MYELOFIBROSIS AFTER RUXOLITINIB INITIATION

Nitin Chopra, Lesley Wu, Ryan Leibrandt, Dahlia Rizk. Internal Medicine, Mount Sinai Beth Israel, New York, NY. (Control ID #3392111)

LEARNING OBJECTIVE #1: Recognize the clinical features of tumor lysis syndrome

LEARNING OBJECTIVE #2: Anticipate the potential for tumor lysis syndrome after initiation of ruxolitinib for treatment of secondary myelofibrosis

CASE: A 66-year-old man with CKD stage 3B and post-polycythemia vera (PV) myelofibrosis presented to the ED with nausea and vomiting for two weeks. Two days prior to admission, ruxolitinib was initiated for myelofibrosis.

Physical exam was notable for left lower quadrant tenderness and right-sided costovertebral angle tenderness. Lab values were significant for potassium of 6.6 meq/L, creatinine of 5.4 mg/dL, calcium 8.4 g/dL, phosphate of 8.9 mg/dL, uric acid of 27.5 mg/dL, and hemoglobin of 7.1 g/dL. Urinalysis was negative for infection. CT abdomen & pelvis without contrast showed stable splenomegaly, moderate left peri-nephritic stranding, and mild concentric bladder wall thickening. Renal US showed no renal vein thrombosis or evidence of obstruction.

Patient was monitored on telemetry and treated with aggressive IV hydration, bumetanide, tamsulosin, and rasburicase for tumor lysis syndrome (TLS). His creatinine gradually improved to 1.5 mg/dL along with resolution of electrolyte abnormalities.

IMPACT/DISCUSSION: TLS is a metabolic life-threatening emergency most frequently encountered in patients with leukemia or lymphoma who are actively receiving chemotherapy. TLS can be diagnosed according to the Cairo-Bishop criteria: at least 2 abnormalities in uric acid, potassium, phosphate, or calcium levels within three days before or seven days after chemotherapy. It is rarely associated with myeloproliferative neoplasms and has not been noted in phase I, II or III studies of ruxolitinib treatment. This case demonstrates the risk of rapidly worsening AKI in the context of TLS in a patient with post-PV myelofibrosis after initiating ruxolitinib.

CONCLUSION: Physicians should be aware of the potential risk of TLS after ruxolitinib administration for treatment of post-PV myelofibrosis. In cases where ruxolitinib is the preferred treatment modality, practitioners should maintain vigilance for early recognition and immediate treatment of TLS.

TURN DOWN THE HEAT IN A CAJUN WITH COLCHICINE

Aimee Sutherland, Laurianne Wild. Medicine, Tulane University School of Medicine, New Orleans, LA. (Control ID #3373136)

LEARNING OBJECTIVE #1: Recognize atypical features of Familial Mediterranean fever syndrome

LEARNING OBJECTIVE #2: Appreciate the efficacy of colchicine as a treatment for periodic fever syndrome of unknown origin

CASE: A 33-year-old Cajun man presented with a 20-year history of recurrent fevers. Fevers developed every two weeks with temperatures ranging from 101 to as high as 105 degrees Fahrenheit. Additional symptoms included myalgias, malaise and headache. Surgical history is notable for an exploratory laparotomy as a child that was unrevealing. The patient had no family history of autoimmune or rheumatologic disease. He was afebrile and no lymphadenopathy, aphthous ulcers, pharyngitis, or rashes were appreciated. IgG4 level returned elevated but otherwise had a negative infectious, malignancy, and rheumatologic workup while inpatient. He was referred to Allergy and Immunology for further evaluation as an outpatient. In clinic, the patient was initiated on colchicine 0.6mg orally twice daily. A periodic fever syndrome panel was ordered. Two months later, he reported no fevers since starting the colchicine. The periodic fever syndrome panel returned negative.

IMPACT/DISCUSSION: Fever is a common symptom encountered by a general internist with basic workup often yielding probable source of infection. Rarely does a patient develop persistent fevers without an identifiable source. Auto-inflammatory etiologies should be considered in patients in which malignancy, autoimmune disorders and unusual infections have been ruled out. Symptom patterns and risk factors, such as family history, patient ethnicity, and symptoms may aid the clinician in diagnosing a particular periodic fever syndrome. The diagnosis can be challenging due to variations in genetic mutations and inheritance patterns, likely seen in the patient discussed in the case. While diagnosis can be made clinically, the use of genetic testing allows for confirmatory testing in patients with an ambiguous presentation. However, despite advances in diagnostics, a large proportion of patients have negative genetic testing. In such patients, empiric treatment with either glucocorticoids, colchicine, or interleukin-1 antagonists may support the diagnosis of a periodic fever syndrome.

Periodic Fever syndromes patients are at increased risk for secondary complications if not started on appropriate therapy. Such complications include amyloidosis, small bowel obstruction and infertility. Empiric treatment is of importance as it can prevent such complications. Further, development of secondary complications could potentially further muddle the diagnostic picture in a patient with recurrent fevers.

CONCLUSION: Timely recognition of periodic fever syndromes can lead to appropriate treatment and prevention of secondary complications.

TYPHOID INTESTINAL PERFORATION IN LIBERIA, AFRICA

Solomon Bogale[1]; Ryan M. Walker[2]; James ". Walker[1]. [1]Internal Medicine, Texas Tech, Amarillo, TX; [2]Oklahoma Baptist University, Shawnee, OK. (Control ID #3344104)

LEARNING OBJECTIVE #1: Intestinal perforation is a common cause of peritonitis necessitating emergency surgical intervention. Perforation of the bowel from typhoid is a serious abdominal complication. The prevalence of typhoid fever is gradually decreasing worldwide; however, it still remains endemic in tropical regions. Perforation of terminal ileum is a cause for acute obscure peritonitis, heralded by exacerbation of abdominal pain associated with tenderness, rigidity and guarding, most pronounced over right iliac fossa.

CASE: A 62 yo male radiology technician came to ER in Liberia, West Africa co 2 day history of severe right sided abdominal pain.

Found to have severe rebound tenderness and with no bowel sounds.

Upright chest x ray showed large free air below the diagram. Patient was taken to surgery for laparotomy and a 2 cm perforation of the ilium was found and repaired.

He recovered well and was discharged home five days after surgery.

As a senior radiology technician, he had taught some of the technicians working in the ER that day!

IMPACT/DISCUSSION: Typhoid fever is a public health challenge which is concentrated in impoverished areas of the developing world which is due to unsafe drinking water and poor sanitation. Typhoid intestinal perforation (TIP) is the most serious complication observed in 0.8- 39%. TIP mortality rate fluctuates from 5 – 80% due to many factors including access to care.

In many areas, care is not available due to many issues including transportation, lack of provider and hospitals, lack of funding and ability to pay for services.

The authors believe that free air under the diagram was very helpful in confirming the need for surgical repair in this case. Labs were done later but played no part in the decision to go to surgery.

Primarily, the mortality and the morbidity rate do not depend on the surgical technique, but rather on the general status of the patient, the virulence of the salmonella and the duration of disease evolution before surgical treatment. That is why, it is so important to provide adequate preoperative management associating aggressive resuscitation with antibiotic therapy. In the literature, it is usually advocated that the last 60 cm of the ileum presents a high concentration of Peyer's patches whose infection is a source of intestinal perforation.

CONCLUSION: Inspite of global scientific development, typhoid fever and its complications continue to be a great health problem especially in developing countries. The management of typhoid enteric perforation needs appropriate early surgical intervention, effective resuscitation in the pre-operative period, post- operative care, and use of proper antibiotics. The key to improved survival in this deadly disease lies not in a better operation or improved perioperative care, but in the prevention of typhoid fever by providing safe drinking water and improved sanitation methods for all of the global community.

UNCLEAR AND PRESENT DANGER: AMBIGUITY IN THE PRE-OPERATIVE RISK ASSESSMENT

Lauren A. Waterman[1]; Alexandra E. Mieczkowski[2]. [1]Internal Medicine-Pediatrics Residency, University of Pittsburgh Medical Center, Pittsburgh, PA; [2]Internal Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3372908)

LEARNING OBJECTIVE #1: Assess a patient's complete, rather than problem-focused, history when evaluating perioperative risk

LEARNING OBJECTIVE #2: Recognize clinical features of cardiac disease when masked by, or misattributed to, other conditions

CASE: Mr. H is a 62-year-old man who presented to clinic for a preoperative visit for a L4-S1 revision laminectomy scheduled in 3 days' time. He denied any chronic conditions other than low back pain, though had not seen a PCP in many years. He stated he can walk up a flight of stairs, though became frustrated when discussing this, as he is "out of shape" due to his back pain. With significant prompting, he eventually endorsed progressive dyspnea when walking more than 20 feet, though denied any associated chest pain. On exam, he was normotensive, though tachycardic to 133. Cardiac exam was otherwise normal, without murmurs. Lung fields were clear to auscultation. An ECG was obtained, showing sinus tachycardia with Q waves in III and aVF. No prior ECGs were available for comparison and patient denied a known history of MI. Patient was referred to cardiology prior to surgery. TTE showed left ventricular hypertrophy. Cardiac MRI diagnosed Hypertrophic Obstructive Cardiomyopathy (HOCM). Metoprolol was initiated with significant improvement in his exercise capacity. He electively canceled his back surgery due to resolved symptoms. He continues to follow regularly with both cardiology and at the primary care clinic.

IMPACT/DISCUSSION: While patients can be focused on obtaining "clearance" for their surgery, it is vital for providers to review all aspects of the patient's health to ensure they are medically optimized for their planned procedure. This can present a challenge for patients without regular follow up, who may be unaware of underlying conditions that may impact their outcomes. The 2014 ACC/AHA Guidelines provide a stepwise approach for further preoperative testing based on ACS symptoms and METs. However, the subjective assessment of METs typically completed in office can often overestimate functional capacity (Wijeysundera et al 2018), especially if symptoms are attributed to another etiology (i.e. Mr. H with his back pain). Upon initial questioning, he met the criteria for 4 METs by being able to walk up a flight of stairs and did not require further testing based on guidelines. However, additional specific questioning elucidated that his symptoms required further evaluation, eventually revealing a diagnosis of HOCM. While he was able to cancel an unnecessary surgery and avoid the increased risk of adverse outcomes associated with HOCM during noncardiac surgeries (Hreybe et al 2006), only through exploration of his entire medical history was the true risk elicited.

CONCLUSION:

- A full history should be obtained when evaluating perioperative risk, especially in patients with minimal health care utilization
- Careful elicitation of functional capacity can reveal hidden symptoms of cardiac dysfunction that require further workup prior to surgery

UNCOVERING THE DIAGNOSIS IN A PATIENT WITH ALTERED MENTAL STATUS

Praneeth Sadda[1]; Deep Sangani[1]; Jerald L. Taggart[2]. [1]Internal Medicine, Tulane University, New Orleans, LA; [2]Medicine, SLVHCS/Tulane University, New Orleans, LA. (Control ID #3391282)

LEARNING OBJECTIVE #1: Identify appropriate situations to measure thyroid function studies in hospitalized patients

LEARNING OBJECTIVE #2: Discuss inpatient management of thyroid replacement therapy

CASE: An 83-year-old man was admitted for six weeks of worsening right ankle pain. He had been taking amiodarone for atrial fibrillation and levothyroxine for hypothyroidism. His vital signs were within normal limits. Radiographic findings were concerning for osteomyelitis. He was treated with intravenous antibiotics. His mental status waxed and waned during his

inpatient stay. He was often oriented only to person and exhibited sundowning behaviors including daytime somnolence and severe nighttime agitation. He was edentulous and macroglossia was present.

TSH returned greater than 48.60 μIU /mL, free T4 equal to 0.26 ng/dL, and total T3 equal to 0.38 ng/dL. Due to severe hypothyroidism, he was started on IV levothyroxine after endocrinology consultation. Hydrocortisone treatment was also initiated. Mental status progressively improved.

IMPACT/DISCUSSION: Hypothyroidism can present with a wide range of nonspecific symptoms and is a common diagnostic consideration by hospital medicine providers. Ordering inpatient thyroid studies on individuals who are acutely ill is generally not recommended as lab results are often difficult to interpret due to acute illness. This testing can add unnecessary cost. Checking inpatient thyroid function is needed, however, in several clinical situations such as in patients who are on thyroid replacement, those who are on medications that can cause or contribute to thyroid dysfunction, and when the clinical presentation is concerning for overt thyroid dysfunction.

When abnormal thyroid function studies are identified, initiating or adjusting thyroid replacement may be necessary. A clinical presentation attributed to thyroid dysfunction or significant biochemical abnormalities (i.e. extremely elevated TSH) should prompt initiation of treatment. Thyroid hormone replacement can also increase cortisol metabolism and potentially unmask underlying adrenal insufficiency. Guidelines by the American Thyroid Association Task Force recommend if the decision is made to treat non critically ill inpatients with levothyroxine (newly instituted treatment or an increase from previous home dosing), oral replacement should be started with a goal of long-term normalization of TSH. If there is reason to suspect underlying adrenal insufficiency, this diagnosis should be ruled out or empiric corticosteroids should be started. For critically ill patients with myxedema, IV levothyroxine along with empiric corticosteroid treatment for adrenal insufficiency is recommended. Levothyroxine dosing should be titrated to clinical improvement. Thyroid studies should be followed every 1-2 days.

CONCLUSION: While thyroid studies may be difficult to interpret in acute illness, testing may be indicated to uncover thyroid disease and to prompt initation of treatment.

UNDIAGNOSED VITAMIN B12 DEFICIENCY AND ITS SEQUELAE IN A PATIENT ON A HUNGER-STRIKE: FOOD FOR THOUGHT

Mikhail Rassokhin, Sami G. Tahhan. Internal Medicine, Eastern Virginia Medical School, Virginia Beach, VA. (Control ID #3387478)

LEARNING OBJECTIVE #1: Recognize various hematologic and neuropsychiatric symptoms of vitamin B12 deficiency presentation in atypical patient population

LEARNING OBJECTIVE #2: Diagnose and treat vitamin B12 deficiency before development of life- threatening irreversible sequelae

CASE: A 45-year old male was escorted to our tertiary medical center from a prison for evaluation of 40 lb weight loss, paraplegia and recently developed urinary and fecal incontinence. The patient had been on a 9-month hunger strike, during which he only consumed one meal per day. In addition to incontinence, he reported a progressive course of paresthesia, numbness and weakness in the legs. He became wheelchair bound. Neurological exam revealed a malnourished and disoriented male with 1/5 strength in the lower extremities, decreased muscle tone, bilateral lower leg swelling, and wasting of intrinsic foot muscles. The patient also had bilateral symmetrical loss of vibratory, tactile senses and proprioception in both legs. CBC demonstrated moderate anemia with high MCV (107 fL), low serum vitamin B12 (82 pg/ml), and elevated homocysteine (272.8 μmol/L) and methylmalonic acid (83,248 nmol/L). Serum and RBC folate levels were normal. Spinal cord MRI and myelogram were unremarkable. Anti-parietal cell and anti-intrinsic factor antibodies were elevated. NCS/EMG demonstrated severe, symmetrical, distal polyneuropathy of the lower limbs. Ultrasound showed lower extremity DVTs. The patient was diagnosed with subacute combined degeneration and pernicious anemia. Cyanocobalamin injections were initiated. Within a month of treatment, his anemia improved and strength in the lower extremities increased to 4/5; but his urinary incontinence persisted. Over the following nine months, the patient reached full hematological recovery; however, he remained weakened and Foley-dependent.

IMPACT/DISCUSSION: This case illustrates that diagnosing vitamin B12 deficiency still poses a formidable diagnostic challenge in atypical patient populations. If vitamin B12 intake ceases, deficiency typically does not develop for at least several years. However, deficiency will develop faster in patients with pernicious anemia which promotes the depletion of vitamin B12 stores via decreased absorption and impaired enterohepatic circulation.

Vitamin B12 deficiency promotes a hypercoagulable state, likely due to increased homocysteine which can lead to DVT and, potentially, pulmonary emboli. Neuropsychiatric symptoms often dominate over other symptoms, and appropriate treatment does not guarantee complete neurological recovery. Treatment extent, dosing regimens and monitoring need further investigation.

CONCLUSION: Vitamin B12 deficiency is still exceedingly common and likely under-diagnosed. The spectrum of manifestations varying from pancytopenia to neuropsychiatric symptoms is well-defined, but the natural course of the deficiency is poorly understood in part due to its highly variable presentation. A high index of suspicion and prompt treatment are necessary to avoid irreversible sequelae.

UNPACKING ANEMIA: DIAGNOSTIC APPROACHES IN A YOUNG ADULT WITH A COMPLEX MEDICAL HISTORY

Brittany Glassberg[1]; Mackenzie Naert[2]; Sarah Duncan[3]; Joseph Truglio[4]. [1]School of Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [2]Medical Student, Icahn School of Medicine at Mount Sinai, New York, NY; [3]Internal Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [4]Internal Medicine, Pediatrics and Medical Education, Icahn School of Medicine at Mount Sinai, Maplewood, NJ. (Control ID #3391915)

LEARNING OBJECTIVE #1: Describe the laboratory characteristics of anemia of chronic disease.

LEARNING OBJECTIVE #2: Recognize the presence of multiple acute complications in a young adult with complex medical conditions.

CASE: AF is a 19-year-old cisgender female with developmental delay who was found to have anemia on routine labs. She has a history of hypertension, cerebrovascular accident with residual left-sided weakness, dilated cardiomyopathy s/p cardiac transplant complicated by post-transplant lymphoproliferative disease of the antrum, drug-induced diabetes mellitus and end-stage renal disease on peritoneal dialysis. A routine CBC revealed a hemoglobin (hgb) of 4.2G/DL, reduced from 10.6G/DL 3 months prior, an MCV of 86.3 (79-98FL) and an elevated ferritin of 2152 NG/ML. On questioning, the patient's mother reported one episode of coffee ground emesis and one recent dark stool. She denied dizziness or shortness of breath. Her exam was notable for a heart rate of 104bpm, blood pressure 115/59, pale conjunctiva and abdominal tenderness to palpation. She was referred to the emergency department (ED) for presumed upper GI bleed. In the ED she was found to have a fever of 38.9 C with worsening abdominal tenderness. She was transfused with two units of packed red blood cells. Upper endoscopy revealed extensive Candida esophagitis without acute bleed. Infectious workup revealed peritoneal

white blood cell count of 55/uL with peritoneal and urine cultures positive for E. Coli. She was treated with ceftriaxone for catheter-associated peritonitis and cystitis, and fluconazole for esophageal candidiasis. Her post-transfusion hemoglobin remained stable, and she was discharged home to continue peritoneal dialysis and renal transplant evaluation.

IMPACT/DISCUSSION: AF's initial presentation of anemia in the setting of coffee ground emesis suggested upper gastrointestinal bleed. However, the ultimate cause of her anemia is likely multifactorial. Her normal MCV, elevated ferritin and relative lack of symptoms point to anemia of chronic disease as the primary etiology. Her endoscopy results of esophageal candidiasis without signs of bleeding support this conclusion, although less acute esophageal blood loss or small bowel blood loss could not be ruled out. Her additional symptoms of abdominal pain and fever in the setting of peritoneal dialysis prompted evaluation and diagnosis of catheter-associated peritonitis and cystitis. Multiple infections may contribute to worsening of anemia of chronic disease.

CONCLUSION: This case emphasizes the importance of considering a broad differential diagnosis, especially in patients with chronic complex conditions. The clinical reasoning approach for complex patients should take into account single unifying diagnoses, as well as multiple diagnoses to explain disparate symptoms and laboratory findings.

UNSAFE DRIVING, UNSAFE NOT DRIVING: PUBLIC SAFETY VS. PATIENT ACCESS TO AND ENGAGEMENT IN CARE

Paul Glasheen[2]; Jennifer Adams[1,2]. [1]General Internal Medicine, Denver Health, Denver, CO; [2]Division of General Internal Medicine, University of Colorado, Aurora, CO. (Control ID #3387903)

LEARNING OBJECTIVE #1: Assess ethical obligations for physicians to report unsafe drivers in a state where physicians are not legally obligated to report impaired drivers to the Department of Motor Vehicles (DMV)

LEARNING OBJECTIVE #2: Recognize the importance of patient mobility in preventing social isolation and preserving engagement in care

CASE: Patient is an 84 year-old male with a history of COPD, CAD, CHF, HTN, and cerebral palsy with instability of gait. His wife is 81, with a history of mitral stenosis, and arthritis. They are each other's sole caretakers and support.

Since 2016, he noted a decline in visual acuity, with his most recent ophthalmology assessment notable for visually significant cataracts affecting activities of daily living in both eyes and a recommendation for bilateral surgical replacement of the lens. He was reluctant about surgery, cancelling appointments with late notice on several occasions. Meanwhile, his health and social situation deteriorated, including hospitalizations related to family violence and elder abuse, incarceration of his son, and food insecurity due a broken refrigerator. A home visit was performed by his PCP and medical student for safety evaluation. He fell during the visit, and multiple fall hazards were noted including a single exit from the home down steep and poorly maintained stairs. Shortly after this visit, he fell again and suffered a rib fracture.

The patient and his wife declined home health and home safety evaluations; their only engagement with medical care is through their PCP 3 miles from their home. Their only form of transportation is his vehicle, as their mobile home park is in an industrial area without access to bus routes. He continues driving, insisting this is safe because he only takes side roads. He still refuses cataract surgery despite concern about driving safety expressed multiple times by PCP and his wife. The ongoing and cumulative risk to personal and public safety led to an anonymous report to the DMV by PCP.

IMPACT/DISCUSSION: This case presented an ethical dilemma, balancing personal and public safety against a frail couple's connection to medical care and key resources. Driving safety is difficult to assess when patients refuse voluntary driving tests. While this patient's visual acuity meets Colorado minimums for licensure, his ophthalmologist deems his impairment significant. Reporting may improve public safety, or even prevent a fatal accident, but it may also break both the patient and his wife's connection to medical care and social resources. Without transportation, this couple would have no means to access care vital to their survival. Furthermore, reporting may threaten the therapeutic relationship with a vulnerable patient.

CONCLUSION: Physicians have an ethical responsibility to their community to report dangerous drivers. This responsibility must be balanced against our obligation to preserve the mobility and independence of our patients, important social determinants of health.

UNUSUAL CASE OF BACTERIAL ENDOCARDITIS IN A HEALTHY PATIENT WITHOUT INTRAVENOUS DRUG USE

Shengnan Zheng[1]; Karthik Ramireddy[1]; Vincent Mirabile[1]; Marino Leonardi[2]. [1]Internal Medicine, Mercy Catholic Medical Center, Darby, PA; [2]Cardiology, Mercy Fitzgerald Hospital, Darby, PA. (Control ID #3392217)

LEARNING OBJECTIVE #1: Recognize the clinical features and possible complications of infective endocarditis (IE), and importance of early accurate diagnosis.

LEARNING OBJECTIVE #2: Recognize the importance of transesophageal ECHO (TEE) in diagnosis, follow-up, and prognostication of patients with IE.

CASE: A 62-year-old female with no major past medical history presented with 5 days of fever, chills, and lumbago. On arrival, patient was tachycardic, tachypneic, and febrile (103.2F) with hypotension. She denied intravenous drug use (IVDU). Labs showed pancytopenia, lactate of 3.9mmol/L, and normal coagulation. Urine drug screen was negative. MR Lumbar Spine, obtained for lumbago, demonstrated early septic arthritic changes in posterior left facets of L3/L4. Patient was admitted to ICU for septic shock secondary to septic arthritis where she was treated with broad-spectrum antibiotics and fluid resuscitation. Blood cultures grew Cefazolin-sensitive Beta-Hemolytic Streptococcus B. While TEE was indicated, patient refused. A transthoracic ECHO (TTE) did not reveal valvular vegetation. She was discharged with 6 weeks antibiotics. While repeat blood cultures remained negative, patient was readmitted the following week with similar presentation. CT Chest revealed right upper, middle, and lower lobe pulmonary emboli with right heart strain. A 1.7x1.2cm vegetation on mid-basal posterior leaflet of tricuspid valve was identified on TEE. Antibiotics were optimized to ampicillin and gentamicin. Following 6 weeks of IV antimicrobial therapy, patient improved clinically but repeat TEE demonstrated unchanged vegetation size.

IMPACT/DISCUSSION: Here, our patient demonstrated a rare case of RSIE in a previously healthy, non- IVDU patient (with delayed IE diagnosis), who returned with further complications.

IE seldom presents as right-sided infective endocarditis (RSIE, 5-10%), which is associated with IVDU or indwelling-catheters/leads (none in our patient). Moreover, our patient's cultures grew Streptococcus, which is a rare cause of RSIE (50-80% are Staphylococcus aureus).

IE's high mortality (30% in 1 year) and morbidity rates warrant close monitoring. One review concluded ~57% of IE patients had at least 1 complication (including neurologic, renal, systemic infections, or cardiopulmonary as in our patient). Current recommendations prefer TEE (sensitivity 93-100%) over TTE (<80%) for IE imaging. Although timing may vary, literature suggests performing TEE after 7 days and on completion of the antibiotic course. Additionally, close monitoring of vegetation size is vital, as an increase in vegetation size or failure to regress (as seen in our

patient), despite antibiotic therapy, is a strong predictor of mortality and embolic events.

CONCLUSION: Early recognition of clinical features and accurate diagnosis of IE is vital in decreasing risk of complications and improving overall outcome.

Failure to regress or increase in size of vegetations on TEE despite antibiotic therapy is a strong predictor of mortality and embolic events.

UNUSUAL PRESENTATION OF AORTIC DISSECTION WITH SEIZURES AND BRADYCARDIA

Dhivya Velu, Tim Anderson, Farrah Ibrahim, Alan Baggett. Internal Medicine, UAB Huntsville regional medical campus, Huntsville, AL. (Control ID #3392023)

LEARNING OBJECTIVE #1: Emphasize on a high index of suspicion for aortic dissection with atypical symptoms.

LEARNING OBJECTIVE #2: Use of POCUS in diagnosing dissections.

CASE: A 30-year-old male with history of Hypertension and Polycystic kidney disease was brought to ER in an awake and diaphoretic state after being found unresponsive. On arrival, patient was significantly bradycardic which improved with Atropine but continued having left-sided dull chest pain. He was alert and oriented but mildly confused with no other focal systemic involvement. Initial cardiac enzymes were normal. Other workups including EKG, CXR and non-contrast CT Brain were unrevealing. Within 2 hours, the patient developed generalized tonic-clonic seizures followed by severe, postictal altered mental status requiring intubation. 6 hours later, troponins elevated to 696 ng/L with no new EKG changes. Left-arm BP readings remained around 90/60 mmHg. In 16 hours, the patient became increasingly tachycardic with HR 110-120bpm and soon developed neurological signs, specifically, loss of gag reflex and withdrawal to painful stimuli with EEG evident of anoxic brain injury. Incidentally, the patient was noted to have a weak right radial pulse with SBP 40mmHg unlike the left arm with SBP of 90mmHg. Point of care ultrasound (POCUS) of carotids identified a suspected intimal flap, concerning for carotid dissection. Stat CTA was done which showed extensive aortic dissection with extension to proximal carotids and distal thoracic aorta into the upper abdomen. Due to decline in patient's clinical status, EEG findings and highly grim prognosis, the surgical option was not pursued, and the family elected for transition to comfort-focused care only.

IMPACT/DISCUSSION: Aortic Dissection (AD) often presents as hypertensive emergency with chest pain, shortness of breath and occasionally neurological symptoms, specifically stroke. PKD has been associated with vascular malformations however presentations with aneurysm or dissection of the aorta are rarely reported. Though the presenting history and worsening neurological decline masked the underlying etiology, the patient's elevated troponins, unequal peripheral pulses, and POCUS findings lead to the discovery of underlying dissection. Simple bedside maneuvers like assessing bilateral pulses and inter-arm BP differences are frequently missed when presenting with such atypical symptoms. Widened Mediastinum in CXR is a helpful finding but lacks adequate sensitivity unlike CTA, always being the definitive test with high sensitivity and specificity. POCUS certainly helps to detect AD however this is limited to patients with dissections involving the aortic root or in those where dissection has spread to the carotid arteries.

CONCLUSION: Aortic dissection can rarely present with hypotension but still with significant interarm pressure difference. In cases with mixed features or wide differential diagnosis, performing a thorough examination is vital and also, POCUS can certainly have a role in triaging such patients at the bedside.

UNUSUAL PRESENTATION OF DERMATOMYOSITIS: TREAT THE PATIENT, NOT THE NUMBERS!

Purva Ranchal[1]; Rahul Gupta[2]; Christopher Nabors[3]. [1]Internal Medicine, westchester medical center, Valhalla, NY; [2]Internal Medicine, Westchester Medical Center, Elmsford, NY; [3]Medicine, Westchester Medical Center, Hopewell Junction, NY. (Control ID #3390673)

LEARNING OBJECTIVE #1: Dermatomyositis (DM) is an idiopathic inflammatory myopathy, characterized by muscle inflammation leading to proximal skeletal muscle weakness. Typical presentation of DM includes characterstic skin eruptions along with muscle weakness with steroids being the cornerstone of treatment. We report a patient with atypical DM presentation with refractory response to steroids.

CASE: A 43-year-old woman presented to the hospital with subjective fevers and proximal muscle weakness which developed over one week. Her symptoms began with sore throat, rhinorrhea and generalized body rash, for which she was treated with azithromycin and a prednisone taper by her primary provider. On admission, she reported severe muscle pain (9/10) and significant weakness in the proximal hip/thighs for which she required assistance to get out of bed. She denied recent travel, sick contacts or tick bites. On presentation, she was afebrile and hemodynamically stable. Physical examination revealed mildly ill appearing woman with periorbital edema and diffuse dark pigmented rash on body; muscle power was 3/5 in upper and 2/5 in lower proximal muscles of extremities bilaterally. Laboratory findings were pertinent for WBC 16, creatine kinase (CK) 28,000, LDH 3581, positive ANA, ESR 38, AST 995 and ALT 330. Serologies were negative for antibodies to SSA, SSB, ds-DNA and smooth muscle. Myositis panel was positive for Mi-2. Infectious myositis panel was negative for viral infections. The patient received intravenous prednisolone 60 mg daily, however, muscle weakness worsened and CK increased to 140,132 with AST/ALT elevation to 4023/1101 respectively. Skin and muscle biopsy revealed hyperkeratosis, parakeratosis, and dermal perivascular chronic inflammation and severe active necrotizing myopathy with extensive fiber necrosis and regeneration confirming a diagnosis of DM. After 3 weeks of steroid treatment, CK started trending down without any improvement in muscle strength. This led to treatment with intravenous immunoglobulin for 5 days but no further clinical improvement. After additional treatment with high dose steroids, there was gradual improvement in muscle strength after 8 weeks. Later, low dose methotrexate was started while steroids were tapered.

IMPACT/DISCUSSION: DM commonly presents with a relatively slow onset of muscle weakness with cutaneous manifestations in the hands, face and chest. This case was unusual with cutaneous findings of diffuse, generalized rash and onset of severe muscle pain and weakness, over the course of a week and resulted in significant, necrotizing myopathy refractory to treatment. Even though there was improvement in CK levels, however, clinical response was delayed. Therapy in patients with DM should be tailored based on clinical improvement rather than CK levels.

CONCLUSION: It is crucial for clinicians to be aware of the variability in presentation and response to therapy in DM as illustrated by this case in order to optimize management for patients presenting for this condition.

URINE TROUBLE: A CASE OF ELEVATED CREATININE AND ABDOMINAL PAIN

Michael A. Miller[1]; Andrew Lutz[1]; Vivek Ashok[1]; Jennifer Corbelli[2]. [1]Internal Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA; [2]Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3392350)

LEARNING OBJECTIVE #1: include intraperitoneal bladder rupture in the differential diagnosis of elevated creatinine in the setting of abdominal trauma

LEARNING OBJECTIVE #2: recognize that an ascites:serum creatinine ratio >1 should raise concern for uroperitoneum which is a surgical emergency

CASE: A 59-year-old man with hypertension and depression presented to the medicine floors from a psychiatric unit for evaluation of acute kidney injury, new ascites, and abdominal pain. He initially presented for suicidal ideation and a major depressive episode. Several days into admission, the patient assaulted a nurse and noted that security pushed him in the abdomen while restraining him. He then developed generalized lower abdominal pain, anuria, and increase in serum creatinine over the next 48 hours. Physical exam was significant for normal vital signs, a soft, mildly distended abdomen with dullness to percussion and tenderness to palpitation in the lower quadrants. There was no bruising, and the rest of the physical exam, including external genitalia, was unremarkable. CT abdomen and pelvis showed ascites with otherwise normal bowel, liver, kidneys, and bladder. Diagnostic paracentesis was significant for normal LDH, albumin, and total protein. The ascites creatinine was elevated at 13.7mg/dL (normally equal to serum level). Serum studies showed a rise in creatinine from a baseline of 0.9 to 5.3mg/dL after 48 hours. A foley catheter was placed which returned 3500mL of sanguineous urine. A CT cystogram with intravesical contrast revealed a defect at the dome of the bladder with foley tip and contrast medium in the peritoneum. Urology performed emergent exploratory laparotomy with repair of intraperitoneal bladder rupture. The patient had an uncomplicated postoperative course remarkable for prompt return of serum creatinine to baseline levels and was discharged back to psychiatric care once medically stable.

IMPACT/DISCUSSION: Bladder rupture is uncommon, but often presents in the setting of high-energy blunt trauma. When distended, the bladder dome may expand into the abdomen, where it is at greater risk to injury at the peritoneal surface following lower abdominal trauma. Signs and symptoms of intraperitoneal bladder rupture include history of trauma with abdominal pain with or without peritoneal signs, difficulty voiding, new ascites, and elevated serum creatinine. An ascites to serum creatinine ratio greater than 1.0 is highly suggestive of uroperitoneum, and should prompt further work-up for intraperitoneal bladder rupture. Definitive diagnosis is established with exploratory laparotomy or vesicular cystography in conjunction with urgent urology consultation. Intraperitoneal bladder rupture requires surgical repair.

CONCLUSION: -Bladder rupture is a rare cause of ascites that should be considered in patients with marked rise in serum creatinine abdominal pain and history of trauma.

-An ascites to serum creatinine ratio >1 is highly suggestive of uroperitoneum and should prompt rapid evaluation for bladder rupture.

USE OF KETAMINE TO RAPIDLY WEAN CHRONIC, OPIOID USE IN A PATIENT WITH SICKLE CELL DISEASE

Jonathan C. Li[1]; Shalini Vadalia[1]; Elissa Miller[2,3]. [1]Internal Medicine-Pediatrics, ChristianaCare, Wilmington, DE; [2]Division of Palliative Medicine, Department of Pediatrics, Nemours A.I. duPont Hospital for Children, Wilmington, DE; [3]Sidney Kimmel Medical College, Thomas Jefferson University, Philadelphia, PA. (Control ID #3341990)

LEARNING OBJECTIVE #1: Ketamine is a common anesthetic agent that has been gaining attention for its use as an opioid-sparing analgesic at sub-anesthetic doses. It has been shown to be effective in managing pain refractory to opioids and to be beneficial in reversing opioid-induced hyperalgesia (OIH). Patients with sickle cell disease (SCD) are a unique population at high risk for developing chronic pain reliance on opioids.

Given the known risks of opioid use, this case illustrates the utility of ketamine for rapidly weaning patients off chronic opioids.

CASE: An 18-year-old female with SCD type SS on chronic opioids presented with a complaint of pain and escalating opioid requirements 24 hours after discharge from an outside hospital. Her SCD had been complicated by history of acute chest syndrome, internal carotid artery occlusion requiring chronic transfusion therapy, frequent vaso-occlusive (VOC) crises resulting in chronic pain; and depression. Over the past 9 months, she presented over 20 times to various hospitals for pain, and was admitted 8 times for inpatient pain management. During these admissions, she was treated with IV opioids including hydromorphone and IV fentanyl. On admission, our patient reported that her current pain was not representative of her VOC pain. Imaging was not consistent with avascular necrosis as a source of her pain either. Due to her persistent opioid use and uncontrolled pain with low suspicion for VOC, there was concern for OIH and opioid withdrawal if opioid therapy was not weaned under close surveillance. The decision was made to offer a ketamine-assisted, rapid opioid wean in the pediatric intensive care unit. Based on the patient's baseline low but persistent daily 30 morphine milligram equivalent use, ketamine was initiated at 0.1mg/kg/hr and titrated based on pain scores to a maximum of 0.35mg/kg/hr. Withdrawal assessment tool (WAT-1) scores remained at zero throughout the weaning process. Subsequently, the patient was monitored for 48 hours and then discharged to the general medical floors for continued care.

IMPACT/DISCUSSION: Ketamine provides a safe and effective method to rapidly wean patients off high dose opioids, especially in the setting of OIH. In some cases, ketamine may even help control pain that is refractory to opioids. Concomitant use of ketamine with opioids has been shown to blunt the development of OIH and reduces opioid consumption. The full potential of sub-anesthetic ketamine in chronic pain management has yet to be seen but shows promising benefit; particularly among patients with SCD.

CONCLUSION: This case is amongst the earliest to describe the use of ketamine to wean a pediatric patient with SCD off high-dose opioids and supports the use of ketamine in managing SCD pain.

VALVULAR HEART DISEASE ANTI-COAGULATED WITH DIRECT ORAL ANTICOAGULANTS

Romana Asad, Shegnan Zheng, Kevin Fleming, Keerthy Joseph. Internal Medicine, Mercy Medical Catholic Center, Drexel Hill, PA. (Control ID #3391490)

LEARNING OBJECTIVE #1: Manage Valvular heart disease with DOACs. Direct acting oral anticoagulants (DOACs) are recommended for treatment of Non-valvular atrial fibrillation (AF). Historically, Warfarin has been used to prevent thromboembolism in valvular heart disease and mechanical valve replacements. Here, we present an unusual case of a patient with mitral valve disease who was started on a DOAC after risk benefit discussions.

CASE: A 44-year-old African American female presented with worsening right sided flank pain over the past several days. Physical examination showed tenderness in right flank. CT abdomen showed wedge shaped region in mid pole of right kidney consistent with infarct. ECHO showed left ventricular systolic ejection fraction of 20-25%. Mitral valve leaflets mobility is moderately restricted rheumatic appearing with mild stenosis. Stress ECHO showed no evidence of exercise-induced ischemia. MRI cardiac showed global decreased left ventricular contractility without focal wall motion abnormalities or areas of abnormal delayed enhancement to suggest ischemia. Thickened valve leaflet compatible with findings of rheumatic heart disease.

IMPACT/DISCUSSION: Patients with valvular heart disease with thromboembolic phenomenon are traditionally treated with Warfarin.

However, our patient was very non-complaint and refused regular PT/INR checks. After discussing with her, the decision was made to start her on Rivaroxaban. After discharge, patient never followed up.

CONCLUSION: Anticoagulation with Warfarin is recommended in patients with moderate to severe rheumatic mitral stenosis (MS) and one or more of following: AF, prior embolic event, left atrial thrombus. Clinicians also suggest anticoagulation with Vit K antagonist for patients with mild MS with above conditions The role of DOACs in patients valvular heart disease is less clear. Recent observational study showed DOAC reduce the risk of stroke, embolism, all-cause mortality compared to warfarin. Despite prior randomized trial data showing increased thromboembolic events with DOAC therapy in the mechanical valve replacement population Sub analysis of data from various trials suggest that DOAC's might be safe and effective in patients with valvular heart disease.

VALVULAR HEART DISEASE IN AN HLA-B27-POSITIVE ADULT

Alexandra Dembar[1]; Samuel G. Ruchman[2]; Brittany Glassberg[2]; Lily Chu[1]; Luis E. Seija[3,1]; Alexis Tchaconas[1]; Joseph Truglio[4]. [1]Med-Peds, Icahn School of Medicine at Mount Sinai, New York, NY; [2]School of Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [3]Medicine, Icahn School of Medicine at Mount Sinai, New York, TX; [4]Internal Medicine, Pediatrics and Medical Education, Icahn School of Medicine at Mount Sinai, Maplewood, NJ. (Control ID #3392142)

LEARNING OBJECTIVE #1: Enumerate the cardiac manifestations of HLA-B27 positive seronegative spondyloarthropathies

LEARNING OBJECTIVE #2: Describe the diagnostic approach to HLA-B27 positive patient with new cardiac symptoms

CASE: GW is a 56-year-old cis-gender female with a past medical history of HLA-B27 seronegative spondyloarthropathy, bilateral uveitis, Hashimoto's thyroiditis who presented with fatigue and palpitations for one week. She also reported recent upper respiratory infection symptoms. Physical exam was significant for a blood pressure of 112/72mmHg, an irregularly irregular cardiac rhythm and III/VI holosystolic murmur best heard at the apex, with radiation to the axilla and back; no diastolic murmur was appreciated. No jugular venous distension or lower extremity edema. An electrocardiogram (EKG) was significant for atrial fibrillation with rate of 80-110. The patient was referred to cardiology clinic for urgent evaluation to rule out aortitis. Transthoracic echocardiogram (TTE) demonstrated moderate mitral regurgitation (MR) and mitral valve prolapse. No aortic or aortic valve pathology was noted. The patient was prescribed metoprolol 25mg daily for rate control and antiplatelet therapy, but declined anticoagulation. She is in the process of work up for possible surgical replacement of the mitral valve.

IMPACT/DISCUSSION: This patient, with significant autoimmune history, presented with new harsh murmur and atrial fibrillation, and was subsequently found to have MR on TTE. HLA-B27 positivity, while typically associated with seronegative spondyloarthropathies including ankylosing spondylitis, psoriasis, and reactive arthritis, has also been associated with certain cardiac pathologies, the most common being aortic insufficiency (AI) and the most dangerous being aortitis, with or without AI. The presentation of aortitis with AI can be acute and severe in patients positive for HLA-B27, frequently requiring emergent aortic valve replacement (AVR). Aortitis was the cause of isolated AI in 4% of patients that underwent AVR, demonstrating the need for immediate cardiac workup in patients with known HLA-B27 positivity who present with new cardiac murmurs. For this reason, our patient was urgently referred to cardiology for TTE. This patient's TTE demonstrated mitral regurgitation (MR) and no significant aortic valve abnormalities. Though MR is less frequently observed than AI in HLA-B27 positive patients, MR is still more prevalent in these patients than in the general population. MR in HLA-B27 positive patients occurs secondary to either mitral valve prolapse, as in our patient, or thickening and fibrosis of the subaortic tissues with extension to the base of the anterior mitral valve leaflet.

CONCLUSION: Providers should have a high index of suspicion for cardiac abnormalities in patients that are HLA-B27 positive. Primary care doctors should perform thorough cardiac auscultation in this population and have a low threshold to explore potential anomalies with EKG and cardiology referral.

VANISHING BILE DUCT SYNDROME: A PARANEOPLASTIC PHENOMENON SECONDARY TO OCCULT HODGKIN LYMPHOMA

Lauren Keim, Ian Cormier. Internal Medicine, University of Nebraska Medical Center, Omaha, NE. (Control ID #3391818)

LEARNING OBJECTIVE #1: Develop an approach for the workup of cholestatic pattern of liver injury.

LEARNING OBJECTIVE #2: Recognize vanishing bile duct syndrome as a pathologic diagnosis in which the underlying etiology must be investigated.

CASE: A 27-year-old female with no medical history presented with one month of progressively worsening jaundice and a 30-pound weight loss. She was found to have conjugated hyperbilirubinemia with an acute cholestatic hepatitis. Ultrasound of the liver was unremarkable and magnetic resonance cholangiopancreatography revealed normal appearing intrahepatic and extrahepatic bile ducts without mechanical obstruction. An extensive workup for autoimmune and infectious etiologies of hepatitis was unremarkable. A liver biopsy was significant for features of cholestasis and ductopenia suggestive of vanishing bile duct syndrome (VBDS). A computed tomography scan of the chest revealed a large complex anterior mediastinal mass with extensive lymphadenopathy. A core needle biopsy of the right supraclavicular lymph node was obtained and pathology consistent with Hodgkin lymphoma. She was initiated on induction therapy with improvement in her liver enzymes.

IMPACT/DISCUSSION: A cholestatic pattern of liver injury describes an elevation in alkaline phosphatase that is greater in magnitude compared to hepatic aminotransferases. Patients presenting with this pattern should initially undergo ultrasonography to evaluate for mechanical biliary obstruction. Those without ductal dilation are said to have intrahepatic cholestasis, which should prompt a workup for autoimmune liver disease. Patients with unrevealing workup and persistent alkaline phosphatase elevation greater than two times the upper limit of normal should be considered for liver biopsy.

VBDS refers to a group of disorders with variable etiologies that cause a progressive destruction of intrahepatic bile ducts with resulting cholestatic liver injury. The diagnosis is made pathologically and requires a paucity of interlobular bile ducts, defined as less than 50% of portal areas with a bile duct on biopsy. Etiologies include infections, ischemia, autoimmune conditions, drug reactions, and malignancy, in which case VBDS may manifest as a paraneoplastic syndrome. Patients present with jaundice, pruritis, and cholestatic pattern of liver injury with hyperbilirubinemia. Treatment depends on the underlying cause and includes withdrawal of offending medications, immunosuppression, ursodeoxycholic acid, and liver transplantation in those with irreversible hepatic failure. Treatment for paraneoplastic VBDS consists of treating the underlying malignancy, which may be difficult in the setting of compromised hepatic function. Prognosis is variable as some progress to cirrhosis and others have regeneration of biliary epithelium with recovery of hepatic function.

CONCLUSION: Patients with intrahepatic cholestasis and unrevealing initial workup should be considered for liver biopsy.

Vanishing bile duct syndrome is a pathologic diagnosis with several potential etiologies.

VAPI: DON'T HOLD YOUR BREATH FOR A STRAIGHTFORWARD DIAGNOSIS

Stephanie Cabrera. Internal Medicine, University of Florida, Gainesville, FL. (Control ID #3389788)

LEARNING OBJECTIVE #1: Distinguish VAPI from other causes of acute respiratory failure

LEARNING OBJECTIVE #2: Recognize the importance of thorough social history especially in younger patients

CASE: A 24 year old male with no chronic medical problems presented for dyspnea and cough for one week with associated high fevers. He was seen in the ER for these symptoms 2 days prior and was diagnosed with community-acquired pneumonia and discharged home with antibiotics. His symptoms did not improve which prompted him to re-present to the ER. Regarding social history, he lives on a farm and works in glass installation. He smokes 1 PPD, uses marijuana, and drinks alcohol socially. Initial vital signs showed temperature of 103.3, tachycardia 104, O2 sat 95% on room air. Labs were significant for leukocytosis. Strep, monospot, and influenza were negative. Chest x-ray showed diffuse patchy infiltrates. He continued to be treated for CAP with empiric IV antibiotics and placed on supplemental O2. He had worsening respiratory distress even though he was on broad-spectrum antibiotics. By the time he required high flow nasal cannula he was quite frightened and admitted that he had been vaping multiple times daily for the past month. Vape-Associated Pulmonary Injury was now high on the differential. Pulmonology was consulted and they felt that VAPI was still less likely than CAP. They did not recommend initiating steroids. The primary team decided that CAP should have responded to antibiotics by now and started steroids despite specialist recommendations. The following day the patient was able to maintain O2 sats in the mid-90s on nasal cannula. He underwent bronchoscopy and analysis with Oil Red O stain showed lipid laden macrophages, consistent with other case reports of VAPI. The patient continued to clinically improved and after the fourth day of steroids he was on room air.

IMPACT/DISCUSSION: Diagnosis of VAPI is highly dependent on obtaining a thorough social history. Patients may be reluctant to offer this information, but after establishing rapport this part of the history can be revisited. This patient had multiple potential environmental exposures that could have contributed to his condition, including his work and home environment.

There are no current guidelines for treatment of VAPI, some case reports have used doses of 1-1.5mg/kg of prednisone daily. In this case, diagnosis was uncertain and there was a potential risk that we would administer steroids to a patient with an active infection. Primary team chose to treat with 40mg per day of prednisone, a compromise between 80mg (based on weight and case reports) and no treatment at all.

CONCLUSION: If treatment has been given sufficient time to work but has been unsuccessful, then differential diagnosis should be re-formulated.

Patients may present with a diagnosis where guidelines for treatment do not exist or may be inconsistent. Consultants are frequently asked for their expert opinion but ultimately the primary physician must make the final decision for appropriate management.

VAPING AND SMOKING ASSOCIATED ACUTE EOSINOPHILIC PNEUMONIA

Einat Kadar[1]; Benjamin Benhuri[1]; Vishad Sheth[2]; Nan Li[2]; Matthew Harrington[1]. [1]Department of Medicine, Mount Sinai Beth Israel, New York, NY; [2]Division of Pulmonary, Critical Care, & Sleep Medicine, Mount Sinai Beth Israel, New York, NY. (Control ID #3392047)

LEARNING OBJECTIVE #1: Recognize clinical characteristics of acute eosinophilic pneumonia (AEP) and its association with tobacco smoking.

LEARNING OBJECTIVE #2: Explore clinical and histologic features of vaping-associated lung injury.

CASE: A 57-year-old man presented to the hospital with 2 days of dyspnea, fever, and cough. He had recently relapsed to smoking cigarettes and began "vaping" nicotine-containing electronic cigarettes two weeks prior to presentation. The patient was ill-appearing, dyspneic, with SpO2 94% on room air. Lung sounds were diminished, with egophony and whispered pectoriloquy in the right lung field. Labs included WBC 22.7 K/uL with 90% neutrophils, and chest x-ray showed a diffuse interstitial pattern with right lower lobe opacities. Ceftriaxone and azithromycin were initiated for empiric community-acquired pneumonia treatment. Influenza, respiratory virus PCR panels, blood cultures, and HIV testing were all negative. By hospital day 3, the patient had progressive dyspnea and worsening hypoxemia that required supplemental oxygen. Lab work was notable for eosinophilia to 1.6K/uL; non-contrast CT chest revealed patchy ground glass opacities and interlobular septal thickening. He underwent bronchoscopy and bronchoalveolar lavage (BAL), which showed acute inflammation and reactive atypia. Transbronchial biopsy revealed chronic inflammation and increased eosinophil count, however lipid-laden macrophages were not seen on BAL or biopsy. Acute eosinophilic pneumonia (AEP) was suspected, and the patient was treated with prednisone 40mg orally daily with improvement in his symptoms. He was discharged with a corticosteroid taper and was asymptomatic at one-month follow-up. Repeat CT chest showed near complete resolution of previous airspace disease.

IMPACT/DISCUSSION: The clinical and pathologic spectrum of vaping-related illness remains incompletely explored. Studies have demonstrated that vaping results in cytokine-mediated inflammation. Recent reports have described pulmonary diseases associated with vaping, particularly acute lipoid pneumonia and diffuse alveolar hemorrhage. AEP, a febrile respiratory illness with hypoxemia, bilateral pulmonary infiltrates, and eosinophilia on BAL or lung biopsy, can be caused by recent onset of tobacco smoking or change in smoking habits. To our knowledge, AEP associated with vaping has been described in two case reports. Our patient's case adds to the evidence suggesting an inflammatory pathophysiology of vaping-associated pulmonary disease.

CONCLUSION: It is important for clinicians to be aware of the spectrum of tobacco-associated lung injury syndromes. Clinical suspicion must remain high for vaping- or smoking-associated lung injury in patients with a history of use of these products who present with acute respiratory illness without clear infectious etiology. Further research is warranted to characterize the disparate clinical and pathologic presentations of vaping-associated pulmonary disease.

VAPING-ASSOCIATED LUNG INJURY IN A PATIENT WITH FEVER AND DECREASED EXERCISE CAPACITY

Amna Aijaz, Mai Takahashi, Svetlana Chernyavsky. Internal Medicine, Mount Sinai Beth Israel, New York, NY. (Control ID #3361762)

LEARNING OBJECTIVE #1: To recognize that E-Cigarette or Vaping Associated Lung Injury (EVALI) may have a variety of different presentations, including fever.

LEARNING OBJECTIVE #2: To emphasize that this is a growing area of study, with new literature developing knowledge about clinical presentation and etiology and evolving recommendations for prevention, diagnosis and management.

CASE: A 41 year old man presented with high-grade fever, chills and night sweats for 10 days. He had been diagnosed with a UTI and community acquired pneumonia (CAP) and received a course of

Levofloxacin, but fevers persisted so his PCP added Doxycycline. His fever broke at our ED, but night sweats continued. He also admitted some dyspnea on exertion (DOE). He used to smoke marijuana but started vaping 10 months back. He got it from a store, the cartridges containing tetrahydrocannabinol (THC). However, the last cartridge was from a friend with unknown contents. He had quit 2 weeks back ever since new evidence of vaping complications emerged. His exam revealed clear lungs. He had an elevated ESR, CRP and LDH with a normal procalcitonin and WBC count. CXR showed bilateral infiltrates (recently only seen on the left side). A CT chest showed diffuse ground-glass opacities (GGOs) and centrilobular micronodular disease. All infectious work-up came back negative (HIV, Histoplasma, Cryptococcus, Babesia, Lyme, Coxiella, AFB and a viral respiratory panel). He received empiric coverage for CAP. He underwent a bronchoscopy that showed a predominance of macrophages (55%). The case was reported to the US DOH who endorsed not starting steroids since supplemental oxygen was not required.

IMPACT/DISCUSSION: The CDC has reported 2290 cases of EVALI from 49 states with 47 deaths from 25 states as of November 20, 2019. THC and Vitamin E acetate have been implicated and recommended to be avoided. Clinical presentation is quite variable with respiratory, and constitutional symptoms and imaging with pulmonary infiltrates on CXR and opacities on CT. Histopathological findings reported patterns of acute lung injury, including acute fibrinous pneumonitis, diffuse alveolar damage, or organizing pneumonia, usually bronchiolocentric and accompanied by bronchiolitis (6). Generally, foamy macrophages and pneumocyte vacuolization were found on BAL/biopsy. For medical therapy, initiation of corticosteroids is recommended if severe, except when fungal/viral infection is suspected. This is a diagnosis of exclusion so other etiologies must be investigated along with early treatment for CAP. A CXR should be obtained on all patients with a history of e-cigarette or vape use who have respiratory or gastrointestinal symptoms, particularly when accompanied by decreased O2 saturation (<95%).

CONCLUSION: EVALI must be on the differential in patients presenting with fevers with a vaping history, particularly with the use of a THC vape. In milder cases, steroids are not indicated. Recommendations are being updated frequently as we better try to explain and manage this disease.

VENOUS THROMBOEMBOLISM IN EVANS SYNDROME

Anthi Katsouli. Internal Medicine, Hospitalist, Loyola University Medical Center, South Barrington, IL. (Control ID #3344241)

LEARNING OBJECTIVE #1: Recognizing Evans Syndrome as many patients are not treated appropriately and/or not offered appropriate prophylaxis for their level of thrombotic risk

CASE: A 74-year-old female with a past medical history of hypertension who presented with gingival bleeding. On physical exam, there was dried gingival blood present with diffuse petechiae and ecchymosis over upper and lower extremities. Her labs were remarkable for platelet count of 5 from a baseline of 150K, Hgb 8. 2 with normal MCV, and WBC of 5.6. APTT and PT were slightly elevated and D-Dimer was at 2287 with normal fibrinogen. Her basic metabolic panel was unremarkable. Her hemolysis panel was positive with low haptoglobin, and elevated LDH and indirect bilirubin. Her peripheral smear showed no schistocytes. The direct antiglobulin test was positive with IgG and anti-complement antibodies indicating an immune hemolysis (AIHA). Evans Syndrome (ES) suspected given comorbid autoimmune hemolysis. DIC was excluded given normal fibrinogen and mildly abnormal coagulation profile and TTP was also excluded given normal creatinine and no schistocytes. The 4Ts Score was low <3 points and the SRA was normal. Other pertinent labs included normal B12/folate, copper/zinc levels and TSH. Part of the rheumatological work up showed negative ANA, RF, anti-double stranded DNA and anti-CCP antibody testing. Infectious work up was negative for CMV, VZV, HIV, Hepatitis B and C. Pt had also normal spleen on images. Doppler of the upper and lower extremities showed evidence of acute deep venous thrombosis in the common femoral and popliteal veins of the right leg. Computed tomographic pulmonary angiography showed pulmonary emboli within the right lobar pulmonary artery. Hematology consulted who suggested starting prednisone and IVIG. Patient's platelets improved to 150K. Pt was started on heparin drip when her platelet improved above 30K. Hypercoagulable work up revealed normal anticardiolipin and B2glycoprotein but mildly elevated lupus anticoagulant.

IMPACT/DISCUSSION: ES refers to the combination of Coombs-positive warm AIHA and immune thrombocytopenia, although, less commonly, some patients will also have autoimmune neutropenia. Although many cases are idiopathic in origin, ES has been associated with a number of other conditions in approximately one-half of the cases, including infections (eg, HCV, HIV), systemic lupus erythematosus, lymphoproliferative disorders, common variable immunodeficiency, and autoimmune lymphoproliferative syndrome.

CONCLUSION: This case illustrates that ES is a rare autoimmune disorder where immune system destroys body's RBC, WBC and platelets. It is a diagnosis of exclusion and any trigger that induces immune system for example infection, inflammatory disorder or lymphoproliferative disorder can be a potential cause. It is usually chronic with periods of worsening symptoms and remissions. VTE is reported up to 8% in patients with IPT and 15-33% with AIHA but the risk of thrombosis is limited for Evans syndrome.

VENTRICULAR FIBRILLATION ARREST: A RARE COMPLICATION OF NIVOLUMAB & IPILIMUMAB

Zoya Iqbaluddin[1]; Dalia Kaakour[2,1]; James Ruether[1]. [1]Internal Medicine, Christiana Care, Newark, DE; [2]Miller School of Medicine, University of Miami, Miami, FL. (Control ID #3391782)

LEARNING OBJECTIVE #1: Recognize a rare and potentially fatal complication from checkpoint inhibitor immunomodulatory therapy

CASE: A 64 year old male with history of colon cancer and active metastatic malignant melanoma presented to the hospital after being noted to have hypotension at outpatient oncology follow-up visit. Shortly after arrival to the ED, patient went into cardiac arrest secondary to ventricular fibrillation. He had no primary cardiac history prior to this admission. Melanoma treatment included therapy with ipilimumab and nivolumab for four cycles, after which he was treated with nivolumab alone. Ventricular fibrillation arrest took place approximately 3 weeks after last dose of nivolumab. Echocardiogram revealed mildly reduced left ventricular systolic function (ejection fraction approximately 40-44%, global mild hypokinesis), and intermittent interventricular septal flattening with borderline right ventricular enlargement. Non-sustained polymorphic ventricular tachycardia with torsades was also noted. Pharmacologic stress test was negative for evidence of ischemia, with normal myocardial perfusion. Cardiac MRI was not pursued. After stabilization for streptococcal bacteremia, an automated implantable cardioverter defibrillator (AICD) was placed. Subsequent complications during this hospital course included central adrenal crisis, DIC, aseptic meningitis, and acute renal failure. Given this patient's history and clinical course, it is believed his treatment with immunomodulatory therapy played significant, causal roles in the above complications.

IMPACT/DISCUSSION: Checkpoint inhibitors represent a relatively new class of immunomodulatory treatment used to treat a variety of cancers, and have substantially improved the prognosis for some patients with advanced malignancies such as melanoma, non-small cell lung

cancer, and renal cell carcinoma. A broad range of immune-related adverse effects (IRAE) attributable to checkpoint inhibitors are increasingly being seen, primarily affecting integumentary, GI including hepatic, and endocrine systems, as well as other less common examples. While myocarditis has been found in a handful of cases, exceedingly few descriptions of ventricular fibrillation arrest have been reported. Studies have noted the onset of adverse cardiac effects generally within 2 to 31 weeks following initiation with checkpoint inhibitor therapy. Very rare cases noted fatal cardiac arrhythmias two weeks following initiation with dual checkpoint inhibitor therapy with nivolumab and ipilimumab. Treatment for IRAE due to checkpoint inhibitor therapy includes cessation of the offending agent and often also systemic corticosteroids. Given the rise of immunomodulatory therapy for these common malignancies, promoting recognition of potentially fatal complications is essential to allow close monitoring as well as early treatment of such.

CONCLUSION: This report presents a case of ventricular fibrillation thought to be caused by checkpoint inhibitor therapy with nivolumab and ipilimumab.

VERTEBRAL OSTEOMYELITIS MASQUERADING AS PULMONARY EMBOLISM

Demian J. Omeh, Moe Ameri, Chris Elsayad. Internal Medicine, Nassau University Medical Center, East Meadow, NY. (Control ID #3391707)

LEARNING OBJECTIVE #1: Diagnose pyogenic vertebral osteomyelitis with atypical presentation

LEARNING OBJECTIVE #2: Recognize mimics of pulmonary embolism

CASE: 58-year old male presented to the emergency room with pleuritic chest pain, shortness of breath, and back pain. His past medical history includes hypertension, dyslipidemia, deep vein thrombus, recurrent pulmonary embolism, coronary artery disease with percutaneous coronary intervention, and paroxysmal atrial fibrillation. He was afebrile and had an oxygen saturation of 91% on room air. The rest of the physical exam was significant for irregularly irregular heart rhythm, left lower quadrant, and left-sided costovertebral angle tenderness. Computed tomography pulmonary angiography was negative for pulmonary embolism. He had leukocytosis, elevated erythrocyte sedimentation rate (ESR) and C-reactive protein (CRP), and methicillin- sensitive Staphylococcus aureus (MSSA) bacteremia. Magnetic resonance imaging (MRI) of the thoracic and lumbar spine revealed left psoas abscess and osteomyelitis of the L3/L4 vertebrae. Computed tomography (CT) guided aspiration of the psoas abscess was done. Aspirate grew MSSA as well. Transesophageal echocardiography (TEE) did not reveal any valvular vegetation. The patient is currently receiving intravenous antibiotics with good clinical improvement.

IMPACT/DISCUSSION: The incidence of pyogenic vertebral osteomyelitis is about 2.4 cases per 100,000 population. The diagnosis can be challenging given the high prevalence of back pain in the general population, the rarity of the disease, and the wide spectrum of clinical presentations. Back pain and fever are the most common presenting symptoms. Our patient had a predominance of chest symptoms, which warranted initial workup for pulmonary embolism. Risk factors include injection drug use, diabetes mellitus, malignancy, long term steroid use, malnutrition, and infection with human immunodeficiency virus (HIV).

Our patient had none of these traditional risk factors. Pathogenesis involves direct inoculation, hematogenous spread, or contiguous spread from adjacent soft tissue infection as in our patient. Staphylococcus aureus and Streptococcus species are isolated in over 50% of cases. MRI is the preferred imaging modality. Blood culture and CT guided biopsy of the involved vertebrae are vital in making a microbiological diagnosis. ESR and CRP are highly sensitive and are useful in monitoring response. Antimicrobial treatment should be directed against an identified organism, and duration of therapy typically ranges between 4 and 6 weeks.

CONCLUSION: High index of clinical suspicion is vital in making prompt diagnosis in cases of pyogenic vertebral osteomyelitis with atypical presentation.

Microbiological diagnosis from tissue biopsy is imperative, and directs the antimicrobial therapy.

VIRAL, BACTERIAL OR BOTH? AN UNUSUAL CASE OF KLEBSIELLA PHARYNGITIS IN THE PRESENTATION OF ACUTE HIV INFECTION

Rebecca Grohman, John Martin, Rushi Talati. Internal Medicine, NYU, Brooklyn, NY. (Control ID #3390696)

LEARNING OBJECTIVE #1: Recognize potential co-existing bacterial infections in the presentation of acute HIV infection

LEARNING OBJECTIVE #2: Recognize receptive oral intercourse as a risk factor for HIV transmission

CASE: A 61 year-old male presented to clinic with five days of objective fevers, malaise, anorexia and diarrhea. Physical exam was initially unremarkable and a non-specific viral syndrome was suspected. He was instructed on supportive care and given return precautions. Eleven days later, he returned for persistent fevers and new-onset sore throat. Additional history revealed he had engaged in receptive oral intercourse with a male partner three weeks prior. He denied anal or vaginal intercourse for the past six months. Outside records revealed a negative HIV test two months prior to presentation. Exam was now notable for anterior cervical lymphadenopathy, a white macule on the soft palate and mild oropharyngeal erythema. Rapid strep testing was negative and throat culture was obtained. Acute HIV and other diagnoses were considered and a broad STI workup was sent. He was called back four days later for positive Klebsiella pneumoniae on throat culture, at which time he was started on Augmentin with rapid improvement in odynophagia. Fourth generation HIV testing resulted positive and was confirmed with PCR. At his fourth visit, he was informed of the diagnosis and counseled appropriately. He was eager to initiate therapy and was escorted by an HIV case manager to an affiliated HIV clinic for treatment and care coordination.

IMPACT/DISCUSSION: To our knowledge, this is the first report of K. pneumoniae pharyngitis in the setting of acute HIV. Though an unusual source of pharyngitis, K.pneumoniae has been associated with deep neck space infections, primarily in Asia. While an increased susceptibility to other infections in acute HIV is not well known, it is well-established that gut-associated lymphoid tissue is among the earliest targets of HIV. This may suggest an area of further research on the risk of bacterial infections in acute HIV.

Additionally, this case demonstrates HIV transmission through receptive oral intercourse, which has previously been estimated as occurring in 0-4/10,000 exposures. For comparison, receptive anal intercourse is estimated at 138/10,000.

This patient's symptoms began in late fall and were initially suspicious for a benign viral syndrome. Fortunately, he returned when symptoms persisted, allowing for additional history gathering and diagnostic evaluation. This case highlights the utility of obtaining appropriate culture data and the importance of avoiding anchoring bias or availability heuristic.

Lastly, this case reinforces a multidisciplinary approach in managing new HIV diagnoses. Rapid availability of resources and treatment initiation can empower patients in disease management.

CONCLUSION: It is important to consider concomitant bacterial infections in the acute presentation of HIV Maintain a high suspicion for HIV even in the setting of recent negative serology and lower risk behaviors

VITAMIN B12 DEFICIENCY MIMICKING ACUTE LEUKEMIA

Jessica Wu[2]; Tu N. Nguyen[1]; Amanda Ewing[1]. [1]Internal Medicine, Cedars-Sinai Medical Center, Los Angeles, CA; [2]UCLA, Los Angeles, CA. (Control ID #3391650)

LEARNING OBJECTIVE #1: Understand the presentation of vitamin B12 deficiency, including in severe cases

LEARNING OBJECTIVE #2: Develop differential diagnosis for pancytopenia

CASE: A 39-year-old male with no significant past medical history presented with four months of 20-lb weight loss, fatigue, generalized weakness, dizziness and leg swelling. He initially had a self-limiting episode of cough and chills, and subsequently developed fatigue, leg swelling, and multiple atraumatic bruises. He was found to have pancytopenia requiring multiple blood transfusions. Physical exam was notable for scattered petechiae and bilateral pitting edema. There was absence of scleral icterus, glossitis, and hepatosplenomegaly.

Labs were notable for pancytopenia (WBC 1.73 with ANC 0.64, Hgb 7.4 with MCV 101, PLT 68). Reticulocyte count was 0.85%, and bilirubin and LDH were both elevated at 2.2 (predominantly direct) and 1938, respectively. Vitamin B12 was low at 162 with elevated homocysteine and normal MMA; folate was low at 1.9. Peripheral smear showed hypersegmented neutrophils, 1+ schistocytes, anisopoikilocytosis, and hairy-like projections on lymphocytes. Infectious workup with HIV, hepatitis, and EBV was negative. Given clinical suspicion for leukemia, the patient underwent a bone marrow biopsy, which showed hypercellular (90%) marrow for age with no increase in blasts, increased iron storage, macrocytic anemia, and thrombocytopenia, consistent with vitamin B12 and folate deficiency. The patient was started on cyanocobalamin 1000 mcg SC daily and folic acid 1 gm daily with improvement of pancytopenia within days. His vitamin B12 and folate deficiency were likely due to a malabsorptive process or restrictive diet while living overseas, as the patient was found to have other deficiencies, including vitamin D and zinc.

IMPACT/DISCUSSION: Vitamin B12 and folate are required in the DNA synthesis process of hematopoiesis. Deficiency typically presents as anemia and neurologic abnormalities; however, severe deficiency can lead to pancytopenia and extramedullary hemolysis, mimicking acute leukemia. Evidence of hemolytic anemia can be seen with elevated LDH and bilirubin, schistocytes in the peripheral blood smear, as well as icterus and hepatosplenomegaly. Bone marrow biopsy is needed to rule out leukemia, and would characteristically show hypercellular and dysplastic cells but with no evidence of infiltrative disease.

Underlying cause of the deficiency needs to be investigated, including pernicious anemia due to autoantibodies against intrinsic factor or gastric parietal cells, strict vegan diet, malabsorption due to celiac disease, IBD, and pancreatic insufficiency.

CONCLUSION: Vitamin B12 deficiency is a known cause of megaloblastic anemia and bone marrow suppression, classically presenting with macrocytic anemia and hypersegmented neutrophils. Severe cases may mimic the presentation of an infiltrative bone marrow process due to hematologic malignancy, making diagnosis and appropriate treatment a challenge.

WALDENSTRöM MACROGLOBULINEMIA – A DIAGNOSTIC ENIGMA!

Rohit R. Goel[1]; William C. Keimig[2]. [1]Internal Medicine, Henry Ford Hospital, Detroit, MI; [2]Internal Medicine, Henry Ford Hosptial, DETROIT, MI. (Control ID #3374193)

LEARNING OBJECTIVE #1: Recognize the clinical features of Waldenström macroglobulinemia.

LEARNING OBJECTIVE #2: Discuss the management of Waldenström macroglobulinemia.

CASE: In 2019, an 87-year-old Caucasian male with a history of chronic back pain presented to his primary care doctor's office with a chief complaint of low back pain. In 2004, an X-ray of the lumbosacral spine revealed mild lumbar spondylosis. His back pain began after bending over to pick up his wife. He denied recent trauma, fevers, chills, intravenous drug use, unexplained weight loss, history of malignancy, saddle anesthesia, bowel or bladder incontinence or progressive weakness. He was referred to pain medicine for consideration of steroid injection. MRI lumbar spine was ordered which showed a pathologic compression fracture of L4 with abnormal bone marrow involvement of the left iliac wing. MRI cervical, thoracic spine and CT chest, abdomen and pelvis were ordered to work up malignancy. CT was without metastatic disease. Repeat MRI showed diffuse heterogeneous bone marrow signal concerning for an infiltrating process. The patient was referred to oncology clinic. His father passed away from lymphoma. Physical exam revealed a well appearing male without adenopathy or midline spinal tenderness. Labs showed WBC 7.2, Hb 15.1, platelet count 250, monocytes elevated to 1.0. IgM was elevated to 1,694 while IgG and IgA levels were decreased. 24-hour urine protein collection was negative. Bone marrow biopsy showed CD5 negative/CD10 negative B-cell lymphoproliferative disorder involving approximately 35% of the marrow cellularity. The differential included marrow involvement by a B-cell non-Hodgkin lymphoma such as lymphoplasmacytic lymphoma (favored by the presence of IgM monoclonal gammopathy) and marginal zone lymphoma. The MYD88 L265P mutation was negative.

IMPACT/DISCUSSION: Waldenström macroglobulinemia is a rare clinicopathologic entity demonstrating bone marrow infiltration by lymphoplasmacytic cells and a serum IgM gammopathy. Elderly, white males are more commonly affected with an annual incidence of 3-4 persons per million. Symptoms are due to the infiltration of lymphoplasmacytic cells in the bone marrow and IgM gammopathy of the blood. Milder symptoms can be secondary to anemia and organomegaly, while more severe symptoms can be due to CNS involvement and hyperviscosity syndrome. Diagnosis is made by monoclonal IgM gammopathy and a bone marrow biopsy demonstrating greater than 10% infiltration by small lymphocytes with a typical immunophenotype. The differential diagnosis includes IgM MGUS, CLL, marginal zone lymphoma and mantle cell lymphoma. Asymptomatic patients are managed by observation alone while symptomatic patients are treated with chemotherapy.

CONCLUSION:

- Waldenström macroglobulinemia is a rare clinicopathologic entity demonstrating bone marrow infiltration by lymphoplasmacytic cells and a serum IgM gammopathy.
- Asymptomatic patients can be managed by observation alone while symptomatic patients are treated with chemotherapy.

WASTING AWAY AGAIN IN MARAGARITAVILLE: A CASE OF DIABETIC NEUROPATHIC CACHEXIA

John Suder[2]; Garrett Bourne[3]; Francisco Diaz Viera[2]; Meghana Gadgil[1]. [1]Population Health & Internal Medicine, Dell Medical School, Austin, TX; [2]Internal Medicine, Dell Medical School, UT Austin, Austin, TX; [3]Dell Medical School, Austin, TX. (Control ID #3385888)

LEARNING OBJECTIVE #1: Diagnose Diabetic Neuropathic Cachexia

LEARNING OBJECTIVE #2: Manage patients with Diabetic Neuropathic Cachexia based on available evidence

CASE: 55 M presented with an unintentional 35lb weight loss over two months and an inability to ambulate for three weeks due to numbness and

pain in his feet and lateral thighs. The patient reported anorexia, nausea and occasional non-bloody, non-bilious emesis. PMH included DM2, hypertension, peripheral arterial disease with a femoral bypass, and hyperlipidemia. A colonoscopy three years prior showed three tubular adenomas. ROS was positive for polyuria, polydipsia, and constipation.

Home meds included insulin approximately every other day and aspirin prn for pain. He did not measure blood glucose at home. Patient did not drink alcohol, worked as a mechanic and lived with his family.

Exam was notable for cachexia with bitemporal wasting and significant subcutaneous fat loss. The plantar aspect of both feet was exquisitely tender to palpation. The lateral thighs were minimally tender to palpation. Labs showed blood glucose 559 mg/dL and HbA1c >14. Creatinine, folate, B12, troponin x3, creatine kinase, HIV and TSH were all within normal limits. His peripheral smear, SPEP, UPEP and admission EKG were unremarkable. CT chest /abdomen/ pelvis demonstrated pulmonary nodules and LLL and lingual opacifications. Bilateral lower extremity arterial doppler studies were normal. The anti-GAD 65, anti-islet cell antibodies, insulin antibodies, and zinc transporter 8 antibodies were all negative.

The patient was treated with a high-calorie diet, insulin, gabapentin and empiric ceftriaxone and azithromycin for community acquired pneumonia. For several days, he reported no improvement in his symptoms of pain and numbness. On day five the initiation of capsaicin cream resulted in an almost immediate relief of lower extremity neuropathic pain. As glycemic control improved, the patient's appetite returned and before discharge he was able to ambulate independently.

IMPACT/DISCUSSION: Diabetic neuropathic cachexia (DNC) is a rare diabetic complication that presents with profound weight loss and severe bilateral neuropathic pain in the lower extremities. DNC was first defined in 1974 and only a few dozen cases have been reported to date.

The mechanism is hypothesized to be immune related. DNC is not tied to glycemic control (cases include patients with A1c as low as 6.2%). Patients report depression, impotence and postural hypotension, polyuria, polydipsia and gastrointestinal symptoms related to impaired peristaltic activity: nausea, vomiting, early satiety and constipation. DNC is more common in males and most patients do not experience a recurrence after treatment.

CONCLUSION: - DNC is a rare and poorly- understood diabetic complication with neuropathic and autonomic symptoms

- Management includes nutrition, improved glucose control and topical capsaicin

- Familiarity with DNC will enable internists to rapidly diagnose and treat this apparently reversible condition

WEIGHT LOSS SURGERY AND ITS' POTENTIAL RISK OF CANCER

Sruthi Sathyakumar[1]; Sophia Binz[2]. [1]Internal Medicine, Wayne State University School of Medicine, Troy, MI; [2]Henry Ford Hospital, Detroit, MI. (Control ID #3391993)

LEARNING OBJECTIVE #1: Recognize the need to screen for gastric cancers in patients who have undergone bariatric surgery

CASE: We present a case of a 66 year old woman with a BMI of 29 status post gastric sleeve surgery 9 years prior who presented with worsening dysphagia and weight loss. Over the last year, she reported nausea and vomiting associated with progressive dysphagia. At presentation, she was unable to tolerate any oral intake. During the two months prior to presenting, she had a 55 pound unintentional weight loss. The patient's primary care provider ordered a barium swallow study, which showed evidence of acid reflux. She was treated with a proton pump inhibitor (PPI) and referred to gastroenterology (GI). An esophagogastroduodenoscopy (EGD) revealed an anastomotic ulcer. Biopsies taken from the patient's EGD revealed gastric adenocarcinoma. Endoscopic ultrasound (EUS) was performed for staging: it was limited as the scope was not able to transverse the mass; however, staging was identified as T3N2Mx. A diagnostic laparoscopy was planned for further staging and a jejunostomy tube (J-tube) for nutrition. Unfortunately, prior to surgery the patient left the hospital against medical advice.

IMPACT/DISCUSSION: This is the sixth documented case of gastric or esophageal adenocarcinoma arising after sleeve gastrectomy [1-5]. This correlation is rare, but has been increasingly noted in the literature. A study of 17 patients found that cancer was often diagnosed at a mean of 8.6 years after bariatric surgery with adenocarcinoma being the most common form [6]. Unfortunately, most of the cancers are diagnosed late because they are often asymptomatic or present with non-specific symptoms such as nausea, vomiting, and dysphagia [5].

Diagnosis is difficult and delayed due to the lack of screening guidelines. Currently, different recommendations exist. Some studies recommend initiating pre-operative EGD screening for bariatric surgeries as obesity itself is known to increase the likelihood of adenocarcinomas [3,7]. Others recommended early and consistent EGD screening post-operatively; whereas, other experts recommend EGD screening only in symptomatic post-operative patients [1,2,4]. Currently, post-operative management of bariatric surgery focuses on nutritional status and lifestyle changes with scant recommendations on cancer screening. This highlights the lack of symptomatic monitoring and cancer screening in the post-bariatric surgery patient population. The absence of more standardized recommendations for such screening puts these patients at risk for late diagnoses of these cancers. Although rare, the occurrence of gastro-esophageal carcinomas post bariatric surgery is concerning and merits a more standardized management protocol.

CONCLUSION: -Lack of official cancer screening in post-bariatric surgery patients who have increased risk of developing cancer due to a history of obesity and the surgery itself

-Providers should be able to recognize the need for cancer screening in post-bariatric surgery patients

WERNICKE'S ENCEPHALOPATHY PRESENTING AS CONFUSION IN A PATIENT WITH NASOPHARYNGEAL CARCINOMA

Jennifer A. Heinen. Medicine, Memorial Sloan Kettering Cancer Center, New York, NY. (Control ID #3392233)

LEARNING OBJECTIVE #1: Recognize the clinical features of Wernicke's encephalopathy in a cancer patient

CASE: A 53-year-old man with locally advanced nasopharyngeal carcinoma presented with one week of confusion, short-term memory loss, diplopia, and gait instability in the setting of one month of nausea, vomiting, and anorexia. He underwent a course of concurrent chemoradiation with cisplatin three months prior to presentation, followed by one cycle of cisplatin and 5-fluorouracil one month prior. His past medical history included hypertension, hyperlipidemia, and diabetes. He had no significant surgical history and denied alcohol use for over one year. Exam was remarkable for poor recall, bilateral cranial nerve VI palsies, horizontal nystagmus, and truncal ataxia. Diagnostic work-up included normal TSH and vitamin B12, as well as MRIs of the brain and spine, EEG, and lumbar puncture, all of which were unremarkable. Following one week of hospitalization and a change in providers, empiric IV thiamine at 500mg three times daily was initiated, and the patient's cranial nerve palsies resolved within 24 hours. He was continued at this dose for two more days, followed by 250mg IV for five days, and then 100mg orally daily thereafter. His cognitive dysfunction, ataxia, and nystagmus improved over weeks.

IMPACT/DISCUSSION: Internists increasingly care for patients with advanced malignancy. Confusion is a common complaint in this population and entails a broad differential. Wernicke's encephalopathy (WE) is a neurologic complication of thiamine deficiency associated with malnutrition. While most often associated with chronic alcoholism, this syndrome is likely underdiagnosed in cancer patients. The classic clinical manifestations include encephalopathy, oculomotor dysfunction (including nystagmus and bilateral lateral rectus palsy), and gait ataxia, although studies suggest that less than one third of patients present with all three. WE is a clinical diagnosis; no laboratory tests or imaging studies are diagnostic. Ocular abnormalities typically improve over hours to days with thiamine therapy, and confusion and ataxia improve over days to weeks; however, a majority of patients experience residual deficits. Early recognition and treatment can avoid life-threatening complications and reduce the risk of long-term neurologic sequelae. Studies in oncology patients are lacking and limited to case reports and small series. Clinicians must be aware of this association and have a low threshold to institute thiamine therapy in a cancer patient presenting with suggestive symptoms.

CONCLUSION: Wernicke's encephalopathy is a clinical diagnosis and should be considered in patients with advanced malignancy presenting with confusion.

IV thiamine therapy should be instituted rapidly if the diagnosis is suspected.

Transitions of care can provide important opportunities to reassess differential diagnosis.

WET, WOBBLY, AND A WEIRD DIAGNOSIS

Andrew J. Bradsher, Neha S. Teekappanavar. Medicine-Pediatrics, UAB, Irondale, AL. (Control ID #3392014)

LEARNING OBJECTIVE #1: Recognize the clinical features of chronic obstructive hydrocephalus in adults

LEARNING OBJECTIVE #2: Understand the importance of following asymptomatic hydrocephalus

CASE: Mr. L is a 48 year old male with intellectual disability, narcolepsy, movement disorder complicated by rheumatoid arthritis, sarcoidosis, bipolar disorder, depression, seizures who presented to clinic after several years. He was referred from a low-income clinic for a high PSA, but had notable gait instability with increasing falls and had required a walker over the past two years. He also had increasing visual blurriness, increased urinary frequency and dysuria in the same time period. His mother reported progressive functional decline since his 30's, and a history of congenital hydrocephalus without prior interventions.

Exam: Vitals: 98.5 F, HR 58, RR 15. Gen: Middle aged male, NAD. HEENT: PERRL, EOMI, no cervical lymphadenopathy. Ophthalmic exam deferred. Pulm: Clear to auscultation bilaterally. Cardiac: regular rhythm, no murmurs. Neuro: Cranial nerves and sensation intact. Decreased muscle mass. 4/5 strength in upper extremities bilaterally. No cogwheel rigidity or tremor. 3/5 strength in right hip and knee, and 4/5 on left. Unsteady, wide-based gait with multistep turns requiring stationary objects for stability. Abnormal finger-to-nose, disdiadochokinesia.

Lab: Clinic PSA elevated to 9.6 ng/mL. Other labs within normal limits.

Differential for ataxia included malignancy, cerebellar infarction, trauma/hemorrhage, obstructive hydrocephalus, neurosarcoidosis, CNS infection, nutritional deficiency or environmental exposures.

Clinical course: Initial MRI revealed chronic severe hydrocephalus, grossly unchanged compared to prior CT, with massive enlargement of third and lateral ventricles, normal sized fourth ventricle and probable focal obstruction of the inferior aqueduct of Sylvius. Mr. L was referred for endoscopic third ventriculostomy, but due to his anatomy and degree of hydrocephalus, is awaiting placement of a ventriculoperitoneal (VP) shunt.

IMPACT/DISCUSSION: Obstructive hydrocephalus classically presents with urinary incontinence, cognitive decline, personality changes, seizures, or gait deviations; aqueductal stenosis is a common congenital cause, although it can be acquired. Diagnosis is challenging in patients with compound neuropsychiatric and/or urologic diagnoses due to slow progression of symptoms over year and is easily missed. Cognitive decline often occurs in parallel with motor deficits and can progress to dementia with irreversible ischemic injury, particularly to white matter. Treatment is almost always surgical with VP shunts in childhood. Patients may require multiple revisions due to infections or shunt malfunctions. Endoscopic third ventriculostomy can be another effective mode of treatment.

CONCLUSION: While most cases are treated during childhood, this case highlights the importance of consistent follow up and transitions of care from pediatrics to adulthood especially given its prolonged course

WHAT YOU CAN'T SEE IS WHAT YOU GET

John Xie[1]; Jerald L. Taggart[2,1]. [1]Internal Medicine, Tulane, New Orleans, LA; [2]Medicine, SLVHCS/Tulane University, New Orleans, LA. (Control ID #3373139)

LEARNING OBJECTIVE #1: Describe the inpatient workup of cholestatic liver disease

LEARNING OBJECTIVE #2: Recognize the importance of liver biopsy in the workup of unexplained cholestatic liver disease

CASE: A 70-year-old man presented with "itching all over" for several months. Hydroxyzine did not provide any relief. No pain, fevers, chills, sweats or recent medication changes were reported. He has a history of type 2 diabetes mellitus and an alcohol use disorder.

Scleral icterus and diffuse skin excoriations were present on exam.

Total Bilirubin level was 16.2 mg/dL with a direct bilirubin of 9.4 mg/dL, Alkaline phosphatase was 1382 IU/L, AST of 160 IU/L, and ALT of 125 IU/L. Gamma-Glutamyl Transferase (GGT) was elevated at 1622 IU/L. AMA, ASMA, ANA, Acute Hepatitis Panel, EBV, CMV, and HIV all returned negative. A right upper quadrant (RUQ) ultrasound was unrevealing.

He subsequently underwent ERCP and EUS, which were also unremarkable. A liver biopsy was obtained at the time of EUS, demonstrating severe portal bridging fibrosis with cholestasis, bile ductopenia, and no features suggestive of PBC or PSC.

Given his cholestatic liver injury and bile ductopenia, he was diagnosed with vanishing bile duct syndrome (VBS). He was treated with cholestyramine and ursodiol. At a follow-up he reported resolution of pruritis.

IMPACT/DISCUSSION: Cholestasis can occur through either extrahepatic and intrahepatic biliary obstruction. A right upper quadrant ultrasound evaluates for extrahepatic causes (i.e. related to a stone or malignancy) followed by an ERCP to confirm the diagnosis. If the ultrasound is not consistent with extrahepatic cause of cholestatic liver disease, intrahepatic causes must be considered and can include drug toxicity, PBC, PSC, and viral hepatitis. Investigation with a detailed medication history and specific labs (AMA, ASMA, ANA, Acute Hepatitis Panel, EBV, and CMV). In the case of PSC or PBC, ERCP or MRCP is often completed to confirm the diagnosis.

In the vast majority of cases, ERCP provides the etiology of cholestatic liver injury. However, when all of these tests are unrevealing, liver biopsy is indicated to investigate rarer causes of liver injury such as infiltrative diseases (amyloidosis, sarcoidosis, lymphoma) and VBS.

VBS is a rare manifestation of cholestatic liver injury. It is a pathological diagnosis characterized by a scarcity of intralobular bile ducts on liver biopsy and persistent elevations in serum alkaline phosphatase and bilirubin for at least 6 months. It is typically caused by drug-induced liver injury, most commonly penicillin, fluoroquinolones, macrolides, and anticonvulsants. Our patient did not take any of these medications – as such, the cause remains unclear. For treatment, ursodiol has been cited to have a positive effect in some case while others have documented gradual improvement without any specific intervention.

CONCLUSION: If ultrasound and ERCP are unrevealing for an etiology of cholestatic liver injury, internists may need to consider liver biopsy to achieve the correct diagnosis.

WHAT'S IN A NAME?

Alice Kung[1]; Alaka Ray[2]. [1]Internal Medicine, MGH, Cambridge, MA; [2]General Medicine, Massachusetts General Hospital, Boston, MA. (Control ID #3392847)

LEARNING OBJECTIVE #1: Recognizing how word selection can have significant impact on the patient's care.

LEARNING OBJECTIVE #2: Preparing a script to talk to patients about new, serious diagnoses can lead to improved patient outcomes.

CASE: A 64 year-old woman with a history of lung cancer s/p resection, bipolar disorder, PKD on HD, and homelessness presents for follow up of an ED visit. A new lung nodule was found but the patient was not aware of the finding. Her resection for lung cancer had been 4 months ago. Knowing that this might be a sensitive topic, the PCP decided to use the word spot instead of nodule. She did not recognize the significance of the word spot and scheduled the repeat CT without further questions.

Months later, the PCP received a page from a case manager. The case manager shared that the word nodule was used to remind the patient about her CT. The patient was very distressed and informed the case manager that this was the first time she had heard the word nodule.

At subsequent visits the patient continued to be distressed. It resulted a damaged doctor-patient relationship due to loss of trust. Even at a visit for new cardiomyopathy, she was unable to discuss anything other than the decision to use the word spot over nodule. It became evident that the therapeutic relationship had been irreparably harmed. The PCP felt unable to provide the necessary care during repeat visits. The hospital's patient advocacy and legal department were engaged to draft a letter of termination as it was felt that it was in the patient's best interest to find a new PCP she could trust to provide ongoing care for her. After a year of many phone calls, visits, and conversations with subspecialty providers, the patient forgave the PCP and re- establish a therapeutic relationship.

IMPACT/DISCUSSION: Providers will relate to the temptation to convey difficult information in a simplistic way. On surface to save the patient from worry/anxiety, but perhaps more honestly to save time in a lengthy day. It was a split-second decision to use the word spot instead of nodule. Preparation prior to the visit, and using established scripts, could have prevented a poor choice in the moment. There is a growing realization of this and scripts have been developed for hospitalists to have difficult conversations with patients and for PCPs for end of life care. There has also been research done on how to talk to patients about pulmonary nodules. These already researched and prepared scripts are not widely known and are underutilized.

CONCLUSION: Word choice is an important part of our lives as physicians. In this commonly applicable case on lung nodules, we demonstrate that a momentary decision to choose one word over another can have a long-lasting impact on the patient's care. Physicians' discomfort with relaying difficult news can lead them to choose minimizing language that can mislead the patient. Familiarity with difficult conversation scripts can help physicians use appropriate language to educate and guide patients towards improved understanding.

WHEN A CHRONIC CO-MORBIDITY TRANSFORMS INTO A RAPID KILLER

Joshua Furtney. Internal Medicine, University of Florida, Gainesville, FL. (Control ID #3392375)

LEARNING OBJECTIVE #1: Recognize the rare complication of acute pulmonary failure due to AML crisis.

CASE: 58 year-old female with history of myelodysplastic syndrome admitted for dyspnea, with initial CT imaging demonstrating multifocal opacities read as scattered areas of nodular consolidation, consistent with multifocal pneumonia. She was started on broad spectrum antibiotics and transitioned to oral levofloxacin after cultures remained negative at 48 hours. Unable to be weaned off nasal cannula oxygen, she remained inpatient status through a 7-day treatment course. During this time, her CBC differential varied widely, with 7-25% blasts and 20-40% monocytes. Without significant improvement of dyspnea, but no further objective evidence of infection, a CT scan of her chest was repeated with a read of worsening diffuse pulmonary edema. Although no evidence of systolic or diastolic dysfunction on transthoracic echocardiogram, she did have elevated RVSP of 75mmHg. Aggressive diuresis was performed over several days until volume contracted. At this point, her respiratory status had worsened to needing ventimask for oxygen delivery. She was transferred to ICU where a bronchiolar lavage revealed 25% monocytes. She rapidly decompensated post-bronchoscopy and was intubated and started on vasopressors. The monocytic predominance was recognized as pulmonary manifestation of MDS progression to an acute leukemia. She was started on high intensity steroids and chemotherapy. The following day she passed away.

IMPACT/DISCUSSION: Myelodysplastic Syndrome (MDS) is a broad group of malignant hematopoietic stem cell disorders characterized by dysplastic production of any cell or platelet precursor. MDS can follow an indolent, course treated with supportive care and transfusions, or it can even evolve into an acute leukemia. In such cases, one may expect to find progressive symptomatic anemia, bruising or bleeding due to thrombocytopenia, or even evidence of leukostasis from high numbers of peripheral blasts. On CBC, increasing blast count can indicate progression of an MDS into AML. However, blasts may easily be mistaken for monocytes on a manual differential. In the case presented, the primary manifestation of her AML was monocyte flooding of the alveoli causing progressive respiratory failure.

CONCLUSION: Although AML is a known complication of MDS, the variability of its presentation can be difficult to recognize even when continuously monitored in an inpatient setting. Awareness of these complications may expedite appropriate chemotherapy, even in setting of atypical radiologic findings.

WHEN A LOW ADAMST13 IS NOT TTP: A CASE OF ATYPICAL HUS

Emily Jacobson, Julie E. Barrett. Internal Medicine, University of Michigan, Ann Arbor, MI. (Control ID #3391576)

LEARNING OBJECTIVE #1: Distinguish atypical hemolytic uremic syndrome (aHUS) from thrombotic thrombocytopenic purpura (TTP)

CASE: The patient is a 72 year-old woman who initially presented for shortness of breath and nausea. She has a history of primary biliary cirrhosis, HFpEF, PRES, and anemia. At the time of presentation, she

reported a month of nausea as well as increasing swelling in her legs and abdomen. On admission, she had normal vitals and exam showed diffuse anasarca. Labs were notable for hemoglobin 9.6 (around recent baseline), platelets 47,000 (had been ~70,000 in the months prior), creatinine 2.66 (from 1 a few weeks prior), and urinalysis with mild proteinuria. She underwent an extensive negative diagnostic work-up that included lymph node biopsy, full body FDG scan, and bone marrow biopsy (normal except a rare granuloma). Her acute kidney injury progressed and she was started on dialysis.

Several days into her admission, her ADAMTS13 level resulted <5% with inhibitor level of 36% consistent with severe acquired TTP. She was started on plasmapheresis and steroids, which she received regularly for 2 weeks without any improvement in her platelet count or ADAMTS13 level, which called the diagnosis into question. Although initial work-up was without evidence of hemolysis, her blood smear was reviewed again and showed 3 schistocytes per HPF. Given this finding along with her renal failure and poor response to plasmapheresis, it was thought that her diagnosis was actually atypical HUS. Of note, ADAMTS13 can be low in cirrhosis, which likely explains her persistently low values. She received rituximab infusions, at which point her platelet count finally started to rise. She ultimately had recovery of her renal function and a sustained improvement in her thrombocytopenia prior to discharge. Because she responded to rituximab, she did not receive eculizumab.

IMPACT/DISCUSSION: TTP and aHUS share several features including thrombocytopenia, microangiopathic hemolytic anemia, and renal impairment. In the past, the exact diagnosis was less important given both were treated with plasmapheresis. With the finding of prompt response to eculizumab (monoclonal antibody against C5) and potential for renal recovery in aHUS, though, getting the correct diagnosis has clear implications. Findings that are more supportive of TTP include lower platelet counts, less severe renal impairment, and severe ADAMTS13 deficiency (<5-10%) whereas more severe renal disease, including need for hemodialysis is more consistent with atypical HUS. The response to plasmapheresis is also another clue as typically platelet count and renal function improve within 4-5 days of plasmapheresis in TTP. If there is not a response to plasmapheresis, the diagnosis of atypical HUS should be considered.

CONCLUSION: Correctly diagnosing TTP versus aHUS has implications for treatment management.

Lack of responsive to plasmapheresis for presumed TTP should raise question of alternative diagnosis.

WHEN IT DOESN'T ALL PAN OUT – REMEMBER SAM

Joe Mcilwain, Roger D. Smalligan. Internal Medicine, UAB-Huntsville, Huntsville, AL. (Control ID #3391934)

LEARNING OBJECTIVE #1: Recognize causes of microaneurysms in abdominal vasculature

LEARNING OBJECTIVE #2: Distinguish between segmental arterial mediolysis (SAM) and polyarteritis nodosa (PAN)

CASE: A previously healthy 56yo white woman presented with sudden abdominal pain radiating to her back with nausea but no fever, chills, vomiting, diarrhea, urinary symptoms, headache, jaw claudication or history of trauma. PMH: no DM, HTN, or arthritis. Meds: oxybutynin; Surgery: cholecystectomy; Family Hx: neg for autoimmune disease; P/S: no smoking, ETOH or drugs. PE: alert woman in pain, BP 110/65, P 89, R 17, lungs clear; heart RRR without murmurs; abdomen: soft but exquisitely tender to palpation; neuro was normal and skin without subq nodules or livido. Normal body habitus and no unusual joint laxity. Labs: WBC 12.9k, Hgb 13, MCV 87, platelets 200k, BUN 16, Cr .8. Images: Contrast abdominal CT: hemoperitoneum and luminal irregularities suspicious for multiple aneurysms involving the SMA but no signs of bowel ischemia. Diagnostic laparoscopy revealed 1500cc of blood and clots; however, her entire small bowel and colon were well-perfused. Extensive rheum/autoimmune workup was negative including rheumatoid factor, ANA, PR3-ANCA, MPO-ANCA, anti-CCP, dsDNA as well as hepatitis B and C. CT angiogram of the abdomen showed 5 splenic artery aneurysms (9mm), a right renal artery aneurysm and various small aneurysms throughout the splanchnic mesentery. CTA of the head was largely unremarkable. High dose steroids were used initially but were stopped once the diagnosis of SAM was made. A splenectomy was recommended for definitive diagnosis and due to the risk of bleeding but that is pending the healing of her intestinal lesions.

IMPACT/DISCUSSION: Systemic arterial mediolysis is a rare, noninflammatory, vascular condition that affects medium to large abdominal arteries. SAM is characterized by lysis of smooth muscle in the medial arterial layer. The differential for SAM includes polyarteritis nodosa, fibromuscular dysplasia, and various connective tissue diseases. This case shows the importance of early differentiation between PAN and SAM. SAM is a self-limited disease process requiring supportive care whereas PAN has a poorer prognosis and requires strong immunosuppressant therapy which can be toxic. Both conditions affect middle-aged and older people. SAM affects both sexes equally while PAN has a slight propensity towards men. SAM tends to be relatively sudden in onset while PAN presents indolently with preceding systemic, inflammatory symptoms. SAM does not typically present with anemia, ESR elevation or an association with hepatitis B as is seen with PAN. A definitive diagnosis of SAM requires tissue evaluation but is often not pursued given sites involved.

CONCLUSION: Physicians need to include SAM in the differential diagnosis of patients with severe abdominal pain and vasculitic appearing lesions on angiography since misdiagnosis of PAN will lead to unnecessary immunosuppressant treatment with its associated serious side effects.

WHEN KIDNEYS EXPLODE: A CASE OF XANTHOGRANULOMATOUS PYELONEPHRITIS (XGP)

Raphaela Lipinsky DeGette[1]; Molly A. Kantor[2]. [1]Internal Medicine, UCSF, San Francisco, CA; [2]Medicine, University of California, San Francisco, San Fransisco, CA. (Control ID #3341586)

LEARNING OBJECTIVE #1: Name the associated pathogens and clinical course of xanthogranulomatous pyelonephritis (XGP)

LEARNING OBJECTIVE #2: Recognized the CT appearance of XGP

CASE: A 69 man with a history of urothelial carcinoma of the bladder status-post cystoprostatectomy with ileal conduit presented with fatigue, tachycardia, night sweats, and foul-smelling urine. He had recently been diagnosed with a new 11cm right renal mass with apparent diaphragmatic invasion at an outside hospital. On exam, he was a pale, chronically-ill appearing man with rigors and but no abdominal tenderness; heart rate was 120 but other vital signs were normal.

The patient was started on antibiotics for presumed bacterial superinfection of a renal malignancy. Percutaneous nephrostomy tube placement drained frank pus, which grew *S. anginosus* but was negative for cancer cells. A week into admission, the patient developed abdominal pain and was found to have a new large perinephric fluid collection on computed tomography. A drain placed in this area evacuated a significant amount of purulent fluid. Eight weeks later, after finishing a course of intravenous antibiotics, the patient underwent a radical right nephrectomy. Pathology of the removed kidney showed xanthogranulomatous inflammation without malignancy, confirming a diagnosis of xanthogranulomatous pyelonephritis (XGP).

IMPACT/DISCUSSION: XGP is a rare, destructive chronic inflammatory disorder of the kidney.[1] A kidney affected by XGP has an enlarged, multiloculated appearance. Chronic infection and obstruction predispose

to this condition. The most common pathogens associated with XGP are Proteus and *Escherichia coli*; a review of the literature did not find any reported cases caused by *S. anginosus*, which was isolated in two fluid samples from this patient. However, *S. anginosus* is a virulent pathogen known for pyogenic infections and can be found in the normal intestinal flora.[2]

Given this patient's cancer history, the heterogenous renal mass seen on imaging was presumed to be a recurrence of urothelial carcinoma. Although he had clear infectious signs and symptoms, anchoring on his past malignancy caused the infection to be missed and delayed drainage of the fluid collections seen on CT, which were thought to be necrotic tumor.

This case also highlights the cognitive bias that can arise when an unusual imaging finding distracts from the clinical presentation. Prior to admission, this patient had presented to several emergency rooms with complaints of weight loss, night sweats, and cough. When CT showed a large renal mass, his infectious symptoms were not worked up further; instead, he was referred for oncologic treatment. As this case demonstrates, imaging results should be viewed as a supplement to the clinical presentation.

[1] https://www.ncbi.nlm.nih.gov/pubmed/21526966

[2] https://www.ncbi.nlm.nih.gov/pubmed/3060239

CONCLUSION: - In patients with a history of malignancy, maintain a broad differential for systemic symptoms

- Consider XGP in patients with destructive renal masses on imaging

WHEN SEX IS A HEADACHE

Karen A. Hauser. Internal Medicine, UCSF, San Francisco, CA. (Control ID #3390867)

LEARNING OBJECTIVE #1: Evaluate a patient with headache associated with sexual activity, recognizing that neuroimaging is required to exclude secondary causes

LEARNING OBJECTIVE #2: Diagnose and treat primary headache associated with sexual activity

CASE: A 35-year-old man presented to primary care clinic with a new headache occurring during sexual activity. He reported 2 weeks of a throbbing bifrontal headache during intercourse and masturbation, with explosive, severe pain at the time of orgasm. These heachaches subsided within 5 minutes, and did not occur with other activities. There was no associated nausea, dizziness, visual, motor or sensory changes. History was notable for twice yearly ocular migraines. He took no medications and had no history of tobacco or drug use. Physical examination, including vital signs, neurologic and fundoscopic exams were normal. Brain MRI and MR angiography were normal. Given his negative imaging, he was diagnosed with primary headache associated with sexual activity (PHASA), and was started on propranolol with resolution of his symptoms.

IMPACT/DISCUSSION:

While headaches associated with sexual activity can occur as a benign primary headache disorder, studies have found a large proportion of sex-related headaches were due to secondary vascular causes and lacked distinugishing clinical features. Neuroimaging such as CT or MRI with angiography is required at first presentation of orgasmic headaches to exclude structural causes such as intracranial bleed, arterial dissection, reversible cerebral vasoconstriction syndromes, and cerebral venous thrombosis. The possibility of subarachnoid hemorrhage (SAH) is particularly concerning, given that intercouse is cited as the precipitating event in 4-12% of patients with SAH.

After exclusion of other causes with neuroimaging, PHASA can be diagnosed when a patient has at least 2 headaches brought on by and occurring only during sexual activity, with pain lasting no more than 24 hours. These headaches can have increasing intensity with mounting sexual excitement or an explosive onset occurring at orgasm, as seen in our patient. These headaches are not typically accompanied by autonomic or vegetative symptoms.

Epidemiologic studies of PHASA have shown a lifetime prevalence of approximately 1%, a mean age of onset between 35 to 40 years old, a 2.9:1 male to female ratio, and high comorbidity with migraine headaches. Up to 40% of all cases run a chronic course over more than a year, but also respond well to treatment. Preventative treatments include Indomethacin 30 to 60 minutes before sexual activity, or daily propranolol in patients with comorbid migraines. Given our patient's unexpected timing of sex and occular migraines, he was started on daily propranolol with good response.

CONCLUSION: - Headache associated with sexual activity is rare, and may be due to a primary headache disorder or dangerous structural cause

- Neuroimaging is required in the work up of headache with sexual activity

- PHASA can be prophylactically treated with indomethacin or propranolol

WHEN SLE IS COMBINED WITH LYME DISEASE

kerolos n. abdelmalek, Randa Hazam, tarek mansi, Ahmad Hallak, Aesha Singh, john kimbugwe, Mazin Saadaldin. Internal medicine, Texas tech health science center of Amarillo, Amarillo, TX. (Control ID #3389642)

LEARNING OBJECTIVE #1: Although rare, muscle weakness along with dysphagia and myositis can be the initial manifestations of SLE.

LEARNING OBJECTIVE #2: Lyme disease can present with myopathy.

CASE: A 24-year-old lady recent immigrant from Honduras presented with generalized weakness more pronounced proximally for the past three weeks which progressed until she was unable to get out of bed.

Associated symptoms included fever, chills, sore throat, choking sensation, chest tightness and dry cough. She denied bowel or bladder incontinence, diarrhea, joint pain, or swelling. Two months ago she was diagnosed with depression and started on treatment without improvement. She has no history of drug or alcohol abuse. Blood pressure was 119/81, temperature 39.4 C, Heart rate 153, and SpO2 96% on room air. Muscle strength was 2/5 in lower limbs and 4/5 in upper limbs with intact sensation and absent patellar reflexes. Kernig's sign, Brudzinski's sign, and neck stiffness were absent. Lab revealed a hemoglobin of 10.9, WBC 3.1, MCV 84, Platelets 153, Alb 1.7, Total protein 5.5, Alkaline phosphatase 322, AST 183, and ALT 69. The patient was started on Vancomycin, Piperacillin-Tazobactam, and Acyclovir. MRI brain and CT Chest/Abdomen/Pelvis were all unremarkable. MRI of the spine showed paraspinous musculature enhancement suggestive of myopathy. Swallowing study showed severe aspiration. Urine and blood cultures as well as CSF analysis were negative. Antibiotics were de-escalated to doxycycline for empiric treatment of Rickettsial disease. Anti Jo1, Anti-myeloperioxidase, Anti-protease, Anti RNP, CK, aldolase, serology for Mosquito borne diseases and rickettsia disease were all negative. Therefore, Doxycycline was discontinued. ANA was 1:1280 and double-stranded DNA>300. She was started on pulse dose steroid therapy for 5 days followed by 60 mg prednisone daily and hydroxychloroquine with modest improvement. Muscle biopsy showed no evidence of myositis. Further tests were negative for syphilis and positive for Lyme IgG and IgM. She was started on IV Ceftriaxone 2 g daily. She had complete recovery within two weeks and was discharged on a prednisone and hydroxychloroquine taper.

IMPACT/DISCUSSION: SLE treatment alone with steroids and hydroxychloroquine resulted in a modest response and significant

improvement was achieved by adding a two week course of IV Ceftriaxone. Although SLE patients with myositis associated with weakness rather than myalgia have been reported, no cases have been reported with associated dysphagia. Some reports have described myositis or peripheral neuropathy in Lyme disease; most of these cases describe muscle weakness with localized pain and swelling along with moderate elevations in CK however this is the first case with seronegative myositis and dysphagia.

CONCLUSION: The initial presentation of SLE with severe muscle weakness and neuropsychiatric manifestations are relatively uncommon. Lyme disease rarely manifests as muscle weakness.

WHEN TACROLIMUS HITS CLOSER THAN YOU THINK: PROXIMAL RENAL TUBULAR ACIDOSIS IN A LIVER TRANSPLANT PATIENT

Usman Hasnie[1]; Ammar Hasnie[2]; Ashita J. Tolwani[1]. [1]Department of Medicine, University of Alabama- Birmingham, Birmingham, AL; [2]University of Missouri- Kansas City School of Medicine, Kansas City, MO. (Control ID #3388285)

LEARNING OBJECTIVE #1: Highlight a case of tacrolimus induced proximal renal tubular acidosis.

LEARNING OBJECTIVE #2: Discuss the clinical decision making to diagnose proximal renal tubular acidosis.

CASE: A 51-year-old male with CKD III, history of PSC and liver transplant presented to the hospital for acute kidney injury. He was asymptomatic but found to have serum creatinine of 5.3 (baseline 1.8). The patient's immunosuppressive medications are tacrolimus, everolimus, prednisone and mycophenolate. Of note his tacrolimus dose had been increased prior to admission.

Initial labs were notable for creatinine of 5.3, Sodium 141, Potassium 3.8, Chloride 115, and Bicarbonate of 14, and serum creatinine of 5.3 Glu 133. On ABG, pH 7.43, CO2 30 mmHg, O2 100 mmHg

Tacrolimus was held in the setting of AKI; however, his additional immunosuppression regimen was continued. Creatinine improved over the course of hospitalization with limited IV fluid resuscitation. He had persistent non anion gap metabolic acidosis. Urine electrolytes were collected with a positive urine anion gap (15). Urinalysis with pH of 5.0, normal potassium, and glucosuria was consistent with renal tubular acidosis (RTA) Type II.

Patient responded to Shohl's solution and bicarbonate level increased to 20 prior to discharge.

IMPACT/DISCUSSION: Type II RTA, also known as proximal renal tubular acidosis, is caused by inability of the proximal tubule to facilitate reuptake of bicarbonate. This results in bicarbonate wasting- clinically these patients tend to present with bicarb in the range of 12-20.

More commonly drugs such as tenofovir and ifosfamide are known to cause Type 2 RTA, however in this case we believe that the RTA was secondary to tacrolimus given the increase in dosage prior to admission.

The patient presented with a normal anion gap and a bicarbonate of 14- consistent with non anion gap metabolic acidosis. A urine anion gap of 15- indicated that there was low urinary NH4+ and is consistent with renal tubular acidosis. His urine pH of 5.0, glucosuria with normal blood glucose and absence of hyperkalemia led to the diagnosis of a medication induced Type 2 RTA.

Tacrolimus has been associated with Type 4 RTA in liver transplant patients, however, is a fairly rare entity.[1]

While the impact that tacrolimus has on the Na/K ATPase and Na/K/Cl cotransporters in the distal convoluted tubule has been studied extensively, there is limited research on the impact of tacrolimus on the proximal tubule. Further research in this area will be beneficial for transplant patients.

CONCLUSION: Patients on immunosuppressive therapy are at risk of renal toxicity in a multitude of ways.

Tacrolimus, while commonly associated with causing pre-renal AKI, can also cause other electrolyte abnormalities. In liver transplant patients that have a non-anion gap metabolic acidosis- immunosuppressive medications, such as tacrolimus, must be considered as a potential culprit.

WHEN THE FEVER BROKE- A CURIOUS CASE OF PERIODIC FEVER SYNDROME

Ira Khanna, Abhinav Bhalla. Internal Medicine, Mount Sinai Beth Israel, New York, NY. (Control ID #3375568)

LEARNING OBJECTIVE #1: Diagnosis and managament of Periodic Fever Syndrome

CASE: A 39-year-old male of Italian descent with no past medical history was referred to Rheumatology by an Infectious Diseases physician for evaluation of 3 weeks of unexplained fevers. He reported daily fevers, with shaking chills, drenching sweats and an 8lb weight loss. He denied any joint pain, swelling, rashes, hearing loss, episodes of uveitis or myalgias. He had an extensive negative infectious work up, labs showed transaminitis, positive ANA, double-stranded DNA, smooth muscle antibody with elevated ESR/CRP. He reported two prior similar episodes of fevers- 7 years ago with similar transaminitis, elevated ESR/CRP, but a positive Rhematoid Factor which responded to steroids. 5 years ago, he had a similar presentation, imaging revealed hepatomegaly and retroperitoneal lymph nodes; bone marrow biopsy was negative for malignancy, however his symptoms and lab abnormalities self-resolved without steroids. During his current episode, AVISE test was done which showed low probability for lupus. He responded to 20mg of Prednisone a day, however could not be tapered below 15mg. We considered a diagnosis of Adult onset Still's Disease, however he had no rash, arthralgias, leukocytosis or high Ferritin. He tested negative for Familial Mediterranean Fever, however were unable to test for other Periodic Fever syndromes due to insurance limitations. He was, nonetheless, diagnosed with a Periodic Fever Syndrome and was started on Canakinumab. He responded well clinically to the first dose of Canakinumab with his ESR and CRP normalizing in just two weeks.

IMPACT/DISCUSSION: Periodic Fever Syndromes are a form of autoinflammatory disorders caused by exaggerated activation of the innate immune system, in the absence of high-titer auto-antibodies or antigen-specific T-cells. They are characterized by inflammatory flares causing fever, rash, serositis, arthritis, meningitis, uveitis, lymphadenopathy associated with elevated inflammatory markers, separated by intervals of general well-being. These are usually diagnoses of exclusion after ruling out infection or malignancy. They usually respond to empiric trial of steroids, colchicine or IL-1 blockers. Diagnosis is extremely challenging with a recent study in Germany revealing median time to diagnosis of 2 years (1-5 years). New evidence based classification criteria were recently developed for Hereditary Recurrent Fevers combining international expert consensus, statistical evaluation of real patients from a large data set of patients in the Eurofever Registry. The new classification criteria combine for the first time clinical manifestations with genotype. Use is recommended for inclusion of patients in translational and clinical studies, but they cannot be used as diagnostic criteria.

CONCLUSION: Diagnosis of Periodic Fever Syndromes remains to be evasive, however with genetic testing we have access to an important tool to help us reach a diagnosis to guide management.

WHEN TO DRAW THE LINE? BALANCING DIAGNOSTIC WORK-UP FOR INCIDENTAL FINDINGS IN A NONVERBAL PATIENT

Erica I. Anunwah, Yunsan Huang. UCSD School of Medicine, San Diego, CA. (Control ID #3392241)

LEARNING OBJECTIVE #1: Explore the extent to which diagnostic workup should be pursued for incidental transaminitis

LEARNING OBJECTIVE #2: Navigate the ethical complexity when the patient is nonverbal and fully dependent

CASE: A 16 year old nonverbal girl with cerebral palsy and severe intellectual disability was admitted from the GI clinic for work-up of incidental transaminitis and abdominal discomfort. Her AST and ALT were 263 and 551 respectively. Her physical exam showed no abdominal tenderness, ascites, masses, or jaundice. Visually, the patient appeared to be at her baseline besides occasional expressions of discomfort. The initial hospital workup included an autoimmune panel, inflammatory markers, and ultrasound imaging, all of which were normal. Her transaminases continued to climb, with AST and ALT peaking at 420 and 730 respectively. The workup then expanded to include a viral panel, hepatitis panel, acetaminophen level, pregnancy test, ceruloplasmin level, and a peripheral smear. None of these labs yielded significant values. Testing was again broadened to include urine drug screen, alpha-1-antitrypsin, and copper levels – which again were unrevealing. A liver biopsy was then performed, which turned out normal. After the parents of the patient expressed frustration with the number of tests yielding no results, the team decided to involve PM&R and pulmonology to investigate other potential causes of patient's discomfort. Ultimately, adjustments were made to the patient's baclofen pump and ventilator settings. Her episodes of discomfort decreased and her liver transaminases began to fall, allowing her to be discharged home after a 7-day admission.

IMPACT/DISCUSSION: This case highlights a common theme seen in academic medicine, where motivation to have all the answers may drive a patient's clinical course. In this case, the patient's inability to verbalize symptoms may have complicated the work-up approach, making trending transaminases the focus instead of patient's symptoms or clinical context. It is also important to consider that an invasive procedure such as a liver biopsy carries significant risk, especially in a special needs patient with severe comorbidities. Many diagnostic methods were added without being guided by any new historical or diagnostic findings. By the time the liver biopsy was ordered, there was already a host of negative panels to suggest the biopsy would likely not yield significant results. In the end, all diagnostic studies did not play a significant role in finally absolving the patient's abdominal discomfort and transaminitis.

CONCLUSION: As tempting as it can be to chase an unknown etiology, it is important to consider the big clinical picture. This is not only with respect to medical cost and waste, but in management of the patient's comfort, safety, and parental concerns. An unintentional consequence of trending lab values is that the focus can become treating the numbers rather than treating the patient.

WHEN ZEBRAS HAVE SPOTS: DIFFERENTIAL DIAGNOSES FOR FEVER AND RASH

Eugenia Uche-Anya, Sharon Wardlaw. Medicine, Columbia University Medical Center, New York, NY. (Control ID #3392207)

LEARNING OBJECTIVE #1: Assess patients presenting with fever and rash

LEARNING OBJECTIVE #2: Recognize vector-borne infections as a cause of unspecified febrile illness

CASE: A 35-year-old man from NY with history of a motor vehicle accident requiring splenectomy presented to the ED in the summer with four days of fevers, body aches, sore throat and mild cough. He initially presented to his PMD who prescribed amoxicillin-clavulanate. He then developed GI upset and a non-pruritic rash prompting self-discontinuation of the antibiotic. He had no sick contacts but recently traveled to Connecticut. He denied outdoor activities or insect bites during this trip. He denied high risk sexual behavior, weight loss and night sweats. He had received MMR, pneumococcal, meningococcal and HiB vaccines.

In the ED, he was febrile (103F) and tachycardic without hypotension. He had mild pharyngeal erythema, a supple neck and a pink blanching maculopapular rash across his abdomen, forearms and legs. The rash spared his palms and soles. Labs were notable for WBC 5, 17% bands, 6% atypical lymphocytes, no eosinophilia, normal creatinine, elevated transaminases and thrombocytopenia. A blood smear was suggestive of an infectious process with low suspicion for malignancy. Cultures and respiratory viral/atypical bacterial swab were negative. Chest radiograph revealed hazy reticular opacities. He tested negative for acute HIV, hepatitis, EBV, CMV, RPR and GCCT. Antibody titers were sent to confirm vaccinations. He was dosed ceftriaxone for CAP and doxycycline given travel history and concern for underlying tick-borne illness. DRESS syndrome was felt to be less likely given absence of eosinophilia. He tested negative for Lyme, babesia and ehrlichiosis. Serum PCR for *Anaplasma phagocytophilum* came back positive.

IMPACT/DISCUSSION: The differential for patients presenting with fever and rash is very broad. A thorough history for risk factors and exposures can be helpful in narrowing the differential. It is important to obtain details about the patient's age, location, travel and sexual history, season, medications, insect/animal exposure, vaccinations and immunocompetency. Etiologies to consider include viral [EBV, CMV, HIV, hepatitis, measles, rubella], bacterial [mycoplasma, meningococcal, endocarditis, toxic shock, STIs], vector- borne [Lyme, babesia, anaplasmosis, ehrlichiosis, RMSF] and non-infectious causes [DRESS, malignancy, vasculitis]. Vector-borne infections in particular are on the rise[1] and warrant significant consideration in endemic areas.

Anaplasmosis typically presents with fever and nonspecific symptoms. However, a proportion of patients develop rash and systemic involvement including leukopenia, thrombocytopenia and abnormal liver tests. This patient was ultimately discharged on a 10-day course of doxycycline with improvement.

CONCLUSION: The differential for patients presenting with fever and rash is very broad. A detailed history and physical exam can be valuable for establishing a diagnosis.

1. MMWR Morb Mortal Wkly Rep 2018;67:496-501.

WHERE DO BROKEN HEARTS GO? MANAGING UNCERTAINTY IN ADVANCED TRANSTHYRETIN-ASSOCIATED CARDIAC AMYLOIDOSIS

Ian B. Kwok[1]; Tsz Keung Eng[1]; Amy Kelley[2]. [1]Internal Medicine, Mount Sinai Beth Israel, Icahn School of Medicine at Mount Sinai, New York, NY; [2]Brookdale Department of Geriatrics and Palliative Medicine, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3391811)

LEARNING OBJECTIVE #1: Recognize the clinical course and prognosis of transthyretin-associated (ATTR) cardiac amyloidosis.

LEARNING OBJECTIVE #2: Identify interdisciplinary needs specific to patients with advanced cardiac amyloidosis.

CASE: WF, an 88-year-old man with advanced, wild-type ATTR cardiac amyloidosis (on tafamidis) complicated by distal conduction disease and heart failure with preserved ejection fraction, presented with syncope and was admitted to the cardiac critical care unit for symptomatic, bradycardic

atrial fibrillation. A continuous dopamine infusion was started with resolution of symptoms and improvement in heart rate. However, attempts to wean from dopamine with midodrine and methylphenidate were unsuccessful.

Palliative care was consulted for support of goals of care. WF expressed a clear preference to prioritize his independence and declined life-prolonging therapies that could adversely affect his quality of life. In the absence of facilities or home services able to provide continuous infusions of palliative dopamine, the option of pacemaker placement was revisited. While WF had previously declined pacemaker placement for the purpose of life prolongation, he expressed a willingness to undergo the procedure if it could allow him to return home with the possibility of fewer hospitalizations, despite uncertainty regarding its potential impact on his functional status and quality of life.

On hospital day six, WF experienced worsening delirium and no longer demonstrated capacity to consent for pacemaker placement. His niece/health care proxy arrived from out of town to formulate a new plan of care informed by knowledge of his values, which he had previously communicated to the primary and palliative interdisciplinary teams. Based on his preferences for independence and comfort over prolongation of life, a shared decision was made to transfer WF to the inpatient palliative care unit. WF was eventually weaned from dopamine, but did not return to his baseline mental status, and was later discharged to an outpatient hospice facility in alignment with his expressed goals.

IMPACT/DISCUSSION: Despite novel gene-silencing therapies and improved diagnostic techniques, advanced cardiac amyloidosis is associated with poor prognosis, with limited research characterizing the quality of life associated with different treatment plans. This case demonstrates the importance of a proactive approach to advance care planning for patients with ATTR cardiac amyloidosis. This requires interdisciplinary teamwork and should address a wide range of clinical scenarios, including the role of pacemaker/ICD placement, the use of inotropes (which may impact care settings), and the possibility of progressive functional loss with frequent hospitalizations.

CONCLUSION: In the absence of evidence-based approaches to advance care planning for patients with advanced ATTR cardiac amyloidosis, palliative care consultation can help to support the development of goal-concordant care plans despite clinical uncertainty.

WHEREFORE ART THOU NEUTROPHILS?: FIGHTING OFF INFECTION IN THE SETTING OF NEUTROPENIA

Meredith Freeman[2]; Leigh Deshotels[2]; Jerald L. Taggart[1]. [1]Medicine, SLVHCS/Tulane University, New Orleans, LA; [2]Medicine, Tulane University School of Medicine, New Orleans, LA. (Control ID #3390775)

LEARNING OBJECTIVE #1: Recognize challenges in treating and preventing bacterial infections in immunocompromised patients

LEARNING OBJECTIVE #2: Explore the utility of prophylactic antibiotics in patients with neutropenia secondary to malignancy

CASE: A 68-year-old man with a known history myelodysplastic syndrome (MDS) was admitted for lower extremity cellulitis. He had recently been admitted for cellulitis and pseudomonas bacteremia which was treated with vancomycin and piperacillin/tazobactam and later transitioned to ciprofloxacin. He was scheduled to begin chemotherapy with decitibine, but treatment was delayed due to infection.

This presentation, he was afebrile and vital signs were within normal limits. Edema and erythema of the right lower extremity were appreciated. There were 2 areas of induration on the RLE concerning for early abscess formation. Absolute neutrophil count was < 500/mm3, as in the previous admission.

He was treated with vancomycin and ciprofloxacin. No drainable fluid collection was noted on serial bedside ultrasounds. Repeat blood cultures remained negative, and he was discharged to complete a two-week course of doxycycline and ciprofloxacin.

A week following completion of antibiotic therapy, the patient was readmitted to the intensive care unit for pseudomonal septicemia.

IMPACT/DISCUSSION: Although uncomplicated cellulitis can be treated outpatient, cases complicated by neutropenia can become quite serious and require broad antibiotic coverage in an inpatient setting. For neutropenic patients, prevention of these infections with prophylactic antibiotic coverage should be considered.

Currently there are no guidelines for infection prophylaxis in patients with neutropenia due to malignancy. The focus is treatment of the underlying disorder. However, patients can be neutropenic for an unknown amount of time before diagnosis, and their risk of having an early infection that delays treatment cannot be quantified.

Research has focused on antibiotic prophylaxis in patients with neutropenia due to chemotherapy, with favorable outcomes. UK guidelines support fluoroquinolone prophylaxis in adults who are expected to see an ANC <500/mm3 due to chemotherapy, though only during the expected period of neutropenia.

Antimicrobial prophylaxis has been shown to decrease febrile episodes in high risk MDS patients taking decitabine. MDS patients can meet neutropenic criteria before beginning chemotherapy, and may benefit from antimicrobial antibiotics even before receiving treatment.

Antibiotic resistance is an important consideration in these cases. Resistance to fluoroquinolones has been shown to increase with use in prophylaxis in hematologic cancer patients. Therefore, only high-risk individuals should be considered (those with significant comorbidities who are expected to have an ANC <500/mm3 for at least 7 days).

CONCLUSION: Prophylactic antibiotics are often life saving in neutropenic individuals with cancer but decisions to initiate treatment can be difficult given lack of specific guidelines on the topic.

WHERE'S THE SOURCE: NORMAL BRAIN IMAGING IN CUSHING'S DISEASE

Steven Allon, Karla E. Williams. Medicine, University of Alabama at Birmingham, Birmingham, AL. (Control ID #3375772)

LEARNING OBJECTIVE #1: Understand the diagnostic approach to determine the etiology of hypercortisolism

CASE: A 70-year-old man with a history of type 2 diabetes mellitus, hypertension, and heavy alcohol use presented to the ED with subacute, progressive weakness. He was independent in activities of daily living until three months prior to admission. He developed gradual weakness of all extremities, eventually requiring assistance with all activities. Associated symptoms included exertional dyspnea and diffuse swelling. His examination was remarkable for an irregular heart rhythm with tachycardia to 140 beats per minute, blood pressure of 185/110, elevated jugular venous pressure, bibasilar crackles, anasarca, and diffuse weakness with 3/5 strength in upper extremities and 2/5 strength in the lower extremities.

Pertinent labs included serum sodium 142 mEq/L, potassium 2.9 mEq/L, bicarbonate 41 mEq/L, BUN 25 mg/dL, creatinine 0.5 mg/dL, glucose 221 mg/dL, and albumin 2.3 gm/dL. Thyroid-stimulating hormone was undetectable with normal free T3 and free T4. Random serum cortisol was 80.4 mcg/dL with serum ACTH 626 pg/mL. MRI brain revealed no intracranial abnormality. A Dotatate PET revealed no radiotracer avid neuroendocrine tumor. Inferior petrosal sinus sampling demonstrated right petrosal sinus ACTH level of 2457 pg/mL with peripheral ACTH level of 682 pg/mL, confirming a probable pituitary source. He was placed on biochemical suppression with metyrapone, and surgical intervention was deferred pending rehabilitation.

IMPACT/DISCUSSION: Cushing's syndrome encompasses a constellation of findings that result from chronic exposure to excess glucocorticoids. The clinical manifestations of Cushing's syndrome vary with the source, degree and duration of hypercortisolism and can include reproductive, metabolic, cardiovascular, musculoskeletal, dermatologic, and neuropsychiatric derangements. The diagnosis is suggested by an abnormal first-line test (i.e., low-dose dexamethasone suppression test, nighttime salivary cortisol, or 24- hour urinary free cortisol).

Measurement of ACTH is essential to localize the source of excess cortisol. Elevated ACTH suggests a central or ectopic source, whereas suppressed ACTH suggests an adrenal source. A pituitary MRI is indicated in patients with elevated ACTH, however, non-diagnostic imaging is insufficient evidence to rule out a pituitary source. Thus, patients with indeterminate findings should undergo inferior petrosal sinus sampling to measure the ratio of ACTH secretion from the pituitary and the periphery. A ratio > 3 is highly suggestive of a pituitary source. For patients with suppressed ACTH, adrenal imaging is indicated. Further management is directed by the underlying cause of Cushing syndrome.

CONCLUSION: - A normal MRI brain does not exclude a pituitary source of hypercortisolism.

- Inferior petrosal sinus sampling identifies Cushing's disease with > 90% sensitivity and specificity.

WHIPPIT GOOD: A CASE OF NITROUS OXIDE INDUCED MYELOPATHY

Ryan Leibrandt[1]; Lesley Wu[1]; Ana Velazquez[2]. [1]Internal Medicine, Mount Sinai Beth Israel, New York, NY; [2]University of California, San Francisco, San Francisco, CA. (Control ID #3390284)

LEARNING OBJECTIVE #1: Recognize that recreational use of inhaled nitrous oxide (NO2) can induce vitamin B12 deficiency.

LEARNING OBJECTIVE #2: Recognize the neurological symptoms associated with vitamin B12 deficiency.

CASE: A 24-year-old female with depression presented with 2 days of burning, tingling and numbness in bilateral feet making it difficult to ambulate. She sprained her right ankle 3 weeks prior to presentation but denied experiencing similar symptoms in the past. She endorsed routine recreational use of inhaled NO2 "whippits" for the past 4 months. Physical exam was remarkable for 4/5 strength in bilateral lower extremities. She exhibited decreased proprioception, pinprick and vibratory sensation bilaterally in a stocking distribution to mid-shin. Romberg was positive and her gait was noted to be antalgic. Laboratory findings included macrocytic anemia with hemoglobin 12.6 g/dL, MCV 107.0 fL, undetectable serum B12 (< 150 pg/mL), and markedly elevated methylmalonic acid 68.09 umol/L. MRI of the cervical, thoracic and lumbar spine revealed signal changes on T2-weighted images along the midline posterior aspect of the cervical cord consistent with subacute combined degeneration. She was counseled on cessation of inhaled NO2 and discharged with oral vitamin B12 1000 mcg daily. At the follow-up 2 months post-discharge, strength had improved to 5/5 in the bilateral lower extremities along with resolution of prior proprioception, pinprick and vibratory sensation abnormalities. Repeat serum B12 was 1,497 (232 – 1,245pg/mL).

IMPACT/DISCUSSION: NO2 is a widely used analgesic for short-term pain relief as it acts as a partial agonist at the opioid receptor. When inhaled, it can cause euphoria and hallucinations making it a popular recreational drug. It is also known to exert its effects on the central nervous system through oxidation and subsequent inactivation of vitamin B12, a coenzyme required for the function of methionine synthase. This enzyme is integral in a cell's ability to produce the methyl groups required to synthesize DNA, RNA and myelin. As a result, even brief exposure to NO2 can lead to a constellation of neurological symptoms, usually starting with sensory impairment presenting as distal and symmetrical paresthesia of the lower extremities. Almost all patients demonstrate loss of vibratory sensation, often associated with diminished proprioception and a positive Romberg sign.

CONCLUSION: Our patient's clinical presentation with undetectable vitamin B12 level, elevated MMA, and MRI findings are consistent with the diagnosis of nitrous oxide induced vitamin B12 deficiency resulting in subacute combined degeneration. When assessing non-specific neurologic symptoms, physicians should be sure to carefully review the patients' laboratory tests for signs of anemia and obtain a comprehensive social history including the use of recreational drugs. Failure to identify this presentation may delay appropriate treatment and adversely affect patient outcomes.

WHO IS RESPONSIBLE FOR THE DIALYSIS BILL?

Yazan Addasi[1]; Alheli Arce Gastelum[1]; Ammara A. Khan[1]; Sima Maraqa[1]; Walter Ariel Marquez Lavenant[2]; Anusha Pinjala[1]; Theresa A. Townley[3]. [1]Internal Medicine, Creighton University, Omaha, NE; [2]School of Medicine, Universidad Autonoma de Baja California, Tijuana, Baja California, Mexico; [3]Creighton University, Omaha, NE. (Control ID #3355888)

LEARNING OBJECTIVE #1: Recognize vulnerable diabetic populations and provide an affordable treatment plan

LEARNING OBJECTIVE #2: Integrate insulin affordability awareness among our clinical practice

CASE: ET is a 46-year-old woman, with poorly controlled type 1 diabetes diagnosed at the age of 9 who had previously been on an insulin pump. Other co-morbidities included CKD IV, HTN and hypothyroidism. She presented with hyperglycemia of 400 mg/dl and fluid retention. Her GFR had decreased to 13 mL/min/1.73 $m^{2.}$ Her physical exam was notable for respiratory distress and anasarca. She failed to respond to aggressive IV diuresis and urgent hemodialysis was initiated.

The patient had been lost to outpatient follow up for a year. She had been co-managed by an endocrinologist and a primary care physician (PCP) but had stopped going to her endocrinologist over a year ago due to inability to afford the co-pays. She subsequently lost her insurance and had to pay out of pocket for her insulin; at this point she decided to stop seeing her PCP and began to ration her insulin. Due to social stigma, she did not mention her financial issues to her healthcare providers.

After identifying these challenges we decided to start her on a more affordable regimen of NPH insulin. Through social work assistance we were able to obtain a charity hemodialysis chair and discharge her home.

IMPACT/DISCUSSION: Healthcare expenditure with regards to diabetes rose to $327 billion from $245 billion in 2012. The costs can be divided into hospitalizations, prescriptions and physician visits. The majority of the cost of diabetes, is covered by government insurance. However, patients are still responsible for a significant portion of the costs. Furthermore, the cost of insulin has increased dramatically in the past 5-10 years. A vial of Humalog cost $35 in 2001 and $275 in 2017.

The price of insulin has continued to increase even after the drug's patent has expired due to the combination of FDA requirements, a monopoly in the insulin market, the lack of federal price controls and Pharmacy Benefits Managers. For patients without insurance or with some high deductible plans, they are expected to pay full price for insulin. The current insulin market is monopolized by pharmaceutical giants.

CONCLUSION: The high out of pocket costs for insulin has led to many instances of insulin rationing amongst both uninsured and insured. This has lead to death in some cases as well as poorly controlled diabetes with increased complications and mortality as in our case.

The cost of insulin is complicated due to a heterogeneous interaction between insurers, pharmacy benefits managers and manufacturers. As

physicians our role is multi-pronged; we can begin by identifying vulnerable populations and offer financial assistance or less expensive alternatives. Although there is a great deal of social media coverage regarding the subject, we also need medical professionals to create awareness and actively participate in the debate over legislation that would curb insulin prices.

WHY IS HE STILL DIZZY?

Elliot G. Martin[1]; Twomey Kathleen[1]; Simran Grewal[1]; Kenneth N. John[2]; Anuj Mehta[3]; Zia U. Durrani[1]. [1]Internal Medicine, Penn State Health Milton S. Hershey Medical Center, Middletown, PA; [2]Internal Medicine, Penn State Hershey Medical Center, Lancaster, PA; [3]Penn State College of Medicine, Milton Hershey Medical Center, Allentown, PA. (Control ID #3392001)

LEARNING OBJECTIVE #1: Distinguish a focal inflammation involving only cranial nerves VII and VIII from other causes of dizziness.

CASE: 79-year-old white male with a history of chronic lymphocytic leukemia not on therapy, type 2 diabetes mellitus, and a history of Lyme disease presented to the emergency department for worsening dizziness and headaches. He was recently evaluated for a right facial droop complicated by the inability to close his right eye; he was diagnosed with Bell's palsy then given a week long course of prednisone and meclizine. The facial palsy persisted and he developed worsening frontal headaches, nausea, dizziness, emesis, and chills. He denied fevers, loss of balance, rashes, diaphoresis, cardiopulmonary symptoms, or changes in bowel habits. Only laying prone improved his symptoms.

On presentation, vital signs were stable. Neurologic exam showed intact facial sensation, right facial droop, inability to close right eye or raise right eyebrow. No vesicular lesions were seen in either ear canal. No change in symptoms on passive and active cervical range of motion. Labs showed hyperkalemia, a mild hyperglycemia, leukocytosis of 93,000. MRI brain and MRA head and neck showed no abnormalities.

Overnight he required acetaminophen, dexamethasone, meclizine, diphenhydramine, and prochlorperazine for symptom control. Otolaryngology was consulted who had no concern for inner ear pathology. He underwent X-ray guided lumbar puncture (LP) which showed 125 nucleated cells/uL, 98% lymphocytes, 1493 red blood cells, glucose of 77 and a protein of 83. PCR showed varicella zoster virus and the patient was diagnosed with Ramsay Hunt syndrome. He started on a 10 day course of IV acyclovir and prednisone.

IMPACT/DISCUSSION: Prolonged dizziness due to a viral etiology should be considered when other common causes have been ruled out. The more common causes include benign positional vertigo (BPPV) and Meniere's disease, each a disease of the inner ear. In this case, there was little concern for either of these, therefore less a common differential was considered. Although vesicular lesions were absent, there was enough clinical suspicion to warrant therapy for Ramsay Hunt syndrome with antivirals and steroids. It is prudent to know that the pathophysiology of this syndrome can include the spread of infection to the geniculate ganglion thereby causing cranial nerve VIII inflammation which results in dizziness.

CONCLUSION: Prolonged dizziness can be due to cranial nerve VII inflammation due to geniculate ganglion VZV infection, which is a rare presentation of Ramsay hunt syndrome. The differential for prolonged dizziness includes BPPV, Meniere's disease or chronic persistent dizziness. Focal inflammation of cranial nerves is a less common diagnosis, however important to consider. Vertigo in the setting of Ramsay hunt syndrome is a sign of severe infection and warrants IV antivirals with steroids for 10-14 days.

WORK PRESSURE AND SMOKING PROBLEMS IN JAPAN.

Yukitaro Ikeda[1]; Ivor Cammack[2]. [1]residency program, Teine Keijinkai Hospital, Sapporo-shi, Hokkaido, Japan; [2]Resident Supervision, Keijinkai, Yoichi, Hokkaido, Japan. (Control ID #3389248)

LEARNING OBJECTIVE #1: Recognize the extreme work culture within Japan and potential detrimental effects on patients.

LEARNING OBJECTIVE #2: Recognize cultural differences in Japan about smoking cessation, and how this can be managed for hospitalized patients.

CASE: HPI

Severe epigastric pain suddenly started while drinking beer on the sofa. The pain got progressively worse and radiated to the back, and one hour later he was transported via ambulance to our hospital.

He reported shortness of breath, but there was no nausea, vomiting, diarrhea or fever. He smoked 30 cigarettes per day and drank 3 cups of Japanese vodka (*Shochu*) per day. He was otherwise well, taking no regular medications.

On, physical examination, he was hypertensive but otherwise stable. Cardiorespiratory exam was unremarkable. Abdominal exam elicited epigastric tenderness with guarding.

Contrast enhanced computed tomography showed a type IIIb abdominal aortic dissection with ulcer like projection.

Clinical course

The patient insisted that he return to work as his job was highly time dependent.

At one point, he even removed his own IV line and absconded temporarily from the hospital, only to be brought back by his ex-wife.

Once these issues were settled, he did comply with the treatment plan.

IMPACT/DISCUSSION: 1. Work pressure in Japan and its impact on treatment plans.

He repeatedly emphasized how important it is to go back to work. In fact, we contacted his employer who was happy for him to take time out. Surprisingly this actually had a negative effect on the mood of the patient. In Japan, work is taken very seriously, and many people have a high degree of pride of their necessity in their workplace.

2. Smoking problems in hospitals in Japan.

Compounding the problem mentioned above was significant nicotine withdrawals, which were difficult to manage. Our hospital has NO designated smoking area, and there is NO supply of NRT, or support for cessation. Moreover, Japan's Guideline for Smoking Cessation says "nicotine replacement therapy should not be used" for patients with cardiovascular diseases; it just encourages the patients to quit. On the other hand 30% of Japanese men smoke and many restaurants and bars in Japan still allow smoking. Also, smoking is ingrained in workplace culture, especially in construction.

3. Why he returned.

At first this is related to the power balance between husband and wife. Japanese women are thought to be submissive, but in the real world many wives have considerable power over the family. In this case, even though they were divorced, the power balance still remained, and she was the only person who could persuade him to return for treatment.

CONCLUSION: 1. Work pressure in Japan is tough and can interfere with adequate patient treatment.

2. Japan's society has a smoking dichotomy; many people smoke outside the hospitals but it is strictly prohibited inside with poor support for cessation.

WORKUP AND MANAGEMENT OF INCIDENTAL EOSINOPHILIA

Samuel Huxley[1]; Ethan Molitch-Hou[2]. [1]Internal Medicine, Emory University School of Medicine, Atlanta, GA; [2]Division of Hospital Medicine, Emory University School of Medicine, Atlanta, GA. (Control ID #3346870)

LEARNING OBJECTIVE #1: Discuss the initial workup and management of incidental eosinophilia

CASE: A 77 year old male with a history of stroke and hypertension presented with atrial fibrillation with rapid ventricular response. Physical exam was notable for right-sided hemiparesis, expressive aphasia and slurred speech, which were at baseline and a diffuse, blanchable papular rash across the patient's body. Lab work revealed a hemoglobin of 8.4 gm/dL, leukocyte count of 15,000/mL, absolute eosinophil count of 13,770/mL and platelet count of 115,000/mL. Creatinine was 3.8 mg/dL with a baseline of 1.4 mg/dL. His atrial fibrillation resolved. Due to thrombocytopenia, anemia, renal failure and papular rash, a workup for incidental eosinophilia was done. Blood and urine cultures were negative. UPEP had free lambda light chains. SPEP showed free kappa of 194 mg/L, free lambda of 2,318 mg/L and kappa to lambda ratio of 0.08. Other labs include ANCA 1:80, IgE > 2,000 IU/mL, tryptase 7.2 mcg/L, RF 76 IU/mL, LDH 232 units/L, CRP 87 mg/L, C3 of 45 mg/dL and C4 of 6 mg/dL. CT chest showed mediastinal adenopathy and multifocal airspace disease. Urine microscopy had muddy brown casts. Skin biopsy was negative for vasculitis. Bone marrow biopsy showed hypercellular marrow with lambda monotypic plasma cell neoplasm. Flow cytometry revealed a 4% population of primarily lambda monotypic plasma cells. FISH analysis was negative for genetic abnormalities indicative of myeloid neoplasia.

IMPACT/DISCUSSION: Eosinophilia is often incidentally discovered. It may be due to an allergic, inflammatory, neoplastic or infectious process. Diagnostic workup depends upon evidence of end organ damage, patient stability and clues from history and physical exam. History should focus on constitutional, cardiac, pulmonary, gastrointestinal, skin and neurologic systems. Medication changes, exposures to undercooked food, travel and activities with risk of encountering parasites should be reviewed. Physical examination evaluates for lymphadenopathy, organomegaly, rash, cardiopulmonary abnormalities and neurologic findings. Lab work to confirm eosinophilia and evaluate for electrolyte abnormalities and liver function impairment should be sent. Peripheral smear can assess eosinophil morphology and for other hematologic abnormalities. Testing for autoimmune diseases or vasculitis should be considered. Hypereosinophilia (absolute eosinophil count > 1500 cells/mL) and thrombocytopenia warrant further workup with dedicated chest imaging, vitamin B12, tryptase, complement levels and inflammatory markers with concern for underlying hematological disorder. Genetic testing for PDGFRA, PDGFRB and FGFR1 can evaluate for a primary myeloproliferative neoplasm that may respond to tyrosine kinase inhibitors. Bone marrow biopsy is recommended when other abnormalities are found.

CONCLUSION: Incidental eosinophilia often requires further workup. History and physical exam are paramount in helping guide a clinician's workup given the broad differential of eosinophilia.

WORRISOME VARICES: A RARE CASE OF UMBILICAL VEIN VARICES

Naga Vaishnavi Gadela, Sana Hyder, Christian Mosebach. Internal Medicine, University of Connecticut, Hartford, CT. (Control ID #3391745)

LEARNING OBJECTIVE #1: To recognize ectopic sources of bleeding in portal hypertension.

LEARNING OBJECTIVE #2: To understand the pathophysiology of portal hypertension and variceal bleeding.

CASE: Our patient is a 58-year-old male with decompensated alcoholic cirrhosis, was bought to the hospital by his wife for altered mental status. She reported that the patient was lethargic and has been complaining of diffuse abdominal pain for a day. He was admitted to the hospital for possible hepatic encephalopathy. Labs were notable for hemoglobin of 8g/dl, platelet count of 90,000/mm3, elevated INR 2.7, and ammonia 268umol/L. Computerized tomography(CT) of the abdomen revealed a soft tissue density below the rectus sheath, suggestive of a hematoma. No surgical intervention was planned at that time. However, the patient continued to decline clinically, requiring multiple transfusions. CTA demonstrated an increase in the size of the hematoma, and a large recanalized umbilical vein with extensive varices around the hematoma, and the abdominal wall. He underwent paracentesis with frank hemoperitoneum, indicating that the umbilical vein is bleeding into the peritoneal cavity. He underwent endovascular coiling of the vein, however, it was complicated with significant bleeding in the peritoneum and puncture sites, consistent with disseminated intravascular coagulation. The family decided to withdraw care due to poor prognosis in the setting of multiorgan failure.

IMPACT/DISCUSSION: Portal hypertension in cirrhosis develops due to progressive fibrosis and regenerating nodules obstructing the portal circulation, leading to the formation of portosystemic venous connections. Ectopic varices are portosystemic collaterals in locations other than the gastroesophageal region such as the duodenum, gall bladder, and umbilicus. The umbilical vein is usually obliterated in early life and maybe recanalized in the setting of portal hypertension. This is rare, accounting for less than 5% of all variceal bleeds, however, has high mortality due to fatal hemoperitoneum. They develop due to a communication between the recanalized umbilical vein and paraumbilical vein of the abdominal wall. Majority of these cases present with abdominal pain and hypotension. Diagnosis can be established by paracentesis, ultrasound Doppler and CT imaging. Although no specific guidelines exist, it is treated with sclerotherapy, trans-jugular intrahepatic portosystemic shunt, ligation of umbilical vein with standard resuscitation. The condition seems to be underestimated because most of the patients present with tense ascites in the setting of cirrhosis in a terminal state rapidly leading to death. Hence physicians must have a high degree of suspicion to diagnose and appropriately manage this condition.

CONCLUSION: Variceal bleeding from ectopic sources is relatively rare. It is crucial to recognize the source early, because of high mortality, if unrecognized. It is also important to differentiate intraperitoneal bleeding from spontaneous bacterial peritonitis.

WORTH A SECOND LOOK: WHEN THE HISTORY DOESN'T MATCH THE HISTOLYTICA

Teresa Johnson[2]; Julie Knoeckel[1,2]. [1]Medicine, Denver Health Medical Center, Denver, CO; [2]Internal Medicine, University of Colorado, Denver, CO. (Control ID #3390631)

LEARNING OBJECTIVE #1: Identify risk factors, typical presentation and complications of amebic colitis

LEARNING OBJECTIVE #2: Recognize the role of multispecialty collaboration in complex cases with diagnostic uncertainty

CASE: A 68 year-old woman with history of atrial fibrillation, CAD and DVT presented with 8 months of diarrhea and intermittent hematochezia. She was from the United States with no recent foreign travel, but had been diagnosed with *Entamoeba histolytica* colitis 5 months prior at an outside hospital and treated with metronidazole and paromomycin.

Stool PCR and O&P were negative. Flexible sigmoidoscopy revealed a colonic stricture and ulcerations. Biopsies demonstrated healing injury

without any microorganisms, cryptitis or granulomas. Weighing the low pre-test probability of amebic colitis in a patient without travel to an endemic area, this patient's vascular risk factors, and endoscopic findings, ischemic colitis was strongly considered as an alternative diagnosis.

Surgery, gastroenterology and infectious disease were consulted and confirmation of her initial infection was recommended. Pathology slides from the outside hospital were reviewed, with identification of *E. histolytica* organisms. Serum *E. histolytica* IgG was positive. Further history revealed travel to Texas near the Mexico border 5 months prior to the onset of symptoms, where the parasite is present but remains a rare cause of diarrhea. Investigation for immunodeficiency was unrevealing.

On direct comparison, the colonic biopsy 3 months after treatment for amebic colitis demonstrated interval healing. Surgical intervention was felt safe to defer per patient preference. Ultimately, the patient had recurrent bleeding and underwent total colectomy for chronic ischemic colitis with stricture 6 months later that was felt to be a sequela of her *E. histolytica* infection.

IMPACT/DISCUSSION: Amebic colitis is common worldwide but rare in the US, typically seen in patients with recent travel to or immigration from an endemic area.

Infection with *E. histolytica* is often asymptomatic, but 10% of patients manifest symptoms including watery or bloody diarrhea, weight loss, fever and abdominal colic. Presentation may be difficult to distinguish from other infections including tuberculosis and non-infectious diseases, including IBD and ischemic colitis.

Rare and more serious complications include fulminant colitis, perforation, hemorrhage and obstruction. Strictures can occur due to amebic invasion into the bowel wall arteries with resultant small vessel thrombosis and bowel necrosis. Ulcerations and strictures often resolve with antibiotics but persistent strictures may require surgical intervention.

CONCLUSION: *E. histolytica* is an uncommon, but important cause of severe gastrointestinal disease which may mimic conditions such as IBD, TB or ischemic colitis, and may require surgical intervention.

Multispecialty collaboration and confirmation of unexpected findings is critical when caring for patients with rare diseases.

"ORIENT YOURSELF": THE IMPORTANCE OF HISTORY AND EXAM IN A CASE OF ACUTE DIZZINESS

Giordano F. Cittolin Santos[1]; Brad A. Keith[2]. [1]Internal Medicine, Medical University of South Carolina, Charleston, SC; [2]Medical University of South Carolina, Charleston, SC. (Control ID #3392077)

LEARNING OBJECTIVE #1: Identify brain tumors as a possible cause of acute dizziness, especially in patients with a previous history of malignancy.

LEARNING OBJECTIVE #2: Recognize which patients with dizziness will require advanced imaging.

CASE: A 52-year-old female with history of breast carcinoma in 2014 status post radical mastectomy and chemoradiation presented to the internal medicine clinic with dizziness, frontal headaches and worsened balance for 1 week. Symptoms were constant and worsened when she stood up. She was taking daily Anastrozole. Labs 6 months prior were unremarkable. CT chest, abdomen, and pelvis in 2015 were negative for metastasis and a mammography one year before revealed BIRADS 2. She was hemodynamically stable with negative orthostatic vital signs. Exam was positive for unstable gait and horizontal nystagmus bilaterally that was not suppressed with eye fixation. Dix-Hallpike maneuver was negative. She had no focal neurological findings. Due to new-onset dizziness associated with headaches, exam suggestive of central vertigo, and cancer history, an emergent CT Head with and without contrast was ordered. The CT Head showed a 3.5x5x4 cm right cerebellar peripherally enhancing lesion crossing the midline with surrounding vasogenic edema and effacement of fourth ventricle, suggestive of metastatic disease. She was admitted with urgent neurosurgery consult. She was started on IV dexamethasone for vasogenic edema with partial improvement of her symptoms. MRI Head confirmed solitary brain metastasis. She was taken to neurosurgery and the solitary brain lesion was removed with pathology confirming metastatic breast cancer to the brain.

IMPACT/DISCUSSION: Traditionally, dizziness has been divided into vertigo, disequilibrium, presyncope or lightheadedness. Unfortunately, patients' descriptions do not reliably predict the cause of dizziness. A systematic approach based on timing, triggers, medications, and comorbidities is a more consistent, clear, and reliable tool to predict central vs. peripheral causes for dizziness. In the setting of continuous dizziness, a positive "HINTS" examination (head-impulse, bilateral nystagmus, or test of skew) suggests that the dizziness is from central cause. Such cases warrant auxiliary tests and imaging. Indications for brain imaging include exam consistent with central lesion, risk for stroke/hemorrhage, neurological signs, or new headache accompanying vertigo. MRI is best due to increased accuracy, but in the acute setting, CT may be preferred. In this case, the patient had vertigo associated with headaches and a history of malignancy. Both the history and the physical examination were independent predictors for a central cause of dizziness requiring imaging and helped us in diagnosing metastatic brain cancer.

CONCLUSION: -It is important to utilize a systematic approach and the right physical exam maneuvers to improve diagnostic accuracy of dizziness

-In patients with history of malignancy, brain metastasis should be on the differential for new-onset central dizziness.

"YOU DON'T UNDERSTAND, I CAN'T GO TO DETOX:" OUTPATIENT MANAGEMENT OF BENZODIAZEPINE WITHDRAWAL IN A YOUNG TRANSGENDER MAN

Hannan Braun[2]; Carl G. Streed[1]; Jessica Kehoe[1]; Jessica Taylor[1]. [1]General Internal Medicine, Boston Medical Center, Boston, MA; [2]Internal Medicine Residency Program, Boston Medical Center, Boston, MA. (Control ID #3385535)

LEARNING OBJECTIVE #1: Design a treatment plan for outpatient medically managed benzodiazepine withdrawal in a patient with coexisting opioid use disorder (OUD)

LEARNING OBJECTIVE #2: Describe the risks of hormone therapy interruption for transgender patients

CASE: A 23-year-old transgender man with benzodiazepine use disorder, OUD, and PTSD presented to a substance use disorder (SUD) bridge clinic to stop heroin/fentanyl and benzodiazepine use. His intranasal benzodiazepine use had increased to 10-12 mg clonazepam and 4 mg alprazolam per day in the setting of trying to stop heroin/fentanyl on his own and losing his testosterone prescriber, resulting in a return of menses and significant gender dysphoria.

On exam, he was tremulous. He reported no history of complicated benzodiazepine or alcohol withdrawal. He was started on buprenorphine/naloxone for OUD. He declined inpatient medically managed benzodiazepine withdrawal, citing trauma in group homes as a teenager. He agreed to a structured outpatient benzodiazepine taper with daily assessments by a clinic nurse manager: diazepam 10mg TID for day #1, 10mg BID for days #2-3, and then 10mg daily. He did well for the first two days (mean CIWA 11) then presented with uncontrolled symptoms on day #3 (CIWA 21). He was referred to an inpatient program but left shortly after intake. He was therefore transitioned to a symptom-triggered diazepam schedule with daily assessments. He required up to 60mg per day – with no signs of sedation – but was then able to taper. His daily visits were interrupted by transportation barriers, and he completed a taper on his own.

Soon after, he resumed weekly testosterone injections. He continues daily buprenorphine/naloxone and has now been in recovery with no benzodiazepine or non-prescribed opioid use for 9 months.

IMPACT/DISCUSSION: Benzodiazepine withdrawal, which can be life threatening, is typically managed in inpatient settings due to high monitoring needs. However, many patients experience barriers to accessing inpatient services or require extended tapers. In this case, the SUD bridge clinic model allowed comprehensive daily assessments and facilitated a successful outpatient taper. Addressing his OUD and resuming masculinizing hormone therapy were also stabilizing.

Testosterone is an FDA Scheduled III controlled substance. Given the theoretical risk of diversion, some providers discontinue testosterone for transgender men with active SUD. Significant dysphoria and distress can result from involuntary hormone cessation, and this case illustrates how continuing therapy despite non- prescribed substance use is often indicated.

CONCLUSION: - Outpatient medically managed benzodiazepine withdrawal is feasible for patients with no history of complicated withdrawal.

- Bridge clinics are low-barrier, rapid-access clinics for patients with SUD. This model can facilitate safe monitoring for patients on benzodiazepine tapers.

- Gender affirming hormone therapy is associated with numerous positive outcomes; involuntary discontinuation should be avoided when possible.

ACHIEVING CARE TRANSFORMATION (ACT) REPORT: USE OF AN ELECTRONIC MEDICAL RECORD (EMR)-BASED REPORT TO LEVERAGE IDEAS OF PROVIDERS TO REDUCE UNNECESSARY INPATIENT AND ED UTILIZATION IN AN OUTPATIENT SETTING.

Christine Gladman[2]; Christine Hamilton[1]; Christina McMillan[4]; Shana Ratner[2]; Darren Dewalt[3]. [1]Medicine, University of North Carolina, Chapel Hill, NC; [2]Division of General Internal Medicine, UNC Chapel Hill, Chapel Hill, NC; [3]Medicine, UNC, Chapel Hill, NC; [4]UNC Internal Medicine Clinic, Chapel Hill, NC. (Control ID #3388594)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): UNC Healthcare is rapidly expanding value-care contracts, and our internal medicine practice has high total cost of care, admission rates, and emergency department (ED) visits.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Identify and implement strategies to reduce unnecessary ED visits and hospitalizations.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We created an EMR-based report to allow faculty providers to review their panel's healthcare utilization in real- time with a process for referral to clinic resources including care management, palliative care, and hospital follow-up clinic. The ACT Report extracted patient panels with data on internal and external utilization of the hospital, ED, and primary care clinic, risk-stratification scores, eligibility for Chronic Care Management and advanced care planning (ACP). Report filters were built to easily identify subgroups of patients including those with an inpatient stay or ED visit in the past three months and high-risk patients without ACP.

Providers were asked to review their ACT report each month independently or during monthly scheduled faculty meetings and provide feedback on actions they took upon review and ideas for interventions to prevent unnecessary hospitalizations and ED visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Number of faculty completing report, type of follow-up recommended, number of change ideas recommended.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From July to December 2019, on average 23 (75%) of faculty providers reviewed their ACT report each month. Each month, 46% of providers requested follow-up appointments with patients, 36% utilized embedded care management services, and 1-10% of providers referred patients to other clinic resources including social work, multidisciplinary hospital follow-up clinic, hotspotting program, and palliative care. Over 75 ideas of resources and interventions have been submitted and include access to specific specialty care services, improved communication to patients, efforts to direct patients to urgent cares, improved access to behavioral health programs, and development and implementation of action plans for acute exacerbations of chronic conditions. Subsequent work is underway with a multidisciplinary clinic team to review these ideas and plan rapid tests of change to implement these ideas. To further operationalize the use of the ACT Report based on common actions taken by providers, access to the report will be expanded to ancillary staff, including care managers to assist providers with identification of patients needing care management, and administrative staff to identify patients with lack of scheduled follow-up appointments after an ED visit and hospitalization.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The ACT Report has allowed for bottom-to-top innovation - individuals directly involved with patient care have helped to drive interventions and improvements developed clinic-wide. Providers are expected to complete these reports, which has yielded greater participation. Further evaluation is needed to determine the effectiveness of improvements and innovations on unnecessary healthcare utilization.

A COMPREHENSIVE QUALITY IMPROVEMENT INITIATIVE TO IMPROVE SERIOUS ILLNESS COMMUNICATION IN THE LONG TERM ACUTE CARE HOSPITAL SETTING

Niharika Ganta[1]; Gregory Mayro[1]; Jeff Greenblatt[1]; Peter Yen[2]; Nina O'Connor[1]. [1]Medicine, University of Pennsylvania, Philadelphia, PA; [2]Medicine, University of Pennsylvania, Havertown, PA. (Control ID #3390024)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite the complexity and acute needs of Long Term Acute Care Hospital (LTACH) patients their values and priorities are not systematically addressed and integrated into care planning.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Teach LTACH providers a structured approach to communication focusing on patients' values and priorities Standardize documentation of serious illness conversations in the electronic medical record

Document and monitor these conversations through use of a smart phrase in the electronic medical record

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The project included a 3-hour communication workshop led by palliative care providers which taught LTACH hospitalists to use the Serious Illness Conversation Guide, a structured approach to serious illness communication. A new workflow was created to initiate conversations soon after admission with social work support to set up family meetings as needed. Lastly, the electronic medical record (EMR) was adapted through creation of a new smart phrase in EPIC that was used to efficiently capture the conversations in Advance Care Planning Notes. This note type is easily

retrievable across settings. Use of the smart phrase was tracked monthly and monitored by project leads. Hospitalists received feedback in the form of bimonthly emails which highlighted overall progress as well as the individual providers who authored the most ACP notes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of Advance Care Planning notes for counted.

The use of the smart phrase was counted. Provider feedback survey.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Implementation started January 28, 2019. The percentage of admitted patients with a documented ACP note increased from 46.4% to 100%. Of note 3 months had 100% completion rate. (Refer to Figure 1 and 2).

In the 6 months prior to initiating this program, there were 41 Advanced Care Planning (ACP) notes documented at the LTACH. In the same period of time following introduction of this program, there were 122 ACP entries, an increase of 297%.

In an email-administered survey of the trained LTACH hospitalists, a majority of providers (62.5%, n= 8) reported feeling slightly less to much less anxiety about having these conversations. A majority of providers (75%) also felt slightly increased to greatly increased satisfaction with their roles in their patient's care as a result of these discussions.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The Serious Illness Care Guide is an effective tool for initiating conversations about patient values and priorities in the LTACH setting.

Workflow and EMR changes were effective in increasing ACP conversations using this format. This quality improvement initiative provides promising and scalable tools to increase conversations in the complex LTACH population. Next steps are to maintain provider engagement in the initiative. The success of this quality improvement initiative serves as a model for other provider groups within our health system.

ADAPTING AND IMPLEMENTING A SHARED MEDICAL DECISION MAKING TOOL TO IMPROVE COLORECTAL CANCER SCREENING RATES IN INTERNAL MEDICINE RESIDENT CONTINUITY CLINIC

Kanika Garg[1]; Jeffrey Bulger[1]; Laura J. Zimmermann[2]. [1]Internal Medicine, Rush University Medical Center, Chicago, IL; [2]Preventive Medicine, Internal Medicine, Rush University, Oak Park, IL. (Control ID #3390769)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): CRC screening is effective in reducing cancer-associated mortality, but screening rates in this urban internal medicine resident clinic remain low (67% in 2019 quarter 3) despite patient reminders and EHR-based resident feedback, with under utilization of stool-based strategies.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Educate internal medicine residents on the indications/contraindications/ordering workflow for FIT and FIT-DNA screening tests

2) Increase utilization of stool-based CRC screening strategies

3) Improve CRC screening rates in this resident clinic to 72% (HEDIS top decile)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our intervention took place in an outpatient internal medicine resident continuity clinic in a large, urban, academic medical center. This primary care clinic includes 92 residents and 22 attending physicians with about 40,000 patient visits per year. We adapted a shared-medical-decision-making tool from the Amerian Cancer Society to reflect the available screening strategies. The tool was distributed to 20 residents in two weekly clinic sessions. The residents concurrently received a brief presentation on indications, contraindications, and ordering procedures for FIT, FIT-DNA, and direct visualization strategies.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We collected data on individual resident CRC screening rates via EHR dashboards pre- and post-intervention. Residents completed a survey with Likert-type items eliciting resident comfort with indications/contraindications/ordering stool- based strategies before and after the intervention. We also plan to compare monthly total orders (FIT, FIT- DNA, colonoscopy) pre- and post-intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Prior to intervention, the mean screening rate of the 20 residents YTD was 61.8% (range 33-73%) which increased to 63.4% (range 50-75%) post-intervention. Overall, the clinic's 2019 screening rate including resident and attending physicians was 68.9%.

Response rate to the survey was 50% pre and post intervention. Prior to intervention, 1 respondant rated their confidence in their knowledge of the indications/contraindications for FIT or FIT-DNA as above neutral (5 "neutral," 2 "low," 2 "not at all"). After intervention, 6 of 10 were "somewhat confident" in indications for FIT (3 "neutral," 1 "low") and all respondents responded that they were "somewhat" or "very" confident about the indications/contraindications for FIT-DNA.

Prior to intervention, 7 of 10 rated their confidence in ordering FIT as "low" or "not at all." 8 of 10 rated their confidence in ordering FIT-DNA as "Low" or "Not at all." After intervention, 5 of 10 were "confident" or "very confident" in ordering FIT, and 6 of 10 were "confident" or "very confident" in ordering FIT-DNA.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We demonstrated that brief resident education and provision of a shared medical decision making tool improves resident confidence in utilizing stool-based CRC screening strategies and can confer modest improvement in overall CRC screening rates in an internal medicine resident continuity clinic.

ADDICTON TREATMENT FOR HOSPITALIZED PATIENTS WITH LINKAGE TO CARE: A NOVEL INTERVENTION TO SCALE ADDICTION MEDICINE EXPERTISE TO HOSPITALISTS

Susan L. Calcaterra, Lauren McBeth, angela keniston, marisha burden. Medicine, University of Colorado, Denver, CO. (Control ID #3388010)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): People with opioid use disorder are increasing hospitalized, yet little is being done to engage patients in addiction treatment during hospitalization. Hospitalists are uniquely positioned to be trained to provide this life-saving care. **OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):** In 2018, we obtained funding to build a hospitalist driven addiction consult service in partnership with an addiction medicine trained hospital medicine physician.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In year one, eleven hospitalists were recruited from an academic hospital

who participated in a comprehensive addiction medicine training program which included: 1) a 13-part lecture series covering medications for opioid and alcohol use disorder, trauma and addiction, interpretation of drug testing, among others, 2) online addiction training modules with textbook, 3) American Society of Addiction Medicine membership, and 4) 10 - ½ day shadowing shifts with an addiction medicine physician. In year two, hospitalists will attend on a Monday through Friday addiction consult service. The program also supports a dedicated social worker and peer recovery coach. All participating hospitalists committed to taking the Addiction Medicine board exam by 2021.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): First year metrics are: 100% buprenorphine certification, 100% online module completion, and 100% completion of shadowing shifts, and to hire a dedicated addiction social worker and recovery coach. Year two metrics are: initiation of Monday through Friday hospitalist-supported addiction consult service with buprenorphine or methadone initiation and linkage to treatment with expansion of community partnerships. Year two quantitative measures include: monthly addiction consults completed; buprenorphine prescriptions initiated, naloxone prescriptions at discharge across all specialties, hospital-based methadone enrollment; billing for addiction services, and addiction medicine board certification.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In year one, all hospitalists were buprenorphine waivered, completed the online training, and completed 85% of the shadow shifts. We hired a dedicated addiction social worker and peer recovery coach who visited six community treatment partners and three methadone clinics in year one and two. In year two, we began our Monday through Friday addiction consult service. From October to December 2019, we initaited and prescribed buprenorphine 15 times at discharge with linkage to treatment, enrolled 21 patients into a methadone program, and billed over $100,500 for addiction services provided. Across all hospital services, naloxone was prescribed 138 times at discharge. Hospitalists will take the Addiction Medicine board exam in 2021 through the practice pathway.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Program success requires 1) a motivated addiction medicine expert to support hospitalists, 2) hospital leadership support, and 3) hospital support for a dedicated addiction medicine social worker.

ADDRESSING FOOD INSECURITY THROUGH A PRIMARY CARE/CBO PARTNERSHIP

Alexander Bryan[1]; Alessandra Calvo-Friedman[2]; Mireille Mclean[3]; Zachariah Hennessey[3]; Grace Kim[4]; Lara Rabiee[4]; Nichola Davis[1]. [1]Office of Population Health, New York City Health + Hospitals, New York, NY; [2]Medicine, NYU School of Medicine, Brooklyn, NY; [3]Public Health Solutions, New York, NY; [4]Lincoln Hospital, New York City Health + Hospitals, New York, NY. (Control ID #3358928)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Time and resource constraints in primary care settings create challenges in identifying and addressing food insecurity, a key social determinant of health contributing to poor health outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To develop a coordinated approach to food insecurity assessment and service referral in a municipal primary care clinic.

To connect patients reporting food insecurity in a primary care clinic to appropriate services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Lincoln Hospital is a municipal hospital in the South Bronx, the NYC borough with the highest prevalence of food insecurity. Screening for social determinants of health was instituted at the Lincoln adult medicine outpatient clinic using a 10-item questionnaire that screens for a number of social needs including food insecurity. Volunteers at the clinic assist patients in navigating referrals for positive needs to resources provided both internally in the hospital and externally with partner CBOs.

Patients who screen positive for food insecurity are referred to Public Health Solutions, a non-profit organization providing on-site food navigators 5 days per week to further assess patients' needs and service eligibility. Food navigators offer a Food and Nutrition Services Bundle which provides a full range of food security resources available in the local community including emergency food resources, medically tailored home-delivered meals, SNAP and WIC enrollment. The bundle was powered by an electronic platform, Unite Us, that enabled network partners across multiple health and social service settings to share information and coordinate care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Starting in March 2019, food navigators were able to systematically identify and track patients referred from positive food insecurity screening in clinic. We assessed the number of patients screening positive for food insecurity, and the proportion of those patients who completed their food navigator intake and were enrolled in a program. Data was shared between partners to determine resource utilization and identify areas for process improvement.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From March 2019 – October 2019, 1568 patients were screened for social determinants of health needs, and 317 screened positive for food insecurity. Of those patients, 94 completed their Food and Nutrition Services Bundle intake, and 57 were enrolled in a service. The most common service referrals were food pantries and SNAP, with patients frequently being connected to multiple resources.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Adequately addressing food insecurity often involves a multitude of interventions for a single patient. Simplifying access to these interventions through a food navigator and physically locating navigators close to the clinic helped to streamline workflows and connect patients to appropriate resources.

Using an electronic platform to track external CBO referrals enabled us to track outcomes and identify areas of patient drop off. The most significant drop off was between positive screening and referral intake, which drove efforts to improve phone outreach to patients.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH IN AN URBAN PUBLIC HEALTH SYSTEM: LESSONS FROM THE SAN FRANCISCO SDOH TASK FORCE

Claire K. Horton. Department of Medicine, UCSF, San Francisco, CA. (Control ID #3392628)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Social determinants of health (SDoH) have a major impact on the health of patients, particularly in vulnerable populations; in fact, they exert a stronger influence than the influence of access to medical care (Schroeder et al., 2007). Although this relationship has been well evaluated, the mechanisms by which health systems can institute systems that result in impactful interventions remains elusive.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The Social Determinants of Health Task Force in the San Francisco Health Network was established to reach the following goals:

- Work with the Network's data governance committee to build standardized SDoH data infrastructure

- Drive continuous improvment work to integrate SDoH screening, data collection, and workflows into the electronic health record

- Break down silos and create collaborative relationships among participants (including representatives from community-based organizations, public health leaders, clinicians, and academicians.)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The SDoH task force was created to bring together a diverse team of individuals working on SDoH screening and intervention for vulnerable patients in San Francisco. Participants include members of the Whole Person Care team, community behavioral health, primary care, hospital-based medicine, emergency services, and the San Francisco food bank. The group created consensus around universal screening questions for SDoH and is now creating standard workflows to connect at-risk patients with services when. Initially, the focus was on implementation of "behavioral health vital signs," which includes screening for tobacco use, depression, intimate partner violence, alcohol and drug use. Now the focus is on screening for additional SDoH, including housing instability, food insecurity, transportation and employment risk. Group members also use the task force to coordinate efforts around parallel sub-projects.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Number of individuals screened for behavioral health vital signs and additional SDoH challenges

Number of interventions offered to those deemed at-risk

Reduction in PHQ9 scores for individuals identified as at-risk

Housing obtained for homeless individuals (sub group)

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date, the network has increased its screening for behavioral health vital signs from 0% to 20% over a one-year period (12,000 individuals screened.) This was accomplished by using an integrated team of primary care clinicians and behavioral health staff.

The Whole Person Care team is tracking housing status and successful housing of homeless individuals for the most at-risk individuals

The task force also successfuly built data fields for additional SDoH questions into the new electronic health record.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Screening for SDoH can be implemented in a standardized fashion across a city-wide health network. Robust collaboration among a highly interdisciplinary group is necessary to make this work a success. Competing priorities (for funding, human bandwidth, and EHR build) will be ongoing challenges.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH IN PRIMARY CARE: PERCEPTION AND PRACTICE

Nicole Treadway, Kayley Alden, Rachel Shah, Sahil Angelo, Meselle Jeff-Eke, Claire Edelson, Tracey Henry, Stacie Schmidt, Jada C. Bussey-Jones, Maura George. General Medicine, Emory University, Atlanta, GA. (Control ID #3390768)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite research indicating that adverse social determinants of health (SDOH) substantially impact burden of disease and health outcomes, evidence suggests SDOH are not adequately addressed in primary care settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To characterize prevalence of adverse SDOH experienced by patients seen in resident primary care clinics at Grady Memorial Hospital, an urban safety net hospital

2) To compare the prevalence of SDOH as self-reported by patients to provider-reported perceptions

3) To assess provider screening practices and identify perceived barriers to SDOH screening

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : A pilot SDOH screening tool adapted from Health Leads Toolkit was given to patients attending primary care appointments within a 12 week period. Resident physicians in Grady Memorial Hospital's continuity clinics were separately surveyed to assess providers' perceptions of SDOH most commonly impacting patients and to assess current practices toward screening in clinic.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Descriptive statistics were utilized to quantify the percentage of patients succesfully screened and to determine the number of resources, including referrals, that were offered by providers following screening.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1,061 (27.3%) surveys were completed. Patient surveys identified 10 SDOH categories with >15% respondents being impacted in last year. Although nearly 25% of respondees experienced at least one adverse SDOH over the past year, less than 5% were offered SDOH related handouts or ancillary service referrals by a resident physician. 87% of residents reported additional knowledge of patients' SDOH would change their clinical care, but only 22.3% of residents reported screening more than half of their patients. The most commonly cited reasons for not screening included lack of time, not having the resources to address barriers, and not knowing how to screen effectively. When comparing patient responses to physician perceptions, resident physicians correctly identified only 1 of the 3 most commonly cited adverse SDOH experienced by patients.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Disparate responses between provider perceptions and patient experiences of SDOH reveal resident physicians may be unaware of the SDOH most prevalent in their patient populations. Providers view SDOH-related information as valuable but institutional barriers prevent providers from screening effectively. Universal screening and enhanced clinic resources may improve patient health outcomes by allowing physicians to identify prevalent SDOH and offer targeted interventions.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH THROUGH THE DUKE HOTSPOTTING INITIATIVE: A MEDICAL STUDENT-PATIENT PARTNERSHIP

Sachiko Oshima, Thomas Bunning, Norah Karlovich, Alison Clay. Duke University School of Medicine, Durham, NC. (Control ID #3391984)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The social determinants of health (SDH) are known contributors to poorer long-term health outcomes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The Duke Hotspotting Initiative (DHSI) is a student-led program that pairs first-year medical students with patients who are identified by social workers as under-utilizers of primary

care with complex social and chronic health needs. The program's tripartite mission is to (1) benefit patients by providing consistent outpatient follow-up and improving health outcomes; (2) benefit medical students by providing opportunities to apply advanced motivational interviewing and health behavioral coaching; and (3) benefit the health system by adjusting these patients' healthcare utilization to be more cost-efficient and sustainable.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Throughout the academic year, students make contact with their patients weekly and attend outpatient medical appointments with patient consent. This program is one of several clinical experiences that fulfills a first-year student academic requirement.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To evaluate DHSI's impact on patients, data on patient's healthcare utilization was recorded for the duration of the 2018-2019 patient cohort (10/17/18 to 5/21/19), as well as a time period of equal length prior to the start of the program. Data collected included number of emergency department (ED) visits, inpatient hospitalizations, and outpatient clinic no-show rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There were 14 patients in the 2018-2019 patient cohort however two were excluded from analysis because they passed away during the program. All p-values were assessed using one-tailed paired T-tests. Overall, the average number of ED visits dropped from 3.66 to 3.08 (p=0.2804), the average number of outpatient no- show visits increased from 4.5 to 4.92 (p=0.3867) and the average number of inpatient hospitalizations decreased from 1.75 to 0.833 (p=0.0380). Separate analysis has shown that students who participate in DHSI show significant improvement in comfort with patient communication, advising patients and clinical skills. While preliminary analysis was limited due to a small sample size, planned analysis for the 2019-2020 cohort includes qualitative evaluation of patients' experiences with the program which may provide a richer understanding of this program's impacts on areas like influence on patient trust in the medical system, and would be included at this conference.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Overall, DHSI demonstrates the feasibility of this low-cost model to provide additional layers of support for medically and socially complex patients, while also educating medical students about SDH through experiential learning.

ADDRESSING SOCIAL ISOLATION IN AN URBAN SAFETY NET HOSPITAL

Alexandria Cantarero[1]; Agnes Premkumar[1]; Kaitlin Vick[1]; Hayley W. Sayrs[2]; Janine Cadet[1]; Kariamu Cross[3]; Charles E. Coffey[1,4]. [1]Keck School of Medicine, Los Angeles, CA; [2]Department of Preventive Medicine, Keck School of Medicine, Los Angeles, CA; [3]UC Berkeley, Berkeley, CA; [4]LAC+USC Medical Center, Los Angeles, CA. (Control ID #3391353)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Social Isolation (SI), a largely unrecognized social determinant of health, has been linked to various negative health outcomes including higher rates of depression, increased risk of cardiovascular disease, and higher healthcare costs, yet little is known about SI among hospitalized patients in safety net settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): I. Measure the prevalence of SI within our inpatient population at a large urban safety net hospital.

II. Quantify the degree and nature of SI using in-depth interviews and a validated screening tool.

III. Understand the factors that contribute to SI in order to create personalized interventions that address SI and meet the needs of a large urban safety net health system.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : From June 2019 through November 2019, we conducted a point prevalence study of SI and a series of focused interviews on adult patients hospitalized in the inpatient wards at LAC+USC Medical center, a 600-bed Level 1 trauma center serving 10 million residents of the greater Los Angeles area.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We assessed the point prevalence of SI, at two different time points, using a short two-question screen of all willing and able patients in the medical/surgical wards of LAC+USC. In addition, we conducted focused, in-depth surveys on patients that were identified by hospital nursing staff as having one or more psychosocial risk factors for SI. These surveys included: 1) a 2-question screen 2) an extended screening instrument adapted from the Berkman-Syme Social Network Index (BSNI), and 3) a series of open-ended questions investigating the underlying mechanisms for social isolation among hospitalized patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To determine the prevalence of SI and loneliness, we screened a total of 149 patients in the medical/surgical units at LAC+USC Medical Center. 32 (21%) of these patients screened positive for SI and 8 (5%) screened positive for loneliness. To date, we have completed 60 patient surveys using the BSNI instrument.

Preliminary results from our surveys indicate that individual-level barriers were the most commonly reported, for those with the highest risks for SI. Furthermore, physical disability and behavioral health issues were the most frequently reported barriers to being socially connected.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): These results highlight the prevalence of SI within our urban safety net hospital system. Additionally, they reveal the need for a patient- centered intervention that addresses SI while serving the needs of our diverse community and goals of our health system. Throughout the next several months, we plan to continue screening and surveying patients to obtain a more comprehensive view of the barriers and resources available to address SI. In the near future, we hope to work with patients and community-based programs to develop and implement an intervention that would link patients with SI to existing community-based resources. Our goal is to improve individual patient health outcomes and strengthen the linkages within our safety net health system to address social isolation and end loneliness.

ADDRESSING THE SOCIAL INFLUENCERS OF HEALTH BY CONNECTING PRIMARY CARE CLINICS TO COMMUNITY RESOURCE NAVIGATION USING A TEAM-BASED CARE APPROACH

Shari Bolen[9,1]; Jonathan Lever[2]; Alvonta Jenkins[2]; Chris Mundorf[1]; Thomas E. Love[9,2]; Samantha Smith[3]; Matthew Finley[4]; Joseph Daprano[5]; Eva Johnson[6]; Marie Masotya[6]; Melissa E. Lohr[5]; David Bar-Shain[7,1]; David Kaelber[5]; Dieter W. Sumerauer[8]; Randall D. Cebul[8]. [1]Better Health Partnership, Cleveland, OH; [2]Better Health Partnership, Cleveland, OH; [3]Cuyahoga County Board of Health, Parma, OH; [4]United Way 2-1-1, Cleveland, OH; [5]The MetroHealth System, Cleveland, OH; [6]University Hospitals Rainbow Babies and Children's Hospital,

Cleveland, OH; [7]Center for Clinical Informatics Research and Education at MetroHealth Medical Center, Cleveland, OH; [8]Department of Population and Quantitative Health Sciences, Case Western Reserve University, Cleveland, OH; [9]Center for Health Care Research and Policy, Case Western Reserve University at The MetroHealth System, Cleveland, OH. (Control ID #3387861)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Addressing social needs of patients could have a large impact on health; however, clinics are struggling with ways to consistently identify and address these needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Develop a scalable electronic linkage model between primary care clinics and community resource navigators to provide more patients with access to community resources for health improvement.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Patients cared for in one of 3 safety net clinics were included for referral if they were: 1) hypertensive adult patients with uncontrolled blood pressure (BP≥140/90 mmHg) at 1 clinic after 09/2018; or 2) children 2-17 years old with overweight/obesity (i.e., body mass index percentile ≥85th) or with diagnosed asthma at the 2 remaining clinics after 07/2019. Qualifying patients who consented (or, whose parent/legal guardian gave consent) were referred by their primary care team to United Way 2-1-1 (UW 2-1-1) via a referral order in the electronic medical record in real time. UW 2-1-1, a non-profit organization covering 2.5 million people in Ohio, called referred patients to assess and connect them to appropriate social, community or health improvement resources through a curated database of >20,000 local resources.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We describe: 1) the percent of patients referred, reached, and with a need addressed; and 2) the type of needs addressed. Longer term health outcomes are planned.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At the 3 clinics, 903 patients were eligible for referral to UW 2-1-1 and 197 (22%) were referred, with a range in referral rates by clinic of 9.4% to 26.1%. Of the 197 referred, 89 patients (45%) were reached by a 2-1-1 navigation specialist and 76% of these (n=68) had either one need resolved or a resolution in progress. Reached patients reported 385 needs and were connected to 1,162 community resource referrals, with an average of 13.2 community resource referrals (SD 8.2) per patient. The average number of community resource referrals were higher for families with referred children (15.5; SD 7.2) compared with referred adults (10.9; SD 8.1). The percent of patients with specific needs fell into 15 of 16 distinct categories in the Alliance for Information and Referral Services taxonomy used by UW 2-1-1: recreation (73%); food/meals (73%); health care (57%); housing (17%); utility assistance (16%); clothing/personal/household needs (16%); individual, family, and community support (9%); transportation (8%); legal services (4%), and 3% or less for the remaining categories. When stratified by adults and children, the same ranking of categories were identified.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Electronically linking patients to community resources is feasible in busy primary care practices. Patients from safety net clinics have an extensive set of social and medical needs and there are many community resources available to address these needs. Addressing referral barriers, resolving needs completely (e.g., no further food insecurity), linking to health outcomes, and addressing gaps in community resources will be critical next steps for these interventions.

ADOPTING SCREENING FOR ADVERSE CHILDHOOD EXPERIENCES IN A GENERAL MEDICINE CLINIC

Elizabeth Jacobs, Teresa Coats, Maj Henriksson, Kristin Vinueza, Samantha Vogel, Kellie Sorensen, Melissa Jones, Krystal Luna. Dell Medical School, University of Texas at Austin, Austin, TX. (Control ID #3391600)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Adverse childhood experiences (ACEs) impact the health and wellbeing of adults, increasing the risk of mood disorders, substance use disorders, and chronic disease. Despite their import, we do not routinely screen for them in adult primary care settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (1) To incorporate a simple ACEs survey into all first primary care visits and (2) offer an introduction to, or consultation, with a social worker to all patients with an ACE score >2 or those asking for help after completing the survey.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The setting was a newly formed academic outpatient primary care internal medicine clinic. The team delivering the program consisted of a physician, nurse practitioner, licensed clinical social worker (LCSW), clinical pharmacist, and medical assistant (MA). The MA introduced the screen to each patient while waiting for the provider, asked them to complete the survey, and answered questions. The provider would ask about the survey, if not completed, and/or inquire about how they could help with any adverse experience noted. This included a brief explanation about how childhood experiences can impact adult mental and physical health. If the patient agreed to or requested help, they were offered a referral to the LCSW; if declined, then medication might have been offered. ACEs scores were recorded in the EMR provider note.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): (1) number of patients completing ACEs surveys, (2) number of those with positive ACE scores for whom the information provided insight and value to their care plan.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Team members were initially resistant to implementing the program, expressing concern that they did not know how to respond to the information. With education, experience, and support from the LCSW and a consulting psychiatrist, they became comfortable with the program within 6 weeks. Some patients were also resistant. Developing a consistent method for communication with the patient regarding the intention and purpose of the survey was critical to gaining patient trust. Approximately 90% of new patients completed the survey and we uncovered previously unknown alcohol use disorder, PTSD, depression, and anxiety resulting in treatment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An interprofessional team is imperative to the success of an ACEs screening program in an adult primary care clinic; support from behavioral health professionals increased the comfort of providers and staff and provides access to care for those with positive ACEs. Education of providers, staff, and patients, as to the value of this information to helping patients is also essential. This information needs to be incorporated into the EMR in a way that those at risk can be identified and followed over time. The most important lesson, however, was the value that the awareness and understanding of a patient's childhood trauma contributed to the clinician's ability to help the patient as a whole.

ADVANCE CARE PLANNING OCCURRING IN ADVANCE: GROUP VISITS FOR ADVANCE CARE PLANNING

Allison Wolfe[1]; Jule Jones[2]; Hillary Lum[1]. [1]Internal Medicine, University of Colorado, Denver, CO; [2]University of Colorado, Denver, CO. (Control ID #3392220)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Advance directives directly help document preferences for medical care in the setting of decisional incapacity, however, up to 70% of Americans have not completed an advance directive

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement Advance Care Planning (ACP) Group Visits at a busy Internal Medicine Clinic 2. Increase ACP documentation among clinic patients

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Group visits can engage patients in ACP discussions in an efficient process that is integrated into primary care. As a quality improvement initiative, we adapted and implemented a published ACP group visit intervention, Engaging in Advance Care planning Talks (ENACT) Group Visits, based on our prior experience and an implementation manual. ENACT helps patients start or continue ACP conversations and advance directive documentation. The group visits aim to gather 6-10 patients for two 2-hour visits, one month apart. This was adapted to a single session due to poor retention and to access more patients. ENACT Group Visits are facilitated by a primary care physician and a social worker with experience in palliative care and advance directives. Each group visit discussion included the following topics: MDPOAs, living wills, CPR, and artificial nutrition and hydration. The discussion also included topics in response to patients' questions that occur organically during the visits. Setting and Context: Using an electronic health record- generated list, primary care patients 65 years and older at a busy Internal Medicine clinic in Colorado were recruited through phone outreach by social workers, medical assistants trained in the objectives of the group visits, and the physician. Implementation used existing clinic resources and staffing without external funding.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Percentage of patients with an ACP document (i.e MDPOA form, living will, MOST form) before and 3 months after a group visit, per medical chart review; comparisons using McNemar test

2. Patient feedback regarding the usefulness of the visit, per evaluation surveys.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Starting in April 2018, we obtained clinic leadership support to implement ENACT Group Visits into the practice. We conducted three cohorts that had two sessions per intervention. Of 19 patients, 42% had an ACP document prior to participating, which increased to 68% at 3 months (p=0.06). We then conducted four cohorts that had only one session per intervention. Of these 23 patients, 26% had an ACP document prior to participating, which increased to 61% at 3 months (p=0.008). Patient feedback from evaluation surveys from all visits (n=46), showed that 61% strongly agreed that group visits were a better setting than a usual clinic visit and 74% strongly agreed that the visit provided useful information.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Group visits are an effective way of discussing and increasing documentation of ACP documents in a general internal medicine practice. The intervention can be adapted to the scheduling and availability of patients. Involving the staff team can help recruit and conduct the visits in a sustainable way.

A JOINT MOTHER/INFANT PRIMARY CARE PROGRAM PROMOTING EVIDENCE BASED POSTPARTUM CARE AFTER GESTATIONAL DIABETES MELLITUS DIAGNOSIS

Seuli B. Brill[1]; Masami Otsubo[1]; Shengyi Mao[1]; Stephen Thung[2]; Cindy Dietrich[1]; Laura Prater[1]; Doug Spence[3]; Allison Lorenz[3]; Melissa Leonard[3]; Reena Oza-Frank[4]. [1]Internal Medicine, Ohio State University College of Medicine, Columbus, OH; [2]Obstetrics and Gynecology, Ohio State University College of Medicine, Columbus, OH; [3]Ohio Colleges of Medicine Government Resource Center, The Ohio State University Wexner Medical Center, Columbus, OH; [4]Ohio Department of Health, Columbus, OH. (Control ID #3392646)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Postpartum handoff from obstetrics to primary care among women with gestational diabetes mellitus (GDM) rarely happen, hindering access to diabetes screening and prevention among patients at very high risk of developing Type 2 Diabetes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Demonstrate feasibility of a mother/ infant dyad clinical program promoting postpartum obstetric to primary care handoffs for women diagnosed with GDM.

2. Provide postpartum Type 2 Diabetes (T2DM) prevention services to women diagnosed with GDM in the setting of joint mother infant primary care visits aligning with infant well child visits.

3. To improve guideline based postpartum T2DM screening rates, compared to baseline institutional and state screening benchmarks, among postpartum women with GDM through engagement in a primary care based mother/infant dyad clinical program.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Pregnant women with GDM in central Ohio were referred by obstetrics clinics, maternal/ fetal medicine clinics, Women Infants and Children (WIC), and the inpatient labor and delivery unit to the postpartum Mother Infant dyad program, based at an academic medical center Med-Peds clinic (7/1/2018 to 9/03/2019). The clinic's nurse care coordinator contacted referred patients. Patients willing to participate were scheduled for dyad primary care visits coinciding with 1 month and 4 month infant well child checks. Dyad based T2DM preventive counseling, tailored using national Diabetes Prevention Program (DPP) framework components and postpartum best practices (e.g. breastfeeding support and postpartum depression screening), was provided with newborn, 2 month, 6 month, and 9 m well child visits. Post-partum T2DM screening was ordered at the 1 month dyad visit for completion between 4-12 weeks postpartum. T2DM risk profiles and care plans were reviewed at the 4 month postpartum visit. Women with a diagnosis of postpartum depression or any psychiatric illness were provided nurse care coordination outreach via telephone and patient portals between visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success included number of referred and enrolled patients, postpartum T2DM screening rates, and patient engagement in T2DM prevention activities.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Institutional EHR data review prior to project start showed 10% of patients with GDM completed any postpartum T2DM screening or primary care follow up in the year after delivery. As of 11.30.19, 339 eligible referrals were received and 64 mother-infant dyads were seen. 53/64 of these patients (80.4%) completed postpartum T2DM screening. 75% of patients reported attending a postpartum visit with an OB/GYN; 60% reported completing postpartum T2DM screening; 81.2% reported receiving education about their T2DM risk at

postpartum visits; 77.7% reported breastfeeding at their 1-month postpartum visits; and 57.8% reported receiving a postpartum depression screening.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Formalized Ob/Gyn to primary care handoffs and joint mother infant care improve postpartum T2DM screening and prevention among patients with GDM.

A MULTIFACETED APPROACH TO IMPROVE CONTINUITY AT AN URBAN INTERNAL MEDICINE RESIDENCY PRIMARY CARE CLINIC

Elizabeth Pines[1]; Michaela Seigo[3]; Gretchen Rickards[2]. [1]Department of Medicine, Christiana Care Health System, Newark, DE; [2]Medicine, Christiana Care Health System, Kennett Square, PA; [3]Internal Medicine, Christiana Care Health System, Delaware, DE. (Control ID #3378502)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Lack of continuity in the internal medicine (IM) residency primary care clinic impacts patient and caregiver satisfaction, as well as no-show rates.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve IM residency continuity to over 50% within first 6 months of 2019-2020 academic year.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We implemented a multifaceted strategy over a 12-month period at an IM residency primary care clinic which included: mailing letters informing patients when their resident PCP graduates, which included the name of their new resident PCP and the PCP's coverage team; designing a graphic flier for patients which included a photo of the resident PCP the PCP's coverage team; educating the call center, medical assistants (MAs), office assistants (OAs), and nurses about the nuances of residency education, resident schedules, and the importance of continuity; releasing resident schedules as far in advance as possible (4-6 months); empowering schedulers to nudge patients to the PCP or respective coverage team for non-urgent appointment needs; encouraging staff and residents to ensure each patient left the clinic with their next appointment date in-hand; balancing resident panel sizes; incorporating phone visits into senior resident schedule templates; assigning a dedicated MA and OA to each resident coverage team.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success included 1) improved continuity, defined as the patient being seen by the assigned PCP or one of the members of the PCP's coverage team, 2) improved no show rates, and 3) increased job satisfaction among clinic staff as measured by the Minnesota Satisfaction Questionnaire Short Form.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Using September 2018 to January 2019 as a baseline, the continuity was 47.4% on average. After implementation of all interventions in August 2019, the continuity rate was greater than 50%, with a mean continuity rate of 63.9%. Furthermore, using linear regression, there was a significant negative association with continuity and no-shows (p=0.04). Baseline job satisfaction rates were being obtained by 2019 graduates who were providers in September 2018 to January 2019. Post-intervention job satisfaction is currently being collected.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Continuity is key in primary care.

Despite scheduling challenges among IM residency primary care clinics, patients still value continuity as demonstrated by their increased attendance. IM residents have anecdotally expressed improved job satisfaction with increases in patient continuity. In the setting of primary care shortages, changes need to be made to ambulatory IM residency training in order to attract physicians-in-training to primary care. Improving continuity may be one critical element in doing so.

AN EDUCATIONAL INTERVENTION TO REDUCE THE COLLECTION OF POTENTIALLY LOW-VALUE LABS

Shea A. Ford[1]; Meghan Uht[3]; Sarah Brown[3]; Michael Westfall[3]; Thomas R. Radomski[2]. [1]Internal Medicine, UPMC, Pittsburgh, PA; [2]Division of General Internal Medicine, University of Pittsburgh School of Medicine, Pittsburgh, PA; [3]Finance, UPMC, Pittsburgh, PA. (Control ID #3391758)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can we reduce potentially low- value labs (PLVLs) by 10% on general medicine inpatient teaching units by conducting an educational intervention and providing physicians with weekly feedback on their performance?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To decrease PLVLs (i.e. a basic metabolic panel, complete blood count, or magnesium level drawn on patients admitted to the hospital ≥ 72 hours) by at least 10%.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : During the first week of each 4-week inpatient rotation during weeks 21-34 of 2019, we conducted a 30- minute educational session geared toward trainees rotating through 2 general medicine inpatient units at a large university hospital. During the educational session, we reviewed principles of high-value care, defined a PLVL, and requested that each teaching team expressly discuss each patient's need for lab testing as part of their daily rounding checklist. On Fridays, we provided each team with a weekly report of the rate of PLVLs per discharged patient and the specific patients who received such labs. Participants then completed an online survey to provide feedback regarding the intervention.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We compared the rate of PLVLs per discharged patient between the intervention units and 2 general medicine teaching units that did not receive the intervention during the study period. We also determined the change in the rate of PLVLs in the 13 weeks preceding the intervention in comparison to the study period. To ensure our intervention did not adversely affect patient care, we compared readmission rates, average length of stay (LOS), and case-mix index (CMI) pre and post intervention. From the survey, we identified perceptions of the intervention and identified opportunities for improvement.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Excluding the first week of each rotation from weeks 21-34 in 2019 (to account for delays in educational session delivery), the overall rate of PLVLs was 4.45 vs 4.16 among patients discharged from non- intervention units. In the 13 weeks preceding the intervention, the rate of PLVLs was 4.29, representing a 3.7% increase during the intervention period. Within each rotation period, there was a transient drop in PLVLs in the week after the educational session – weeks 21-22: 7.8 vs 3.9, weeks 26-27: 5.4 vs 2.5, weeks 31-32: 8.5 vs 4.7. Overall, 30-day readmission rates (pre: 23.9%; post: 17%), average LOS (pre: 7.5; post: 6.8 days), and CMI (pre: 2.05; post: 2.09) decreased or were unchanged during the intervention. While 78.9% of participants

agreed that the educational presentation was effective in conveying information regarding low- value lab testing, only 42.1% reported that the weekly reports were helpful in reducing PLVLs.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The educational intervention was transiently effective at reducing the rate of PLVLs, but lacked durability. Improving the content and dissemination of the weekly reports may facilitate more effective reflection among teaching teams and enhance the durability of the intervention in future iterations.

AN INTERPROFESSIONAL APPROACH TO SCREENING AND ADDRESSING SOCIAL DETERMINANTS OF HEALTH AND BEHAVIORAL HEALTH NEEDS

Magan Hoisington[2]; Megan Reed[2]; Kimberly Belanger[2]; Kara Henry[2]; Kelsey LaRoche[2]; Alexis Chamberlain[2]; Heather Ashey[2]; Kelly A. Kieffer[1]; Daniel S. Moran[2]. [1]Medicine, Dartmouth-Hitchcock Medical Center, Lebanon, NH; [2]General Internal Medicine, Dartmouth-Hitchcock Medical Center, Grantham, NH. (Control ID #3392482)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients seen in primary care frequently have needs for behavioral health and community support services that are not effectively identified during clinic appointments.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Increase the number of patients screened for social determinants of health and behavioral health conditions. Increase the percent of patients that request help or information about resources related to social determinants of health.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : A Comprehensive Core Standardized Assessment (CCSA) questionnaire is used to assess social determents of Health (SDoH), behavioral health, and general health concerns in New Hampshire Medicaid patients 18-64 years of age seen in the General Internal Medicine (GIM) clinic at Dartmouth-Hitchcock Medical Center (DHMC). DHMC is located in Lebanon, New Hampshire and is the state's only academic medical center, serving patients from across rural northern New England.

In order to improve screening rates and increase the number of at-risk patients referred for care, we developed a standardized workflow, incorporating medical assistants (MAs) in both the design and implementation phases. The MAs met twice monthly with the project lead to develop a workflow and interventions that would help achieve the objectives. The workflow engages the MAs as a liaison between the community health worker (CHW) and the primary care provider and to communicate with patients about how the CHW can help with SDoH, especially in patients that identify positive SDoH but do not request help. The MAs also identified and rank ordered 14 interventions. The MAs created smaller workgroups to manage each of the top 5 priorities, which included: MA education on SDoH and the CCSA questionnaire; coordination with reception staff; communication with a CHW; public announcements in the waiting area; and quality improvement management.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A data dashboard tracks monthly rates of CCSA completion; positive screens for SDoH; patient identified interest in receiving help or information about help; and rates of referral for services.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the 4 months prior to the intervention, a mean of 27 patients per month completed the CCSA questionnaire, with a mean of 23 patients screening positive for SDoH related risk factors. 5 patients per month (22% of positive screens) indicated that they would like help. In the initial 6 months of the intervention, a mean of 66 patients per month completed the questionnaire, 49 per month screened positive, and 10 (20%) per month indicated that they would like help. Total referrals for SDoH issues were 15 per month pre-intervention and 20 per month post-intervention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Medical assistants can be effectively engaged in both the development and implementation of processes that improve screening and reduce the stigma of asking for help in primary care patients with unmet needs related to social determents of health. Increasing the proportion of patients reporting an interest in receiving help may be more challenging than increasing screening rates.

A POPULATION HEALTH VALUE APPROACH TO HIGH NEED, HIGH COST POPULATIONS: A SYSTEM-WIDE INTERVENTION TO REDUCE HOSPITALIZATION AND ADDRESS SOCIAL INFLUENCING FACTORS AMONG CHRONIC KIDNEY DISEASE PATIENTS

Reshma Gupta[1]; Samuel A. Skootsky[2]; Katherine L. Kahn[3]; Lucia Chen[2]; Sitaram Vangala[4]; James Wilson[2]. [1]Department of Internal Medicine, University of California, Los Angeles, CA; [2]Medicine, UCLA-University of California at Los Angeles, Los Angeles, CA; [3]Medicine, David Geffen School of Medicine at UCLA, Los Angeles, CA; [4]Medicine, University of California, Los Angeles, Los Angeles, CA. (Control ID #3344822)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Chronic kidney disease (CKD) is a leading cause of healthcare utilization and morbidity, and caring for stage 4-5 CKD populations is complex and inefficient.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Discuss methods to create a multispecialty leadership team and actionable electronic health record and claims data to risk stratify and identify improvement opportunities including social influencing factors for engaged and unengaged stage 4-5 CKD patients.

Discuss methods to redesign proactive multispecialty care coordination pathways bridging primary and multispecialty care teams and develop greater ambulatory infrastructure to support care needs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In 2016, UCLA Health implemented a Population Health Value (PHV) CKD intervention for the organization's 1442 stage 4-5 CKD patients. The organization created a multispecialty multidisciplinary team to redesign care coordination pathways across settings and develop greater ambulatory infrastructure to support care needs including patient input.

The intervention used a full-time, unlicensed CKD Care Coordinator (CKD-CC) who provided coordination support to the system-wide care team. Different than prior efforts that focused in primary care or subspecialty clinics alone, this was a system-wide effort and also addressed attributed patients who may not reach primary or specialty care.

The CKD-CC aimed to proactively identify and coordinate rapid interventions across the health system for stage 4-5 CKD patients with clinical decline using clinical informaticas and a system-wide care team network. A registry helped early identification of decline, and she

consolidated relevant clinical and social service needs in real time to align resources and define acute care plans with the system-wide care team. The CKD care coordinator also guided appropriate care to less costly ambulatory sites and a network of community resources grew to address patients' social influencing factors.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Outcomes included hospitalizations and emergency department (ED) visits. We used a multiple time series design evaluating outcomes during the pre-intervention (April 1, 2015- September 30, 2016) and post-intervention (January 1, 2017- December 31, 2017) periods.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The monthly estimated rate of decline for hospitalizations among stage 4-5 CKD patients was 5.4% (95% CI: 3.4%-7.4%), which was 3.4 percentage points faster post-intervention than the 18- month pre-intervention decline of 2.0% (95% CI: 1.0%-2.2%) per month (p=0.004). Medicare patients' average ED visit rate of decline was 3.0% per month (95% CI: 1.2%- 4.8%) post-intervention, which was 2.6 percentage points faster than the pre-intervention rate of decline of 0.4% per month (p= 0.02).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Rather than implementing a new technology or tool across a heterogenous population, it was key to understand the spectrum of needs that patient had including social influencing factors.

Using methods of co-creation was slow initially but also the reason for success in implementation of shared system-wide care pathways with shared resources.

A PRIMARY CARE BASED INITIATIVE TO REDUCE HOSPITAL READMISSION RATES BY IMPROVING TRANSITION OF CARE

Taryn Spencer[1]; Dawid Czarny[1]; Roberto O. Diaz Del Carpio[2]. [1]Medicine, University at Buffalo, Buffalo, NY; [2]Medicine, University at Buffalo, Buffalo, NY. (Control ID #3390779)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Research has shown that timely follow-up appointments are associated with lower 30-day readmission rates, however, boundaries that prevent timely follow up with primary care physicians (PCP) include lack of communication between the inpatient physician, PCP, and patient.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase discharge follow up appointments for patients who receive their primary care at Hertel Elmwood Internal Medicine Clinic (HEIMC) by utilizing Cortext.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The inpatient service at Buffalo General Medical Center (BGH) and HEIMC are linked closely by a secure messaging service called Cortext. The team formulated a group on Cortext that contains a list of PCP that are involved in the care of HEIMC's patients. The inpatient service sends a message containing the patient's name and date of birth to the HEIMC group via Cortext. The HEIMC receives this message and contacts the patient via telephone to schedule a follow up appointment within 7 days. We communicated our goals and instructions with the inpatient teams verbally and with the use of visual aids, such as flyers and handouts.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The outcome measures include percentage of HEIMC patients that have successfully followed up with their PCP and percentage of HEIMC patients that were readmitted to BGH despite timely follow up. The process measures include the ratio of cortexts received from BGH's inpatient clinicians for HEIMC patients vs. the total number of HEIMC patients discharged from BGH. Also, the percent of HEIMC patients that were contacted to schedule a follow up appointment. The balance measures include the average wait time for scheduling an urgent appointment before and after the implementation of the project.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among the patients discharged from the hospital in which a Cortext was received, approximately 66% of patients were scheduled for an appointment within 7 days of discharge vs. 26% in the non-Cortext group. In the Cortext group, 0 patients had an ER visit or hospital readmission within 30 days of discharge. In the non-Cortext group, 12.7% of patients had an ER visit and 3.6% were readmitted to the hospital within 30 days of discharge. Lastly, in the Cortext group 88% of patients had scheduled a follow up visit vs. 71% in the non- Cortext group. Of those patients with scheduled appointments in the Cortext group, 100% of patients attended their appointments vs. 85% in the non-Cortext group.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The preliminary data collected suggests that improving communication between the inpatient providers at BGH and PCPs at HEIMC helps increase timely outpatient follow up and reduces ER re-visits along with hospital readmission rates. With the progression of this program to outside clinics and hospitals, we hope to enhance patient's quality of care by improving transition back into the community and reducing readmission rates.

ASSESSING CAPACITY TO MEET DEMAND: A NOVEL APPROACH TO PANEL SIZES

Robert Doolan, MD[1]; Hillary Chrastil[1]; Lauren Drake[2]; Mark Earnest[2]. [1]General Internal Medicine, University of Colorado, Aurora, CO; [2]Medicine, University of Colorado, Aurora, CO. (Control ID #3392133)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Is there a formula primary care leadership can use to consistently define panel size expectations for primary care providers based on provider capacity and patient characteristics?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): -Create and test a capacity assessment that calculates maximum panel size for providers based on return-to-clinic (RTC) rates, patient complexity, and available clinic slots.

- Describe how the method for calculating maximum panel size can be applied to all primary care practices across a healthcare system.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) :

1. Calculate average RTC rates for six patient groups defined by a complexity index based on a modified/enhanced Charlson co-morbidity index.

2. Calculate the proportion of patients in each group for each primary care clinic.

3. Calculate the available clinic slots per provider, per year, based on a 1.0 FTE. (e.g. a 1.0 FTE averaging 8 slots per session at 8 sessions per week working 45 weeks a year has 2880 available slots).

4. Using the number of slots available, the proportion of patients and average RTC rates in each complexity group for a given clinic, calculate the panel size that would be expected to fill all available slots.

5. Adjust each provider's panel size based on their clinical FTE.

6. Reduce the maximum panel size for advanced practice providers to allow for more acute visits.

7. Adjust provider's expected panel size again by 10% for each standard deviation from the clinic complexity index mean.

We used this capacity assessment to evaluate panel sizes for 52 primary care providers across 4 General Internal Medicine practices in an academic setting. The complexity index factors in patient elements such as chronic disease, utilization, and medications.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Adoption- used as standard practice by the health care system.

# of providers appropriately empaneled- a provider's actual panel size is within 5% of expectation.

# of providers under-empaneled – a provider's actual panel size is more than 5% below expectation.

# of providers over-empaneled - a provider's actual panel size is more than 5% above expectation.

# of clinics appropriately empaneled- a clinic's actual panel size is within 5% of its expectation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In contrast to the current, arbitrary methodology, of 52 providers 31% were under-empaneled and 67% were over-empaneled, leaving 2% appropriately empaneled.

When applied to clinics as a whole, three out of the four clinics evaluated were found to be over-empaneled.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Using a broadly accepted capacity assessment tool to determine maximum panel size ensures providers have access and availability to care for their existing patients before expanding to new patients.

Adjusting the panel size for the unique patient complexity distribution at each clinic tailors panel sizes based on patient characteristics, increasing buy-in from providers and improving the accuracy of capacity measures.

ASSESSING READINESS TO GRADUATE: HEALTHCARE UTILIZATION AFTER PARTICIPATION IN HIGH INTENSITY PRIMARY CARE

Melanie Martin, Jessica Valente. General Internal Medicine, Wake Forest Baptist Medical Center, Winston Salem, NC. (Control ID #3391892)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Care Plus is a high intensity program for primary care; this study investigates duration of engagement in the program and hospital utilization after leaving this intensive program.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Determine duration of program participation and types of discharges from the Care Plus program; 2) Quantify the frequency of hospital admissions and ER visits 1 year post-Care Plus discharge.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Care Plus was created in 2013 as a multidisciplinary team based model for high-need, high-cost patients from an academic safety net practice. Previous data has shown significant reduction in hospital utilization for enrolled patients as compared to their historical selves. This study reviews duration of engagement of enrolled patients and hospital utilization for patients that leave the intensive program and return to usual primary care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We reviewed duration of program enrollment and categorized types of discharge. We further calculated the number of hospital admissions and ER visits 1 year pre-post Care Plus enrollment compared to 1 year post-Care Plus discharge.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Average duration of program participation is 2.8 years. Of the 321 total participants, 109 (34.2%) participants remain enrolled. 210 patients were discharged from Care Plus [deaths (26.4%); graduated Care Plus (16%); relocation/placement (11.6%); lack of engagement (10.3%)]. Comparing 1 year pre-post program enrollment, we demonstrated an overall 41% decrease in hospital admissions and ER visits. For patients who returned to usual care, this decreased hospital utilization was sustained 1 year post-Care Plus discharge (-37.8% decrease admissions, -40.1% ER visits). Further subgroup analyses showed that non-engaged patients (average duration in program 1.6 years) experienced a 37% and 81% *increase* in hospital admissions and ER visits 1 year immediately post-Care Plus discharge, but still 30% and 20.5% less admissions and ER visits, respectively, when compared to pre-Care Plus enrollment. Care Plus graduates (average duration in program 1.7 years) showed sustained decreases in hospital admissions (-26.7%) and ER visits (-43.6%) 1 year post- Care Plus discharge.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Multidisciplinary models for patients with frequent healthcare utilization can reduce hospital and ER visits during program enrollment and up to 1 year after discharge. Decisions about patients' continued participation can be challenging but data suggest some benefits continue beyond program enrollment. The significant mortality rate of our cohort speaks to the vulnerability of high intensity primary care patients.

A STUDY EVALUATING VARIATION IN RADIOLOGY ORDERS WITHIN A LARGE PRIMARY CARE NETWORK AND THE EFFECT OF PEER-COMPARISON FEEDBACK ON ORDERING TRENDS

Adrian Clark-Randall, David Halpern, Kevin Shah. Medicine, Duke University, Durham, NC. (Control ID #3391461)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does peer-comparison feedback lead to reduced clinical variation in radiology orders?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To evaluate existing variation in radiology ordering in a large primary care network in central North Carolina

2. To determine whether sharing monthly utilization data with providers reduces variation or changes practice patterns.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : First, we examined provider-level radiology orders (excluding recommended screening exams like mammography) within a large academic primary care network in North Carolina, spanning 159 providers and approximately 1.3 million outpatient encounters over a three year period. We calculated an imaging rate (radiology tests ordered per 1000 patient encounters) for each provider. We then examined the effect of a peer-comparison dashboard tool which provides a benchmark for providers to evaluate their imaging behavior compared to others at the same practice as well as across the network. We measured the impact of data-sharing by comparing two years of data prior to the creation of the utilization

dashboard with one year of data obtained after implementation, examining both trends in imaging orders as well as orders stratified by imaging type (X-Ray, CT, MRI, Ultrasound, Nuclear Medicine, PET).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measured imaging rates, stratified by imaging type, across providers on a monthly and yearly basis, as well as variation, defined by the standard deviation in imaging rates by provider over time. Imaging rates are normalized to encounter volume.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We observed significant variation in imaging rates among providers in the network, with some "high-utilizer" providers and others who ordered radiology tests less frequently. Regression analysis demonstrated that neither patient age nor provider experience was significantly associated with imaging volume. Additionally, there was no significant difference in imaging rates between advanced practice providers and physicians. While patient characteristics *did* vary by provider, these differences were *not* significantly associated with imaging rates. After implementation of the utilization dashboard, we saw a 17.2% decrease in median provider imaging rate (p=0.00017) and a 14.1% reduction in provider variation (p=0.14), as measured by standard deviation. Decreases in ordering rates were seen across all provider deciles. Median order rates for more costly cross-sectional imaging, including CT, MRI, and nuclear medicine studies, decreased by 30.5% (p=2.3e-7), 16.7% (p=0.011), and 40.5% (p=0.019) respectively, after implementation of the dashboard.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Peer-comparison based feedback can impact provider imaging ordering even in the absence of targets or financial incentives. Peer comparison is a low touch, lost cost intervention for influencing provider ordering and may have applicability in other clinical areas.

A TEAM-BASED APPROACH TO IMPROVING MEDICATION ADHERENCE AMONG PATIENTS WITH CHRONIC DISEASE

Jonathan Arend[3]; Edward Bailly[1]; Cathleen Mathew[1]; Ruchi Tewari[2]; Shalini Bansal[3]. [1]Internal Medicine Associates, Mount Sinai Hospital, NY, NY; [2]Pharmacy, Mount Sinai Health System, New York, NY; [3]Medicine, Mount Sinai Health System, New York, NY. (Control ID #3392151)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Poor adherence to medications among patients with chronic disease is associated with significant morbidity and mortality, as well as high cost to the health care system. Although numerous strategies have been employed to improve medication adherence (MA) in these populations, achieving success remains challenging and likely requires a multimodal approach.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve the detection of patients with suboptimal MA; to improve the efficiency of MA interventions; and to improve MA among patients with chronic disease

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our academic internal medicine practice serves predominantly Latino and African American residents of East Harlem, a medically and psychosocially complex population. These patients shoulder a significant burden of chronic disease, the effects of which are exacerbated by suboptimal rates of MA. In order to improve MA among our patients with chronic disease, we developed a MA program that incorporates a range of professional and paraprofessional disciplines and applies pharmacy data to identify patients at risk for suboptimal MA. The team consists of patient navigators, registered nurses, nurse practitioners, and a clinical pharmacist, working in coordination with primary care providers. Interactions occur in the context of population-based outreach, pre-visit planning, face-to-face encounters, and post-visit follow-up. Activities include medication fill reminders and missed fill notifications, barriers assessment and related interventions, conversion to 90-day prescriptions, and nurse follow-up after newly prescribed medications. Patient identification, adherence patterns, and expected fill dates are provided by the patients' managed care organizations and are based on pharmacy claims and health information exchanges in which pharmacies participate.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Medication adherence rates, based on the proportion of the measurement period in which patients have the medication in their possession, according to pharmacy dispensing records.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): As we have refined our program over the past several years, rates of MA among our patients with chronic disease have continued to trend upward. For example, in the patient population covered by one of our Medicare Advantage plans, adherence to cholesterol medications increased from 75% to 83% and adherence to diabetes medications increased from 74% to 83% from 2016 to 2019.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Efforts to support MA among patients with chronic disease often require resources beyond the primary care provider in order to be successful. High functioning, multidisciplinary teams coupled with reliable data sources for patient identification, risk stratification, and monitoring may be necessary to optimize MA in certain populations.

AUGMENTED INTELLIGENCE: AUTOMATION OF VANCOMYCIN DOSING AND MONITORING TO IMPROVE PATIENT SAFETY

Vimal Mishra, Alan Dow. Internal Medicine, Virginia Commonwealth University, Midlotian, VA. (Control ID #3392084)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Because vancomycin is the leading cause of medication errors resulting in morbidity, an approach utilizing augmented intelligence (AI) may improve the therapeutic dosing of this medication. Treatment failure and chances of developing drug-resistant S. aureus increases if vancomycin serum trough level is less than 10 mg/l.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We describe an approach utilizing augmented intelligence (AI) to improve therapeutic dosing of Vancomycin and frequency of trough dose collection at the appropriate time.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The complexity of vancomycin dosing may make it an ideal target for augmented intelligence (AI), the use of computational methods and systems to enhance human decision-making. A multidisciplinary team identified a lack of timely monitoring of serum vancomycin level and failure of appropriate dosing as the highest risk steps in vancomycin use. To address the lack of timely monitoring that had been dependent on practitioner recall, the team designed an EHR-based rule that automatically ordered appropriately timed trough levels and reminded nurses to draw this trough level before another dose could be administered (Intervention

1). Then, to improve initial dosing, the team designed and implemented an AI-based tool that automatically calculated and suggested appropriate vancomycin dose (Intervention 2).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The impact of these interventions was studied as an interrupted time series. Data from encounters from October 2016 to December 2016 were defined as the pre-intervention group (Pre). In January 2017, Intervention 1 was implemented, and vancomycin trough level data were collected for encounters between February 2017 to April 2017 (Post #1). Intervention 2 was implemented at the beginning of May 2017, and data were collected from May to July 2018 as the Post #2) group. Vancomycin serum levels between 10-20 mg/l were considered appropriate. Groups (Pre, Post #1 and Post #2) were compared via least-squares means with Bonferroni adjustment for multiple comparisons.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Prior to either intervention, 53.9% of patients had therapeutic trough levels. After the first intervention (Post #1 group), the percentage of therapeutic levels dropped to 43.4% although trough levels were more often drawn in a timely fashion, suggesting better measurement due to automation may have identified additional lapses in care (p=0.51). After the second intervention (Post #2 group), the percentage of therapeutic trough levels increased to 65.8% with a small increase in the percentage of supratherapeutic trough levels (p=0.0059 vs. pre; p<0.001 vs Post #1).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): AI-based automation for ordering vancomycin doses and trough levels enhanced vancomycin efficacy by increasing the timeliness of troughs collected and the percent of therapeutic trough levels. This study demonstrates the imperative of an automated approach to collecting vancomycin levels and prescribing dose amounts. A similar approach can be applied to other high-risk medications. Further work should continue to refine this approach.

BREAKING THE ICE FOR HEALTH CARE PROXY DISCUSSIONS

Kwesi Blackman[2,1]; Modupe Oluya[2,1]; Alastair Thomson[2,1]; Ami Jani[2,1]; Bryan Chesen[2,1]; Gayatri Malhotra-Gupta[2,1]; Nadia A. Williams[2]; Andrew A. Chang[2,1]; David L. Stevens[2,1]; Melissa S. Lee[2,1]. [1]Internal Medicine, SUNY Downstate Health Sciences University, Brooklyn, NY; [2]Ambulatory Medicine, NYC Health + Hospitals/Kings County, New York, NY. (Control ID #3392163)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A primary care performance improvement project conducted by residents at our institution in 2018 found that despite 83% (n=78) of patients being interested in discussing advanced care planning (ACP) with their primary care providers (PCPs), only 37.5% had documented ACP discussions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): - To improve patient health literacy around health care proxy (HCP) discussions

- To develop a standardized educational video based on the New York State HCP form

- To measure the impact of the video on patient perceptions and understanding around ACP

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Internal Medicine residents in our urban safety-net primary care practice produced a 2-minute educational video addressing common questions about HCP. Starring physicians and nurses, the message was delivered by culturally familiar staff. A similar intervention addressing influenza vaccination myths improved flu vaccination rates in 2018. An educational video was played in the exam room while the resident met with his/her attending preceptor to avoid additional patient wait time. Patients were asked three questions about perceptions of HCP before and after the intervention.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Effectiveness of the video was measured using a quasi-experimental pretest, posttest design. Patients were asked 3 questions before and after the intervention to evaluate perception around importance of a HCP, ability to identify a HCP, and comfort in discussing healthcare preferences. Results were analyzed using descriptive statistics and Wilcoxon signed rank test.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): -49 patients (response rate, 96%) completed the survey after conducting a pilot study of 10 patients. Participants were 59.1% female, within 55-64 age group and 71.4% Afro-Caribbean.

- Our intervention yielded statistically significant increases in patient agreement on HCP importance 38.9% ($p<0.001$), willingness to assign an HCP 12% ($p<.001$), and willingness to discuss ACP values with someone 3% ($p=.006$).

- Although not measured, we noticed anecdotally that physicians in our practice felt a standardized educational tool prompted conversations around HCPs during subsequent primary care visits.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

- This innovative form of patient education using video media during office visit time facilitated discussions and improved patient perception around HCP.

- Key components included a tailored, culturally sensitive educational platform featuring our patients' healthcare team. We highlight the importance of using personalized, alternative media as an approach to improving health literacy and perceptions around ACP.

BRING IT UP: OUTCOMES FROM AN ADAPTED COLLABORATIVE CARE MODEL FOR DEPRESSION CARE INNOVATION IN A SAFETY-NET, PRIMARY CARE CLINIC

Lisa Ochoa-Frongia[1]; Tamara Bendahan[2]; Margo Pumar[2]; Andrea Elser[2]; Rachel Loewy[2]; James Dilley[2]; Elle Clelland[3]; Jackson Barnett[3]; Gala Moreno Lepe[3]; Karen Yee[1]; Christina Mangurian[2]. [1]Medicine, University Of California San Francisco, San Francisco, CA; [2]Psychiatry, University of California San Francisco, San Francisco, CA; [3]School of Medicine, University of California San Francisco, San Francisco, CA. (Control ID #3391561)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does our resource-limited, adapted collaborative care model of depression treatment improve care by PCPs in a primary care safety-net clinic?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To determine if our intervention improves rates of:

1) PCP delivery of evidence-based care for depression including prescription of antidepressants and referral for behavioral therapy

2) Depression improvement

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS.

OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Over 80 clinical trials demonstrate the efficacy of the collaborative care model (CCM) to treat depression in primary care by integrating physical and behavioral health services using multi-disciplinary teams. However, there is significant variability in the success of real-world CCM implementation. The feasibility of CCM in safety-net clinics faces clinical, organizational and financial challenges limiting the use of key components such as the depression care manager (DCM). Yet, research on CCM adaptations in under-resourced settings is sparse.

Bring It Up! (BIU) is an adapted CCM pilot study for patients with depression conducted at The Richard Fine People's Clinic (RFPC), a primary care safety-net clinic in San Francisco serving over 8,000 adult patients (39% Latino, 24% Asian, 18% White and 14% African American). 40% of patients speak a primary language other than English, 1% have private insurance, and 10% are homeless. 21% of RFPC patients have a depression diagnosis.

40 patients of seven PCPs at RFPC received BIU. Inclusion criteria: 1) Age 18+; 2) PHQ-9 score 10+; 3) Diagnosis of Major Depressive Disorder or dysthymia. The PCPs received BIU training on depression standards of care and could refer patients to the BIU team (PCP mental health champion, psychiatric consultant, data analyst and medical assistant). This team tracks BIU patients, provides basic depression care coordination and assists PCPs in evidence-based depression care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Electronic health records were reviewed for: 1) PCP adherence to depression standards of care including titration of antidepressant to effective dose, PCP follow up frequency and referral to behavioral health services 2) change in depression symptoms as evidenced by PHQ-9 scores over multiple visits (via paired t-test).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Compared to the general RFPC population with depression, BIU patients were treated with much higher rates of evidence-based depression treatments such as prescription of antidepressants (27% vs 76%) and behavioral health referral (11% vs 64%). We will also examine patient outcomes including changes in PHQ-9 scores and remission rates.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Training primary care providers on evidence-based management of depression in conjunction with the support of a multidisciplinary behavioral health care team adapted for the setting improves fidelity to evidence-based depression care.

CALL THE NURSE! BUILDING A LEARNING TELEPHONE TRIAGE SYSTEM AT A LARGE ACADEMIC MEDICAL CENTER.

Cody Dashiell-Earp, Amy Vigil, Jennifer Rodgers. University of Colorado, Denver, CO. (Control ID #3387390)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Research demonstrates that nurse- led telephone triage can help health systems manage the demand for same-day appointments and reduce provider workload while providing safe and appropriate care for patients, however, little is published about how to implement, maintain and continuously improve an evidence-based telephone triage system.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Build a system for continuous triage protocol review and customization.

Develop education and clinical decision support tools that allow nurses to deploy evidence-based telephone triage protocols in real time.

Understand how protocols are used and how they impact emergency room use.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The ambulatory telephone protocol committee (ATPC) reviews each triage protocol on an annual basis. This committee includes stakeholders from across the health system, including nurses, physicians and pharmacists. The majority of protocols were purchased from a vendor and adapted by the ATPC to reflect local resources and best practices. Nurses were educated on telephone triage and a clinical decision support tool was created to help nurses search for and document protocol use during calls. A report was built to capture and summarize EHR data related to protocol use.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): % of triage encounters in which a protocol was used

% of generic "sick adult" protocol vs specific protocol such as "female dysuria"

% of patients recommended for home care

% of patients recommended for emergency room care

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Over 12 months, there were 19,784 telephone encounters completed by office-based nurses in 10 primary care offices. Of these, 4,208 encounters were symptom-based triage encounters in which a standardized triage protocol was used. The remaining 15,576 encounters were a call in which information was communicated but a protocol was not used, such as reviewing lab results. 206 unique protocols were used. The top 5 most used protocols were sick adult (12%), cough (6%), female dysuria (5%), well-child information (4%) and breathing difficulty (4%). 66% of patients were advised to care for themselves at home, while only 3.5% were instructed to proceed to the emergency department.

Review of our protocols on an annual bases is labor intensive. Many of the protocols we purchase must be adapted not just to reflect local resources and system constraints, but in some cases to reflect well-established best practices. Our vendor has been responsive to feedback regarding changes to a number of protocols.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An interdisciplinary team representing stakeholders from across the health system is needed to maintain a telephone triage system. Commercially-available protocols can be used, but must be reviewed regularly to ensure they are up-to-date with the most recent evidence and consistent with local resources. Major revisions should be shared with vendors.

Telephone triage reduces provider workload and demand for same day visits without increasing emergency room use

CAN APPRECIATIVE INQUIRY IMPROVE INTERDISCIPLINARY EXPERIENCES?

Shreya P. Trivedi[1]; Stefanie Reiff[2]; Jung-Eun Ha[1]; Marwa Moussa[3]; Davis Boardman[4]; Lisa Altshuler[5]; Deserie Duran[2]; Lorna Lee-Riley[2]; Laura Mansfield[2]; Frank Volpicelli[6]. [1]Internal Medicine, NYU, New York, NY; [2]Internal Medicine, NYU Langone Hospital - Brooklyn, Brooklyn, NY; [3]Internal Medicine, NYU Langone, Staten Island, NY; [4]Division of General and Internal Medicine, NYU School of Medicine, New York, NY; [5]General Internal Medicine, NYU School of Medicine, New York, NY; [6]Internal Medicine, New York University, New York, NY. (Control ID #3392425)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Do brief multidisciplinary appreciative inquiry sessions enhance multidisciplinary communication and experiences?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (1) Allow chance for each member of the team to voice their role on the team

(2) Guided opportunity to discuss multidisciplinary norms

(3) Improve team morale and reinforce role as a respected team member

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Every other Wednesday (corresponding to resident team switch day) the medical unit director or nurse manager introduced a guided session at the beginning of multidisciplinary rounds (MDR) by saying, "We see each other all the time but we don't know much about each other's work process and how to be more effective for one another."

The team (including unit interns (I), residents (R), attendings (A), nurses (N), nurse practitioners (NP), case managers (C), and social workers (S)) was then prompted to say their preferred name, role, and preferred communication method; what positive things others do to improve their day; and actions that could further improve rounds. The following week, the leader revisited the prior stated priorities of the multidisciplinary team and asked for further suggestions or feedback as well as shout-outs to other team members.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Study coordinators timed and directly observed each session. They took field notes on content, non-verbal cues, and wrote their own impressions of the discussion. A retrospective pre-post survey using a four-point Likert scale (1=strongly disagree, 4 = strongly agree) was administered during the revisit session the following week to evaluate improvement in feeling heard on MDR, knowing MDR members and roles, feeling collegiality, and understanding what others need to be effective in their roles. We used Wilcoxon signed-rank test for pairwise comparisons of pre- and post- perceptions and content analysis for free responses.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The intervention was completed on three units over 6 weeks (3 rounds of intervention). Sessions lasted an average of 5 minutes. 90 participants responded to the survey (37 N, 15 I, 11 S, 7 C, 7 R, 5 A, 5 NP, 3 missing). Direct observations indicated participants proactively clarified interdisciplinary issues that may lead to unsaid frustrations (i.e roles and responsibilities for communicating disposition options to patients) and team members were engaged, particularly in giving positive feedback. Survey responses indicated improvements in participants feeling heard on MDR, knowing MDR members and roles, feeling collegiality, and understanding what others need to be effective in their roles (mean improvement of 0.5 on a 4-point scale, $P<0.001$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A brief appreciative inquiry intervention facilitates interdisciplinary dialogue that can foster effective team collaboration and mutual understanding. Interpretation of the results is preliminary, and further studies with direct observation of changes in subsequent interdisciplinary communication practices are warranted.

CARING FOR THE HIGH NEEDS, HIGH COST POPULATION THROUGH COMMUNITY OUTREACH AND SOCIAL WORK

Tina V. Valdez[1]; Brendon Troutman[2]; Jacquelyn Georgen[2]. [1]Internal Medicine, Oak Street Health, Chicago, IL; [2]Oak Street Health, Chicago, IL. (Control ID #3387971)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A large percentage of healthcare costs are allocated to a small group of medically complex patients with challenging psychosocial situations that encompass different social determinants of health; they are often referred to as "high needs, high costs" patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objectives are to show how Oak Street Health (OSH), an outpatient practice, 1)utilizes Community Outreach (CO) and Social Workers (SW) to care for the most vulnerable/sick and 2) share OSH's results of CO, SW and medical team collaboration.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : CO engages the community by building relationships with various organizations, churches and individual members. They serve as the local neighborhood experts. SW provides case management and expertise on local community resources. They also help navigate complex home situations, challenging family dynamics and assist in Advance Care Planning. CO and SW at OSH focus on challenging patients which include complex medical conditions and social situations, and help identify barriers to one's care. A thorough understanding of a patient's home and community environment helps identify these barriers. CO and SW allow for patient engagement in the clinic. As patients become more engaged, they invest more time and interest in prioritizing their care, which yields better healthcare outcomes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Together CO and SW provide insight in identifying and understanding the needs of the "high needs, high cost" population. In collaboration with the medical team, these high needs also allow for close analysis of costs, such as ER visits, hospital admissions or post- acute care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At OSH, findings to date have shown a 40% decrease in ER utilization and hospital admissions in comparison to Chicago's benchmark, a 5 star rating on the HEDIS score and a 92% Net Promoter Score.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The workshop's goal is to share OSH's innovative ways on how to care for the high needs, high cost patient through the utilization and collaboration among CO, SW and the medical team.

CATALYST - ADAPTING OFFICE-BASED ADDICTION TREATMENT IN PRIMARY CARE FOR ADOLESCENTS AND YOUNG ADULTS: LESSONS LEARNED AND OPPORTUNITIES FOR GROWTH

Sarah Bagley[1]; Scott E. Hadland[4]; Deric Topp[2]; Erin M. Ashe[5]; Eliza Hallett[5]; Samantha F. Schoenberger[6]; Jeffrey H. Samet[3]; Alexander Y. Walley[2]. [1]Medicine and Pediatrics, Boston Medical Center, Newton, MA; [2]General Internal Medicine, Boston Univ, Boston, MA; [3]General Internal Medicine, Boston University School of Medicine, Boston, MA; [4]Division of General Pediatrics, Boston Medical Center, Boston, MA; [5]Pediatrics, Boston Medical Center, Boston, MA; [6]Clinical Addiction Research and Education Unit, Boston Medical Center, Boston, MA. (Control ID #3390577)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Substance use often begins in adolescence and young adulthood (youth), yet most office-based addiction care is not developmentally tailored for youth. Engaging and retaining youth who use substances in care is very challenging.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To adapt the adult-focused Office-Based Addiction Treatment approach for youth by providing integrated behavioral health, family support, and other developmentally appropriate services.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : CATALYST is a multidisciplinary, outpatient program for youth who use substances. The care team at Boston Medical Center includes physicians, psychiatrists, a nurse, social workers, recovery coaches, and a program manager. Patients are seen in adolescent or adult primary care and are offered primary care including hepatitis C virus testing and treatment, addiction treatment, harm reduction, naloxone kits, psychotherapy, recovery support, family support, and assistance addressing social determinants of health. Patients are typically referred from the hospital system and the community. Care is tailored to meet patient and family goals and priorities. Innovative engagement strategies include text messaging communication, including reminders, transportation assistance, and food vouchers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We calculated the proportion of patients with opioid use disorder who received medication (i.e., buprenorphine or naltrexone in CATALYST, or methadone at an outside opioid treatment program) and retention in care at six months.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From July 2016 through December 2018, 153 patients had at least one visit, 61% (93/153) had an opioid use disorder (OUD). At the time of the first visit, patient characteristics were the following: median age 21 years; 94% primary language English; 60.8% white; 15% Hispanic; and 18% Black. Clinically, 31% had depression, 32% anxiety, and 19% post-traumatic stress disorder. The 82 patients who completed assessment for social determinants of health reported the following: 24% being unemployed or looking for a job; 28% housing insecurity or homelessness; and 30% food insecurity. Among patients with OUD, 88% (82/93) received medication for OUD. Patients with OUD were engaged in care for a median of 10 months; 58% were engaged six months after the initial visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Many youth presenting for care had co-occurring mental health disorders and a high proportion of housing insecurity, unemployment, and food insecurity. Despite this, retention at six months of care was high relative to current standards for OBAT. Adapting a developmentally appropriate behavioral approach and addressing behavioral health and social determinants of health needs may all be key for engaging and retaining youth in integrated addiction and primary care.

CHANGING HEALTHCARE INEQUALITIES BY OFFERING AVNEW MODEL FOR HEALTHCARE DELIVERY: PHARMACIST DELIVERED PREP FOR PEOPLE OF ALL GENDERS

Nicole L. Nisly, Michelle L. Miller. Internal Medicine, University of Iowa Carver College of Medicine, Iowa City, IA. (Control ID #3390982)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): For years we have discussed healthcare inequalities for certain populations. The most significant challenge is how to reduce or eliminate health disparities. The Institute of Medicine designated LGBTQ identified people as a group at risk for health disparities. We offer a new model of access which is aimed at reducing health disparities by offering increased and prompt access at an LGBTQ inclusive program.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Offer immediate access to PrEP (HIV pre-exposure prophylaxis) to a vulnerable population, when general healthcare access is limited.

2. Develop a new model of healthcare delivery considering shortage of primary care physicians with long wait times for appointments.

3. Create a program which is safe, welcoming and inclusive of all LGBTQ identities and sexual behaviors, with a particular focus on Transgender and Non-Binary identified people.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Nationally, there is shortage of primary care physicians and access to care is often delayed and subject to long wait times. Physicians may not have adequate training or access in their practices to provide PrEP according to best practice recommendations which involves following patients on PrEP every 3 months. We developed an innovative program developed and led by a clinical pharmacist, utilizing a collaborative practice protocol, to provide PrEP (HIV pre-exposure prophylaxis) to diverse populations at high risk for HIV infection as well as people who desire to reduce their risk. An internal medicine physician serves as medical director, but the pharmacist is able to independenty prescribe, monitor and treat patients consulted. This service is offered in a university health system. Patients can be consulted by a variety of providers in several primary care settings. Once consulted, patients PrEP therapy is solely managed by the pharmacist, this includes clinic visits, lab monitoring, STI treatment as well as management of insurance coverage issues.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): - Enrollment statistics

- Hepatitis A and B immunity rates and vaccination
- HPV vaccinations completed
- STI data
- patient survey data

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): -235 patients have been consulted to the service since 3/2017

- Average patient age 31 (18-68)
- Gender identity: 69% men, 20% transwomen, 9% transmen, 1% women, 1% other
- total population hepatitis B immunity: 59% immune to hepatitis B
- population 25 yo and younger: 51% immune to hepatitis B

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our goal of this presentation is to arm providers with the tools needed to implement non-physician run PrEP Clinics and improve access to a potentially life saving medication. We can provide others with the clinical pearls we have learned over the past three years.

CHRONIC OPIOID MANAGEMENT IN PRIMARY CARE

Shalom Schlagman[1]; Bethany D. Corbin[1]; Alice Baker[1]; Enrico Caiola[1,3]; Angela K. Nagel[2,3]; Amanda M. Ramos[3]; Robert J. Fortuna[1,3]. [1]Internal Medicine-Pediatrics, University of Rochester, Rochester, NY; [2]Pharmacy Practice and Administration, St John Fisher College, Rochester, NY; [3]Culver Medical Group- Primary Care, URMC, Rochester, NY. (Control ID #3391897)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Since the turn of the century, the opioid crisis has claimed nearly four-hundred thousand American lives; operational processes are needed to implement best practices and support safe prescribing of opioids in the primary care setting.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To implement best practices for prescribing opioids

2. To develop a weaning protocol to decrease opioid doses when the risks outweigh benefits

3. To support patients in whom an opioid use disorder is identified

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We developed a multi-disciplinary opioid management program utilizing the tools within our EMR to actualized a three-pillar approach to (1) implement best-practices around opioid prescribing consistent with the CDC recommendations, (2) develop weaning protocols for patients receiving high doses of opioids, when medically appropriate, and (3) establish supports for patients when opioid use disorders were identified. The opioid best practices establish the expectations for (a) controlled substance agreements, (b) annual urine toxicology profiles, (c) co-prescribing of naloxone for patients receiving high dose opioids, and (d) routine appointments every 3 months for patients receiving over 50 morphine milligram equivalents (MME). We developed weaning protocols for patients receiving more than 90 MME of opioids, when weaning was determined to be medically appropriate. To support patients when opioid use disorders were identified, we established a referral process with health-home care managers and developed an internal buprenorphine program. To guide care, we developed tools within the electronic health record to track outcomes and alert providers to deficincies at the point of presciption or during visits. To align efforts throughout the office, a multidisciplinary team developed resident educational modules for opioid prescribing and opioid weaning.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To evaluate the success of this program we measured (1) the percent of patients who have a controlled substance agreement on file; (2) the percent of patients who have a toxicology screen within the last year; and (3)the number of patients on >50MME with naloxone prescribed

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At the beginning of this intervention, our Internal Medicine-Pediatrics teaching practice had nearly 300 patients receiving chronic opioids. Of these 36% received more than 50 MME, and 15% received more than 90 MME. Within one year of initiating our intervention, documentation of a controlled substance agreement increased (6% to 71%; P <0.001), urine toxicology testing increased (19% to 62%; P<0.001), and naloxone prescribing increased (0% to 60%; P<0.001). Co-prescribing of benzodiazepines was reduced, though the change was not statistically significant (16% to 12%; P=0.5).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An operational and education structure to support a comprehensive opioid management program offers the potential to improve best practices and appropriate opioid prescribing. Operational and education tools will be shared to support dissemination.

COMMUNITYRX-HUNGER: TRIALABILITY OF A LOW-INTENSITY HOSPITAL-BASED INTERVENTION TO ADDRESS HUNGER AND OTHER RELATED SOCIAL NEEDS AMONG FAMILIES WITH HOSPITALIZED CHILDREN

Doriane Miller[2]; Emily Abramsohn[1]; Deborah L. Burnet[2]; Kelly Boyd[1]; Emily Chase[3]; Kate Doyle[1]; Kelsey Paradise[1]; Jennifer A. Makelarski[1]; Eva Shiu[1]; Elaine Waxman[4]; Stacy T. Lindau[5]. [1]Obstetrics and Gynecology, University of Chicago, Chicago, IL; [2]Medicine, University of Chicago, Chicago, IL; [3]University of Chicago Comer Children's Hospital, Chicago, IL; [4]Urban Institute, Chicago, IL; [5]Ob/Gyn and Geriatics and Palliative Care, University of Chicago, Chicago, IL. (Control ID #3391485)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The rate of food insecurity (FI) among U.S. African American and Hispanic households with children is nearly double that of non-Hispanic white households with children; FI is associated with poor health outcomes among children and adults.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Using a double-blind, randomized controlled trial (RCT) design, the CommunityRx-Hunger (CRxH) intervention aims to 1) improve self-efficacy for self-care among FI caregivers of hospitalized children; 2) mitigate FI; and 3) not diminish satisfaction with care among all caregivers.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We pretested the intervention arm of the RCT to assess feasibility of the intervention and data collection protocols. Research assistants (RA) were trained using standardized protocols including role-playing and real-time feedback with an investigator. Caregivers (i.e., parents) of hospitalized children were approached for participation based on home ZIP code and whether they were being treated by a clinician with whom we had engaged. All caregivers were screened for FI. Delivery of CRxH included 1) a FI-focused educational intervention about the common non-medical needs of families after a child's hospitalization, 2) review and delivery of a resource list for local, vetted resources addressing these needs, 3) coaching on how to access resources and a community resource navigator, and 4) a series of automated text messages from the navigator informed by the Critical Time Intervention supporting the transition from hospital to community. Text messages were sent at discharge, then weekly for one month. Participants were surveyed in-person at baseline and by phone at 7 and 30 days following discharge.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Continuous and comprehensive community and stakeholder engagement; recruitment and enrollment rates and sociodemographic and health characteristics commensurate with a prior study; intervention fidelity.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between March-December 2019, we engaged a multi-stakeholder Advisory Board, physician and nurse scientists and hospital leadership via meetings, presentations and email. We trained 4 RAs. We initiated pretest (01/2020) on 2 of 5 hospital floors. Using EMR data, in 1 week we identified 20 children living in an eligible ZIP code. We screened caregivers for 11 of these patients; 10 (91%) were eligible and 8 (80%) consented to participate, similar to our prior study in the children's hospital (85%). On average, participants were slightly younger than in our prior study (27 years old, range: 19-44 vs. 36 years old, range: 18-57). Participants in this pretest were all women and non-white, more than anticipated (70% and 62%, respectively). Three participants (38%) screened positive for FI in the last twelve months, on par with our prior study (43%). CRxH took 3 minutes (range: 2-5) to deliver and was correctly delivered to all participants.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Community and stakeholder engagement is critical for identifying champions of the intervention. Trialability of CRxH will inform implementation of the larger RCT.

CRUSADERS AGAINST SOCIAL INJUSTICE: HOW A SAFETY-NET HOSPITAL SYSTEM LEVERAGES VOLUNTEERS TO COMBAT INEQUITY

Sijia Zhang[1]; Jenny K. Cohen[2]. [1]Anthropology, University of California, Berkeley, San Ramon, CA; [2]Division of Primary Care, Highland, Oakland, CA. (Control ID #3390754)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Clinicians often report feeling overwhelmed trying to provide quality patient care that includes all facets of the biopsychosocial model due to lack of resources, time to discuss social determinants of health, and expertise to address legal or financial issues.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To address complex social needs of patients, the Health Advocates Program (HAP) was created in 2012 at Alameda Health System, which is a county safety-net health system located in Oakland, CA. The objectives of HAP are to:

1. Provide public benefits application assistance
2. Help alleviate the factors that prolong hospital stays
3. Increase exposure of pre-health students to the hospital system and social determinants of health

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : HAP is a volunteer-based organization comprised of 100+ undergraduate volunteers, 94% of whom plan to pursue a career in the health professions, and 5 paid staff. Providers refer low-income and unstably housed patients with the goal of helping them get linked to community-based resources. Between June and September 2019, the program on average received 92.5 inpatient and 137 outpatient referrals monthly.

To understand the impact this program has on staff and participants, we conducted 20 semi-structured, anonymous, opt-in interviews with providers and volunteers associated with HAP. A thematic coding system of participants' responses and literature review were used to inform findings and identify measures to better support volunteers in their efforts to help patients.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Thematic coding qualitatively showed that providers felt HAP enabled them to more holistically address their patients' needs. Volunteers felt enriched by actively improving patients' lives.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Although public benefits intend to support low-income, disabled, and elderly individuals, volunteers express that the complex terminology of applications excludes these very populations. With an advocate to navigate the public benefits system, patients can apply for resources that they are unknowingly qualified for, such as SNAP, SSI, and IHSS. Furthermore, although the providers interviewed are aware of the social determinants of health, they feel helpless discussing these issues without being able to provide their patients solutions.

HAP provides a link to more deeply discuss non-clinical aspects of patients' lives, allowing for greater whole person care and strengthening the connection between patients and providers. Also, providers mentioned that data generated by HAP increases their awareness for areas of need that are especially lacking. Lastly, HAP provides future health professionals meaningful opportunities to experience patient health in relation to the safety net.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Keys for success include:

1. An integrated electronic health record system to promote transparent team-based care.
2. A pipeline of enthusiastic, high-quality volunteers and a mix of paid staff to maintain structure, training, and do program outreach.
3. Robust education to providers about resources the program can provide and how to refer to the program.

DEVELOPING PLATFORMS TO FACILITATE INTRA-INSTITUTION KNOWLEDGE SHARING AND COLLABORATION IN HEALTHCARE INNOVATION

Margaret Krasne[1]; Ashley Shaw[2]; Mugdha Joshi[4]; Deanna Belleny[5]; Cynthia So-Armah[3]; David W. Bates[3]; Lindsay S. Hunt[5]; Russell Phillips[5]; Lisa Rotenstein[3]. [1]Internal Medicine, Johns Hopkins, Baltimore, MD; [2]Pediatrics, Massachusetts General Hospital, Boston, MA; [3]Medicine, Brigham and Women's Hospital, Boston, MA; [4]Harvard Medical School, Boston, MA; [5]Center for Primary Care, Harvard Medical School, Boston, MA. (Control ID #3375880)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Currently, it can be challenging for innovators to share knowledge and capitalize on opportunities to collaborate with others conducting similar work even within a single organization.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We customized our national knowledge-sharing tool (www.carezooming.com) for the Brigham and Women's Hospital Internal Medicine Residency and Division of General Internal Medicine (www.bwh.carezooming.com) and the Harvard Medical School Center for Primary Care (https://advancingteams.carezooming.com/) in order to provide these entities with a communal platform to publish and share practical information about improving systems of care, connect innovators conducting similar work to foster collaboration, and offer opportunities for project leads to share project needs and recruit team members.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Each organization's knowledge forum consists of searchable protocols of projects completed by members of the specific organization including practical information such as a project description, team members involved, measures, and results. Protocols are either submitted by members of the community directly or generated from publicly available abstracts. The database also includes a searchable list of innovators with whom users can connect through the platform. A monthly newsletter is sent to community members showcasing 3 new projects, highlighting projects that expressed particular needs, and highlighting opportunities for dissemination of project outcomes. Connections are suggested between individuals conducting related work. Reports of ongoing work can be drawn from the data available in the database and used by departmental leaders for reporting and decision-making.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Quantitative measures include the number of featured protocols, number of featured innovators, number of newsletter recipients, and users' reported usefulness of the website in their healthcare innovation efforts. Qualitative measures include themes that emerged from conversations with users about their experience with the site.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The two websites combined contain over 100 implementation protocols representing innovations in over 20 important medical domains including quality and safety, technology integration, and patient-centered care. The content is circulated monthly

to a combined 600 people. The websites feature over 70 innovators. We have made over 75 connections between users and innovators. In interviews, users expressed that the websites have fostered community, increased awareness of ongoing projects, and celebrated the importance of quality improvement work and innovation research. User survey data on the utility of the newsletter and website is forthcoming.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We often struggle to develop and implement quality improvement and healthcare innovation projects due to lack of on-the-ground knowledge. When thinking about implementation of these projects, practical guidance and potential collaborators can often be found within one's own institution if they are easily identifiable through a searchable database.

DEVELOPMENT AND IMPLEMENTATION OF AN EARLY WARNING SCORE TO PREVENT CLINICAL DETERIORATION IN HOSPITALIZED ADULTS AT DENVER HEALTH HOSPITAL

Beza Jobira[1,2]; Thomas MacKenzie[2,1]; Tara Hiller[2]; Carolyn A. Valdez[2]; Rehaan Shaffie[2,1]. [1]University of Colorado School of Medicine, Aurora, CO; [2]Denver Health & Hospital Authority, Denver, CO. (Control ID #3374833)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Adult hospitalized patients who are clinically deteriorating have a delay in the recognition of their clinical deterioration, triggering a rapid response activation and in an escalation of care, which increases in-hospital mortality and morbidity.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Develop and implement an early warning score, the Deterioration Index Model, at Denver Health Hospital. 2) Reduce the number of cardiopulmonary arrests on the floor. 3) Develop and implement a stand-alone designated rapid response team (RRT) that proactively responds to deteriorating patients.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The in-hospital mortality rate at Denver Health is increasing. The need to develop and implement a new early warning score for deteriorating patients in the inpatient setting came out of a pilot study called the Deterioration Index (DI). Prior to the DI pilot, a single vital sign parameter was used to identify rapidly deteriorating patients; however, this system failed to capture majority of patients who needed escalation of care. The DI score, built within the EPIC electronic medical record, provided a composite score by weighting vital signs, neurological assessment, lab values and change in score over time, and the DI score is updated automatically based on patients' most up to date clinical markers. The DI identified deteriorating patients that needed escalation of care in real-time and triggered a rapid response activation to be evaluated by a dedicated RRT.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcomes of interest include in-hospital cardiac arrest and respiratory failure (increased oxygen or intubation requirement). Secondary outcomes of interest include goals of care discussion, and proactive changes in code status. Pre-intervention data (2018) prior to implementation of the DI pilot will be compared with the post- intervention data (2019).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Compared to pre-intervention, we found that post-intervention period had a reduction in rates of cardiac arrest events. In addition, there were an increased rate of comfort care orders placed and increased rate in code status change to Do Not Resuscitate (DNR) during post-intervention period.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Identifying clinically deteriorating patients requires more than a single vital sign parameter. A multifactorial early warning score that not only accounts for vital signs, neurologic assessments and key lab values is critical in identifying in-hospital deterioration with improved accuracy and sensitivity. A dedicated RRT without competing clinical responsibility is imperative for proactive assessment of deteriorating patients and appropriate escalation or changes in goals of treatment.

DEVELOPMENT OF A TRANSITIONS PRIMARY CARE CLINIC IN AN ACADEMIC MEDICAL CENTER

Lisa Rotenstein[1]; Caroline Melia[1]; Peter Gonzalez[1]; Rebecca Cunningham[1]; Stuart Pollack[1]; Christin N. Price[2]. [1]Medicine, Brigham and Women's Hospital, Boston, MA; [2]Psychiatry, Brigham and Women's Hospital, Brookline, MA. (Control ID #3391693)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Transitions of care, such as between the emergency department (ED) or hospital and home, leave patients vulnerable to adverse outcomes, including readmissions, worsening symptoms, reductions in functional status, and psychological distress.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): -To establish a Transitions Primary Care Clinic that serves patients who do not have a primary care provider (PCP) or cannot get timely PCP follow-up after a transition of care.

-To demonstrate that a Transitions Clinic (TC) can enhance accessibility of care while reducing healthcare utilization.

-To quantify patient experiences of care at a TC.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : This program was established at Brigham Health, an academic medical center in Boston, MA. The TC was established within an existing primary care practice and opened in January 2019. It employs one full-time RN Care Coordinator, one full-time medical assistant, and is staffed by one PCP each weekday afternoon. Both medical and social diagnoses that require close follow-up post-discharge are addressed. Patients are seen as many times as necessary until PCP care is established.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): -Time to a TC visit.

-Number of patients seen in the TC, and their referral sources and payor breakdown.

-Impact of the TC on repeat ED use and hospitalizations.

-Percent of patients successfully connected to a new PCP.

-Patient ratings of ease of scheduling, getting to an appointment, and satisfaction.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 11 months after its establishment, the clinic has received 469 referrals (73% from the ED, 23% from inpatient) and has seen 179 patients. 52.5% of patients seen have Medicaid as their primary insurance (27.3% in the Brigham Health-affiliated ACO), 12.3% have Medicare, and 24.9% have commercial insurance. Patients are seen a mean (SD) of 4.6 (±2.9) work days after discharge. This contrasts with a mean 68.7 ± 44.5 work day wait to see a new PCP across Brigham Health. While patients seen in the clinic had a mean (SD) of 0.4 (±0.7)

hospitalizations and 1.2 (±1.0) ED visits in the 3 months prior to their visit, this decreased to 0.2 (± 0.5) hospitalizations ($p<0.01$ for difference) and 0.3 (±0.7) ED visits ($p<0.01$ for difference) in the 3 months after their visit. 67.0% of patients seen in the TC successfully connected with a new PCP. Average patient ratings of ease of scheduling, getting to an appointment, and satisfaction were 4.7/5, 4.5/5, and 4.8/5, respectively.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A TC can provide accessible, attentive care post-discharge. Insurance issues and inability to reach patients post-discharge were the most common reasons a patient was not seen in the TC after a referral was placed. Availability of a multidisciplinary team that can see patients for repeated visits until establishment of PCP care was a key factor for success of the TC. Further work is needed to assess the effect of this clinic on healthcare spending and its quantitative impact on addressing social determinants of health.

DIABETES DISTRESS, ITS PREVALENCE AND CLINICAL DETERMINANTS IN PATIENTS WITH TYPE II DIABETES

Heba Yassin Jioussy[1]; Tamara Goldberg[2]; Theresa Mack[3]. [1]Internal Medicine, Mount sinai st Lukes - West, New York, NY; [2]Internal Medicine, Mount Sinai St. Lukes West, New York, NY; [3]Medicine, Mt. Sinai St. Luke's Hospital, New York, NY. (Control ID #3385787)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The correlation between depression and poor diabetic control has been well established. However, emerging literature suggests that diabetes distress, independent of depression, can have a profound impact on self-management and diabetic outcome and necessitates a different management strategy.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To identify the prevalence of diabetes distress among a vulnerable, underserved urban patient population in our outpatient community health center.

2. To compare two screening tools' ability to capture diabetic patients at risk for poor outcomes, caused by behavioral and psychosocial factors.

3. Investigate the correlation between diabetes distress and poor diabetes mellitus control

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : This cross sectional study was implemented at the Ryan Adair clinic, a federally qualified health center in Harlem that serves as a primary care training site for our internal medicine residents. We identified all patients with diabetes who presented to the clinic over a four-week period. A well-validated diabetes distress screening tool (PAID5) was administered to each patient by a physician. We retrospectively reviewed the charts of those patients to identify Hb A1C values, smoking status, BMI, lipid panel, PHQ2, pre-existing mental problems, and known complications of diabetes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): PAID5 cutoffs were deemed positive at a threshold score of 8. PHQ2 of 3 was considered the cutoff to screen positive for depression. The cohort was divided into two groups based on diabetes distress status. The average Hb A1C as well as the prevalence of uncontrolled DM (defined as Hb A1C>=9) was compared between each group.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 69 patients were screened during the study period. 42% of the cohort population screened positive for diabetes distress, whereas, only 3% of those screened positive for depression based on PHQ-2.

While 57% of those who screened positive for diabretes distress were found to have uncontrolled diabetes, only 24% of diabetic patients with no DD had uncontrolled disease. The average Hb A1C for all the participants in the positively-screened group was 9.6%, and in the second group it was 7.72%.

Behavioral parameters were also noted to be different between the two groups. Those with diabetes distress were more obese (BMI: 34.7 vs 31.6), with more tendency to smoke (27% vs 22.5%). Lipid profile were similar between both groups.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Diabetes distress is an underdiagnosed condition, that has a profound impact on the course and outcomes of type II diabetes. Screening for diabetes distress and early intervention can lead to better management and control of diabetes.

DIGITAL COACHING STRATEGIES TO FACILITATE BEHAVIORAL CHANGE IN TYPE II DIABETES: A SYSTEMATIC REVIEW

Conor J. Hillert[1,2]; Brad Gershkowitz[1,2]; Bradley H. Crotty[2,1]. [1]Medicine, Medical College of Wisconsin, Wauwatosa, WI; [2]Collaborative for Healthcare Delivery Science, Medical College of Wisconsin, Milwaukee, WI. (Control ID #3389928)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Diabetes is extremely prevalent and costly to our healthcare system leading to poor outcomes and placing a large strain on our health care system in terms of patient volume.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

Aim 1: To determine if digital coaching strategies offer similar clinical benefits to in-person and telephone- based health coaching for the prevention and management of type II diabetes.

Aim 2: To compare the effectiveness of each strategy on clinical outcomes, patient engagement, cost, and ease of implementation considerations for use in a work health population.

Aim 3: To find and elucidate the best mHealth application based behavioral modification approaches to treating diabetes and prediabetes.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We reviewed the existing peer-reviewed literature on diabetes health coaching applications using PRISMA guidelines. We analyzed 7311 abstracts, 105 full-text articles, and ultimately 20 papers met our rigorous inclusion criteria. Our review was focused on finding, analyzing, and synthesizing knowledge about an emerging field of mHealth interventions focused on treating and preventing type II diabetes. One of the goals of our research was to find an application with the strongest evidence of efficacy to implement as a prescribable app at my home institution of Froedtert & the Medical College of Wisconsin.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We looked at quantitative metrics of weight loss, BMI, and changes in A1c as primary outcomes in our analysis. We also examined the quality and risk of bias of each of the studies using a clinically validated scale designed specifically for mHealth and technology-based interventions. We assessed the efficacy of interventions and compared them against standards created by the Diabetes Prevention Program (DPP).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Twenty studies met our criteria. All studies reported statistically significant improvements in at least one measure of diabetes control, including HbA1c or weight loss when compared to baseline measurements (range of -3.7% to -7.5% body mass at 1 year for four studies). These results were similar to outcomes seen in the Diabetes Prevention Program, which reported -4.7% body mass at 1 year. Six studies compared a digital coaching group to an in-person or telephone-based coaching group and showed better or similar outcomes in the digital coaching group. Overall our analysis of current evidence showed long-term clinical benefits in diverse populations for reducing HbA1c and body weight for adults at risk of type II diabetes.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Digital health coaching is a promising strategy for the management and prevention of type II diabetes and offers similar benefits to in- person or telephone-based health coaching.

We recommend that healthcare providers and healthcare organizations consider the option of using digital health coaching strategies to prevent and manage type II diabetes especially in cases where in-person health coaching or telephone-based health coaching is challenging.

DOTPHRASE.ORG: A PLATFORM FOR CROWDSOURCING EVIDENCE-BASED, EFFICIENT, EDUCATIONAL NOTE TEMPLATES

Patrick Sanger, Eric H. Lee, Nathaniel Gleason. Internal Medicine, UCSF, San Francisco, CA. (Control ID #3392190)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Documentation is inefficient, arduous and often not evidence-based; dotphrases can efficiently serve as diagnostic and therapeutic clinical decision support.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To facilitate the crowdsourcing of usable, accurate, evidence-based dotphrases across multiple medical specialties

2. To identify best practices for creation and maintenance of dotphrases

3. To serve as an educational resource for clinicians

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The authors developed a public website based on MediaWiki (created to run Wikipedia) with iterative design input from 10 internal medicine residents, a target end-user group. The site allows users to create, revise, and share dotphrase content. Dotphrases have associated metadata ("tags") – such as organ system, medical field, and inpatient/outpatient – which allow for easy browsing and filtering. Users can rate each dotphrase with an overall star rating and flag inaccurate content. Threaded comments under each dotphrase allow discussion. Any user can make edits to dotphrases; volunteer page editors and section editors monitor changes to maintain high quality, and a moderation system can be enabled to require approval of changes by these editors if needed. A community-maintained "Best Practices" guide can be displayed while browsing or editing. A mobile interface is under development. Broad dissemination via medical schools, residencies and social media is planned Q1 2020.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Quantitative (cumulative and monthly trend): Number of accounts registered; number of institutions represented; number of dotphrases created; average number of edits per dotphrase; average star rating; % of dotphrases with page editors volunteered; number of dotphrase page views; number of dotphrase downloads. Qualitative: comments and suggestions received via feedback channels.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): No existing public websites that facilitate aggregation and distribution of dotphrases were identified. No literature was found relating to community standards or best practices for dotphrases. No existing software platforms (including our Epic EHR) provided both the usability and flexibility required for this project —significant software customization was required.

During a beta launch in Q4 2019, of approximately 120 senior internal medicine residents emailed via listserv, 10 users signed up and contributed 93 dotphrases.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): * Focus initially on simplicity and usability, then add complexity based on end user input.

* Beta test with limited users to identify usability issues and technical errors prior to broad dissemination.

* Provide structure for contributions (ie SOAP headings, organ systems) but avoid being overly prescriptive with content or style.

* Identify and reach out to authors within your institution who have a reputation for high quality personal dotphrases.

* Start with barebones content and incrementally improve it; do not aim for perfection initially.

ECONSULT IN A LARGE SAFETY NET HEALTH SYSTEM: EARLY IMPACTS ON ACCESS TO CARE

Hannah Byrnes-Enoch[1]; Xuan Xu[1]; Jesse Singer[2]; Dave Chokshi[3]; Theodore G. Long[1]; Andrew B. Wallach[1]. [1]Ambulatory Care, NYC Health + Hospitals, New York, NY; [2]Population Health, NYC Health + Hospitals, New York, NY; [3]Brigham & Women's Hospital, Boston, MA. (Control ID #3391459)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How effective is an eConsult referral management system in improving measures of access to care in a large urban safety-net health system?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Establish a referral management system across ambulatory clinics

2. Increase access to specialist expertise by improving communication between primary care and specialty clinicians

3. Maximize existing specialty clinic capacity by ensuring patients receive the right appointments at the right time

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : NYC Health + Hospitals, the nation's largest safety-net health system, began implementing an integrated eConsult referral management system in 2016 across 11 hospital outpatient departments and 6 community health centers averaging over one million referrals each year. The system integrates clinician review of all referrals with a proactive appointment scheduling system for referrals requiring a face-to-face (F2F) visit. Specialist clinician reviewers have the opportunity to triage referrals to F2F visits or to reply with an electronic consultation note. As of early 2020, over 170 specialist clinics located in 12 care delivery sites are using eConsult to manage approximately 20,000 referrals per month.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO

EVALUATE PROGRAM/INTERVENTION): For 38 adult medical and 11 surgical specialty clinics using eConsult before February 2019, we calculated monthly average referral volume and access metrics at 2 months prior to eConsult as baseline. Clinics were stratified by type and compared with the first two months and the fourth & fifth month after implementation on the following metrics:

1. Referral volume

2. % of referrals requiring F2F appointment a) % resulting in a scheduled appointment

3. % of appointments occurring within 30 days

4. Average wait time (days) for F2F appointment

5. Referral appointment no-show rate

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1. 25,005 referrals submitted to the 49 specialty clinics were included in the analyses

2. Referral volume dropped after go-live, likely due to modifications to EMR order naming and structure; it returned to near previous levels by months 4 and 5

3. The percentage of referrals requiring an appointment dropped as expected after implementation, then rose significantly in the 4th and 5th month for surgical clinics, which may indicate that surgeons require some time to adjust to the new workflow

a) Overall, the percentage of referrals needing a F2F visit and resulting in a scheduled appointment improved significantly, increasing from 79% at baseline to 88% in the second comparison period

4. The percentage of scheduled appointments occurring within 30 days improved significantly overall compared to baseline, from 28% to 29% ($p<0.0001$)

5. Average wait time for appointment improved compared to baseline ($p<0.0001$). For adult medicine specialty clinics, only the first two months improved significantly

6. Overall no-show rate increased from 23% at baseline to 25% after implementation (not significant)

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementation of an integrated eConsult and referral system can improve measures of access to care, but effects may vary between medical and surgical specialties

ELECTRONIC HEALTH RECORD VISUAL OVERLAY PROMISES TO IMPROVE HYPERTENSION GUIDELINE IMPLEMENTATION

Raef A. Fadel[2]; Jacob Ross[1]; timothy asmar[1]; Karthik Sridasyam[1]; Guneet Ahluwalia[2]; tamara roumayah[2]; Megan Scott[2]; Hanan Ibrahim[2]; Rawan Hammoudeh[2]; Nitesh Gandhi[2]; Meaghan Flynn[1]; zachary demertzis[2]; Joseph Miller[3]. [1]Emergency Medicine, Henry Ford Hospital, Detroit, MI; [2]Internal Medicine, Henry Ford Hospital, Detroit, MI; [3]Internal Medicine, Henry Ford Hospital, Detroit, MI. (Control ID #3392657)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary care management of essential hypertension (HTN) in urban communities has become increasingly challenging given time constraints in direct patient care, electronic medical record burnout, lack of socioeconomic resources, compounded with recently published guidelines integrating risk stratification tools - such as atherosclerotic cardiovascular disease (ASCVD) risk - into decision-making and further increasing physican duties.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Measure whether overlay of visual decision support (VDS) with standard electronic health record (EHR) platform improves guideline-based treatment, and reduces time burden associated with EHR use, in the outpatient management of essential hypertension.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Improvement of electronic health record to include visual support device in management of patients with essential hypertension in an academic Internal Medicine clinic affiliated with a tertirary care hospital.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Assessed whether treatment selection was congruent with guidelines and tracked time physicians consulted the EHR in two scenarios: 1) using standard EHR to guide treatment, and (2) using VDS, including graphical blood pressure (BP) trends, target BP with recommended interventions, ASCVD risk score, and information on the patient's social determinants of health, to guide treatment.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We evaluated 70 case simulations in total. Use of VDS compared to usual EHR was associated with: higher proportion of correct guideline prescribing (94% vs. 60%, $p<0.01$), more ASCVD risk determination (100% vs. 23, $p<0.01$), and more correct BP target identification (97% vs. 60%, $p<0.01$). Time clinicians spent consulting the EHR fell an average of 121 seconds with use of VDS ($p<0.01$). On a 10-point scale, clinicians rated the VDS 9.2 vs. 5.9 ($p<0.01$) for ease of gathering necessary information to treat HTN.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The integration of VDS tools into the EHR demonstrates potential to reduce time and improve HTN guideline implementation. Further testing in clinical practice is indicated, and can improve overall quality of patient care in the outpatient setting.

EMBRACING OUR VALUES: CREATING A SOCIAL MEDICINE CORE WITHIN ACADEMIC HOSPITAL MEDICINE

Sarah Schaeffer[1]; Sirisha Narayana[2]; Archna Eniasivam[3]. [1]Medicine, University of California, San Francisco, San Francisco, CA; [2]Medicine, UCSF, San Francisco, CA; [3]Internal Medicine, Pediatrics, UCSF, San Francisco, CA. (Control ID #3392248)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Opportunities to promote social medicine are often not integrated within traditional hospital medicine priorities.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Incorporate tenets of social medicine within the mission and culture of our hospital medicine division

Develop a core group of hospital medicine faculty to engage in work around equity, advocacy, diversity, and inclusion within the realm of hospital medicine

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Social medicine is care that encompasses health disparities, advocacy and equity, bias and privilege, and understanding local and national contexts that impact health. As hospitalists working with diverse patient and trainee groups, we sought to incorporate these topics into the core work done by our division.

We first mapped social medicine concepts to existing areas of focus in our academic hospital medicine division: Quality Improvement (QI),

Mentorship & Education, Patient Experience, and Faculty Development. Over one academic year, we developed novel activities in the following areas:

Health Policy & Advocacy: We led faculty development sessions on health-related election issues, single payer system, and prescription drug pricing. We helped coordinate hospitalized patient voting assistance and participated in in state and national advocacy.

Inpatient Health Disparities: With QI leadership, we assessed disparities in common inpatient metrics by gender, race and ethnicity, primary language, and payer and housing status. This led the division to select opioid prescribing and use of interpreter services as QI areas of focus.

Care for Vulnerable Populations: We facilitated sessions on gun violence as a public health issue, trauma- informed care, and care of patients with limited English proficiency. We assessed physician uptake and use of video interpreters, to identify an intervention to improve their use.

Diversity, Equity, and Inclusion: We educated faculty on creating an inclusive teaching environment, responding to microaggressions, and promoting gender equity in medicine. We partnered with leadership to address enhance recruitment and hiring of diverse faculty, and promoted faculty participation in institutional diversity, equity, and inclusion training.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Social Medicine faculty development sessions were well-attended. Improving the use of interpreter services became our annual QI focus. Our division adopted a statement of diversity as part of faculty recruitment. We significantly increased the number of faculty from underrepresented and diverse backgrounds.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In one academic year, 50% of faculty and all in leadership positions completed institutional diversity training. Projects among hospital medicine fellows showed a shift towards addressing Social Medicine issues (e.g., improving interpreter services, forming a Social Justice Discussion Group).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Concepts of Social Medicine are relevant to many aspects of our roles as academic hospitalists and, with support from leadership, can be successfully adapted to align with traditional priorities.

ENGAGING STAKEHOLDERS TO IMPROVE HEALTHCARE TEAM COMMUNICATION

Katarzyna Mastalerz[1]; Charles Snyder[2]; Rivera Luis[2]; Lori Sarten[3]; Cynthia Burrows[2]; Sarah Flood[2]; Jillian Merkle[4]. [1]Hospital Medicine, Rocky Mountain VA Medical Center, Aurora, CO, Denver, CO; [2]Nursing, Rocky Mountain VA Medical Center, Aurora, CO, Aurora, CA; [3]Pharmacy, Rocky Mountain VA Medical Center, Aurora, CO, Aurora, CO; [4]Denver Health Hospital, Denver, CO. (Control ID #3354359)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Inpatient healthcare providers and leadership identified poor interprofessional (IP) communication as a cause for increasing length of stay and late discharges.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve interprofessional (IP) communication about patient care plans.

2. Engage stakeholders to create and implement a bedside interprofessional rounds (IDR) structure to improve communication.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our facility is a 133-bed Veterans Affairs Medical Center (VAMC) with bedside rounding and significant structural and cultural professional siloes. Starting in January 2019, stakeholder hospitalists, pharmacists, nurse managers, rehabilitation specialists, care coordinators, and social workers met iteratively to discuss how to transform bedside rounds to improve IP communication and care coordination. We used elements of Human Centered Design to prototype a rounding structure. Stakeholders took questionnaires back to their professional groups to discuss barriers and facilitators. Patients and residents were surveyed their experiences of rounds, and bedside nurses provided input about the information they wanted to contribute daily. We secured executive leadership support via our mission/vision and project charter. Taking into account all the inputs, after reviewing existing bedside IDR structures, stakeholders created a structured rounding framework which included the medical team, bedside nurse, pharmacist, and care coordinator. Each professional group was assigned a leader to support training and implementation. We implemented the structured bedside IDR on 6/23/2019.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We gathered pre and post implementation data that included IP team attendance and participation during rounds and qualitative interviews with patients. We also we tracked discussion themes at a bimonthly interprofessional huddle. We will examine staff engagement, length of stay, and discharge times as lagging indicators.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): After implementation, consistently more IP team members participated in bedside rounds, including nurses participating 90% of rounds (as opposed to 84% prior), and care coordinators attending 76% of rounds vs 14%. Physicians and pharmacists had high rates of attendance and input. 95% of nurses called to bedside rounds reported that their input was incorporated into the plan.

IP team members perceived a sense of improved communication and shared mental model of care plans by patients and the healthcare team. The rounds served as a platform for reducing unnecessary VTE prophylaxis and decreasing telemetry use.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Thoroughly and intentionally engaging local stakeholders to create the rounding model significantly simplified implementation and empowered healthcare team members.

Ongoing strong IP leadership after implementation was crucial; we identified champions in each profession to continually advocate for the vision of the project.

EVALUATION OF A NURSE-DRIVEN TELEPHONE-BASED VIRTUAL VISIT PROGRAM FOR DIABETES MANAGEMENT

Xisui S. Chen[1]; Sarah LaMar[3]; Susan C. Day[2]. [1]Internal Medicine, University of Pennsylvania, Philadelphia, PA; [2]General Internal Medicine, University of Pennsylvania, Philadelphia, PA; [3]Division of General Internal Medicine, Penn Medicine, Philadelphia, PA. (Control ID #3389730)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a nurse-driven telephonic diabetes management intervention improve A1c control among diabetic patients?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve diabetes control (measured by A1c) through providing individualized self-management support to diabetic patients referred by their primary care provider.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS.

OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The program consisted of virtual visits (VV) which were telephone visits conducted by nurse practitioners (NPs) to provide clinical support between office visits at an academic general internal medicine practice and designated patient centered medical home. NPs recruited patients with A1c >8 based on quarterly reports of the practice's diabetes registry and PCPs could also refer their patients directly. The number and frequency of VVs was individualized by the NP to the patient's needs and perceived engagement level.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome was the change in patients' A1c before and after participation in the program.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A retrospective evaluation of the VV program from 2014- 2018 was conducted based on EHR data. Patients with at least two VV encounters during this period and a A1c >6.4 prior to their first VV encounter were included. The final sample comprised of 376 patients. The mean age was 58 ± 11 years, 58% of patients were female, and 44% had Medicare insurance. The mean baseline Charlson Comorbidity Index (CCI) was 4.8 ± 2.9 and the mean baseline HbA1c was 9.85 ± 2.3. There was substantial variation and a right skew in number of VV encounters with a mean of 5.1 ± 4 and median of 3.

On average, patients' A1c decreased by 1.15 ± 2.5 points from before their first VV to after their last VV encounter. Multivariable regression models were used to identify factors associated with change in A1c. Adjusting for age, insurance type, residing in a high-risk low-income zip code, enrollment in the online patient portal, CCI, number of VV encounters, PCP type, and number of office visits between the first and last VV encounter, the duration of time between the first and last VV (-0.04, 95% CI -0.075, -0.004), female gender (-0.52, 95% CI -1.038, -0.006), and number of office visits in the year prior to the initial VV encounter (-0.28, 95% CI -0.445, -0.108) were significantly associated with A1c change. In an adjusted multivariate logistic regression model with the outcome of a ≥1 point decrease in A1c, only having fewer office visits in the year prior to the initial VV encounter (-0.21, 95% CI -0.35, -0.06) remained a significant predictor.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In this retrospective evaluation of a nurse-driven telephone-based VV program for diabetes, there was preliminary evidence of an improvement in A1c. However, future work should incorporate an adequate control group to assess for regression to the mean. Adjusted analyses of factors associated with A1c change suggest that patients with fewer office visits in the year prior were more likely to benefit. Thus, patients with a history of poor engagement with traditional office-based care may be an ideal target population for non-face-to-face care interventions.

EVERY PATIENT, EVERY VISIT: A HEALTH SYSTEM APPROACH TO BEHAVIORAL HEALTH INTEGRATION IN PRIMARY CARE

Elizabeth Cuevas[1]; Mary Lynn Sealey[1]; Nicole Sacca[1]; Courtney Watson[2]; Angela Kypriotis[3]; Heather Daugherty[3]; Bruce Ling[2]. [1]Internal Medicine, Allegheny Health Network, Pittsburgh, PA; [2]Center for Inclusion Health, Allegheny Health Network, Pittsburgh, PA; [3]Primary Care Institute, Allegheny Health Network, Pittsburgh, PA. (Control ID #3391918)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Since co-occurring depression can complicate and even worsen medical disease, should the primary care clinic be responsible for routine, universal screening for depression of all patients seeking medical care?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop an effective and efficient process for a primary care clinic to screen patients for depression using a PHQ9 screening tool.

2. Teach mutliple primary care clinics about depression, the PHQ9 screening tool, and a standardized approach to screen every patient, every visit for depression using the medical assistant during the rooming process.

3. Measure rates of depression diagnosis and potential changes in health care outcomes with increased screening for depression.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Stage 1 of this project began by identifying 9 high-performing, early-adopter outpatient primary care clinics within a large health care system. Each clinic nominated champions who were taught basic principles of practice transformation and quality improvement through recurrent learning sessions. Early sessions focused on depression screening with education on the PHQ-9 screening tool, how to use it, and what to do with positive results. Clinics were also taught how to incorporate the PHQ9 screen into the rooming process by the medical assistant. The goal was set to screen "*every patient, every visit*" with a PHQ-9 screen. Two subsequent stages including more primary care clinics (for a total of 29 clinics) entered into a similar learning cohorts at later dates. They followed the same learning curriculum with integration of the PHQ-9 screen into the routine primary care visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Rates of PHQ9 screening and severity of depression based on PHQ9 scores were tracked as were ER utilization rates across the network for these 29 clinics over a 26-month period. Rates were compared across the various stages of implementation using Chi-square tests and included the pre-implementation phase (Stage 0).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Rates of depression screening increased over time ($p<.001$) as follows: (1) Stage 0 (23%), (2) Stage 1 (29%), (3) Stage 2 (33%), and (4) Stage 3 (48%). There is a significant increase in the percent of visits which scored as severe or moderately severe depression ranging from 2.4% in Stages 0 and 1 compared to 2.8% in Stages 2 and 3. Among those with a visit in which the PHQ9 score was in the severe depression range, the percent with an ED visit 90 days after did not significantly change from Stage 0 (14.5%) to Stage 3 (15.9%) ($p=0.9$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A large network of integrated primary care clinics can be taught and engaged to successfully implement process change in a short period of time. Depression is underrecognized in primary care and once universal depression screening of "every patient, every visit" was implemented, screening increased across the network with more severely depressed patients diagnosed. This project includes data for the initial roll out of one component of primary care transformation in a large health care system with additional cohorts are planned in the near future.

FACTORS INFLUENCING PATIENTS' ABILITY TO SELF-MANAGE AND CONTROL TYPE 2 DIABETES

Yeriko Santillan, Tamara Goldberg, Olufunke Olushoga, Theresa Mack. Internal Medicine, Mount Sinai St. Lukes West, New York, NY. (Control ID #3380401)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Since most guidelines suggest that self-management is a critical pillar of optimal diabetes care, it is essential to understand the barriers to self-care among high-risk diabetic populations to improve overall control.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To identify the factors impacting self-management of diabetes in an urban, underserved population.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our project was conducted at a Federally Qualified Health Center in New York City that serves as a primary care training site for internal medicine residents. The clinic population is ethnically diverse and financially- burdened, with the majority of patients falling below the federal poverty level. In 2019, the rate of uncontrolled diabetics (A1c ≥9%) was between 25-32%. To better understand barriers to diabetic self-care among this population, we conducted a retrospective case study of 161 patients seen at our clinic between January 2017 and January 2019.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The following was collected: age, sex, zip code, history of psychiatric diagnoses, applicable Z codes based on social/educational history, number of primary care visits, number of visits with a nutritionist, number of visits with a certified diabetic educator (CDE), number of hemoglobin A1c results and their values, and number of missed appointments. We then stratified patients who achieved an A1c <9 by the end of the study period and those who remained ≥9, and compared the above variables using odds ratio.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 161 patients with hemoglobin A1c ≥9, 44% attained a hemoglobin A1c <9 by January 2019. Women were more likely to remain uncontrolled than the men in our study (OR 1.22). Patients who did not achieve glycemic control were more likely to have poor health literacy (OR 2.6), life-management problems i.e. cognitive and/or physical issues limiting ability to adhere with medications and manage daily tasks (OR 4.27), to be under- or uninsured (OR 1.78), have a concomitant mental illness (OR 1.44), and to have missed appointments with their primary provider (OR 1.42). Patients who did not attend a nutritionist or CDE appointment were just as likely to achieve glycemic control as those who did (OR 1.0).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This retrospective chart review sheds light on key variables contributing to long-term diabetic control among a low-income, underserved urban population. Decreased number of missed appointments with a PCP was associated with better control, yet we found no difference in control between those who were engaged in care with a CDE or nutritionist and those who were not. Life-management problems and poor health literacy had the greatest association with poor control. These results help guide our intervention priorities such as reducing no-shows, routinely screening and documenting social barriers to care, focusing on resources to mitigate these barriers, and providing patients with literacy-appropriate educational material. A limitation of this project was that social barriers were not documented in s a standardized way, suggesting the importance of educating our resident providers about Z codes.

FEASIBILITY OF A NUTRITION AND LIFESTYLE FOCUSED SHARED MEDICAL APPOINTMENT PROGRAM IN A RESOURCE-CHALLENGED COMMUNITY SETTING

Nazleen Bharmal[1]; Marilyn Alejandro-Rodriguez[2]; Michelle King[2]; Kayla Alejandro[2]; Michelle Beidelschies[2]. [1]Cleveland Clinic Community Care, Cleveland Clinic, Cleveland, OH; [2]Center for Functional Medicine, Cleveland Clinic, Medina, OH. (Control ID #3390910)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Will a Shared Medical Appointment Program (SMA) in a resource-challenged community with a high burden of chronic disease and racial and socioeconomic health disparities be feasible and acceptable to programmatic stakeholders and community residents in the Fairfax/Hough neighborhood of Cleveland?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To determine the feasibility of community resident participation in a 10-week SMA in a community setting.

2) To understand the barriers and facilitators for implementation and scalability of the pilot program through a participant focus group and one-on-one stakeholder interviews

3) To evaluate pre- and post-intervention changes in wellness indices, self-efficacy, and trust in medical researchers using a written survey.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Functioning for Life (FFL) is a 10-week SMA program focused on providing nutrition, lifestyle and behavioral health education and interventions to patients with various chronic conditions, and is led by a multi-disciplinary team of caregivers (a medical provider (MD/DO/PA/NP), dietitian and health coach). Participants (n=15) were community residents in the Fairfax/Hough neighborhood of Cleveland, OH and the sessions were conducted in a community center. Participants received in-kind healthful food, dietary supplements, and lab testing. An IRB-approved research evaluation of the program was conducted.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1) Participation in the 1-2 hour weekly session for 10 weeks

2) Improvements in health behaviors, trust in medical researchers/physicians, self-efficacy, and biometrics

3) Input from participants and stakeholders via focus group and interviews regarding feasbility

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): All 15 particpants attended all weekly sessions, which was faciliated by the community organization staff calling participant to remind them to attend sessions. The majority of participants were older adult, African American women.

Pre- and post-surveys showed participants had increased sleep duration, fruit and vegetable intake, and improved self-reported health status after the program. The majority did not have a hard time following the nutritional recommendations, incorporating the lifestyle changes, taking the supplements, and/or eating the food delivery meals.

All participants had improvements in their systolic blood pressure; there was a 10mmHg decrease in mean systolic blood pressure over 10 week program (SBP 132 to 122). Other changes included a change in mean diastolic blood pressure from 65 to 61 (-5mmHg) and a mean weight loss of 6lbs lost from 226lbs to 220lbs.

Faciliators to the program included enthusiastic clinical staff who were familiar with the content and could adjust to a low health literacy group, partnership with a trusted community partner, and group support. Barriers to sustainability include heavy time and personnel resources to carry out the program and lack of in- kind food delivery.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): SMAs can be feasible and acceptable in community settings in partnership with trusted organizations.

FOOD AS MEDICINE: HOW TACKLING FOOD INSECURITY IN PRIMARY CARE CAN ADVANCE THE QUADRUPLE AIM AND HEALTH EQUITY

Rita Nguyen[1,2]; Helen Gambrah[4]; Brian Aldana[3]; Erin Franey[6]; Sarah Cox[1]; Ellen Chen[5]. [1]Population Health Division, San Francisco Department of Public Health, San Francisco, CA; [2]Internal Medicine, University of California San Francisco, San Francisco, CA; [3]University of California Berkeley, Berkeley, CA; [4]Vanderbilt University School of Medicine, Nashville, TN; [5]San Francisco Health Network, San Francisco Department of Public Health, San Francisco, CA; [6]Food as Medicine Collaborative, San Francisco Department of Public Health, San Francisco, CA. (Control ID #3392395)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Food insecurity is associated with worse health outcomes and increased healthcare costs but it is unclear how healthcare can effectively tackle this major social determinant of health.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Establish a multisector collaboration to drive policy, systems, and environmental change within healthcare to address food insecurity

2. Frame food insecurity as an equity issue and use quality improvement (QI) tools to operationalize equity within clinics to improve Black/African American (B/AA) health

3. Align food insecurity interventions with QI goals to advance the quadruple aim

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Food as Medicine (FAM) Collaborative is a multisector collaboration that advances health equity by developing partnerships between healthcare and food systems to address food insecurity. We implemented Food Pharmacies in ten primarily safety-net clinics across four health systems in an urban region. Food Pharmacies allowed patients to access food, nutrition education, cooking demonstrations, and referrals to the food safety net and were integrated into primary care operations. These efforts were aligned with QI goals around B/AA hypertension control. QI tools were applied to operationalize equity and ensure B/AA were prioritized. The culture change that occurred as a result of establishing Food Pharmacies enabled healthcare partners to identify and drive a policy agenda to change Medicaid funding for food insecurity.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Blood pressure; pre-post surveys and focus groups on diet changes, patient satisfaction; qualitative feedback from providers; clinical productivity (patients per hour).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 867 patients across 10 clinics with Food Pharmacies were served between Jan-Sept 2019, 67% of whom were B/AA (compared to 5% of the population). Among patients who filled their food prescription >=3 times for whom we had access to clinical data (n=144), there was a 4.4 mm Hg decline in systolic blood pressure (CI 0.71-8.69, p=.021) and 2.7 mm Hg decline in diastolic blood pressure (CI 0.92-5.37, p=.005). 91% of patients adopted healthier eating practices (n=117). Patient reported a greater sense of community as a result of participation in food pharmacy. Clinicians reported decreased burnout. Physician productivity increased from the organizational benchmark (2.4 billed visits per hour vs 2.25). 60 organizations signed on to a position paper authored by the FAM Collaborative advocating for California's Medicaid to include food supports as a covered medical benefit, including the California Primary Care Association and the California Association of Public Hospitals and Health Systems.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Partnerships between food and health systems are not only possible but also synergistic in advancing health equity, QI goals, and food security.

Tangible, on-site food programming can advance culture change in healthcare to embrace food insecurity as a health issue to tackle. This culture change can then enable greater collective policy change.

Effective equity work requires naming and addressing racism within healthcare.

FOOD FOR THOUGHT: A CULINARY NUTRITION PILOT FOR INTERGENERATIONAL PARTICIPANTS IN AN UNDERSERVED, URBAN SETTING

Juliana Giraldo-Ramirez[1]; Erin Allmer[6]; Baaba Blankson[7]; Mariecel Pilapil[2]; Omolara T. Uwemedimo[3]; Shari Jardine[4]; Barbara Keber[5]. [1]Internal Medicine, Northwell Health, Woodside, NY; [2]Internal Medicine, Pediatrics, Zucker School of Medicine at Hofstra/Northwell, New Hyde Park, NY; [3]Pediatrics, Zucker School of Medicine at Hofstra/ Northwell, New Hyde Park, NY; [4]Office of Academic Affairs, Northwell Health, New Hyde Park, NY; [5]Family Medicine, Zucker School of Medicine Hofstra Northwell, Glen Cove, NY; [6]Pediatrics, Northwell Health, Manhasset, NY; [7]Family Medicine, Northwell Health, Glen Cove, NY. (Control ID #3391386)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Given the prevalence of chronic health conditions (i.e. heart disease, diabetes, etc) and its interplay with social determinants of health, we implemented a community-based culinary nutrition series in an underserved area to improve participants' understanding of the relationship between chronic health conditions and dietary practices.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): (1) Increase participants' nutritional literacy and knowledge of chronic disease, (2) Assess participants' confidence and willingness to prepare healthy, low cost meals and (3) Evaluate changes in dietary habits in favor of healthier options.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : This project is an academic-community partnership between a community-based organization (CBO), resident physicians in Internal Medicine, Family Medicine and Pediatrics, and dietetic interns. Our partner CBO has 4 sites in a geographically isolated, underserved urban area with a predominantly African American population. The intervention includes 6 culinary nutrition sessions at each of the 4 CBO sites (24 sessions total). The curriculum teaches participants basic nutrition facts, impact of diet on chronic disease, and how to prepare healthy/low cost meals. Topics include: Weight Management, Cardiovascular Disease, Diabetes, Dietary Fat, Hypertension and Plant Based Diets. Each session includes a presentation on the topic of the day with relevant chronic disease and nutritional education. An applicable recipe is demonstrated with a taste test. Pre- and post-session surveys are given to participants age 15 and above. Age-appropriate questionnaires are given to those less than 14 years old.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Survey data showing improvement in health and nutritional literacy as well as increased willingness to change dietary habits are used to evaluate success.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date, 2 (of 6) sessions have been

completed. Data was gathered from 1 CBO site. There was an average of 7 participants per session. Mean adult participant age was 33 years (range 18-49). All adult participants were female. Mean child participant age was 9 years (range 5-15). The mean household number was 5.5. Most respondents felt that vegetables were easily to moderately affordable. 33% (3/10) of participants noted an increase in confidence in preparing a healthy meal. Most participants endorsed that they will change their eating habits after the session. There was no significant change in health care literacy after the intervention. 80% of the children ages 13 and under endorsed that they would try the recipe again.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This intervention demonstrates implementation of an interdisciplinary academic-community partnership to improve nutritional and health literacy in an underserved community is feasible. Overall, participants are willing to improve dietary habits. This pilot program also provides an opportunity for exposure of resident physicians and dietetic interns to social determinants of health, which may influence their future practice.

FROM SCREENING TO SERVICES IN SOCIAL DETERMINANTS OF HEALTH: A RESIDENT- LED ANALYSIS OF PROGRAM IMPLEMENTATION

Byung Jae Kim, Shinn-Te Chou, David F. Lee, Jay Luthar, Soumya Narayan, Janine Petito, Leah Zallman, Rebecca Rogers, Maren Batalden. Medicine, Cambridge Health Alliance/ Harvard Medical School, Cambridge, MA. (Control ID #3390995)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Cambridge Health Alliance began screening for health-related social needs (HRSN) - food, housing, transportation, medication and utility insecurity - during primary care visits. Patients who screened positive for food insecurity (25%) were referred to a local food organization, Project Bread, who then called the patients to provide food access. Successful contact was made in about 60% of cases. We aimed to improve this connections rate.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Understand the process of HRSN screening at individual clinic sites; Elucidate barriers to connecting patients with resources; Implement changes to improve the rate of successful connection to Project Bread

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We spoke with the screening tool development team, Project Bread, clinic resource specialists and staff, and patients. We mapped the screening process at three different primary care clinics to identify pitfalls and area of improvement. Many patients and providers did not understand the processes and many front-line staff did not understand the goals and outcomes of the screening, despite training. Reviewing 29 consecutive patients revealed that of those who screened positive for food insecurity, most were unaware that their responses would trigger a referral for services, but they all responded favorably to being contacted by Project Bread when it was explained by the physician.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1) Improved understanding among physicians and health system leadership of the challenges individual clinics and healthcare systems face when rolling out new programs. 2) Greater appreciation of the importance of HRSN and improved morale regarding screening among non-physicians. 3) Increased and ongoing engagement of residents in quality improvement work.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Decreased unsuccessful connection rate from 47% to 41% in six months. Now, direct hot line number is provided to patients who screened positive at the visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): First, efficiency of the screening was improved when any changes to the screening process was adapted to each clinic's workflow. Second, medical assistants' overburden of new screening form and uncertainty of how to trouble shoot incomplete forms or patient questions was smoothed-over after additional training. Third, low appreciation for the screening due to poor understanding of goals and benefits of HRSN screening among non-physician staff gradually improved as residents and leadership communicated with staff. Fourth, automation screening and referral processes decreased work for providers but also reduced the discussion about HRSN with physicians, which may have contribute to reduced connection to resources. Now, survey data are entered earlier so providers know the screening results before seeing the patients. Fifth, through our data collection, conversations, and observations, we learned that introducing a new screening tool can be quite disruptive to a healthcare system, but continuous engagement and quality improvement can smooth the rocky road.

GUARANTEEING HEALTH CARE TO ALL IN NEW YORK CITY

Theodore G. Long[1]; Marielle Kress[1]; Mitchell H. Katz[2]. [1]Ambulatory Care, NYC Health + Hospitals, New York, NY; [2]Office of the President, NYC Health + Hospitals, New York, NY. (Control ID #3390869)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There are nearly 300,000 people who are uninsured and ineligible for health insurance in New York City, with half of all the uninsured in New York City's public healthcare system only going to the emergency room and never going to primary care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):
- Determine the components and structure of a universal access to care program in the largest city in the country
- Work within the nation's largest public healthcare system to implement the program
- Complete real time evaluation of the program and study long-term outcomes through research

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : NYC Care is a health care access program that guarantees low-cost and no-cost services to New Yorkers who do not qualify for or cannot afford health insurance based on federal guidelines. The program is available regardless of immigration status or ability to pay. While NYC Care is not an insurance plan, under NYC Care patients have a similar experience to what people with health insurance have such as a membership card, a primary care doctor, a transparent fee schedule based on family income, a 24/7 customer service line, and 24/7 access to affordable medications. Services include outpatient, inpatient, diagnostic, emergency department, and pharmacy and are provided at NYC Health + Hospital sites.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Real time evaluation metrics are being monitored including enrollment, expanded access medication utilization, and wait times for new patient appointments. Once the program has been in effect for at least one year, other metrics will include: patient experience/satisfaction, age appropriate screening and chronic

disease outcomes, avoidable emergency department/hospital use, overall costs and costs for specific services.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The program went live in the Bronx in August 2019. In the first four months, 10,000 patients were enrolled. One hundred percent of new patients were offered a primary care appointment within two weeks. In addition, over 14,000 medications have been filled in new expanded hours alone, meaning these medications would not have been available to uninsured patients before the program started.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): ● Understanding community need and working with community based organizations to engage hard to reach populations is critical for bringing people into primary care

● Access to care is a cornerstone of primary care, but with a national shortage of primary care doctors, access programs like NYC Care must develop innovative workforce solutions to meet the demands of new and existing patients.

● In systems like NYC Health + Hospitals where large amounts of money are already being spent on inpatient hospitalization and emergency department use, it may be possible to refocus resources on primary care and thereby achieve better outcomes without substantial increases in overall costs.

HBA1C-TRIGGERED ENDOCRINOLOGY ELECTRONIC CONSULTATION FOR T2DM MANAGEMENT

Karthik Rao[1]; Andrew Oseran[2]; Chrisanne Sikora[3]; Yuchiao Chang[4]; Deborah J. Wexler[5]; Daniel M. Horn[6]. [1]Medicine, Massachusetts General Hospital, Cambridge, MA; [2]Medicine, Massachusetts General Hospital, Boston, MA; [3]Medicine, Massachusetts General Hospital, Boston, MA; [4]Harvard Medical School, Boston, MA; [5]Medicine, Massachusetts General Hospital, Boston, MA; [6]Medicine, Massachusetts General Hospital, Boston, MA. (Control ID #3389833)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): It is unknown whether automatically triggered endocrinology electronic consultations (eConsults) to primary care providers based on hemoglobin A1c (HbA1c) can be successfully implemented and whether they can improve glycemia in T2DM.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Evaluate whether automatically triggered endocrinology eConsults for primary care patients with a HbA1c between 8.5-10.5 can be implemented in clinical practice

2. Evaluate whether recommendations provided by endocrinology in automatically triggered eConsults are implemented by the receiving primary care providers

3. Evaluate whether automatically triggered endocrinology eConsults led to improved glycemic control as compared to a matched control group

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Many health systems have implemented eConsult programs. One potential way to optimize and enhance utilization of eConsults is by automatically triggering eConsults based on clinical criteria. We randomized 161 primary care providers (PCPs) affiliated with Massachusetts General Hospital (MGH) into intervention (n=81) and control (n=80) arms. PCPs in the intervention arm automatically received endocrinology eConsults on a rolling basis if their patients met pre-specified inclusion criteria: age < 80, HbA1c 8.5-10.5, PCP office visit within 14 months, and no prior endocrinology visit within 2 years. Patients who received an eConsult were matched 1:1 with controls. Patients were followed for 6 months after completion of the eConsult.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We performed a comprehensive chart review at the beginning and end of the study period to track implementation of eConsult recommendations. We compared change in HbA1c in intervention and control patients using paired t-tests and sign test.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): No significant differences in baseline characteristics existed between the two groups. Among 275 patients initially eligible for an eConsult, 130 patients received one. The main reason for deferring consultation was improvement in HbA1c in the interim. A total of 230 discrete management recommendations were made via eConsult with an implementation rate of 34.7%. Of the 130 matched pairs, 95 had 6-month HbA1c follow-up data for paired analysis. The mean HbA1c decrease was 0.91 (SD 1.4) in the intervention arm and 0.61 (SD 1.29) in the control arm (p=0.12). Intervention patients had greater improvement in 58% of the pairs (p=0.05). The 145 patients from the intervention group who did not receive an eConsult had a mean HbA1c decrease of 0.23.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): An automatically triggered endocrinology eConsult system can be successfully implemented in clinical practice. HbA1c threshold triggered endocrinology eConsults show promise for improving diabetic control. Future interventions should work toward real-time implementation to optimize effectiveness.

HERE'S MY CARD: ASSESSING PATIENT PERCEPTION ABOUT ACCESS TO RESIDENT PRIMARY CARE

Michelle Likhtshteyn[2,4]; Jeremy Smith[2,4]; Brais Gandara[2,4]; Panid Borhanjoo[2,4]; Ebunoluwa Onafalujo[2,4]; Aminat Akintola[3]; Andrew A. Chang[2,4]; Nadia A. Williams[2,3]; David L. Stevens[2,4]; Melissa S. Lee[1]. [1]Ambulatory Medicine, Kings County Hospital, Brooklyn, NY; [2]Ambulatory Medicine, NYC Health + Hospitals/Kings County, New York, NY; [3]Ambulatory Care, NYC Health + Hospitals/Kings County, Brooklyn, NY; [4]Internal Medicine, SUNY Downstate Health Sciences University, Brooklyn, NY. (Control ID #3392225)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients are not confident in their ability to access their resident primary care providers (PCP) and teams (PCT).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve patient confidence in their ability to contact the resident PCT To determine how our patients prefer to communicate with their care teams

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : A standard patient satisfaction survey administered by Press Ganey from July 2018 to July 2019 indicated that 89% of patients were likely to recommend our safety-net primary care practice in Central Brooklyn.

However, only 77% felt they had good access to the practice. In our Internal Medicine resident practice, patient continuity and accessibility to resident PCPs is complicated by the rotating resident inpatient- outpatient schedule. We studied the use of a standard resident MD business card to determine its impact on patient confidence around communications with the resident PCT.

A one-question survey using a Likert scale was administered prior to the visit to gauge baseline patient confidence regarding the ability to contact their PCP and care team. Patients were given a business card with resident PCP name, Practice availability, and appointment line information. After

the visit, patients were asked the same question to assess if the business card impacted patient confidence around the ability to contact their PCP/PCT.

Patients were also asked how they preferred to be contacted by the practice: email, phone, text messaging or letter.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used a quasi- experimental study design with a one-question pre- and post-intervention survey that utilized a 5-point Likert Scale. Pre- and post-intervention data was analyzed using the Wilcoxon Signed Ranks Test.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 30 patients were included in our study; the mean age of our patients was 54.3 years, 18 were females and 12 were male.

A Wilcoxon signed-rank test showed that provider business cards elicited a statistically significant increase in patient confidence in being able to contact the PCT ($Z = -2.7137$, $p = 0.006$); the mean pre-Intervention rating was 2.8 while the mean post-Intervention rating was 3.7.

Of the 30 patients surveyed regarding their communication preferences, 86.7% selected phone, 6.7% email, 3.3% text message and 3.3% regular mail.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): - Resident business cards significantly improved patient confidence regarding the ability to contact their resident primary care team.

- Based on previous studies linking patient satisfaction to perceived connection with a PCT, a resident business card with specific dates of clinic availability and a contact number for the PCT can improve patient satisfaction.

- Patient communication preferences vary by community. This may be impacted by social determinants of health; many patients in our practice prefer phone calls over email communication.

- Although our practice recently transitioned to EPIC, we don't know how our patients in a safety net system will use the new technologies.

HIDOC: AN EXPANDED OUTPATIENT CARE DELIVERY MODEL TO MEET THE NEEDS OF MEDICALLY COMPLEX, HIGH-UTILIZING PATIENTS

Caitlin Driscoll[1,2]; Alex H. Cho[1,2]; Laura Germino[2]; Valerie Keck[1,2]; Elissa Nickolopolous[2]; Lynn Bowlby[1,2]; L. Ebony Boulware[1,2]. [1]Medicine, Duke University, Durham, NC; [2]Duke University Hospital, Duke Outpatient Clinic, Durham, NC. (Control ID #3392361)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can a complex care medical home model grow to continue to improve utilization outcomes for its population?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): - Address acute care needs of medically complex patients experiencing frequent exacerbations of advanced chronic illness, in a primary care setting

- Achieve sustained reductions in excess ED and inpatient utilization within a primary care population

- Redirect care from an overcrowded university hospital (UH) to a more accessible community hospital (CH) location, when appropriate

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Duke Outpatient Clinic (DOC) is a hospital-based adult medicine primary care teaching clinic in Durham, NC. It serves minority, older, and lower-income patients, including many with high rates of emergency department (ED) and hospital use. Prior work addressed behavioral drivers of utilization, and over 2 years reductions in ED visits and hospitalizations were observed, but in the third year hospitalizations rose. Analysis of ED visits leading to admission identified an opportunity for acute care for complex patients experiencing frequent exacerbations.

The HIDOC (Highly Individualized, Dedicated Onsite Care) program began in January 2017, featuring onsite walk-in acute care for problems that might be sent to an ED; and a team composed of a nurse case manager who also provides bedside clinical care, nurse practitioner scheduled to be able to see walk-ins and do home visits, clinical social worker, and medical director. Clinical pharmacy support is also available.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The DOC primary care population panel is defined as patients with 2 primary care visits in the past 36 months, and one in the past 12. This list is updated at the start of a fiscal year (FY). For each intervention year, inpatient admissions and ED visits by DOC primary care panel patients were measured at the two hospitals, both university-affiliated, located in the same county as the clinic. To provide a direct basis for comparison, inpatient and ED utilization was also measured for the same DOC panel in the preceding year. Admissions were counted if they originated in the ED. Descriptive statistics were used to analyze changes in utilization in the first 2 full years after implementation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In July 2017, at the start of FY18 (Year 1), the DOC primary care panel numbered 3,877, and in FY19 (Year 2) 3,831. In Year 1, there were reductions of 16.4% in ED visits and 17.9% in hospitalizations at the UH. Year 2 saw a 22.0% reduction in ED visits and 2.7% fewer hospitalizations at the UH. At the CH, ED visits decreased in both years, and hospitalizations rose 8.8% in Year 2.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): After creating additional onsite capacity to serve the acute medical needs of patients with advanced chronic illness, continued reductions in ED and inpatient utilization were observed; there was also some evidence of redirection of care. Adequate staffing is a challenge in many primary care settings. Here we were able to make an alternative justification for additional staffing, to create more capacity to address an important hospital need.

HOSPITAL-BASED INITIATIVES TO ADDRESS UNMET SOCIAL NEEDS OF HIGH-RISK PATIENTS

Thuy Bui[1]; Lisa George[2]; Mike Bowersox[3]; Mary Hawk[2]. [1]Medicine, University of Pittsburgh, Pittsburgh, PA; [2]Graduate School of Public Health, University of Pittsburgh, Pittsburgh, PA; [3]Southwest PA AHEC, Pittsburgh, PA. (Control ID #3373083)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Prioritization of medical needs during acute care hospitalization and lack of organizational support prevent healthcare teams from fully addressing social concerns, contributing to a lack of evidence-based care around social needs screening in acute care settings

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Implement a social needs screening program to improve care transitions for socially at-risk populations and to decrease readmissions

2. Identify obstacles to linking patients with community resources

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : As part of a quality improvement initiative–Social Needs Action Program (SNAP), patients admitted to the medicine service at an academic tertiary care hospital were screened using an application adapted from the Protocol for Responding to and Assessing Patients' Assets, Risks, and Experiences (PRAPARE). Patients were screened if they met the following criteria: high risk for readmission based on UPMC predictive algorithm, residing in 2 targeted low-income zip codes, did not enroll in hospice, and not residing in a long- term group home or skilled nursing facility. A patient who screened positive for one or more social needs was referred to a community helper after discharge. The SNAP team community helpers are part of a program called Connections4Health that is modeled after Health Leads, which trains volunteer college students in social services referrals. The SNAP physician who engaged the patient in the hospital communicated findings and recommendations with the inpatient care team and PCP. Weekly check-ins between the SNAP physician and community helpers ensure that patients are followed until the social needs are met. Home visits and assistance with scheduling follow up appointments were provided for high-risk patients.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Metrics for program evaluation include percentage of social needs met as self-reported by patients, decrease in 30-day readmission rates, and increase in PCP follow-up after discharge.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 187 patients who met the inclusion criteria were screened over a one-year period from October 2018 to October 2019. Patients in the intervention group were predominantly black (76%) and female (55.4%). Transportation, social support, food insecurity and housing modification are among the more common social needs identified. Food insecurity was successfully addressed most of the time while the rates of needs met are lower for paying utility bills, transportation, caregiver and housing needs. The 30-day return rate decreased from 38.2% in the year prior to the intervention to 26.8%. 30-day PCP follow up increased from 22% to 35%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Improving care transition and addressing social needs are feasible for hospitalized patients at high risk for readmissions. Coordination of care, prompt outpatient follow-up and home visits are important to reduce readmissions. Meeting financial and housing needs remain challenging. Warm handoffs between the inpatient and the community teams are needed to ensure ongoing engagement with patients after discharge.

IMPACT OF NURSE-DRIVEN ADDICTION MEDICINE CONSULT SERVICE ON HOSPITAL UTILIZATION AND PATIENT OUTCOMES DURING ITS FIRST YEAR

J. Deanna Wilson, Stephanie Klipp, Emily Joseph, Payel Roy, Jane M. Liebschutz. Medicine, University of Pittsburgh, Pittsburgh, PA. (Control ID #3389536)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): While acute hospitalization represents an opportunity to identify and engage patients with active substance use disorders into treatment, health systems routinely fail to offer evidence-based services to patients with addiction.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The purpose of the addiction medicine consult service (AMCS) is to proactively manage substance use withdrawal among hospitalized patients; to promote patient engagement and linkage to substance use treatment; and to initiate evidence-based pharmacotherapy during acute hospitalization.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The AMCS was launched in October 2018 at an urban academic hospital with a large suburban and rural catchment area. The service was composed of a multidisciplinary team consisting of a physician (a general internist boarded in addiction medicine or a toxicologist), social worker, and peer navigator. In March 2019, a certified addictions registered nurse was added to the team. The nurse triages consults to prioritize care and then facilitates coordination of care. Patients are engaged across the continuum of the hospital stay, and the team engages bedside staff and hospital leadership through informal discussions and staff didactics to improve delivery of compassionate, non-judgmental addiction care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We tracked engagement metrics (e.g. numbers of consults seen, reasons for consults, pharmacotherapy, and discharge disposition). We evaluated impact of the AMCS on hospital utilization (ED visits, readmissions, and hospital length of stay) and on patient outcomes (90-day mortality measured from date of index discharge) using propensity scores to match controls hospitalized during the previous year.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The AMCS provided care to 490 patients through September 2019. Patients had diagnoses of alcohol use disorder (28.7%), opioid use disorder (OUD) (27.8%), and polysubstance use disorder (40.3%). Only a minority (n=26; 5.2%) were engaged in substance use treatment prior to hospitalization, but during hospitalization, the majority of those with OUD were started on evidence-based medications (n=237 started on buprenorphine; n=58 on methadone; and n=2 on vivitrol/naltrexone).

There was a reduced likelihood for 30-day readmission rates for patients seen by AMCS compared to matched control group (average treatment effect=-3.80%; 95% CI: -7.4,-0.18; p=0.039). Ninety-day all-cause mortality was significantly reduced among patients seen by AMCS (-3.19; 95% CI: -4.1, -2.3; p=<0.001) compared to matched controls.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In a short-period of time, there has been wide-scale adoption of the AMCS to an inpatient acute care setting. A nurse-driven addiction medicine consult model appears acceptable and feasible to patients and staff. AMCS involvement may help reduce hospital utilization and improve all-cause mortality for patients with substance use disorder.

IMPACT OF THE NP ANCHOR MODEL: CLINICIAN JOB STRESS, PATIENT ACCESS, AND PANEL MANAGEMENT

Joanna D'Afflitti, Melissa Jacobs, Sophia Thornton, Rose Solomon. General Internal Medicine, Boston Medical Center, Boston, MA. (Control ID #3391763)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Job stress, workload, and caring for complex patients are well-documented challenges facing primary care providers (PCPs); team-based care is one strategy for addressing these challenges, but few data exist to support this approach.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve PCP satisfaction and decrease job stress by implementing team-based care through physician-nurse practitioner (MD-NP) partnerships

2. Increase patient access to care with a team clinician

3. Improve diabetes control

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We implemented MD-NP care teams ("NP Anchor" model) in a primary care practice at a large urban safety-net hospital. Using a ratio of 1 NP FTE:1.5 MD FTE we created teams using NPs as team "anchors." 40% of the NP's time is protected to address between-visit care (*e.g.,* test result follow-up, medication titration, and outreach to complex patients). The remaining time (60%) is allotted for clinical sessions. We began this initiative with one team in February 2016 and gradually expanded the model to its current state of 17 teams (17 NPs and 55 MDs), covering 90% of our practice.

Beginning in June 2019 NP Anchors met with team MDs to review lists of patients with poorly controlled type 2 diabetes mellitus (DM2), defined as a glycosylated hemoglobin (A1C) >9%. During these panel management sessions MDs and NPs developed care plans for patients that included MD/NP appointments, referrals to clinical pharmacists, and referrals to patient navigators to address social determinants of health such as food insecurity and housing.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. NP and MD satisfaction measured through anonymous surveys

2. Access to care measured by time to 3rd next available appointment

3. Panel-based diabetes control measured by percent of patients on each team with an A1C >9%

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We sent anonymous surveys to all 17 NPs and 55 MDs, with response rates of 95% for NPs and 75% for MDs. 100% of respondents agreed/strongly agreed that the NP Anchor model expanded access to care for their patients, 90% agreed/strongly agreed that important information was communicated effectively between MDs and NPs, and 79% agreed/strongly agreed that being part of the NP Anchor model helped reduce stress at work.

With the addition of an NP to the care team, the average time to 3rd next available routine appointment with a team MD or NP went from 43 to 20 days.

We looked at diabetes data for 16 MD-NP teams and one team without an NP. On average, each team had over 300 patients with DM2. Mean percent of patients on each team with A1C >9% at baseline (prior to implementing panel management) was 20.6%, and variance over time within each team was low (mean variance 0.6%). At 6-month follow-up, 13 NP Anchor teams saw a decrease in percent of patients with A1C >9% (mean decrease 3.1%) and 3 teams saw a slight increase (mean increase 0.6%). The team without an NP saw a 2% increase in percent of patients with an A1C >9%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Data suggest that NP Anchor teams are effective in reducing job stress for PCP's, improving patient access to care, and potentially improving diabetes outcomes.

IMPLEMENTATION OF A COMPUTERIZED ADAPTIVE TEST FOR DEPRESSION SCREENING IN PRIMARY CARE

Neda Laiteerapong[1]; Melissa Franco[1]; Alexandra C. Knitter[2]; William Deehan[4]; Amber Keahey[1]; John Moses[4]; Sachin Shah[1]; Robert Gibbons[3,1]; Daniel Yohanna[3]; Nancy Beckman[3]; Lisa Vinci[1]; Erin M. Staab[2]. [1]Medicine, University of Chicago, Chicago, IL; [2]Department of Medicine, University of Chicago, Chicago, IL; [3]Psychiatry & Behavioral Neuroscience, University of Chicago, Chicago, IL; [4]Information Technology, University of Chicago, Chicago, IL. (Control ID #3391595)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A common tool to screen for depression in primary care is the Patient Health Questionnaire-2 (PHQ-2); however, the PHQ-2's sensitivity in our academic urban general internal medicine (GIM) clinic was 58% and many cases of major depressive disorder (MDD) were missed.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase the sensitivity of MDD screening in our GIM clinic without increasing the time required to complete screening.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In 2/2019, we implemented a computerized adaptive test for MDD screening and severity assessments (CAT-MH^{TM}) into the electronic health record (EHR) (Epic) at the University of Chicago GIM clinic. The clinic includes 40 attendings and 110 resident physicians (18 full-time equivalents), and 8 medical assistants (MAs). The CAT-MH^{TM} for MDD is a cloud-based bank of 88 questions for diagnosis and 389 questions to assess severity. Questions are adaptively administered depending on patient response. Patients without MDD answer an average of four questions in about 40 seconds. Patients with MDD complete about seven additional questions in about 90 seconds to assess severity. Before integration, PHQ-2 screening was due every 12 months and completed by MAs in 55% of visits. The rate of positive screens was only 1% and 10% of positive screens were not communicated to physicians. Using user-centered design, we gathered stakeholder feedback to create a new workflow. For patients screening positive, CAT screening reflexed into a severity assessment and trigger mandatory physician alerts with clinical decision support. Screening remained an MA responsibility. Then we used continuous quality improvement to troubleshoot issues and improve workflow.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Number and rate of screens, change in rate of positive screens, satisfaction

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between 2/2019 and 12/2019, 6541 screenings were completed and 7% of patients screened positive for depression. However, because the new process required more steps and clicks (e.g., ordering and clicking on link), screening rates decreased to 38% of visits. In 6/2019, we surveyed clinical staff (response rate 63%, N=36/57). All MAs who responded (4/6) said they knew how to order the CAT and were confident administering the CAT; only 1 said they did not have time to do it. 73% (19/26) of attendings reported that the CAT was an acceptable tool and knew where to find results. Most attendings (17/26) were confident interpreting results and incorporating them into decision-making. About 58% (15/26) of attendings and 75% (3/4) of MAs were satisfied with CAT screening and agreed that the transition went smoothly.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Brief screeners for mental health conditions trade efficiency for sensitivity and lead to under-diagnosis. In contrast, computerized adaptive tests are efficient and more sensitive strategies for gathering patient-reported outcome data, which can be integrated into clinical practice and the EHR. Integration of novel EHR technology in clinical practice requires repeated trainings for physicians and staff in order to ensure the provision of high-quality care.

IMPLEMENTATION OF A HOME BLOOD PRESSURE TELEMONITORING PROGRAM TO IMPROVE HYPERTENSION CONTROL IN A PRIMARY CARE CLINIC

Kelsey B. Bryant[1]; Nadia Liyanage-Don[1]; Nathalie Moise[1]; Maria H. de Miguel[2]; Jessica R. Singer[2]; Hye Gi Shim[3]; William S. Fuller[4]; Charu

Gee[6]; Adina Bono[6]; Ian M. Kronish[5]. [1]Department of Medicine, Columbia University Medical Center, New York, NY; [2]Department of Medicine, New York Presbyterian Hospital - Columbia University Medical Center, New York, NY; [3]General Internal Medicine, Columbia University Medical Center, New York, NY; [4]Internal Medicine, Columbia University Vagelos College of Physicians and Surgeons, New York, NY; [5]Medicine, Columbia University Medical Center, New York, NY; [6]Innovation Team, New York Presbyterian Hospital, New York, NY. (Control ID #3376506)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hypertension (HTN) guidelines recommend home blood pressure (BP) monitoring and team-based care to optimize BP control, yet implementation is challenging.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Pilot the use of supported home BP monitoring among patients with uncontrolled HTN in a clinic without previous telemonitoring opportunity

2. Assess BP change in individuals enrolled in the program

3. Assess patient and provider satisfaction with program and adjust protocol based on ongoing feedback from all involved parties

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In partnership with the New York Presbyterian Hospital (NYP) Innovation Team, we developed a novel home BP telemonitoring program. Primary care patients with elevated office BP were referred at participating clinician's discretion. They must reside in New York State, and are capable of self-measuring their BP with or without the assistance of a caregiver. Patients are instructed to measure BP twice daily for the first week, followed by a minimum of three times per week for up to 6 months. Key components include: 1) providing eligible patients with home BP device paired with Samsung tablets that transmit data via cellular or WiFi networks to a web-based database accessible to clinicians; 2) nurse support for clinicians through day-to-day monitoring of home BP readings, reserving urgent notifications for dangerously elevated BP readings; 3) nurse support for patients through scheduled video-visits at which nurses provide feedback on BP readings and education about HTN, including lifestyle modification and 4) biweekly meetings among referring clinicians, innovation team, and nurse representatives to discuss program workflow and opportunities for improvement.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Mean BPs are reported to clinicians each week. Paired t-tests will be run to assess statistically significant changes in mean BP from the start of the program to a future point, week 9 in the current analysis. In the future, we plan to compare BP changes with a non-randomized control group with propensity score matching as well as analyze process data including frequency of regimen intensification, impact on patient adherence, and patient and provider satisfaction with the program.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since program launch in July 2019, 93 patients were referred and 80 initiated the program. At the time of analysis, 40 patients had 9 weeks of program participation. Seventy percent were female and mean age was 68 years (SD 11). Mean home BP at week 1 was 143/83 mmHg (SD 18/12) compared to 132/79 (SD 14/10) at week 9 (95% CL for SBP 4.8-16.3 mmHg, $p<0.001$). Mean number of home BP readings in week 1 was 6 (SD 3) compared to 9 (SD 5) in week 9 ($P<0.001$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Invited clinicians were enthusiastic to participate and received positive feedback from patients at follow-up

2. Decrease in BP observed at 9 weeks suggest promising early pilot results, and future comparison to control group will confirm this trend

3. Initial concerns about excessive provider notification for elevated BP readings were resolved once the threshold for urgent phone calls was increased

IMPLEMENTATION OF A LOW-COST PROGRAM FOR MEDICAL SCRIBES IN A LARGE PUBLIC HEALTH CARE SYSTEM

Jeremy O'Connor[1]; Mark Baehser[2]; Michelle Lam[3]; Andrew B. Wallach[1]; Theodore G. Long[1]. [1]Ambulatory Care, NYC Health + Hospitals, New York, NY; [2]Gotham Health / Judson Health Center, NYC Health + Hospitals, New York, NY; [3]Elmhurst Hospital, NYC Health + Hospitals, Queens, NY. (Control ID #3391410)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Although medical scribes can increase clinic efficiency and decrease levels of burnout, the implementation of medical scribes programs is associated with high costs that limit their use.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify and recruit volunteers from the community to be trained as medical scribes

2. Develop a training curriculum to prepare the volunteers to document in the medical record

3. Assess the feasibility of and satisfaction with the early implementation of the program

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : NYC Health + Hospitals is the largest public health system in the United States, with more than 11 acute care hospitals and 70 community based health centers in New York City. Within this system, we sought to design and implement a medical scribes program at low or no cost. We developed our own training curriculum, which included both didactics and electronic medical record practice. The setting for the pilot phase of the program was five primary care clinics. We chose the clinics because of their readiness for the program and the diversity of their practice sizes, ranging from 7 to 24 full-time clinicians in each practice. We planned to measure the success of the program using surveys, interviews, and clinic efficiency metrics.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Numbers of volunteers who completed the program for training as scribes

2. Satisfaction with the training program among scribes

3. Satisfaction with the scribes program among physicians and nurse practitioners

4. Changes in clinic efficiency metrics – including patient cycle time and time spent on documentation – before and after the start of the program

5. Changes in levels of clinician burnout before and after the start of the program

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We recruited 19 community volunteers to complete our training curriculum and to work as a medical scribe. All of the volunteers were college undergraduate or postgraduate students in New York City. The feedback from the training was positive, with survey responses ($n = 12$, response rate = 0.63) showing that 100% of the volunteers thought the training was very informative or somewhat informative. In a survey of supervising providers ($n = 9$, response rate = 0.50), 100% of the respondents expected the volunteer scribes to have a very positive or positive impact on work satisfaction and interactions with patients. In response to semi-structured interviews, supervising providers

reported the scribes to be doing work that was meaningful and helpful to their clinical practice.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. It is feasible to recruit and train emerging adults to volunteer as medical scribes

2. The early work of the scribes is associated with high levels of satisfaction among supervising physicians and nurse practitioners

3. Large public health systems with limited budgets can address concerns about clinic efficiency and burnout by designing internal programs for medical scribes

IMPLEMENTATION OF AN ELECTRONIC AUTO-REFERRAL PROGRAM TO IMPROVE LUNG CANCER SCREENING

Deven Patel[1]; Andrea Levchuk[2]; Jimmy Dang[2]; Meghan Ramsey[3]; Natalie Lui[1]; Anuradha Phadke[4]. [1]Cardiothoracic Surgery, Stanford University, Stanford, CA; [2]Primary Care and Population Health, Stanford University, Stanford, CA; [3]Medicine-Pulmonary Critical Care, Stanford University, Stanford, CA; [4]Medicine, Stanford University School if Medicine, Palo Alto, CA. (Control ID #3389599)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Rates of lung cancer screening with low-dose computed tomography are low nationwide, despite convincing evidence of a survival benefit.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Increase the rate of lung cancer screening in eligible patients.

2) Pilot a process of bulk referral and direct patient outreach (auto-referral) to a comprehensive lung cancer screening program.

3) Qualitatively assess the patient perspectives on the pilot process.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We identified patients within an academic primary care clinic who were older than 55 years and current smokers as documented in the electronic medical record (EMR). They were sent a message through the electronic medical record (EMR) patient portal that they may be eligible for lung cancer screening and they have been automatically referred to our comprehensive lung cancer screening program. Patients were then contacted by phone to assess eligibility, and if eligible, to schedule an appointment for lung cancer screening. Patients who declined screening were contacted later to complete a phone survey to assess barriers to lung cancer screening.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The goal of the pilot was to implement an auto-referral program through the EMR patient portal and to evaluate the effectiveness of this novel approach. We also wanted to assess patient perspectives on barriers to lung cancer screening and our pilot process.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Thirteen patients were included in the pilot auto-referral program and were sent a message through the EMR. 8 of the 13 patients were digitally identified to have read our auto-referral message. Ultimately, 2 of the 13 individuals enrolled in our comprehensive lung cancer screening program, 1 was confirmed ineligible, 7 declined screening, and 3 were not able to be reached. On follow-up phone survey, patients who declined screening said the reasons were existing medical comorbidities, logistics of making the appointment for screening, desire to speak with their provider for more information, and not believing the need for screening.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The auto-referral program affords healthcare networks a scalable approach to improve lung cancer screening enrollment. It augments standard PCP processes for referral and sends information directly to high-risk patients who may not be aware of screening. Limitations to our process included lack of complete smoking history within the electronic medical record, dependence on the use of the EMR patient portal, and small sample size. Our experience with the pilot auto-referral program presents a new strategy, but also highlights the difficulties, in increasing rates of lung cancer screening.

IMPLEMENTATION OF A SOCIAL DETERMINANTS OF HEALTH SCREENING AND REFERRAL PROCESS AT A FEDERALLY QUALIFIED HEALTH CENTER

Jennifer Norton[2]; Iman Sharif[1]; Judd H. Anderman[3]; Isaac Dapkins[4]. [1]Pediatrics, NYU Langone, Brooklyn, NY; [2]Population Health, NYU Langone Health, New York, NY; [3]Quality Improvement, Family Health Centers at NYU Langone, Brooklyn, NY; [4]Family Health Centers at NYU Langone, NYU, Brooklyn, NY. (Control ID #3391589)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Does a screening and referral process for social determinants of health (SDH) improve patients' connection to resources?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In this pilot study we sought to evaluate the impact of SDH screening on patient connection and satisfaction with the referral process.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : New patients attending a federally qualified health center (FQHC) are interviewed by a nurse at intake to assess for social needs using the OCHIN tool, which is integrated into the electronic medical record (Epic). Certain responses trigger an alert to the treating provider to make a referral to the FQHC's Family Support Services (FSS) program. FSS staff then contact the patient by phone to discuss social needs and help direct patients to resources. Referral outcomes are now recorded in Epic. The clinic population is largely Spanish-speaking and lower-income. We conducted a pilot study to assess the impact the screening and referral process had on patients' connection to resources and satisfaction with the process using a combination of documentation in Epic and interviews with patients conducted two to four months after the initial clinic visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We examined documented connection to resources and self-reported patient satisfaction with the screening and referral process.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Preliminary data include 53 patients identified with at least one social need who were referred to FSS between Nov 2018-May 2019. Of all participants, mean age was 40.7 years; 53% were female; 89% were Hispanic/Latino and 77% were Spanish-speaking. Of 16 needs eligible for FSS referal, most patients had more than one social need (median=3 needs). Referral order and referral outcomes were not always documented in Epic, although this improved with time. Of the 53 patients, 5 were missing a documented referral order in Epic and 17 were missing a documented referral outcome in Epic. Based on Epic documentation, 17 patients were attempted to be contacted by FSS but staff were unable to reach them and could not leave a message; 9 patients were reached but declined services or said they were not needed; 3 patients were left a voicemail; 5 patients made an appointment to meet

with FSS; 2 patients met with FSS or received a referral to another community resource. A total of 27 patients completed a follow-up interview. Most indicated that they had not received a phone call. However, many participants indicated that they liked the screening process and being asked questions related to social needs.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Even with a robust Family Support Services program in place, it is difficult for staff and patients to connect and not all patients with a social need identified through a screening tool will want assistance. We are doing additional work to understand the best ways to connect patients to resources.

IMPLEMENTATION OF BREAST CANCER SCREENING SHARED DECISION MAKING USING AN EHR-BASED DECISION AID

Brooke Herndon[1,2]; Shoshana Hort[3,2]. [1]General Internal Medicine, Dartmouth-HItchcock Medical Center, Lebanon, NH; [2]Department of Medicine, Geisel School of Medicine, Hanover, NH; [3]General Internal Medicine, Dartmouth Hitchcock Medical Center, Lebanon, NH. (Control ID #3390759)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Providers and patients in the U.S. face at least four different professional society guidelines for breast cancer screening, and many have suggested that shared decision-making may be the best approach to address this dilemma.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To support providers and patients in shared decision making for breast cancer screening by integrating a decision aid (Health Decisions) into the EHR

To align care with patients' breast cancer screening preferences by capturing their chosen screening schedule in the EHR

To harmonize patients communications (reminder and result letters) with their chosen screening strategy

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Due to variation in US professional society guidelines, patients may receive different guidance on breast cancer screening depending on the provider they see. To improve patient experience, Dartmouth Hitchcock's (DH) Knowledge Management Unit and Clinical Practice Committee endorsed organizational guidelines recommending a) risk assessment for women 25 and older to identify those at above average risk, and b) shared decision making for women 40 and older to support women in selecting the screening strategy aligned with their goals and values. In November 2018, DH installed a breast cancer screening decision aid (HealthDecisions^{TM}) in the electronic health record (Epic). We then programmed the health maintenance function of the EHR with a menu of screening choices that can be set manually to capture patient's screening decisions. These changes were implemented in the ambulatory setting at all DHH primary care campuses.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our goal was to measure the penetration of breast cancer shared decision into DH primary care practices from the launch of the decision aid in November 2018 through December 2019. We used any manual re-set of a patient's breast cancer screening schedule as a proxy for completion of shared decision-making. We also calculated the frequency of manual re-sets according to provider characteristics (gender, medical specialty, and practice location). Our secondary outcome was the proportion of women who chose annual v. biennial screening according to patient age.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): DH primary care providers actively chose a breast cancer screening strategy for 6,708 patients over 14 months. The proportion of patients choosing annual vs. biennial screening varied by provider gender (63% v. 53% for male v. female), specialty (64% v. 59% for Family Medicine v. Internal Medicine), and practice location (range 64% to 43%). Fifty-six percent of women age 40-49 years elected annual screening v. 63% of women ages 60-64 and 65-74 years.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): When provided with a high quality decision aid embedded in the electronic health record, provider and patient uptake of shared decision making for breast cancer screening is high. However, the screening strategy selected by patients may vary systematically according to provider gender, discipline, and practice location.

IMPLEMENTATION OF DAILY SAFETY HUDDLES TO REDUCE HARM EVENTS AT A SAFETY NET HOSPITAL

David J. Chung, Kira Watson, Charles E. Coffey, Allison Luu, Laura Sarff. Hospital Administration, LAC+USC Medical Center, Los Angeles, CA. (Control ID #3391375)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The Hospital's rates of catheter associated urinary tract infections (CAUTIs), central line associated blood stream infections (CLABSIs), and hospital acquired pressure injuries (HAPIs) were above the national average.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Decrease the total event rate of CAUTIs, CLABSIs, and HAPIs on an inpatient med-surg unit from 0.9 per month to 0.5 per month by using unit safety huddles.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The unit safety huddle (USH) was first piloted on a thirty-two bed medical-surgical unit. The huddles occur daily and are led by frontline nurses and attended by unit nursing staff, nurse leadership, hospital administration, and physicians. Using a standardized script, the huddle facilitator helps the staff identify patients at risk of harm and discusses interventions to keep patients safe. To augment the huddles, an existing white board was repurposed to visually identify patients at risk of CAUTIs, CLABSIs, and HAPIs by using differed colored magnets. After creating colored magnets to represent risk of harm events, the staff further tailored their board to highlight additional risks important to their respective unit (E.g., Patient mobility status).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of harm events that occurred before and after the launch of the USH and huddle boards were tracked and converted to harm events per month. Success was defined as decreasing the rate of harm events from a baseline of 0.9 events per month to 0.5 events per month.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Following the implementation of the USH, the pilot unit saw a marked reduction in the total number of CAUTIs, CLABSIs, and HAPIs, and the rate of harm events dropped to 0.45 per month. Given the success of the USH, it was recently spread to several other units. More time is needed to see the impact of the USH on these additional units.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The daily focus of the USH on preventing harm events continuously reinforced key preventative strategies and interventions. The multidsiciplinary attendance at the USH promoted a culture of teamwork, communication, and transparency. Having leadership and administration at the huddles demonstrated strong institutional support for the initiative and ensured that frontline staff were equipped with what they needed to succeed (E.g. supplies, clear lines of communication with medical teams, staffing).

IMPLEMENTATION OF POST-ACUTE REHABILITATION AT HOME: A SKILLED NURSING FACILITY-SUBSTITUTIVE MODEL

Matthew R. Augustine[2,6]; Claire Davenport[1]; Katherine Ornstein[1]; Mitchell Cuan[1]; Pamela Saenger[1]; Sara Lubetsky[1]; Alex Federman[2,1]; Linda DeCherrie[3,2]; Bruce leff[4]; Albert L. Siu[5]. [1]Geriatrics & Palliative Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [2]Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [3]Geriatrics, Icahn School of Medicine at Mount Sinai, New York, NY; [4]Geriatrics, Johns Hopkins University School of Medicine, Baltimore, MD; [5] Geriatrics and Palliative Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [6]Geriatrics Research Education and Clinical Center, James J Peters VA Medical Center, New York, NY. (Control ID #3374431)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): For patients who require frequent and intensive therapy services after hospitalization, delivering post-acute rehabilitation in patients' homes offers a potential alternative to care in skilled nursing facilities (SNF).

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To deliver SNF-level post-acute rehabilitation and transitional care within the home.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Rehabilitation-at-Home (RaH) program was a 30-day bundle of post-acute rehabilitation and transitional care delivered within the home from October 2015 to September 2017. The program included a multidisciplinary home-based team of providers, including physicians, physical, occupational and speech therapists, and social workers. Participants were eligible if they were 18 years or older, resided in Manhattan, NY, and qualified for SNF-based rehabilitation services. Patients were admitted from home, the Emergency Department, and inpatient observational, medical and surgical units. The 30-day bundle included an "active" phase of home- based medical and rehabilitation services followed by a "plus" phase of transitional care.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We abstracted demographic data, characteristics of hospitalization or acute care, participant functional mobility, and characteristics of RaH treatment through chart review. Seven providers and investigators (6 physicians, 1 physical therapist) reviewed RaH notes from medical providers and therapists to identify functional mobility, goal achievement, and barriers to care and judge global functional improvement. To identify factors associated with greater functional improvement, we used multivariable logistic regression with the binary outcome of considerable vs. moderate/slight/no global functional improvement.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 237 patients participated in RaH over 264 episodes of care. Participants were predominantly over the age of 85 (57%; mean 84.2, SD 10.0 years) and of non-Hispanic white (70%) race and ethnicity. The majority were admitted after hospitalization (88.2%) for conditions representing 117 different diagnostic related groups. Average length of stay in RaH was 14.2 (SD 6.5) days with patients receiving 1.83 (SD 2.22) medical provider, 1.67 (SD 1.58) nursing, and 5.24 (SD 1.05) physical therapist visits weekly. The majority of patients fully or almost fully met their goals for bed mobility (65%), bed transfer (69%), chair transfer (67%), and ambulation (64%) with the majority achieving moderate or considerable (61%) global functional improvement. Achieving moderate or considerable global improvement was negatively associated with dementia diagnosis (OR 0.30, 95% CI 0.10-0.88) and positively associated with higher baseline ambulation (OR 4.74, 95% CI 1.95-11.51). At 30 days, 87.3% of participants were living within the community.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Delivering SNF-level post-acute rehabilitation care in patients' homes for a broad range of diagnoses was feasible, and most participants achieved moderate or considerable functional improvement. This approach may help older adults maintain living status in the community.

IMPLEMENTATION OF PRIMARY CARE BASED TREATMENT OF OPIOID USE DISORDER USING THE COLLABORATIVE CARE MODEL

Charles D. Brackett. GIM, Dartmouth-Hitchcock Medical Center, Lebanon, NH. (Control ID #3391108)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Treatment of opioid use disorder (OUD) is highly effective, but access is limited and care is often fragmented.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our primary goal was to add treatment of opioid use disorder with buprenorphine to an ongoing project implementing the Collaborative Care Model of behavioral health integration into primary care at several clinic sites. We sought to improve access to treatment, and to address psychiatric and physical co-morbidities in a holistic, efficient, and non-stigmatizing way.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The collaborative care model, which traditionally has focused on depression and anxiety, adds a behavioral health clinician (BHC, LICSW), supervised by a consulting psychiatrist, to the primary care team and utilizes a registry to proactively track patients. Workflows were developed to include care of patients with OUD by alternating visits between the waivered primary care provider (PCP) and the BHC. These visits are supported by a medical assistant, who collects urine for drug screening, queries the Prescription Drug Monitoring Program, administers the Brief Addiction Monitor questionnaire, and cues buprenorphine prescription refills. An infrastructure of necessary documents, note templates, electronic health record (EHR) tools was developed. Implementation teams are supported by regular meetings with core project staff, and clinician decision making is supported by a locally developed guideline, EHR based e-consults, and a monthly learning collaborative.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our main measure of reach was number of patients initiated on buprenorphine per month, and our main measure of quality was 90 day treatment retention. A pre-implementation staff questionnaire was done to assess attitudes and

barriers, and will be followed by a post-implementation questionnaire. We tracked number of PCPs waivered to prescribe, and number of PCPs prescribing buprenorphine to one or more and five or more patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At the beginning of the intervention, <20% of PCPs were waivered. The majority of those had not prescribed yet, and were unwilling to do so without the availability of in-clinic behavioral support. Over the implementation period, the number of waivered PCPs quadrupled (11 to 46). The number of PCPs prescribing buprenorphine for 5 or more patients in the past year rose from 2 to 18. The number of patients initiated on buprenorphine rose to 8-11/month. 90 day treatment retention was 65% in the most recent quarter.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Both OUD and buprenorphine are associated with stigma and misunderstanding that must be overcome at the all-staff level; this takes time, and can be done explicitly through training and implicitly through positive experiences of early adopters. Other barriers to primary care based treatment include limited clinician access and under recognition of OUD. Although medical treatment of OUD is relatively straightforward, the behavioral and monitoring needs are best met by a team approach. Medical and psychiatric comorbidities are common, and are best addressed through an integrated approach.

IMPLEMENTING LOW-THRESHOLD ACCESS TO MEDICATION FOR OPIOID USE DISORDER IN A NON-URBAN SETTING: EXPERIENCES FROM REACH MEDICAL.

Judith L. Griffin. REACH Medical, Ithaca, NY. (Control ID #3389292)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Access to high quality, evidence- based healthcare services for people who use drugs (PWUD), including medication for opioid use disorder (MOUD) and harm reduction services, is very limited non-urban and rural areas.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The primary objective of REACH was to expand access to high quality, compassionate and equitable healthcare in our community, especially for PWUD and those who traditionally face stigma and discrimination accessing healthcare. Additionally, we sought to transform the healthcare delivery model for PWUD to actively reduce stigma and increase patient engagement. Finally, we aimed to create and retain a healthcare workforce that is dedicated to providing low threshold care in a harm reduction framework.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : REACH—an acronym for Respectful, Equitable Access to Compassionate Healthcare—is an independent medical practice in Ithaca, NY that opened in February 2018. REACH offers integrated outpatient care including MOUD, primary care, behavioral health services, PrEP and testing and treatment for Hepatitis C and HIV at a single location. REACH contracts with local medical providers to maximize the number of available buprenorphine slots offered in a novel approach to expand MOUD access.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patient engagement as measured by enrollment and retention in care are key measures of success. Additionally, testing and treatment for Hepatitis C is an important measures of success in terms of providing comprehensive care to our patients (primarily, but not exclusively, PWUD). The number of new waivered providers in the community and their ongoing provision of MOUD are also measures of interest. Finally, outcome measures like the number of overdose deaths in our community are critical to measuring success.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since opening REACH has seen nearly 1,500 unique patients, with over 1,000 receiving MOUD. The retention rate is approximately 80% for patients receiving MOUD. Over 80 patients currently are engaged in or have received treatment for Hepatitis C and over 1200 naloxone kits have been distributed. In its first 12 months, REACH successfully assisted 10 new providers in obtaining their DATA-waiver and onboarded these providers, thereby increasing access to MOUD significantly in the community. Ten providers continue to work at REACH. Specialties include internal medicine, family medicine and emergency medicine.

Between 2017 and 2018 the number of overdose deaths in Tompkins County dropped 19% from 22 to 18. Though we are not able to draw a directly causal link, given that REACH opened in February 2018, this may be early evidence of impact.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patient and provider engagement are high in a low-threshold, low-stigma practice environment offering compassionate, evidence-based care. MOUD visits serve as an opportunity to deliver other healthcare services, including primary care or treatment for Hepatitis C, to PWUD. Contracting providers who work in other settings in the community to prescribe MOUD may reduce barriers and facilitate expansion of MOUD in underserved areas.

IMPLEMENTING TRANSITIONAL CARE MANAGEMENT SERVICES IN A LARGE ACADEMIC OUTPATIENT PRACTICE

Andrew Silapaswan[1]; Niloofar Latifi[2]; Jaya Kanduri[3]; Ryan Eid[4]; Robert N. Stuver[2]; Tara M. Skorupa[1]; Rebecca Glassman[5]; Kelly L. Graham[2]. [1]Internal Medicine, Beth Israel Deaconess Medical Center, Boston, MA; [2]Medicine, Beth Israel Deaconess Medical Center, Boston, MA; [3]Internal Medicine, Beth Israel Deaconess Medical Center, Boston, NJ; [4]internal Medicine, Beth Israel Deaconess Medical Center, Brookline, MA; [5]General Medicine/Primary Care, Beth Israel Deaconess Medical Center, Boston, MA. (Control ID #3390658)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can implementation of Medicare's Transitional Care Management (TCM) services in a large academic outpatient practice reduce medication errors, readmissions, and mortality?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The Centers for Medicare and Medicaid Services introduced TCM services in 2013, which provide financial reimbursement for Medicare patients discharged from inpatient hospital settings to home. TCM services are designed to identify acute issues in Medicare patients within 48 hours after discharge, ensure timely outpatient follow-up within 7-14 days, and improve transitions in care.

Intervention objectives:

1. Implement a standardized TCM protocol in an academic hospital-based primary care clinic

2. Operationalize a multi-disciplinary team approach that includes community resource specialists (CRS) and pharmacists

3. Reduce medication errors, readmissions, and mortality among Medicare patients receiving TCM services

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Healthcare Associates is a large academic hospital-based primary care

clinic. We have operationalized TCM services to include a multidisciplinary team. We have measured both process and outcome measures. Outcome measures will be analyzed among 3 patient populations: 1) Medicare discharges who do not receive any TCM services; 2) Medicare discharges who receive a TCM phone call and an office-based follow-up visit; 3) Medicare discharges who receive a TCM phone call and a follow-up home visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): To assess the impact of our intervention, outcome measures include the average time to follow-up visit (days), post-discharge visit keep rate, percentage of patients with medication errors identified during the TCM phone call, and 30-day readmission rates in the intervention and control groups. We will also measure the percentage of patients referred to CRS and clinical pharmacists in the intervention arms receiving a post-discharge TCM phone call.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among Medicare discharges who received a TCM phone call (n=19), 80.0% had an office-based follow-up visit scheduled within 14 days after discharge. 55.0% of patients were scheduled with their own PCP and the average time to follow-up visit after discharge was 8.3 days ± 4.8. 76.4% of patients kept their scheduled appointment. 75% had at least 1 medication error identified during the TCM phone call and 55% were subsequently referred to a pharmacist for further investigation of medication errors. 10.0% of patients were referred for CRS evaluation. Data will continue to be collected and compared between the intervention and control arms through March 2020.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our pilot demonstrates feasibility in implementing TCM services in a large academic outpatient practice. A multi-disciplinary team approach that includes CRS and pharmacists can help identify other transitional care issues related to home services, transportation, health literacy, and other key social determinants of health. Assessing practice resources will help determine feasibility in implementing TCM services at other institutions.

IMPROVING ACCESS TO CARE FOR VETERANS THROUGH SAME-DAY VIDEO APPOINTMENTS TO HOME

Elizabeth Marshall[1]; William Smith[1]; Amy D. Lu[2]. [1]General Medicine, San Francisco Veterans Affairs, San Francisco, CA; [2]Geriatrics, San Francisco VA Medical Center, San Francisco, CA. (Control ID #3392311)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Many Veterans lack access to timely primary care within the VA due to geographic barriers and local clinic staffing shortages, resulting in poor veteran and staff satisfaction and, when accessed, non-VA care disconnected from individual health histories and VA benefits.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

Provide same-day access visits via video for complaints evaluated in primary care clinic

Demonstrate that video-to-home visits can resolve majority of patient health concerns with high rates of staff and veteran satisfaction

Describe complaints addressed, visit success rates and demographics veterans served

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The VISN 21 Clinical Resource Hub (CRH) Open Access Program (OAP) was started in late 2018 to provide same day access to primary and urgent care services via telemedicine to veterans living in predominantly rural areas of Northern California. Among non-metropolitan Veterans, 18% drive >1 hour and over one quarter of the most rural Vets drive > 2 hours for primary care (West 2010). Rurality is associated with higher rates of disease and poverty (Moy 2017). While the OAP improved access to VA care, it did not address travel time. Thus in late 2019 we initiated the Video-to-Home pilot. The pilot consisted of video-to-home (VVC) visits offered M-F and up to 7pm and aligned with the VA directive of using telehealth to "[improve] convenience by providing access to care from their homes when they need it."

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): >90% of concerns addressed same day

>90% of concerns resolved measured by rate of in-person follow up < 72 hours

>90% VVC success rate

Concerns, age and rural status similar those addressed in local clinics

Positive qualitative feedback from veterans and staff

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 98 of 106 (92%) visits were conducted the same day requested with majority of next day visits due to vet preference

96 of 106 appointments (91%) resolved the veteran's concerns; 4 were directed to in-person care by the provider

4% of VVC visits were unsuccessful. Failure was due to technology problems or user difficulty with the technology.

Complaints were similar to national data (proxy): MSK (n=29), derm (n =13), GU (n = 14), HEENT (n=12), GI (n =10), resp (n=7), misc. (n=5), ophtho (n=3), neuro (n=1) and dental (n=1)

52 of 106 VVC visits were vets > 55 y/o (48%), 10 vets were > 75 y/o (10%). Majority lived in rural (90%), highly rural (6%) and urban (6%) areas.

Veteran & local staff satisfaction was persistently and overall very positive.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Appointment timing: Mid- afternoon appointment times were most popular due to greater walk-in volume in PM, ease of other options in AM, and veteran preference.

Few (5%) of visits were unable to be completed in a video-to-home format, supporting the reliability of this method.

Our findings suggest significant adoption of video-to-home visits by veterans > 55 years old.

Aside from procedures, nearly all health concerns appropriate for general medicine clinic can be addressed with VVC

A faculty champion is critical to early and consistent success of such a program to provide training and encourage utilization.

IMPROVING GLYCEMIC CONTROL FOR PATIENTS WITH POORLY-CONTROLLED TYPE 2 DIABETES MELLITUS WITH POINT-OF-CARE HEMOGLOBIN A1C TESTING

Alexandra Hashemi[1]; Travis Howlette[1]; Charlotte Ezratty[2]; Katherine Small[1]. [1]Medicine, Mount Sinai, New York, NY; [2]Student, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3388585)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can point-of-care (POC) hemoglobin a1c (A1c) testing performed at the time of clinic visit lead to improvements in glycemic control

in type 2 diabetes mellitus (T2DM) patients <75 years old with A1c values ≥ 9% by facilitating timely intervention at the visit?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve rates of timely interventions aimed at improving glycemic control, specifically adjustment of current medications, addition of new medications, and referral to a certified diabetes educator (CDE).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Starting with our first Plan-Do-Study-Act (PDSA) cycle, we educated internal medicine attendings, residents, nurse practitioners, medical assistants, and nurses at the residency continuity practice of an urban tertiary care hospital about the initiative to standardize POC testing for T2DM patients <75 years with A1c values ≥ 9%. Providers received weekly care-gap reports which identified patients with upcoming visits and existing A1c values ≥ 9%. Clinicians provided medical assistants and nurses with this list and pended orders for POC A1Cs which were then performed by medical assistants and nurses while they were obtaining vital signs. The POC A1c results were available to providers at the start of the visit and used to make interventions at the time of the visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome is rate of interventions ordered at the time of visit. Interventions included medication addition, dose adjustment, or referral to a CDE. Process measures include appropriate use of POC A1c testing (i.e. for patients <75 years of age with previous-to-visit A1c value ≥ 9%).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The electronic medical record tool identified 118 T2DM patients <75 years old with A1c ≥ 9% due for A1c testing (>70 days since last A1c) who were seen between 3/1/2019-6/30/2019. Seventy-four (63%) received POC A1c tests. Of the patients who received POC A1c tests, 76% received an intervention at time of visit. In contrast, only 27% of patients who had a serum A1c drawn (whose results were only available after the visit) had an intervention ordered ($p<0.0001$). Patients who were prescribed a new medication were more likely to have received a POC A1c than serum A1c (93% vs 7%, $p<0.05$). Patients who were referred to CDEs were more likely to have received a POC A1c than a serum A1c (92% vs. 8%, $p<0.05$). Patients who were prescribed an increase in medication dose were more likely to have higher A1c levels at the time of visit (10.8 vs. 10.0, $p<0.05$).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): POC A1c testing led to significant increases in rates of interventions for patients with poorly controlled T2DM, specifically medication adjustment/addition and referral to CDEs. POC A1c testing can be used to improve timely interventions as described which is critical for optimizing glycemic control and improving overall diabetes care. Further research will assess whether POC A1c testing results in decreased A1c results at the subsequent visit.

IMPROVING MEDICATION SAFETY AT TRANSITION TO A SKILLED NURSING FACILITY THROUGH A STRUCTURED DISCHARGE HUDDLE

Amber Inofuentes[1]; Jessica Dreicer[1]; Alexander Levit[1]; Katherine L. Coffey-Vega[2]; Paul Helgerson[1]; Bethany Delk[3]; Christa T. Brooker[4]; Evelyn Nicholson[1]. [1]Department of Medicine, University of Virginia, Charlottesville, VA; [2]Department of Medicine, University of Virginia, Charlottesville, VA; [3]Pharmacy, University of Virginia Medical Center, Charlottesville, VA; [4]Pharmacy, University of Virginia Health, Charlottesville, VA. (Control ID #3392194)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In a needs assessment study of all discharges from three general medicine units to skilled nursing facilities (SNFs), 57% of discharge (DC) summaries contained a medication discrepancy, increasing the risk for serious adverse events at care transition.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To decrease the frequency of medication discrepancies for patients discharged to SNFs.

2. To reduce the severity of potential medication errors for patients discharged to SNFs

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In fall 2019, a needs assessment study was conducted to determine the prevalence of medication errors at discharge to SNF from three general medicine units of a 600-bed academic hospital. The four-week study revealed a 57% mismatch rate between medications embedded in the narrative compared to the medication list at the end of the summary. Errors often involved high risk medications such as antibiotics, anticoagulants, insulin, antiarrhythmics and diuretics. A multidisciplinary team began a structured process improvement effort to address this problem. Given the severity and frequency of errors, the team immediately implemented a DC huddle consisting of nurse-physician review of the DC summary for internal consistency, accuracy, and completeness. Residents, hospitalists and nurses were educated to the process through email, unit huddles, and structured team meetings. Units utilized visual management boards to track process fidelity and capture near misses (medication errors caught prior to discharge) in real time.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Beginning one week after huddle implementation, DC summaries sent to SNFs were reviewed to determine presence and severity of errors (scored using the Agency for Healthcare Research and Quality's classification system). Adherence to huddle process and near misses were also tracked.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In a six-week period following huddle initiation, the absolute error rate decreased from 57% (n=52) to 41% (n=79). Of errors found, those prior to implementation were much more severe including two category I (risk of patient death), one category H (potential for requiring intervention to sustain life) and one category G (risk of permanent harm) and only 17% were category C (unlikely to cause harm). In one case, a patient discharged after an intracranial hemorrhage had orders to continue anti-platelet agents and in another, both an intravenous antibiotic and anticoagulant were omitted. Post-intervention, nearly 50% of errors detected were category C and there were no category G, H, or I errors. Notably, the huddle intervention had excellent penetrance, occurring prior to discharge 93% of the time, resulting in 53 near misses.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The high prevalence of medication errors on transition to SNFs has been documented in the literature, a finding confirmed at our institution. These errors can cause significant harm in a medically fragile population. Our initiative demonstrates that a brief medication safety huddle at discharge can significantly reduce the severity and frequency of medication errors due to internal inconsistency in DC documentation.

IMPROVING REGIONWIDE BLOOD PRESSURE CONTROL AMONG DISADVANTAGED PATIENTS SEEN IN PRIMARY CARE CLINICS

Shari Bolen[1,2]; Douglas Einstadter[1,2]; Thomas E. Love[3,1]; Jonathan Lever[4]; Chris Hebert[5]; Randall D. Cebul[3]. [1]Center for Health Care Research and Policy, Case Western Reserve University at The MetroHealth System,

Cleveland, OH; [2]Better Health Partnership, Cleveland, OH; [3]Medicine, Pop & Quant Health Sciences, Case Western Reserve University, Cleveland, OH; [4]Better Health Partnership, Better Health Partnership, Cleveland, OH; [5]Mercy Health, Cincinnati, OH. (Control ID #3391660)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hypertension has been poorly controlled in the U.S. over many years, especially among disadvantaged patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To improve regionwide blood pressure (BP) control in patients cared for by 614 primary care providers in 7 Northeast Ohio urban health care systems at 35 clinics over five years (2013-17).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We used a positive deviance approach where Better Health Partnership (BHP), a regional non-profit health improvement collaborative, identified and disseminated a hypertension best practice including: 1) accurate/repeat BP measurements; 2) timely follow-up; 3) patient outreach; 4) a treatment algorithm; and 5) a communication curriculum. BHP approached 16 lower performing clinics to offer monthly practice coaching to implement the hypertension best practice (High intensity approach); 15 clinics approached BHP for consultation with clinic leaders around implementation (Moderate intensity approach), and 4 clinics solely attended BHP Learning Collaboratives where the best practices were disseminated (Low intensity approach). In the high intensity group, BHP staff resources were enhanced by federal and state grant funding.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Electronic health record data of hypertensive adult patients (ages 18+) at each practice were reported to BHP every six months for the last 12-month reporting period between 2013 and 2017, stratified by race/ethnicity, preferred language, and estimated income and education. Sample sizes varied between reports, but were around 115,000 individuals. Weighting by practice size, we estimated BP control changes for each intensity level in regression models.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): BP control (BP < 140/90 mm Hg) improved from 67% to 74% from 2013 to 2017 overall and across all socio- demographic and insurance categories. Higher levels of implementation intensity were associated with larger BP improvement. Our model-based estimates of improvement were 14.9 percentage points (95% CI 10.2, 19.5) in the high intensity clinics, 5.2 (0.8, 9.5) in moderate intensity clinics, and 0.2 (-3.9, 4.3) in low intensity clinics. Differences in BP control among disadvantaged patients uniformly declined from 2013-2017, including insurance types (larger improvements among uninsured and Medicaid patients compared with Commercial and Medicare patients), race and ethnicity (larger improvements in non-Hispanic Black and Hispanic patients compared with White patients), and income and education (largest improvements in the lowest groups).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In this regionwide investigation of approximately 115,000 patients with hypertension in urban Northeast Ohio, BP control improvements were remarkable. This study highlights a regional collaborative opportunity to improve BP, adopting a documented "positive deviance" approach, and benefiting patients most in clinics that were the most intense adopters.

INCORPORATING PATIENT FEEDBACK INTO HOSPITAL MEDICINE QUALITY IMPROVEMENT AND RESEARCH: THE ROLE OF A PATIENT & FAMILY ADVISORY COUNCIL (PFAC).

James D. Harrison, Rachel Weiss, Margaret Fang, Brad Sharpe. Division of Hospital Medicine, University of California San Francisco, San Francisco, CA. (Control ID #3390815)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Hospital Medicine quality improvement (QI) and research could benefit from incorporating the patient perspective to ensure a patient- centered approach. However, hospitalists rarely get the opportunity to directly engage patients with this work, so often struggle to effectively integrate patient insights.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To create and operationalize a Hospital Medicine Patient & Family Advisory Council (PFAC) that is accessible to hospitalists and fosters opportunities to incorporate patient perspectives into QI and research efforts.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We employed a consultative and collaborative approach using best practice tools and methodologies for patient engagement to create a Hospital Medicine PFAC. We recruited 16 PFAC members via a variety of methods during and after inpatient admissions. We developed a communication strategy to introduce hospitalists to the PFAC and how best to utilize it – including regular announcements in newsletters, presentations at faculty development events, and outreach to QI and research faculty. PFAC meetings are held monthly in the early evening ensuring they do not conflict with hospitalists' clinical work.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Descriptive qualitative summary of PFAC activities and quantitative survey results from 10 PFAC members and 11 presenters.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since September 2018, hospitalists have presented and solicited feedback on 15 different QI and research initiatives ranging from mobility, medications, and discharge materials to telehealth, librarian resources, and artificial intelligence. Positive experiences were reported by the 8 (73%) presenters who responded to our survey. The most common reasons for bringing a project to the PFAC were to determine how best to ensure project implementation was patient-centered (63%), to get input on patient-facing materials (67%) and to determine how relevant a project was to patients (50%). Presenters felt coming to the PFAC was valuable/extremely valuable (75%) with 100% stating they were satisfied/highly satisfied. All presenters (100%) obtained feedback that was new or unique. PFAC feedback changed many aspects of each initiative including updates to patient-facing materials, surveys and interview guides, and workflow improvements to promote sleep opportunity, interpreter use and telehealth. Feedback on grant applications has also been invaluable. Seventy percent of PFAC members responded to our survey with 86% strongly agreeing that each meeting was interesting, productive, valuable and a learning opportunity. All PFAC members agreed/strongly agreed that their opinions were listened to and valued.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The PFAC model facilitates critical interactions between patients, caregivers and hospitalists, helping to ensure that quality

improvement and research efforts seeking to advance the care and experiences of hospitalized adults are patient-centered from concept development through implementation and dissemination.

INCREASING ORDERING OF COLORECTAL CANCER SCREENING IN A PRIMARY CARE CLINIC OF A SAFETY NET HOSPITAL

Ahmed Gemei[1]; Steven Coffin[1]; Najla Abdurrahman[1]; Laura S. Chiu[1]; Juhee McDougal[2]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Medicine, Boston University Medical School, Boston, MA. (Control ID #3381919)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Current guidelines by USPSTF recommend CRC screening for asymptomatic adults ages 50-75, citing strong evidence of reduction in CRC mortality (the current national average screening rate is 65%); it has been noted that low socioeconomic status (SES) patients have lower screening rates which can partially be attributed to both patient and system level barriers.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Measure CRC screening rates ordered and completed at Boston Medical Center (BMC) in one adult primary care clinic which serves a high proportion of low SES patients

2. Test whether offering Fecal Immunochemical Tests (FIT) in addition to colonoscopy can improve ordering of colorectal cancer screening rates

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : BMC is an academic medical center and a safety net hospital serving a diverse population. Adult primary care is comprised of six suites, one of which is the Women's Health Clinic where only about a quarter of eligible patients were screened for CRC.

As a pilot trial in the Women's Health Clinic suite, medical assistants (MAs) were instructed to use the Best Practice Advisory (BPA) option embedded in the hospital's electronic health record (EHR) to identify patients overdue for CRC screening and pend FIT test orders prior to the provider seeing the patient. The MA would also place the FIT testing kit on the provider's desk when rooming the patient. Colonoscopy could be ordered instead of FIT based on the patient-provider discussion. Each month, rates of CRC screening were shared with both MAs and providers of the suite. Five months of data were reviewed for patient encounters who were overdue for CRC screening.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Monthly CRC screening rates, both ordered and completed, were compared amongst pre and post intervention clinic cohorts over a 5 month period for patient encounters who were overdue for CRC screening.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 652 patient encounters were reviewed from January 2019 through May 2019, with the intervention being in March (i). There were 458 patients, 97% of which identified as female, 56% were Black/African American, 22% were White, 2% were Asian, and 20% declined to disclose a race/ethnicity. For patients who were overdue for screening, combined (FIT + colonoscopy) order rates were 26% in January and 77% in May. Of those, colonoscopy orders declined from 73%, to 40%, while FIT orders rose from 27% to 60%. Colonoscopy order completion rates were 58%, 71%, 50% (i), 55%, and 49%, while FIT completion rates were 55%, 60%, 40% (i), 38%, and 34%. Ultimately, of patients who were due for screening completion rates of either colonoscopy or FIT rose from 15% to 31%, with colonoscopy showing better completion rates.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): CRC screening completion rates doubled on month five (31%) compared to month one (15%). MA utilization of the BPA tool in EHR combined with MA teaching was successful at increasing CRC screening rates ordered and completed in a busy safety net hospital clinic.

IN-SCRIBING CHANGE IN AN ACADEMIC RESIDENT CLINIC

Ting-Jia V. Lorigiano[2]; Maura J. McGuire[2]; Jihae V. Snyder[2]; Belle V. Liang[2]; Nicholas V. Rebbert[2]; Peter Chin[2]; Gail Berkenblit[1]. [1]GIM, Johns Hopkins, Baltimore, MD; [2]Medicine, Johns Hopkins School of Medicine, Baltimore, MD. (Control ID #3391408)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):

Given the challenges that medical residents face in the era of EHRs, can medical scribes improve resident satisfaction and panel management?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

1. Evaluate the effect of working with a scribe on resident satisfaction with documentation efficiency and quality as well as impact on the patient-physician interaction.

2. Determine if a scribe can enhance resident diagnosis capture to provide a more complete picture of panel case mix and health care needs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Residents were given access to a medical scribe for two weeks during their ambulatory urgent care rotations. At the end of this period, residents were surveyed regarding their perception of patient interactions, documentation efficiency and note quality. Diagnosis capture in the medical record was compared prior to the scribe pilot and during the scribe pilot.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

1. Resident surveys assessed resident documentation practices and used Likert scales to evaluate their perceptions of note quality, documentation efficiency and ability to interact with patients during the visits prior to and during the scribe pilot. Statistical analysis using the Mann Whitney U test were performed to identify significant changes.

2. A medical complexity factor (MCF) score available in the EHR was used as a proxy for diagnostic capture.

Clinic composite MCF scores over time were obtained from the EHR and analyzed by linear regression as well compared to the total MCF for the prior year.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Thirty eight residents participated in the scribe intervention and 19 (50%) completed the survey. At baseline, 26% of residents reported taking hand written notes during a visit while 74% reported typing notes during the visit. Although 79% rated themselves as highly proficient in the EHR, only 21% of residents completed notes during the visit. While working with a scribe, more residents reported being satisfied with efficiency of documentation (3.58 versus 2.68; p 0.05), the time spent on notes outside of visits (3.2 versus 2.74; p=0.06), and their ability to listen to patients (4.16 versus 2.89, p <0.05). Residents perceptions of note quality were unchanged while working with a scribe versus usual practice (3.53 versus 3.68; p=0.77). 80% of residents surveyed were in favor of continuing working with scribes.

Diagnostic capture occurred at a greater rate in the resident clinic during the scribe intervention than in other hospital clinics (MCF increase/month

0.068 versus 0.043; p=0.01). Compared to the prior year, among a subset of 30 patients with continuous care in the resident clinic, MCF scores were higher in December of the year with the scribe intervention than in the prior year (1.065 vs 0.597; p= 0.03).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?):

1. Resident satisfaction with documentation and patient interactions was increased by working alongside medical scribes and increases in performance metrics, at least partially, offset the cost of scribes.

2. Resident diagnosis capture, important for panel management and value based adjustment can be improved by interactions with scribes.

INSTITUTING VIDEO VISITS FOR HYPERTENSION CONTROL IN AN URBAN TEACHING PRACTICE

Justin T. Gasper, Martha Catalina Morales Alvarez, Leonard Amoruso, Alfred Burger, Christina M. Cruz. Medicine, Mount Sinai Beth Israel, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3357126)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Poorly controlled hypertension is a common problem in urban clinics; studies demonstrate telehealth improves hypertension control, yet adoption has lagged.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Integrate video visits into our teaching practice workflow for hypertension management as part of a patient-centered approach for all patients with poor hypertension control.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our outpatient medicine resident teaching clinic serves an urban community in New York City. On recent review of several quality metrics, our patient population hypertension control is at 40.8%–below the national average of 48%–and reflects the health disparities experienced by our racially and ethnically diverse population. Access to physicians and prescriptions present the greatest challenges in addressing poor hypertension control. While multiple large RCTs demonstrate telemedicine increases reduction in SBP and DBP, implementation is sparse. Recent New York telehealth parity law ensures reimbursement for telehealth for Medicaid patients, while recent app technology has integrated video visits into the ambulatory EMR.

As part of this evolving landscape, we offer video visits as part of a patient-centered approach at our resident teaching practice for patients with poorly controlled hypertension, as defined by 2017 ACC/AHA guidelines. Telehealth interventions are rapidly being adopted for a variety of indications, but there have been only limited trials. To our knowledge, no teaching practice has incorporated video visits into standard ambulatory workflow. Our patients are enrolled after an initial clinic visit; exclusion criteria include hospitalization or fall within three months, BP ≥180/110, or diagnosis of dementia. Visits occur every six weeks via smartphone, with BP readings to be performed at least three times on separate days by electronic cuffs or at local pharmacies. We hope that by eliminating transportation barriers, reducing wait times, and reducing medication barriers our patients will experience both continuity and improved hypertension control.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Integration of video visits into standard ambulatory workflow at our resident teaching practice.

Short and long-term improvements in BP control at 6 months, 1 year, and 2 years in patients enrolled and completing video visits.

Patient satisfaction to be evaluated by survey after first visits.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Analysis of performance metrics on preventive measures for all patients at our outpatient teaching practice with 2 or more visits over an 18-month period revealed adequate hypertension control, defined as BP ≤140/90, at only 40.8%.

Subgroup analysis stratified by race and gender revealed disparate outcomes.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Physicians and patients are enthusiastic about telemedicine use

Feasibility requires overcoming substantial administrative barriers and clinical inertia. Trainee supervision for these visits is not nationally developed; policies vary by institution. Understanding state-specific telehealth laws around access and coverage will inform feasibility for target populations.

INTERIM RESULTS OF AN EMERGENCY DEPARTMENT-BASED BUPRENORPHINE INITIATION PROGRAM IN A STATE WITH LIMITED MEDICAID EXPANSION: BUILDING BRIDGES

Michael A. Incze[1]; Kyle Moore[2]; Jeremy Theuson[2]; Paula Cook[2]; Peter P. Taillac[3]. [1]Internal Medicine, University of Utah, Salt Lake City, UT; [2]Psychiatry, University of Utah, Salt Lake City, UT; [3]Emergency Medicine, University of Utah, Salt Lake CIty, UT. (Control ID #3372687)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Lack of insurance and few community-based entry points for starting medication assisted treatment for opioid use disorder (MOUD) substantially limit access to evidence-based treatment in Utah, a state with high rates of opioid-related mortality.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Provide a portal of entry for uninsured and underinsured patients to access MOUD.

2) Provide short term intensive outpatient treatment with case management to facilitate enrollment in insurance and connection to primary care.

3) Provide linkage to ongoing treatment from community providers to achieve sustained remission for opioid use disorder.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The University of Utah BRIDGE program offers same-day initiation of MOUD in the Emergency Department (ED) followed by four weeks of free outpatient treatment, intensive case management, and connection to primary care-based addiction treatment. During the initial ED visit participants are assessed, counseled on starting Buprenorphine, and given a small supply of medications. Onsite care navigators facilitate a transition to a partnering outpatient treatment center for ongoing OUD care. During outpatient treatment, participants are screened for social determinants of health and offered available resources. After this four week intensive treatment period, patients are connected to select community programs for ongoing MOUD

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): During the four week program we continually assessed retention in treatment, substance use, naloxone distribution, housing and insurance status, and HIV/HCV screening. Longitudinal data on retention in care,

interval substance use, and other health outcomes were collected from partnering community programs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From April 23 through November 30, 2019, 507 patients were enrolled through a single ED. 67% attended their first outpatient visit. 55% completed the four week outpatient program. At entry, 45% of participants had Medicaid while 23% were uninsured. 32% of uninsured patients were enrolled in Medicaid through the program. 19% of patients had positive HCV Ab and 1% had documented HIV infection. Over 90% of patients received naloxone.

We have complete data from one continuity program. 27 patients were referred. 81% attended an initial visit.

74% are actively engaged in treatment. 74% are currently recieving MOUD. 78% were screened for HCV and HIV. 37% temporarily lost their insurance while in treatment. 15% had treatment interrupted because of insurance lapses. Data from other partners is forthcoming.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) The scope of practice and case mix of a typical large ED are amenable to implementing programs for initiating MOUD. In areas with few community-based resources, EDs can play a central role in access to addiction treatment.

2) ED-based care navigators and a partnering outpatient clinic that can provide short term stabilization, intensive case management, and linkage to care can improve retention.

3) Insurance is a critical element in preserving access to MOUD. Restrictive policies frequently interrupt treatment and place patients at risk for relapse.

INTRODUCING CLINICAL PHARMACISTS FOR COLLABORATIVE DRUG THERAPY MANAGEMENT TO IMPROVE DIABETES OUTCOMES IN A LARGE PUBLIC HEALTHCARE SYSTEM

Hannah Jackson, Madden Rowell, Ross Kristal, Andrew B. Wallach, Theodore G. Long. Ambulatory Care, NYC Health + Hospitals, New York, NY. (Control ID #3389957)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can we improve diabetes patients' outcomes with a new type of care team provider?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Integrate clinical pharmacists trained in Collaborative Drug Therapy Management into primary care teams as providers at five facilities to independently see patients and manage medications

2. Improve diabetes by A1c and standards of care (statin use, annual ophthalmology and podiatry exams)

3. Decrease ED utilization for uncontrolled diabetes patients

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : NYC Health+Hospitals has 11 hospitals and 60 community health centers (CHC) with more than one million patients and more than five million ambulatory care visits a year. Most patients have public or no insurance. We have over 63,000 diagnosed diabetes, with 36% not at their goal A1c<8.0 before program start. 5 initial pilot sites of 3 hospitals and 2 CHC for diversity in facility characteristics and practice population. Based on number of diabetes patients per site, we hired 1 to 3 clinical pharmacists (CP) trained in outpatient chronic disease management. CP joined the site's primary care (PC) teams as independent providers under a Collaborative Practice Agreement. PC physicians whose patients required intensive management referred patients to CP visits focused on diabetes medication management. Credentialing CP as providers (allied health professionals), let them start, change, or stop a medication, and order and interpret labs. Changes communicated to PC physician within 24 hours of patient visit.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Numbers of patients seen and visits (new and revisit)

2. Numbers of medication changes made by CP (by "start", "change dose" and "stop")

3. Absolute and percent change in A1c prior to initial CP visit and after at least single visit

4. Total number of patients at goal A1c<8 prior to initial visit and after at least single CP visit

5. Percent patients receiving statin therapy (compared to patients without CP intervention)

6. Percent patients receiving annual ophthalmology and podiatry exams (compared to patients without CP intervention)

7. ED visits 12 months prior to and after initial CP visit

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):
- 755 unique patients with 1,853 visits March to November 2019
- 2,210 medications initiated or changed
- 84% of patients seen by CP improved A1c
- Average A1c reduction 1.43%
- Largest A1c reduction 9.1%
- More than 1/3 of patients with high A1c's now A1c < 8
- Improved A1c goal and medication adherence estimates maximum net income $39,431,477 from value- based payments for system

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. CP are effective addressing uncontrolled diabetes and have substantial impact on system's population health goals

2. To assess program success, we measure process metrics (ex: number of visits per patient; number of medications changed) and outcomes metrics (ex: change in A1c; use of statin therapy)

3. Financially feasible, improves gains with limited resources. In cost of adding CP to your system, including projected direct gains from billed visits, add indirect gains in meeting metric targets with value-based payments and increased access to PC provider

IT TAKES A VILLAGE: COMPARATIVE ANALYSIS OF STRATEGIES TO IMPROVE PROVIDER ENGAGEMENT FOR WEIGHT MANAGEMENT AT AN ACADEMIC MEDICAL CENTER

Shreya Shah[3]; Carmen Lu[1]; Sandra A. Tsai[3]; Amy Reisenberg[3]; Ana Calugar[2]; Heather Filipowicz[3]; Christopher Sharp[3]; Anuradha Phadke[3]. [1]Pharmacy, Stanford Health Care, Palo Alto, CA; [2]ambulatory quality, Stanford health care, Palo Alto, CA; [3]Medicine, Stanford University School if Medicine, Palo Alto, CA. (Control ID #3390625)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite evidence to support the benefits of weight loss counseling, the majority of providers do not engage in discussions about weight with their patients; while BMI screening rates at our institution are >85%, only 27% of patients have appropriate follow up documented by a provider.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop and implement a care pathway to identify and treat patients with BMI≥25 using evidence-based medicine.

2. Develop and implement electronic health record (EHR) tools, including clinical decision support (CDS), to improve assessment and provider engagement for patients with BMI≥25.

3. Improve rates of appropriate follow up documentation for patients with BMI≥25

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our multi-level, multi-intervention quality improvement initiative took place at outpatient clinics within an academic medical center. Our care pathway includes an algorithm for risk stratification and management based on evidence-based medicine, and standardized clinical workflows to incorporate recommendations into practice. EHR tools include CDS to prompt BMI screening and follow up documentation for patients with BMI≥25. The CDS tool incorporates physician order entry with an orderset that includes diagnosis codes, documentation templates, suggested orders, and weight loss counseling instructions. The care pathway was piloted at a single primary care clinic (Pilot Clinic A). The CDS tool was piloted at several primary care and specialty clinics (Pilot Clinics A-E). These interventions were designed and implemented by a multidisciplinary team of clinicians, quality consultants, and extended care team members working through a structured lean quality improvement approach.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measured rate of appropriate follow up documentation for patients with BMI≥25 (# of patients with appropriate follow up/total # of patients). Our pre and post-intervention measurement periods were 4 months, with similar volume of total patients pre-intervention (n=9095) vs post-intervention (9211).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): At baseline, our mean rate of appropriate follow up documentation for pilot clinic A (n=2736) was 42.6% vs 35.8% for pilot clinics B-E (n=6359). Following the interventions, our mean rate of appropriate follow up for pilot clinic A was 60.6% vs 42.4% for pilot clinics B-E, with a relative difference of 17.9% (CI 15.4%-19.9%), $p<0.001$ determined using a Wilcoxon rank sum test with continuity correction.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. EHR tools can improve provider engagement to discuss weight loss recommendations with patients.

2. Implementation of CDS alongside a team-based care pathway can be even more successful in changing provider behavior.

3. Attendees can learn how to replicate the various components of our initiative and understand the lean- based problem-solving approach we utilized in developing these solutions.

LEGAL BARRIERS AND SOLUTIONS TO ESTABLISHING AN IN-OFFICE FOOD BANK

Kaitlin Gordon[1]; Jennifer Olges[1]; Diane Chlebowy[2]; Cody Moore[1]; Amanda Miller[2]; Nancy T. Kubiak[1]. [1]Internal Medicine, University of Louisville, Louisville, KY; [2]School of Nursing, University of Louisville, Louisville, KY. (Control ID #3392137)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): To address the high prevalence of food insecurity (FI) in our clinic, we partnered with a local food bank to establish an in-office food pantry but encountered legal obstacles.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to establish an in-office food bank for FI patients that complied with legal statutes about patient incentives.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : After assessing the FI level in our clinic, we partnered with a food bank to establish an in-office pantry which would provide shelf-stable, healthier foods. To justify implementation, we used the American College of Physicians' policy supporting interventions regarding nutritional social determinants of health. We reviewed the project with our legal department to address statutory barriers.

The Office of the Inspector General (OIG), tasked with preventing Medicare and Medicaid fraud, stated that providers may not remunerate patients by providing an item or service below fair market value. An independent entity (e.g. local food bank) may provide items or services to needy patients. A determination of need must be made and universally applied. The OIG stated that receipt of goods or services must not depend on the use of any particular provider.

To comply with these directives, we established a process for screening all patients for FI and policy regarding the food bank. Our policy used the federal eligibility guideline of 185% of the poverty level to establish need. This is verified by proof of Medicaid or by considering all sources of income for a household and using tables to determine eligibility. Our policy stated that patients that qualify for the food bank are eligible for one year, and may access food in the office at any time. Receipt of food may not be restricted for any reason, including no shows for the clinic.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): After developing the policy addressing these statutes, the food pantry opened in August 2019. Screening began in August 2019. In September, a monthly report of the number of referrals was created.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From August-December 2019, 175 of 380 (46%) screened patients were FI and the remaining 205 were food secure. 108 of the FI patients were referred to the in-office food bank from September-December. The remainder did not meet eligibility requirements, declined referral, or were not initially recognized to be food insecure and subsequently could not be contacted to assess interest in the food bank. The food bank was accessed 77 times.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): While physicians look at the provision of a healthy diet as a prescriptive option, the legal system is wary of such endeavors, and compliance with OIG guidance is imperative to avoid potential civil penalties of up to $10,000 per wrongful act. Physicians should be aware of legal standards affecting in-office initiatives to address FI.

LENGTH OF STAY AND READMISSIONS REDUCTION POSSIBLE WITH ABDOMINAL PAIN SYNDROMES GUIDELINE

Allison C. Heacock[1]; Keiko Smith[2]; Oksana Gizunterman[2]. [1]Hospital Medicine, The Ohio State University Wexner Medical Center, Columbus, OH; [2]Quality Department, The Ohio State University Wexner Medical Center, Columbus, OH. (Control ID #3391909)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients diagnosed with abdominal pain syndromes (functional abdominal pain) have high numbers of emergency room visits and hospital admissions with increased lengths of stay and readmissions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): In patients presenting to our emergency room or admitted with Abdominal Pain Syndromes we aim to:

Reduce length of stay and readmissions

Reduce abdominal CT utilization

Reduce the percentage of patients receiving narcotic therapy

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Length of stay and readmission rates on the hospital medicine services at our institution was above goal.

Analysis of our problem through QI methods showed that patients coded with DRG 392 had the largest amount of opportunity days. Performing chart review revealed that a majority of these patients could be classified as having one of the abdominal pain syndromes. The root cause of our problem was determined to be lack of standardized care for these patients. Our intervention was to develop an Abdominal Pain Syndromes guideline under the guidance of our evidence based practice committee. A multi-disciplinary team was developed and included members from hospital medicine, gastroenterology, pain management anesthesia, emergency medicine, dietary, pharmacy, integrative medicine and case management. The guideline was developed using available evidence based literature, Milliman guidelines and expert opinion. An order set was developed. Education was deployed to the hospital medicine and emergency room faculty.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success included reduction in length of stay and readmission as the primary outcome. Secondary metrics included reduction in abdominal CT scans and the percentage of patients receiving opioid therapy.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data was calculated from a baseline of twenty months prior to the January 2018 guideline roll out date through August 2019. Average length of stay decreased from 1.19 to 1.12 (p=0.127). Readmission rates decreased from 18.23% to 14.84% (p=0.038). Percentage of patients prescribed opioids increased from 75.67% to 80.21%. Abdominal CT scan usage increased from 42.72% to 44.88%. The guideline was accessed through the website 35 times in 2019. Control charts were analyzed for all four outcome metrics and did not have any noted special cause variation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Standardization of care for abdominal pain syndromes is difficult given the paucity of strong evidence to guide management. A large multidisciplinary team was vital for development of our Abdominal Pain Syndromes guideline as using expert opinion was necessary. After initial guideline education, continued education is necessary to prevent the reduction in usage that was seen with our guideline.

We were able to show that standardization of care through guideline development can significantly reduce readmissions. This approach also reduced length of stay that was operationally significant. More analysis will necessary to determine why guideline development was not able to reduce imaging and narcotic usage.

LEVERAGING EXTENSION OF COMMUNITY HEALTH OUTCOMES (ECHO) FOR BEHAVIORAL HEALTH INTEGRATION IN FREE AND CHARITABLE CLINICS (FCCS)

Kanika Mittal[1]; Daniel Johnson[1]; Karen Lee[1]; Christina Newport[2]; Ornella Razetto[3]; Daniel Yohanna[1]; Doriane Miller[1]. [1]Medicine, University of Chicago, Chicago, IL; [2]Americares, Stamford, CT; [3]CommunityHealth, Chicago, IL. (Control ID #3391152)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Free and charitable clinics often serve as the gateway for behavioral health care for the under and uninsured, however many lack the organizational infrastructure to provide behavioral health care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Train free and charitable clinic staff to implement team-based care through a behavioral health integration model for patients with depression and anxiety

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Seven FCCs across the country participated in a series of 14 weekly, one-hour training sessions hosted by ECHO-Chicago through an interactive videoconferencing technology in partnership with Americares, a national non-profit that supports free and charitable clinics. The clinic care teams comprised of primary care providers, behavioral health specialists, care managers, IT staff and clinic leadership. This series, facilitated by experts from University of Chicago and CommunityHealth - a free clinic in Chicago, supported care teams to implement components of the Advancing Mental Health Integrated Solutions (AIMS) Collaborative Care model to integrate behavioral health into their clinics. The curriculum was designed to support clinics to implement changes around clinic redesign and enhanced workflow, utilize evidence-based screening questionnaires for case finding and measurement-based treatment to target, deploy a patient registry, use team- based approaches to care and enhance capacity around medication management. Plan, do, study, act cycles (PDSAs) focused on site operations were presented as case discussions to further the collective learning of the group, in keeping with the ECHO format. Participants also presented a series of patient cases to the experts to get real-time feedback on how to best manage some of their most complex patients. Participants presented capstone projects at the end highlighting systems changes made during the series.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Implementation of core components of Behavioral Health Integration using the Advancing Mental Health Integrated Solutions (AIMS) Collaborative Care model. Core components include: patient centered team care, use of registries for population based management, measurment based treatment to target, use of evidence based guidelines and accountable care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): All sites made structural clinic-level changes to support patients with depression and anxiety. These included use of warm handoffs and improved communications, use of registries to track patients, steps to reduce stress and stigma, and increased use of screening tools, further advancing their journey toward behavioral health integration.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Participation in the ECHO series resulted in care teams at FCCs implementing PDSA cycles to significantly change clinic-level processes and operational changes to better address the behavioral health needs of patients.

LEVERAGING SECRET SHOPPER METHODOLOGY TO DRIVE QUALITY IMPROVEMENT AND MOTIVATE CHANGE IN THE CARE OF VULNERABLE POPULATIONS

Rachel K. Mix[1]; Juell Homco[1]; Glenda Armstrong[2]; Kristin Steuck[1]; David Kendrick[1]. [1]Medical Informatics, University of Oklahoma, Tulsa, OK; [2]Medical Informatics, University of Oklahoma, Tulsa, OK. (Control ID #3391492)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Leadership at a rural Federally Qualified Health Center (FQHC) sought assistance with improving poor patient satisfaction in seven diverse practices.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to create a secret shopper program to 1) evaluate both clinical and non-clinical services; 2) gain a perspective of the patients' experience; and 3) facilitate and support system-wide quality improvement (QI).

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The University of Oklahoma Sooner Health Access Network (HAN) provides care management, specialty care access, education and training, and quality improvement support for practices serving the Medicaid population in Oklahoma. Working with FQHC leadership, the HAN developed a plan using a secret shopper methodology to determine the root causes of low patient satisfaction scores. Posing as patients, three HAN staff called practices to schedule an appointment and one staff member attended a clinical visit at each site. FQHC IT staff was engaged to ensure the secret shopper's chart was flagged in the electronic medical record.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): After secret shopper interactions, HAN staff recorded their experiences using a data collection tool with an emphasis on the evaluation of customer service, patient experience, trauma informed approach, cultural consciousness, policies and procedures, quality of care, safety, and compliance. Results were used to identify practice-level themes and specific gaps in care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Two of the seven practices provided outstanding care and consistently followed practice policies and procedures. The remaining practices lacked basic customer service skills and adherence to policies and procedures. Key issues included failures to address positive depression screens (PHQ4), to provide interpreter services for patients with limited English speaking skills, and biases in appointment scheduling. As a result, FQHC senior leaders and the Board of Directors revisited their mission and vision statements and aligned their three-year strategic plan around customer service, education, and empowering employees. The education plan included customer service training, motivational interviewing, and trauma-informed approach for all staff. Employee knowledge of motivational interviewing was measured and on average, post-test scores were 21.4 percentage points higher than pre-test scores (95% CI: 14.5-28.4). Patient satisfaction survey response rates have increased by 300% over 11 months and the FQHC's nursing staff turnover rate has dropped by 50%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Complex healthcare systems often lose their human focus and the secret shopper assessment yielded numerous opportunities for improvement that could not otherwise be detected. Secret shoppers presenting findings to leadership proved to be an unexpectedly emotional experience for all who attended but provided significant motivation for practice improvement.

LINKING PATIENTS TO PRIMARY CARE-BASED BUPRENORPHINE TREATMENT THROUGH A CENTRALIZED EMAIL REFERRAL SYSTEM

Tiffany Y. Lu[1]; Laila Khalid[1]; joel bumol[2]; Mariya Mayusokova[2]; Angela G. Giovanniello[3]; Shenell Thomas[1]; tanya William[1]; Chinazo Cunningham[1]. [1]General Internal Medicine, Montefiore Medical Center, Bronx, NY; [2]Family Medicine, Albert Einstein College of Medicine & Montefiore Medical Center, Bronx, NY; [3]Montefiore Medical Center, Bronx, NY. (Control ID #3391689)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite increasing demand for opioid use disorder (OUD) treatment in the US linking patients to primary care-based buprenorphine treatment has been challenging

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1)Facilitate referral of a large number of patients to primary care-based buprenorphine treatment using the email referral system 2)Facilitate a wide variety of providers to refer patients to treatment 3)Increase linkage to primary care-based buprenorphine treatment

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We implemented an innovative email referral system at a large academic medical center in Bronx, NY which has high rates of opioid-overdose deaths. Buprenorphine treatment is coordinated at 6 affiliated community health centers by a non-physician clinical provider (clinical pharmacist, nurse). Created in late 2017 an institutional email listserv reaches all treatment coordinators who screen referrals, communicate directly with referring providers/patients and schedule initial buprenorphine treatment visits. In 2018, this email referral system was disseminated both internally and externally with partners in community, jails, public health department, and addiction-related websites. We established a registry of patients referred and extracted data from emails/medical records. Variables included patients' demographics, ongoing opioid use, buprenorphine treatment status, referral setting, and referring persons

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1)Number and rate of unique patients referred through the email referral system 2)Types of referral settings and people 3)Linkage rate to primary care-based buprenorphine treatment

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between 2018-2019, 70 unique patients were referred. Over 24 months the rate of referral increased 4-fold, from 8 referrals in first 6 months to 32 referrals in last 6 months. Most patients were middle-aged (mean age 49±13), male(71%), and publicly insured(73%). At time of referral, 44 patients(63%) were actively using heroin or illicit opioids, and 28(40%) had recently initiated buprenorphine treatment. Patients were referred from hospitals (43%), drug treatment programs(23%), jail(14%), and outpatient clinics(13%). 3 patients(4%) self-referred. Among all referred patients, 51(73%) were scheduled for an initial visit with the buprenorphine treatment coordinator. Of 19 referred patients who did not schedule an initial visit, 12(63%) had inaccurate contact numbers/did not respond. Of 51 scheduled patients, 37(73%) attended their first visits. Thus, the majority (53%) of all 70 referred patients completed their initial visit

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We developed and evaluated an innovative email referral system that links patients with OUD to primary care-based buprenorphine treatment. Utilization of our email referral system increased 8-fold over 24 months, and majority of referred patients were successfully linked to care. Next steps include expansion to more providers/patients, along with efforts to improve linkage rate. As opioid epidemic worsens, a similar email referral system could be implemented in other large medical centers to improve access and linkage to OUD treatment

LIPID LESSONS: EFFECT OF A MULTIFACETED QUALITY IMPROVEMENT INTERVENTION ON PRESCRIPTION OF GUIDELINE-DIRECTED TREATMENT IN PATIENTS WITH AN INCREASED RISK OF CARDIOVASCULAR DISEASE

Angelina Zhyvotovska[1,2]; Denis Yusupov[1,2]; Rishard Abdul[1,2]; Samara Skwiersky[1,2]; Anoop Puskoor[1,2]; Nadia A. Williams[1]; Melissa S. Lee[1,2]; David L. Stevens[1,2]; Andrew A. Chang[1,2]. [1]Ambulatory Medicine, NYC Health + Hospitals/Kings County, New York, NY; [2]Medicine, SUNY Downstate Health Sciences University, Brooklyn, NY. (Control ID #3391053)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a multi-faceted quality improvement (QI) approach, aimed at patient activation, result in improved patient understanding of statin therapy and improve guideline-directed cardiovascular disease prevention in an urban underserved primary care practice?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Determine the effectiveness of a multifaceted QI intervention on patient understanding of the benefits of statin therapy and on the improvement of guideline-directed prescription of statin therapy.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Atherosclerotic cardiovascular disease (ASCVD) is the leading cause of mortality in the United States. Guideline-directed statin therapy can help patients reduce risk, yet patients with lower socioeconomic status are disproportionately affected and less likely to be on statin therapy. Primary care patients between the ages of 40-75 with diabetes mellitus requiring primary prevention of ASCVD with statin therapy in an urban underserved resident practice were included in the study. A multi-faceted intervention including staff education, educational flyers, posters, and a short video played during visits, was designed to educate and engage these patients about ASCVD risk reduction with statin therapy.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success was measured by assessing two components. The first component assessed patients' awareness, understanding and importance of statin therapy using identical 3-question pre-/post- intervention surveys on a 5-point Likert scale.

The second component assessed prescriber adherence to American Heart Association/American College of Cardiology guideline-directed therapy (moderate-high intensity statin for patients with diabetes). We reviewed randomly selected pre-/post- intervention charts from the same house-staff clinic.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A multi-faceted QI approach can improve patients' understanding of statin therapy and enhance primary prevention outcomes even in settings with limited resources. For the patient component, pre-/post-intervention patient surveys were administered to 35 patients. There was a mean increase of 2.09 ($p < .001$), 2.00 ($p < .001$) and 1.97 ($p < .001$) in patient awareness, understanding or importance of statin use for each question respectively.

For the provider guideline adherence component, 47 pre-intervention charts were reviewed showing a 62% guideline adherence. A different set of 47 post-intervention charts were reviewed showing 89% guideline adherence. There was a pre-/post-intervention mean difference of 28% ($p < .05$). This allowed for a power of 80% at a two-sided significance level of 0.05.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A multi-faceted QI approach can improve patients' understanding of statin therapy and enhance primary prevention outcomes even in settings with limited resources.

LONG STAY COMMITTEE FINDS INNOVATIVE DISCHARGE PLANS FOR DIFFICULT DISCHARGES

Allison C. Heacock. Hospital Medicine, The Ohio State University Wexner Medical Center, Columbus, OH. (Control ID #3392003)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Length of stay outliers or "long stay patients" with complex discharges significantly increase hospital length of stay which results in higher cost and increased morbidity to our patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aim to develop innovative discharge plans for patients with the most complex discharge needs in order to reduce length of stay at our institution.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We developed a multidisciplinary Long Stay Committee that facilitates the most complex discharges throughout the institution. The Long Stay committee is comprised of Medical Directors, Directors in Nursing, Directors of Case management/Social work, Risk management, Finance, Ethics, Psychiatry and Directors of Rehabilitation. The committee meets once a week to discuss cases.

This innovation led to the development of a long term care service through the hospital medicine division. This service is composed of medically stable for discharge general medicine patients with complex discharges and those requiring guardianship or Medicaid applications. The service is managed by a team including a lead physician, case manager and social worker. All discharge planning and continuity is achieved by this central team. Day to day patient care is delivered at a ½ shift allocation by hospital medicine faculty who focus on chronic disease management.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Goals for our program are reduction in the number of patients with a length of stay greater than 100 days. In addition, we strive to contribute to reduction in length of stay throughout the institution, specifically the hospital where most of general medicine patients reside. Most importantly, our goal is to develop innovative patient care discharge plans and models to serve our most at risk patients.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the last year we have reduced our number of patients with a length of stay >100 days from a rolling average of 12 to 4. We have contributed to hospital medicine division reduction in

length of stay index in patients >100 days from 9.89 to 8.82 and hospital wide from 8.09 to 7.52.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In order to achieve innovative complex discharge plans for length of stay outliers a multidisciplinary team is necessary. We have found that weekly meetings are required to continue proactive management of the most complex patient discharges. In addition, innovative plans frequently require partnering with community resources and the judicial system to assure safe discharges. These plans may also require funding such as aiding a patient in traveling long distances in order to be discharged to a safe environment with family. In the end, this model of complex discharge planning requires resource utilization but ultimately leads to length of stay reduction for the institution.

MAID IN COLORADO: HOW A SAFETY NET HEALTH SYSTEM APPROACHED MEDICAL AID IN DYING

Jeremy Long[1]; Skye O'Neil[2]; Connie S. Price[2]. [1]GIM, Denver Health, Denver, CO; [2]Medicine, Denver Health, Denver, CO. (Control ID #3392034)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Safety net systems struggle with their role when a state approves medical aid in dying.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Build a program that justly serves Colorado without compromising other essential programs

2) Avoid conflict of interest or jeopardizing federal reimbursement for an institution dependent upon federal funding

3) Streamline a process for patients at the end of life

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The state of Colorado passed a law (Proposition 106) allowing medical aid in dying in November 2016, by a margin of 65% to 35%. Denver Health, an urban integrated safety net health system, considered its role in this new arena. After recognizing that many voting precincts in the Denver Health catchment area favored the law, at times by a 3:1 margin, the system convened a work group to assess the matter and consider "opting in" as a system to the law.

The Denver Health MAID program officially began 1/1/18 including: CMO, finance, legal, nursing, psychiatry, chaplaincy, physicians, social work and pharmacy. A Program Coordinator was hired and clinicians were recruited. A centralized service was designed, located in a non-FQHC area.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1) Program data are recorded and reported to the state of Colorado. Data include demographics, terminal diagnosis, regimen consumed, time to death, and other info.

2) Follow-up is conducted with surviving family/spouses, hospices, and other parties to gain helpful feedback on day of death corcumstances.

3) An in-depth interview was recorded with one patient and used in educational events.

4) Family members have become advocates for the program and participated in continuing education.

5) A medical staff survey was conducted to assess receptiveness of Denver Health medical staff to the provision of medical aid in dying – 80% of medical staff members reported to moral, ethical, or religious conflict with Denver Health opting in to the state law.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):

2018 Data (Year 1):

-Total Inquiries: 45

-Patients seen: 12

-Scripts written: 7

-Patients deceased w/Maid: 6

-Patients deceased before ingestion: 5

-Unknown outcome: 1

2019 Data (Year 2):

-Total patients seen: 36

-Scripts written: 26

-Patients deceased w/MAID meds: 17

-Patients died before ingestion: 10

-Patients alive w/plan to ingest: 6

-Patients who were disqualified: 2

-Unknown outcome 1

Other findings:

1) No conflict with federal funding

2) Billing for this service is challenging

3) Provider recruitment crossed multiple specialties and strengthened the program from 2018 to 2019

4) Denver Health received no negative feedback from opting in to MAID.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) Safety net institutions can take a politically-controversial issue and discern a role that honors its patients, its community, and its staff.

2) Medical Aid in Dying programs can draw on the justice-based values of its staff to recruit a team that delivers high-quality, timely care to end of life patients seeking this service.

3) Vulnerable patients, including homeless or substance-addicted patients, can be well-served by a MAID

program that considers their request and pursues an appropriate evaluation.

MD PHONE HOME: DECREASING NO-SHOW RATES IN AN URBAN UNDERSERVED RESIDENT PRACTICE THROUGH DIRECT PHYSICIAN TO PATIENT REMINDER PHONE CALLS

Filip Oleszak[1,2]; Haytham Aboushi[1,2]; Hira Chaudhary[1,2]; Helen Cha[1,2]; David L. Stevens[1,2]; Andrew A. Chang[1,2]; Nadia A. Williams[1,2]; Melissa S. Lee[1,2]. [1]Ambulatory Medicine, NYC Health + Hospitals/Kings County, New York, NY; [2]Medicine, SUNY Downstate Health Sciences University, Brooklyn, NY. (Control ID #3392113)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Will direct physician to patient telephone call reminders 24 hours prior to scheduled appointments decrease primary care no show rates in a predominantly Afro-Caribbean underserved population in Brooklyn, NY?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To decrease “no-show” rates by 10% from our practice’s usual care (37%) over two months (October-December 2019)

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : No- show is defined as a patient who does not appear for their scheduled appointment. Lower socioeconomic status, income, and unemployment are associated with higher missed appointment rates. Patients with higher no show rates are more likely to suffer from poorer chronic disease control, higher rates of hospital admissions, and substandard cancer screening. Our practice uses Medical Assistants (MA) to make live patient reminder telephone calls 48-hours prior to scheduled appointment date. Our no-show rate was 37% compared to national average of 23-34%.

Resident primary care providers (PCP) called their patients 24-hours prior to the scheduled appointment. Patients were reminded about their scheduled appointment time and date using a standardized script. Appointment adherence rate was recorded following the completion of each clinic day.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The absolute decrease of no show rates following the intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): A total of 301 patients were given reminder calls, PCP (n=143); MA (n=158). The no show rate among the PCP group was 22% compared to the MA group's 37%. The association between reminder calls and appointment keeping (attendance) was statistically significant, $\chi(1) = 7.969$, (p=.005). The intervention reduced the practice's absolute no show rate by 15% (p=.005).

Of the 143 patients called by their resident PCP, 49% of patients were successfully reached. For patients that spoke with their PCP, 96% presented for their scheduled appointment, the remaining 4% notified that they were unable to attend their visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Despite studies showing that no- show rates can be reduced by telephone reminders by administrative staff, no prior studies have examined the impact of PCP-led personal reminders.

Using a typical Medicaid reimbursement of $90 per visit and a 15% increase in show rate, the value to the practice is $1350 per 100 calls, without accounting for lost productivity or other costs.

Direct PCP reminder calls seem to be more effective than MA reminder calls. Strategic use of PCP reminder calls in high risk patients could have added benefit.

MENTORING INTERPROFESSIONAL CO-LEADERSHIP DYADS: BUILDING EMPATHY AND MOMENTUM FOR IMPROVEMENT

Katarzyna Mastalerz[1,2]; Andrew Berry[1]; Jackson Turbyfill[1]; Spring Mayer[3]; Chung-Wen Wang[4]. [1]Hospital Medicine, Rocky Mountain VA Medical Center, Aurora, CO, Denver, CO; [2]Hospital Medicine, University of Colorado, Aurora, CO; [3]Physical Medicine and Rehabilitation Service, Rocky Mountain VA Medical Center, Aurora, CO, Aurora, CO; [4]Pharmacy Services, Rocky Mountain VA Medical Center, Aurora, CO, Aurora, CO. (Control ID #3359976)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Decisions that affect healthcare providers in our hospital are often made without key stakeholder involvement.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Establish inpatient interprofessional (IP) co-leadership dyads to partner key stakeholders and prioritize multidisciplinary projects.

2. Mentor co-leadership dyads to design effective methods for implementing system changes that improve patient care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : After a facility move, the inpatient services at our 133-bed Veterans Affairs Medical Center (VAMC) faced significant structural barriers to integrating across professions, including professionally segregated and limited workspaces, and lack of an organized communication structure. Literature suggests that IP co-leadership dyads can create a shared mental model of care, and have a creative approach to problem solving due to complimentary skillsets. After a pilot RN/MD unit co-leadership dyad created and implemented an IP bedside rounding model that improved communication and teamwork, VAMC leadership supported the creation of IP co-leadership dyads to improve teamwork and identify areas for quality improvement.

Based on previous experience with co-leadership in several care settings and concepts from quality improvement and organizational change, we created a curriculum for IP co-leadership dyads that included topics of shared mental model, intentional pairing, vulnerable leadership, Human Centered Design, and IHI- inspired tools for creating project charters and stakeholder registries. In addition to the curriculum, the co- leadership dyads receive mentoring in quality improvement projects. Two co-leadership pairs started the curriculum in 2019, developed shared mission/vision/values statements, and are currently working on IP quality improvement projects that align with our facility goals.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Interprofessional co-leaders with shared mission/vision/values & interprofessional projects that engage stakeholders.

Long term, we will measure dyad engagement and empathy and use dyad projects outcomes as measures of success.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Two IP co-leadership dyads are participating in the mentorship program at our facility, in addition to the pilot dyad: a Hospitalist/RN Unit Manager dyad, Hospitalist/Physical Therapist dyad, and Hospitalist/Pharmacy dyad. All dyads have completed mission/vision/values statements together.

Current mentored projects pursued by IP co-leadership dyads are: 1) creation of a standardized process for appropriate and informed PT/OT consultations, and 2) a trial of discharge pharmacist to decrease late patient discharges. Paired co-leaders describe a deeper understanding of each other's roles and more effective advocacy for each other.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Despite being a very new program, IP co-leadership dyads at our VA generated IP curiosity and better understanding of each other's professional roles. The dyads had immediate ideas and enthusiasm for quality improvement projects that impact daily care and embarked on meaningful projects early in the mentoring process.

MOBILE LOW THRESHOLD BUPRENORPHINE PLUS PATIENT NAVIGATION PROGRAM: IMPACT ON TREATMENT INITIATION AND RETENTION AMONG PATIENTS WITH OPIOID USE DISORDER IN NEW LONDON, CONNECTICUT

Paul J. Joudrey[1]; Jennifer Muggeo[2]; Kelly Thompson[3]; Carol Jones[3]; Trisha L. Rios[3]; Donnie Rose[3]; Jessica Morris[3]; Leigh Stepanian[3]; Katie C. Clark[1]; Robert Heimer[1]; E. J. Edelman[4]. [1]General internal medicine, Yale School of Medicine, New Haven, CT; [2]Ledge Light Health District,

New London, CT; [3]Alliance for Living, New London, CT; [4]Internal Medicine, Yale University School of Medicine, New Haven, CT. (Control ID #3391103)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite availability of clinic-based buprenorphine, many people with opioid use disorder (OUD) do not receive treatment due to administrative, transportation, and cost barriers.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Create engagement between patient navigators and people with OUD who are not receiving buprenorphine, methadone, or naltrexone treatment.

2) Among patients who interact with a navigator and report interest in buprenorphine, facilitate connection to a mobile prescriber for low threshold buprenorphine.

3) Successfully link mobile buprenorphine patients to a clinic-based buprenorphine prescriber.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : A small New England city, New London, experienced nine drug overdose deaths and 91 non-fatal overdose events in 2018. In response, Ledge Light Health District (regional health department) and Alliance for Living (harm reduction organization) started the Coordinated, Access, Resources, Engagement, and Support (CARES) project in partnership with the mayor's office, police and fire departments, and emergency medical services. With funding from the University of Baltimore Center for Drug Policy Research, four navigators with lived OUD experience engaged community members with OUD and assisted with needs such as housing and transportation, offered harm reduction services, and connected interested patients to treatment services.

In response to difficulty accessing clinic-based buprenorphine, the CARES program partnered with Yale School of Medicine in April 2019 to pair a buprenorphine prescriber with navigators to provide low threshold, mobile buprenorphine initiation three times per month. In October 2019, through a partnership with a federally qualified health center, a second prescriber joined once per week. When a patient interested in buprenorphine was identified, the navigator and prescriber team completed a medical evaluation at the patient's preferred location and scheduled a visit with a clinic-based prescriber. A buprenorphine self- initiation prescription was provided to facilitate same day initiation with enough medication to bridge to the clinic visit. The navigator assisted with prescription pick up and clinic visit attendance, covering medication and transportation costs when indicated.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We included the following measures: 1) number of unique patients engaged with navigators, 2) number of unique patients who picked up a mobile buprenorphine prescription, 3) number of patients who attended a continuity clinic-based visit within two weeks.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the first six months, 234 unique patients engaged with a navigator and 60 were prescribed buprenorphine, of whom 58 (97%) picked up their medication and 53 (88%) completed the continuity visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A mobile buprenorphine prescriber embedded within a navigation program can increase initiation and retention in buprenorphine treatment. Key innovations included empowering navigators with lived experience to engage with patients not currently receiving treatment and connecting patients with a prescriber outside of the traditional healthcare system.

MODELING AND MANAGING ACCESS TO PRIMARY CARE SERVICES IN THE VETERANS HEALTH ADMINISTRATION

Susan Kirsh[2]; Steven D. Pizer[1]; Taeko Minegishi[1]; Kyle Barr[1]; Elsa Pearson[1]. [1]PEPReC, Department of Veteran Affairs, Boston, MA; [2]central office, veterans health administration, Pepper pike, OH. (Control ID #3385887)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Based on criteria mandated by the MISSION Act of 2018, VHA researchers assessed gaps in access to VHA primary care by identifying underserved VHA medical centers (VAMCs) struggling to meet their enrolled Veterans' demand for care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Analyze the relationship between Veteran demand for and the supply of primary care in the Veterans Health Administration (VHA) to estimate the impact on access metrics.

Inform policy decisions around resource allocation using evidence-based methodologies.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Researchers developed a statistical model to identify VAMCs as underserved for primary care. 128 VAMCs providing primary care between FY14 and FY16 were included. The model included 19 variables to measure Veteran demand for and VAMC supply of care. To characterize Veteran reliance on VHA care, researchers included Veteran demographic characteristics, average drive time, and the local Health Provider Shortage Area score. To characterize the supply of VHA care, researchers included capacity and productivity measures.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Researchers measured success through the adoption of underserved scores as a way to guide resource allocation aimed at improving access.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): For each VAMC, the model estimated an adjusted predicted waiting time based on the 19 included variables and used this to calculate an underserved score. The 128 VAMCs were then ranked in relation to each other, by underserved score, to identify the facilities with the highest need. The top seven underserved VAMCs were highlighted by VHA leadership to receive national resources. The top twenty were required to submit action plans to VHA leadership demonstrating how they plan to respond with local resources.

The MISSION Act requires that VHA submit to Congress an annual report of the year's most underserved VAMCs and their action plans. The top seven VAMCs underserved in primary care were included in the June 2019 congressionally mandated report.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Statistical modeling demonstrated that access to VHA primary care can be estimated based on the relationship between Veteran demand for and VAMC supply of care. The underserved model is meant to guide VHA operational decisions. Several VHA offices are targeting new programs or resources based on our findings in an effort to improve Veteran access to primary care.

Annual reporting provides an opportunity to continually improve the model. We have done this ahead of the June 2020 congressionally mandated report, including more granular data sources and time trends. We also plan to expand this kind of statistical modeling to both primary care at VHA's community-based outpatient clinics and specialty care at VAMCs.

Other learning health care systems can use a similar methodology to identify areas of need among their facilities or served populations. Using an evidence-based approach for resource allocation allows for equitable distribution, constant refinement, and measurable success.

MODERNIZING CARE THROUGH PATIENT EMPOWERMENT: USE OF CONTINUOUS GLUCOSE MONITORING FOR UNDERSERVED PATIENTS WITH UNCONTROLLED TYPE 2 DIABETES

En-Ling Wu, Nathaniel E. Pena, Gabriela Alvarez, Roberto George, Elvira Carrizales, Rachel Cheung, Paola E. Seguil, Brenda Rodriguez, Carrie Kindleberger, Veronica Galvalisi, Andrew J. Van Wieren, Gillian Connolly, S. M. Yacht, Axa M. Anaya Noubleau, Sara B. Hunt, Maria Silva, Blanca Iriarte-Oporto, Sylvia A. Shokunbi, Maximiliano Luna, Marialuisa Doubek. Esperanza Health Centers, Chicago, IL. (Control ID #3369792)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can CGM be accessible and efficacious for low-income adult patients with insulin-dependent diabetes and A1C > 9.0?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To determine impact of CGM on diabetes control, engagement in care, and qualify of life.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Esperanza Health Centers is a federally qualified health center with four clinics in Chicago's southwest side. In 2019 we served 16895 adults, of whom 46% were uninsured and 87% identified as Hispanic/Latino. As 1 in every 6 adult patients has type 2 diabetes, we are constantly developing new programs to help improve glycemic control. With increasing CGM use in the US, we decided to build upon our pre-existing registered nurse (RN)-led insulin titration program for patients on basal or mixed insulins. Managing insulin is especially difficult for patients and providers alike. Few patients are able to perform self-monitoring of blood glucose (SMBG) as frequently as desired due to busy schedules, discomfort with lancets, and cost of supplies. Without this information, providers struggle with how best to adjust insulin doses.

We therefore set out to study whether CGM use would be feasible, beneficial (and eventually cost-effective). RNs were trained in sensor placement, reader navigation and uploading/interpretation of reports. A qualifying patient with uncontrolled diabetes (A1C > 9.0 per Uniform Data System) requiring multiple daily insulin injections interested in CGM is referred by PCP to RN for additional education. Once CGM is approved (either via insurance prior authorization or clinic's CGM assistance program for patients who are uninsured or who have high-deductible private plans), patient has a non-billable office visit with RN for sensor placement and reader use instruction, followed by an additional visit within 10-14 days to review glucose trends.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We are examining change in mean A1C pre- and post-intervention (and whether change is sustained at 12 months), change in weight and rate of uncontrolled hypertension (proxy markers of behavioral modification), number of provider or nurse visits over 12 months (estimate of patient engagement/retention in care) and subjective reporting on quality of life measures (working to standardize pre- and post-surveys).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date we have enrolled 28 patients and seen a mean reduction in A1C of 1.5%. The opportunity for patients and RNs to review glucose trends has helped tailor behavior modification and insulin doses, as well as provided insights into stressors affecting patients' health:

"She realized that she is missing her second injection of the day. We set alarms throughout the day that will help her with adherence."

"We figured out she was not injecting her insulin at all. I asked her how she was injecting and I noticed she was not removing the inner insulin pen cap."

"I spoke to them about safety concerns at home with son who is schizophrenic. It seems like he may have stopped medication and fell out of care."

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Innovations in medical technology can be accessed by and benefit underserved, low-income communities.

MODERNIZING PATIENT-CENTERED SCHEDULING THROUGH TEXT MESSAGE PRIMARY CARE APPOINTMENT REMINDERS FOR A LINGUISTICALLY DIVERSE PATIENT POPULATION IN THE NATION'S LARGEST URBAN HEALTHCARE DELIVERY SYSTEM

Amanda Johnson[1]; Jordan Berman[1,2]; Lynnette Mercado[1]; Kaushal Challa[1]; Theodore G. Long[1]. [1]Ambulatory Care, NYC Health + Hospitals, New York, NY; [2]Boost Services, Epic, New York, NY. (Control ID #3390764)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Missed primary care appointments lead to care gaps, lost revenue, resource underutilization, & decreased access.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Empower patients to cancel & reschedule appointments they can no longer attend

2. Empower practices to make informed decisions regarding same-day accommodations

3. Expand language access to reflect the population served

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : New York City Health + Hospitals (NYCH+H) is the public healthcare delivery system serving New Yorkers regardless of national origin or ability to pay. Its primary care footprint encompasses 11 essential hospitals & a 60-site federally qualified health center. On 7/22/2019 NYCH+H deployed a 3rd party automated appointment reminders solution to deliver SMS reminders to adult patients at Coney Island Hospital three days & one day before primary care appointments. Primary care is broadly defined, including visits with providers, nurses, financial counselors, & other team members. Patients without mobile numbers or who opt out of SMS reminders receive reminders through interactive voice response (IVR) or email if such details are available. The reminder prompts the recipient to confirm, cancel, or reschedule the appointment. SMS reminders are published in our system's top 14 languages, with 8 languages for IVR. Patient responses are integrated into the medical record & displayed to frontline staff. On 12/9/2019 the solution was expanded to include adult, adolescent, & pediatric primary care in three additional hospitals & one community health centers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION):

- Missed appointment rate
- Patient engagement rate
- Language reminder concordance
- Opt-out rate

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED):

95,483 automated reminders were sent between 7/22 & 12/26/2019 (SMS=86.2%, IVR=12.61%, email = 0.13%). 24% of reminders received a response (confirmations=82.5%, cancellations=10.9%, reschedule or other help=5.2%, opt-out=0.5%). 96.4% of reminders were delivered in the patient's preferred language; 53.1% of messages were sent in a language other than English. Of the help requests, 77.2% required outreach from our centralized contact center; contact center agents were successfully able to reach the patient within two attempts 76% of the time. In Coney Island adult primary care, the missed appointment rate decreased from 26.9% to 20.8% between comparable 21-week time periods in 2018 & 2019.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patients who receive primary care in large, urban public delivery systems overwhelmingly provide mobile phone numbers, which can be used to deliver interactive, automated SMS appointment reminders. This implementation coincided with fewer

missed appointments in the initial pilot practice. Accidental cancellations were the most common patient error. Providing language-concordant, gender-affirming reminders is essential to serving a diverse patient

population, though the cost & operational complexity of managing multiple languages is not yet adequately compensated in our current healthcare system or in the telecommunications industry at large.

NAVIGATING YOUR WAY TO TREATMENT: RESULTS FROM AN EMBEDDED BUPRENORPHINE CLINIC IN PRIMARY CARE

Irina Kryzhanovskaya, Valeria Gutierrez. Intern Medicine, UCSF, San Francisco, CA. (Control ID #3391247)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): With a high burden of opioid use disorder (OUD) in the area and difficulty accessing OUD treatment for our clinic population, we launched an embedded and navigator-managed buprenorphine clinic to streamline linkage of patients to evidence-based addiction treatment in primary care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To

increase access to treatment for patients with OUD in primary care

2) To enhance primary care capacity to treat patients with OUD in a timely manner

3) To expand the workforce to ensure clinic sustainability

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We implemented a twice-monthly half-day buprenorphine clinic designed specifically to treat patients with opioid use disorder (OUD) and embedded it in a General Internal Medicine (GIM) outpatient practice. A patient navigator manages the clinic as the primary point of contact for referrals from the emergency department (ED), urgent care, inpatient teams, and outpatient practices. The clinic is staffed by a faculty primary care physician who has an x-waiver from the US Drug Enforcement Agency to prescribe buprenorphine for OUD. Outreach efforts are predominantly focused on patients already receiving their primary care at the GIM clinic housing the buprenorphine clinic. The buprenorphine clinic thus functions as an extension of the patients' care, encouraging them to seek addiction treatment in a known setting. To increase the number of clinicians who can follow patients evaluated in the buprenorphine clinic, a free and gift-card incentivized x-waiver training was organized for GIM faculty, nurse practitioners, and resident trainees.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): In the first year of the clinic, we aim to

-Improve access to buprenorphine consultation as quantified by filling two-thirds of appointment slots (i.e. 4 of 7) and ensuring an average reasonable time (<14 days) from referral to evaluation

-Increase the number of patient initiations on buprenorphine for OUD by 50% (from 8 to 12+/year)

-Double the number of x-waivered GIM clinicians (from 15 previously to at least 30)

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the first three months of launching the clinic, we made progress on all measures. We filled 70% of appointment slots (above target), scheduled patients on average 17 days from referral (30% scheduled <14d, approaching target), and evaluated 22 total patients for buprenorphine. Fifteen patients were either initiated or maintained on buprenorphine (at target). Seven residents, two nurse practitioners, and four faculty physicians have received their waiver since the clinic and trainings launched (28 total x-waivered, approaching target).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The creation of an embedded buprenorphine clinic in primary care, managed by a patient navigator, increases access to treatment for OUD. In the clinic's first three months, we have made significant progress toward our appointment and treatment goals and expect all numbers to ramp up to targets in upcoming months. Additionally, incentivizing clinicians to attend waiver trainings increases the likelihood that they will complete their certification and expand the pipeline of buprenorphine providers.

OPEN ACCESS IN A PUBLIC SYSTEM: USING ROLLING TEMPLATES TO IMPROVE CONTINUITY, ACCESS, AND NO-SHOW RATE

Hannah Jackson, Kaushal Challa, Njeri Micheu, Theodore G. Long, Andrew B. Wallach. Ambulatory Care, NYC Health + Hospitals, New York, NY. (Control ID #3390877)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Continuity is tantamount in providing quality and effective primary care; in such a large health system with 70 sites and more than 5 million ambulatory care visits each year, how do we improve access and increase the proportion of time that a patient is seen by their own primary care provider?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve continuity between patient and primary care provider (PCP) as measured by the percent of patients a provider sees in a day that are assigned to them as PCP

2. Lowering wait times to increase access for patients to see their PCP

3. Increase efficient utilization of provider's time by decreasing no-show rate.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : NYC Health + Hospitals is the largest public health system in the country, consisting of 11 hospitals and more than 60 community health centers serving more than one million patients and delivering more than five million ambulatory care visits each year. The majority of patients have public or no insurance. Using Bellevue Hospital as a pilot, we initiated a new scheduling system that utilized time-released appointment times, including a certain proportion of appointment slots that are saved for open access scheduling within a week. These appointments would become available for patient booking at pre-determined time points before an actual appointment date. Using access data, we established best-practice guidelines for the percentage of appointment slots that should become available at these different time points. We then measured continuity, access, and no-show rates before and after this initiation, all of which improved substantially with these changes. With the success time-release slots at Bellevue, we have expanded rolling template use to all 11 hospitals and 7 large community health centers across the city.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Percent of patients seen by a provider that is part of their continuity panel every month

2. Wait time to appointment / Third-Next Available Appointment (TNAA)

3. No-show rate

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1. Continuity – The frequency at which a patient saw their assigned primary care provider increased from 50% to 87%, with improvement being sustained for more than 14,000 visits over a six month time period.

2. Access – Appointment wait times decreased from 52 days to less than 14 days between January 2018 and January 2019. Wait times for follow-up visits are now less than one week.

3. No-show Rate – Relative decrease of 16% for no-shows for revisits.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Moving toward open access scheduling with rolling templates can work in a complex public healthcare system and, therefore, can also likely work in other ambulatory care settings

2. Improving continuity has a dramatic effect on decreasing wait times

3. Appointment templates should not be static and improving show rates through letting patients schedule appointments closer to when they want to be seen can vastly improve daily clinic utilization

OPTIMIZING AN EHR-BASED CONSULTATION PROCESS VIA DEVELOPMENT OF A "CONSULT COMMITTEE" AND CONSULT EVALUATION TOOL: A QUALITY IMPROVEMENT INITIATIVE

Juliette F. Spelman[1]; Brian C. Coleman[3]; susan maya[1]; Christopher Ruser[2]. [1]General Medicine, Yale University School of Medicine, Fairfield, CT; [2]Internal Medicine, Yale University School of Medicine, West Haven, CT; [3]Medical Informatics, Yale University School of Medicine, New Haven, CT. (Control ID #3372767)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A major challenge in electronic health record (EHR) use is optimizing information exchange during the consult ordering process

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Describe implementation of an interdisciplinary "Consult Committee" to review and revise consult ordering menus and templates in the VA Connecticut Healthcare System (VACHS) EHR

Introduce a novel objective review tool to revise consult templates in accordance with best practice recommendations

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : An interdisciplinary committee was established to optimize the EHR based consult ordering process.

The "Consult Committe" consists of representatives from primary and specialty care and medical informatics. The committee convened monthly to review templates before and after re-design.

An 18-item "Report Card" was developed with elements based on best practice recommendations around EHR-based consultation ordering, to objectively evaluate and revise consultation templates. The consultation template is scored before and after revision, with components geared towards facilitating ease and time of entry and optimizing the quality of information conveyed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): It was hypothesized that poor consult template design resulted in high rates of discontinued consults (baseline average discontinuation rate for our facility was 18.6%). Discontinuation rates per service were obtained for a ±60-day window around the revision go-live date for seven specialties.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Seven specialty consult menus and templates have been successfully modified. The discontinuation rates varied greatly for the 60-day period before (range: 7.0%-47.3%) and after (range: 8.0%-37.5%) revision. Individual specialties demonstrated mixed results, with only two specialties showing a reduction in consult discontinuation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): It is likely that additional factors affect discontinuation, such as policy mandates on management of consult requests and scheduling. Most consultation requests are reviewed by a single designated specialty provider, resulting in significant inter-user variability. A 60-day window may also be insufficient to capture meaningful change in behavior. A broader set of outcomes should be used to measure the impact of this intervention.

The concept of consult optimization is likely to become more salient as healthcare systems shift toward capitated models and EHR-based ordering. It is well known that EHR generated administrative tasks contribute significantly to provider burn out, and optimizing information exchange can have a significant effect on efficiency of care and work-load.

Further study is needed to identify meaningful outcomes associated with consult redesign, including time- motion studies, accuracy and completion of pre-consult work-up, and qualitative analysis of provider satisfaction.

Use of a standardized tool to grade components of EHR ordering in accordance with best practice is generalizable to other healthcare systems and EHR platforms, although additional evaluation of the psychometric properties of the standardized review tool is needed.

OVERCOMING BARRIERS TO SCREENING FOR SOCIAL DETERMINANTS OF HEALTH: IMPLEMENTING SOLUTIONS IN HEALTH CARE

Tracey Henry[1]; Stacie Schmidt[2]; Jocelyn A. Carter[3]. [1]Medicine, Emory, Powder Spgs, GA; [2]General Medicine, Emory University, Atlanta, GA; [3]Department of Medicine, Massachusetts General Hospital, Boston, MA. (Control ID #3380342)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Screening for social determinants of health is challenged by a lack of standardized tools, as well as increasing time and resource constraints in caring for patients with complex clinical, social, and behavioral needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Identify the challenges associated with implementing SDoH screening in health settings

2. Broaden knowledge of SDoH resources and available solutions for implementation

3. Apply resources available for SDoH screening in a case-based and practice-based learning approach

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Within our safety net hospital in an urban, academic center, we conducted PDSA interventions aimed at (1) exploring whether SDoH are being assessed by residents in the primary care clinic (PCC); (2) Identifying barriers to SDoH screening; (3) Comparing patients' reported adverse SDoH to resident physician perceptions of them.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our SDoH initiative introduces and addresses common challenges to initiating SDoH screening in health care settings, while presenting useful solutions and a tool kit for implementation. Attendees will leave the session with: A written assessment identifying barriers to SDoH screening at their institution(s), including identified possible solutions (based on case presentations and generative discussions with small and large group members). A personal written SDoH action plan to overcome identified barriers.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We utilized an SDoH screening tool adopted from Health Leads ToolKit administered to a convenience sample of all patients attending primary care appointments between 9/10/18-11/23/18. Written patient responses to the survey were shared with providers during the clinic visit, for review and action at the discretion of the resident PCP.

Of the 1,061 patient surveys completed, written SDoH resource-related handouts were provided to 26 patients (2.5%). Top 3 SDoH for patients: food insecurity, access to care, unemployment. Physician SDoH Perceptions Surveys were administered as an online survey. 54 of 98 surveys were completed (55.1% response rate). Per Residents: top 3 SDoH most commonly affecting their patients: lack of trasnportation, access to healthcare and housing instability. Comparing patients responses to residents, there is a massive discrepancy between what residents believe are patient's top SDOH and what patients believe are the top SDOH. Patient's #4 concern - social isolation, was not even ranked by residents. The most common reasons for not screening patients: include insufficient time (85.2%), not having the resources or tools to address barriers (70.4%), and not knowing how to screen effectively (48.1%). 77.8% of residents reported screening less than half of their patients for SDOH during clinic visits.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Understand challenges to SDOH screenings through our screening initiative to help identify key tools/solutions on how to start and/or scale SDoH screenings in their respective healthcare settings.

Attendees will form of an action plan equipping them with the tools to integrate SDOH screening within their healthcare system.

PATIENT SELF-TRIAGE AND DIRECT SCHEDULING FOR EXPEDITED INFLUENZA CARE

Timothy Judson[2,1]; Jessica Chao[1]; Aimee Williams[1]; Ralph Gonzales[1,2]. [1]Clinical Innovation Center, UCSF, San Francisco, CA; [2]Department of Medicine, UCSF, San Francisco, CA. (Control ID #3388353)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The cold and flu season leads to increased demand for appointments, resulting in delays in care for all patients, and difficulty in providing timely antiviral treatment to patients with influenza.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We implemented a patient self-triage and direct scheduling module titled "Do I have the flu?" with the goals of providing personalized online triage recommendations to patients, and expediting care for patients with a high flu likelihood.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Flu module was built using Epic Decision Tree and accessible through the patient portal. The symptom questions and triage algorithm were adapted from an influenza prediction model (Afonso et al. in 2012), and included questions related to complications and competing diagnoses. Upon completing the questions, patients are provided estimates of their likelihood of influenza (low, moderate, high), and care recommendations (self-care, immediate care, scheduled visit, advice nurse). Eligible patients can directly schedule in-person or video visits.

The Flu module was introduced to patients at two primary care clinics in San Francisco in December 2019, at the beginning of increased influenza activity. These clinics combine to provide ~1000 visits per month for flu-like symptoms. Clinic patients were sent two messages via the patient portal informing them that the module was available. Other patients in the health system could see the tool on the patient portal but were unable to use it.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Key metrics include access rates, completion rates, rates of antiviral treatment and visit rates. We also monitored the percentage of patients triaged into each category.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between Dec 18th and Jan 10th, 393 patients attempted to access the module, of which 237 were part of the pilot group. Of these 95 (40%) completed the module. Seventy (72%) were female. Median age was 52 years (IQR 38-66). Forty-seven patients (49%) were low likelihood, 42 (44%) were moderate likelihood, and 4 (4%) were high likelihood of having the flu. Nineteen (40%) low likelihood, 29 (69%) moderate likelihood and 4 (100%) high likelihood patients were recommended to seek care immediately. In total, 56 of 95 patients (59%) followed the recommendations provided. The percentage of high, moderate and low likelihood patients who were diagnosed with influenza and received antiviral treatment were 75% (3/4), 12% (5/42) and 0% (0/47) respectively.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): First, with little advertisement, this module was accessed by an approximately 30% of patients with flu-like symptoms at these clinics, suggesting interest in getting triage advice through patient portals. Second, a large proportion of patients were triaged to seek care immediately, highlighing the tension between being conservative to avoid false negatives and recommending care only to those who really need it. This approach may lead to a lower percentage of patients following recommendations. Third, the algorithm was able to differentiate patients based on flu likelihood, allowing for specific patients to be targeted for expedited care.

PEELING BACK THE LAYERS: THE ROLE OF MASSAGE AND ACUPUNCTURE IN AN INTEGRATIVE PAIN MANAGEMENT PROGRAM IN A SAFETY NET CLINIC

Theo Slomoff[1]; Barbara Wismer[2]; Joseph Pace[2]; Kristina Leonoudakis[2]; Maria T. Chao[3]. [1]General Internal Medicine, University of California, San Francisco, San Francisco, CA; [2]San Francisco Department of Public Health, San Francisco, CA; [3]Osher Center for Integrative Medicine, University of California, San Francisco, San Francisco, CA. (Control ID #3387882)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): While there is strong evidence to support the use of multimodal integrative chronic pain management, programs providing this service can be particularly complex to implement in resource-limited settings.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

Objective 1: To examine how each component of a multimodal, integrative program changed patients' pain- related outcomes in a public safety net clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Data for this study were derived from the Integrative Pain Management Program (IPMP) at a community-based primary care clinic in San Francisco. IPMP is a 12-week core program that provides pain education, movement, and tools for pain self-management with optional additional sessions of acupuncture and massage.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients completed validated quantitative surveys about pain-related outcomes at the program's initiation, at the end of the program, and 3 months following the end of the program. We used mixed linear models to compare IPMP participants who received acupuncture and massage treatments during the program with those that did not.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Data were collected for 105 patients with initial surveys, 75 patients at the end of the study period and 28 patients at the three-month follow-up. For patients who received acupuncture and massage (n=88), scores of pain self-efficacy and pain catastrophizing trended down over the study period and reached significance prior to the three-month follow-up. Between group analysis indicated a statistically and clinically significant decrease in pain interference (Δ4.08, p=0.02) and increase in pain self-efficacy (Δ5.14, p=0.023) among patients who received massage and acupuncture. Although there were decreased scores for depression, anxiety and sleep disturbance, they did not meet our threshold for clinical significance. No significant improvements were observed for global physical health, physical functioning, or social satisfaction among patients who attended acupuncture and massage sessions.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): While the core integrative pain management program provided benefit to patients in an underserved setting, participation in additional acupuncture and massage sessions was associated with improvement in the domains of pain catastrophizing, pain interference and self-efficacy.

PERCEPTIONS AND FEASIBILITY OF HOSPITAL-LEVEL CARE AT HOME IN RURAL AMERICA: A QUALITATIVE AND SIMULATION ANALYSIS

Meghna Desai[2]; Joseph Ross[2]; Emily Gill[3]; Natalie Como[5]; Steve Holley[4]; David M. Levine[1]. [1]General Internal Medicine and Primary Care, Brigham and Women's Hospital, Boston, MA; [2]Ariadne Labs, Boston, MA; [3]University of Auckland, Tauranga, New Zealand; [4]Utah Valley University, Orem, UT; [5]University of Utah Health, Salt Lake City, UT. (Control ID #3391357)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Rural hospitals are closing in record number. Hospital-level care at home in urban areas delivers low-cost, high-quality, safe care, but could similar "home hospital" care can be delivered in rural areas?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Determine how home hospital care is perceived by patients and clinicians in rural America. Determine the preliminary feasibility of delivering acute care at home that would traditionally be delivered in a hospital.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We performed semi-structured interviews of rural clinicians throughout America, focus groups with clinicians experienced with care in rural Utah, and semi-structured telephone interviews with patients living in rural Utah. We performed "mock admissions" in rural Utah with chronically ill patients who had previous hospitalizations. These patients were asked to feign acute illness and were "admitted," "rounded on," and "discharged," multiple times to allow for iterative rapid cycle improvement. The rural home hospital (RHH) model included a remote physician guided by a nurse or specialized paramedic, advanced point-of-care testing, and continuous biometric monitoring, all facilitated through mobile satellite connectivity as needed.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Elicit patient and clinician perspectives surrounding RHH. Correct operation of workflows, technology, and personnel during RHH mock admissions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Patients expressed challenges when accessing acute care including lengthy travel, lack of reliable transportation, and concerns with the quality of care at their local hospital. Most rural clinicians and patients had a positive perception toward the RHH model. Rural clinicians felt it could deliver much more timely care; rural patients were open to receiving acute care in their homes. Potential barriers included rural hospital and physician politics, cost, safety issues surrounding drug abuse, and the availability of skilled human resources.

Several iterative improvements were made to the RHH model during the mock admissions. For example, the use of a tablet arm was introduced and data transfer limitations were noted for the portable satellite connection. Clinicians and patients that participated had positive experiences and said they would recommend RHH. A clinician noted, "when you can get the patient in their environment and can see how they live…I just think this is better. The environment tells me a lot about the patient beyond what them sitting in a clinic can tell me." A patient noted, "…you're in familiar surroundings…and that makes a difference when you're really sick."

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Pending further study, the RHH model could represent a response to America's struggling rural hospital system. Rural

communities with closed or threatened hospitals could adopt a RHH model to deliver care, potentially allowing for lower-cost, high-quality acute care.

PHYSICIAN PERSPECTIVES ON HOSPITALIST CO-MANAGEMENT ON AN INPATIENT PSYCHIATRY UNIT

Timothy J. Day[2]; Michael Davenport[2,3]; Shimrit Keddem[2]; Matthew Garin[2,3]; Corrie A. Stankiewicz[3]; Robert Burke[1,2]. [1]Hospital of the University of Pennsylvania, Philadelphia, PA; [2]Corporal Michael J. Crescenz VA Medical Center, Philadelphia, PA; [3]Department of General Internal Medicine, University of Pennsylvania SOM, Narberth, PA. (Control ID #3391788)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients with serious mental illness have a higher burden of common medical conditions and there is no "best practice" model for management of co-morbid medical illness on inpatient psychiatry units.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

Widely used hospitalist co-management models for surgical inpatients have proven to decrease complications and improve provider satisfaction. We developed a similar co-management model for our inpatient psychiatry unit. We gathered qualitative data from hospitalists and psychiatrists working on the psychiatry unit with the objective to refine our co-management model, assess provider satisfaction, and ultimately improve patient safety.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The hospitalist service has provided a co-management physician for the inpatient psychiatry unit at the VA Medical Center in Philadelphia since November 2018. The hospital is an academic-affiliated, urban, regional referral center for a VA Integrated Service Network and has a closed, inpatient psychiatry unit with a typical census of 20-35 patients. Patients can be admitted to the unit through the Behavioral Health Emergency Care Unit, from an outside hospital, or as a transfer from medicine. Since its inception, this co-management role included evaluating all new admissions to the psychiatric floor and responding to consult questions from the four inpatient psychiatrists. There has been considerable practice variation among hospitalists.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Form interviews were conducted with eight physician stakeholders. Questions were designed to elicit provider perspectives on changes in patient safety, provider satisfaction, and delineation of roles and responsibilities for providers on the unit since the inception of the co-management model. The interviews were de-identified, transcribed, and the responses analyzed.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): There was universal agreement that the establishment of this hospitalist co-management model improved medical care on the unit and provider satisfaction. Moving forward, all providers desired hospitalist ownership of medication reconciliation, order entry, specialist consultation, and triage decisions. Psychiatric providers voiced a need to define standard practice for documentation and communication of hospitalist interventions. There was improved comfort with managing patients with greater medical complexity at the physician level, but concern that medical acuity could overburden nursing resources. Lastly, all respondents supported shared ownership of patient care, rather than a strictly consultative model.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This hospitalist co-management model was intially developed in response to a perceived increase in medical complexity among patients on our psychiatry unit. By responding to stakeholder feedback, we are moving towards true co-management and away from a consultative attitude. This model is applicable to hospitals with inpatient psychiatry units. However, as physician co-management services expand, the practical limits of nursing and psychiatry unit resources must also be considered.

PHYSICIAN TO PATIENT COMMUNICATION USING A PATIENT-CENTERED AUDIT SYSTEM

Kira Watson, David J. Chung, Charles E. Coffey. LAC+USC Medical Center, Hawthorne, CA. (Control ID #3391664)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): We aim to improve physician- patient communication by using a patient-centered audit system that evaluates physician-patient communication and provides physicians feedback in real time.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To improve the overall quality of communication between patients and physicians in real time

2) To improve performance in the *Communication with Doctors* domain on the HCAHPS survey to >90% "Top Box" by June 30, 2020

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We developed a framework for physician-patient communication, called iSPA, (I-introduce yourself, S-sit down, P-explain the plan for the day and for discharge, A-ask what questions the patient has). We are currently training all physicians in the iSPA technique with plans to implement the framework hospital-wide by end of 2020. To assess the efficacy of iSPA on the quality of communication perceived by patients, we created an audit tool completed by the patient. This form asks patients to indicate if their provider completed the four iSPA behaviors during an encounter, and to rate their overall satisfaction with physician communication. We randomly select hospitalized patients to complete a paper-based audit form after the physician encounter occurs.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We are measuring the percentage of physician-patient encounters in which all four iSPA elements are successfully completed. In addition, we are measuring the average patient satisfaction rating of physician-patient communication. We will also measure the *Communication with Doctors* domain on the HCAHPS survey.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We collected baseline communication data via the patient audit tool in October 2019 on the medical-surgical units in our public teaching hospital. At baseline only 56.4% of audited patient encounters had all four iSPA elements present (Table 1). With the intervention, we saw that 69% of audited patient encounters included all elements of iSPA in December 2019 (Table 2). Similarly, there was improvement in reported patient satisfaction with physician communication; the rate went from 4.16/5 in October to 4.69/5 in December (Table 1 and 2).

We anticipate an increase in HCAHPS over time as we continue the iSPA intervention towards the end of June 2020. Our initial HCAHPs top box score in the *Communication with Doctors* domain was 89.4% in October 2019, and given lag in return of surveys for our institution, we plan to trend over time.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): We developed a patient audit tool to evaluate the use of the iSPA communication technique, and the overall quality communication between patients and physicians in real time. Preliminary results of our project show how the combination of structured communication and consistent, real-time audit and feedback over time can improve patient satisfaction. We hope that over time this improvement in the audit data translates to improvement in our top box score in the *Communication with Doctors* domain. If successful, this project illustrates both a successful model of patient-patient communication, and a method of engaging patients in patient satisfaction improvement efforts.

POINT-OF-CARE DIABETES MONITORING REDUCES CLINICAL INERTIA

Cecilia Kraus[1]; David E. Willens[2]. [1]Internal Medicine, Henry Ford Hospital, Ferndale, MI; [2]Internal Medicine, Henry Ford Health System, Detroit, MI. (Control ID #3390553)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Lack of hemoglobin A1c results at clinic visits can lead to clinical inertia in diabetes care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve reliability of diabetes monitoring by medical assistant-ownership of hemoglobin A1c testing at the point-of-care.

2. Increase frequency of appropriate intensification of diabetes therapy.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In our urban academic primary care clinic during a one-year baseline, our physicians failed to appropriately order 30% of A1c labs for patients with diabetes at clinic visits. We implemented point-of-care A1c (POC A1c) testing by medical assistants (MA) at visit check-in, triggered by electronic medical record (EMR) reminders.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We tracked the rates of MA ordering of POC A1c and physician medication intensification or referral to diabetes support programs in response to elevated A1c values. We compared the rates pre- and post-POC A1c implementation.

Unstructured interviews with clinicians were used to determine barriers to treatment intensification pre- and post-POC A1c implementation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): MA POC A1c testing at clinic visit check-in improved rates of diabetes monitoring to greater than 95% over four months. Prior to POC A1c, physicians received A1c results after the clinic visit and attempted to communicate recommendations to patients via phone call, which posed many barriers. Availability of test results during the visit facilitated meaningful discussion of diabetes management and treatment intensification or referral. Rates of appropriate treatment intensification or referral following traditional A1c versus POC A1c in 397 patients showed 46.2% and 64.0% ($p < 0.0005$), respectively.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementation of POC A1c required coordinated leadership and infrastructure. Our laboratory certified the POC A1c equipment to comply with regulations and trained staff in daily calibration and testing procedures. Health system technology specialists facilitated immediate upload of results into the EMR. Staff leadership created a standing order to allow MAs to test A1c's by protocol. To engage MAs in the new process, competitions for highest rates of A1c testing completion were held between clinics. A multidisciplinary workgroup determined the most efficient workflow and standardized communication of results in the EMR. Though POC A1c is approximately four-times as expensive as lab A1c testing, the clinic's diabetes control rate has improved substantially due to improved reliability of monitoring and reduced clinical inertia in treatment.

PRELIMINARY FINDINGS FROM A PILOT OF AN EMBEDDED IMMIGRATION ATTORNEY WITHIN A PRIMARY CARE SETTING FOR IMMIGRANT AND REFUGEE PATIENTS

Houda Chergui[2]; Claire E. Oppenheim[2]; Sarah Kimball[1,2]. [1]General Internal Medicine, Boston University School of Medicine, Boston, MA; [2]Boston Medical Center, Boston, MA. (Control ID #3390423)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): We seek to evaluate the impact of an embedded immigration legal clinic in a safety net hospital in Boston on immigrant patients' understanding of their immigration legal options, psychological distress, and general health status.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The goal of the legal clinic is to connect immigrant patients with resources to address immigration legal needs within a healthcare setting. The primary objective of this pilot study is to assess change in participants' knowledge of their legal options, in their reported psychological distress and in reported general health status.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The immigration legal clinic is embedded within a clinic that primarily serves immigrant and refugee patients. This clinic has a full-time navigator with expertise in immigration legal issues, who provided referrals to community-based immigration legal resources. Despite this intervention, only 37% of patients referred to community resources were able to secure legal representation. Therefore, we introduced a pilot intervention of embedding an immigration legal clinic staffed by an attorney, who took on cases for pro bono representation or pro se support.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients who received consultation were recruited to participate in an evaluation study that included demographic information, a K6 distress scale, self-rated understanding of immigration legal options and self-rated general health status. Following the consultation, participants rated their level of understanding of immigration legal options. Between 60-90 days after participation in the legal consultation, participants again rated their level of understanding of their immigration legal options and completed the K6 psychological distress scale.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between June and December 2019, 30 participants consented to participate, and 7 reached their 60-90 day follow-up. Participants were from 18 different countries, with the highest proportions hailing from Haiti (18%) and Guatemala (14%). Of those who provided their immigration status, 33% were undocumented, 19% were on a visa or temporary work permit, 24% had a green card, 19% were citizens and 4% had temporary protected status. Following their legal consultation, 3 participants (13%) were taken on for full representation, 1 (4%) was taken on for pro se support, and 20 (83%) received general advice and counsel around their immigration legal concerns and the remainder had a brief service provided during the clinic. We found a significant improvement in participants' understanding of their legal immigration options between before the consultation and immediately

after (Mean score pre-consult=5.21, Mean score post-consult=8.5, p<0.0001). We anticipate that we will obtain 60-90 day follow-up data which will be presented in this Abstract if accepted.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This study shows that embedding immigration legal services in primary care can lead to a significant increase in patients' understanding of their immigration legal options through one meeting with an immigration attorney.

PRIMARY CARE PATIENTS' PERCEPTIONS OF CHAPLAINS AND THEIR POTENTIAL IMPACT IN THE OUTPATIENT CLINIC

Patrick Hemming[1]; Alissa Stavig[1]; Jan Dillard[2]; Katherine Henderson[2]; John P. Oliver[2]; Lynn Bowlby[2]. [1]Department of Medicine, Duke University School of Medicine, Durham, NC; [2]Duke University, Durham, NC. (Control ID #3381512)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): What role do patients perceive a chaplain can play in a hospital-based outpatient primary care clinic?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Beginning in August 2019, the Duke Outpatient Clinic began an outpatient chaplain pilot with a clinical pastoral care (CPE) intern working part-time in the clinic. The aims of the program were to (1) provide an effective outpatient learning CPE experience, (2) better identify patients' and staff members' needs for spiritual care, and (3) Establish a protocol for outpatient chaplaincy

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Duke Outpatient clinic is an urban, hospital-based teaching clinic that provides primary care for many low- income patients. Clinic services include social work, pharmacy support, and care management for medically and psychiatrically complex patients.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We designed and implemented a survey of patients, Surveys were collected electronically on tablets in the waiting room during several clinic sessions. Patients were asked about (1) perception of the level of spiritual support from the medical team (2) prior experiences with chaplains, (3) factual knowledge about a chaplain's role, and (4) perception of chaplains' assistance

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 102 individuals responded (78 % were patients and 22 % were caregivers). While 81 % of patients reported feeling supported by the medical team, only 17 % said that the team had asked about their spiritual needs. A significant minority of patients (23 %) had previously met with a chaplain and all but one reported positive experiences. Patients had significant gaps in their understanding of a chaplain's role. Fewer than 20 % of patients were aware that a chaplain is not primarily present for giving last rites, inviting people to their religion or "saving people." Patients did see chaplains as generally a positive presence. 77 % agreed that health care team member may call a chaplain for any patient. A plurality of patients (40 % or more) stated that they would want a chaplain to assist them with grieving, provide a listening ear, or pray with them.

Fewer than 20 % of respondents said they would want a chaplain to help with making decisions about mental health, physical health, or help them resolve an interpersonal conflict. We are currently gathering similar survey input from residents, attendings and all clinic staff. Since August, our chaplain intern has designed and led a grief support group, and been conducting provider-triggered one-on-one interventions with patients.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Chaplains provide spiritual support to patients from a full range of religious and non-religious backgrounds and do so in support of the medical team. The outpatient clinic offers a unique opportunity to help patients navigate medical care. Based on our findings, key targets are: (1) educating staff and providers on ways to invite discussions about patients' spiritual needs, (2) clarifying misconceptions about chaplains' role and training and (3) develop protocols for common triggers for chaplain care in the outpatient setting.

PRIMARY CARE PROVIDER UTILIZATION OF EMBEDDED AND ELECTRONIC CONSULTATION IN A LARGE, INTEGRATED HEALTH SYSTEM

Jessica Hohman[1]; Elizabeth Pfoh[2,1]; McKinley Crisp[2]; Christopher Babiuch[2]; Michael B. Rothberg[1,2]; Anita D. Misra-Hebert[1]. [1]Internal Medicine, Cleveland Clinic, Cleveland, OH; [2]Medicine, Cleveland Clinic, Cleveland, OH. (Control ID #3392523)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary care providers (PCPs) manage increasingly complex panels. Implementing co-management infrastructure to support specialty access can help ensure timely care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our large integrated health system implemented both embedded and electronic consultative services within our practices to facilitate timely access and support co-management between specialty services and PCPs.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Electronic consultations to 21 specialties were implemented in the electronic medical record across 47 outpatient community and academic primary care sites within the Cleveland Clinic Health System in 2018, enabling providers to obtain specialty guidance without the long wait times frequently associated with in- person appointments. In the same timeframe, additional embedded primary care consultative resources—social work, behavioral health, and pharmacy became accessible telephonically or during primary care visits.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We included PCPs in our sample if they placed >10 consult orders in 2018. For each clinician, we identified the number of electronic and embedded consult orders. Providers were identified as adopters if they ordered >1 electronic or embedded consult and "sustained users" if they ordered >2 consults across two quarters. We used mixed- effects logistic regression models to estimate the association between adoption and sustainment of electronic and embedded consults and provider and panel characteristics, accounting for clustering by practice site.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our study population included 267 physicians and 55 nurse practitioners/physician assistants, with 38% from Family Medicine and 61% from Internal Medicine. The majority of providers were female (56%), with a mean 16 years since training and an average 1332 empanelled patients. Fewer physicians adopted electronic onsults than other embedded consultative services. Almost half (44%) adopted all consult services. In the adjusted regression model, the odds of adopting all consult services increased 7% for every additional 100 patients in a provider's panel (95%CI: 1.02-1.12) and increased twofold for Family Medicine vs Internal

Medicine providers (95%CI: 1.09-3.83). Among adopters, 70% sustained electronic consult use, 69% sustained pharmacy, 74% sustained social work, and 29% sustained all consults. In the adjusted regression model, the odds of sustaining all consults increased 7% for every additional 100 empanelled patients (95%CI: 1.01-1.13) and increased twofold for female vs male clinicians (95%CI: 1.03-5.33).Panel complexity was not significantly associated with provider adoption or sustainment.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A majority of physicians adopted electronic or embedded consultative resources in the first year, with variation in uptake by department type, panel size and provider gender. There remains substantial room for growth. Future work will further define effects of provider panel characteristics and team composition on uptake of these panel management resources.

PROACTIVELY MANAGING SOCIAL DETERMINANTS OF HEALTH: USING A MOBILE TECHNOLOGY PLATFORM TO SCREEN FOR SOCIAL NEEDS AND REFER PATIENTS TO COMMUNITY RESOURCES

Melissa Van Cain[2]; Jennifer G. Faries[1]; Juell Homco[2]; Blake Lesselroth[2]; David Kendrick[2,1]. [1]MyHealth Access Network, Tulsa, OK; [2]Department of Medical Informatics, University of Oklahoma Tulsa School of Community Medicine, Tulsa, OK. (Control ID #3363731)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a community Health Information Exchange (HIE) use mobile technology to screen patients for social determinants of health (SDoH) needs and connect those in need with community resources?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Establish a protocol for collecting protected health information (PHI) from patients through their smartphone. Develop a technology infrastructure based on an HIE for SDoH needs screening.

Deploy a mobile screening workflow to identify SDoH needs, connect patients with community resources to meet identified needs, and provide a feedback loop to clinicians

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : In 2016, the Centers for Medicare & Medicaid Innovation (CMMI) awarded 32 cooperative agreements for the Accountable Health Communities (AHC) nationwide, with the goal of assessing the impact of widespread screening and intervention on 5 specific SDoH needs, including housing instability, food insecurity, transportation needs, utility needs, and safety/interpersonal violence.

In Oklahoma, the Route 66 AHC Consortium led by MyHealth, a local non-profit HIE, found that clinicians struggled to incorporate SDoH screening into their workflow. We developed a novel solution that leveraged HIE and mobile technology to screen patients during clinical intake. The local electronic health record (EHR) sends an automated message to MyHealth, which, in turn, sends a text message to the patient's phone. The message includes a secure link to the AHC Health-Related Social Needs (HRSN) screening tool.

Patients with needs receive a follow-up phone message with a community resource summary (CRS) and tailored referrals to local resources. The CRS typically provides the patient three options: (1) a resource vetted by local partners; (2) a state or national resource; and (3) a resource near the patient. Medicare and Medicaid patients with at least two ER visits in the preceding year are also assigned a personal healthcare navigator. Providers receive secure online reports about their patient panels. This SDoH program qualifies practices for their CMS Merit Incentive Payment System (MIPS) requirement and is an approved methodology for the Comprehensive Primary Care Plus (CPC+) Program.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We use several process metrics to assess the program: (1) practice participation rates; (2) message delivery rates; (3) patient response rates; (4) positive screening rates; and (5) patient acceptance rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between August 2018 and December 2019, MyHealth enrolled 90 Oklahoma practices. MyHealth sent 541,813 SDoH screening messages to 265,487 unique patients; 450,156 (83%) were successfully delivered. 58,480 (13%) patients completed the SDoH screening and 24% of those screened positive, which varied by payer source.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Patient-facing smartphone-based screening is a workflow-compatible innovation to efficiently screen large populations. The HIE provided a platform to automate steps, reduce staff workload, and accelerate clinician adoption. To maximize patient response rates, it is crucial to engage providers and staff in the process.

PROSTATE CANCER SCREENING: IMPLEMENTATION OF A SHARED DECISION-MAKING TOOL FOR PATIENT CONVERSATIONS

Colin Killeen[1]; Anita D. Misra-Hebert[2]; Toyomi Goto[1]; Jacqueline Fox[1]. [1]Internal Medicine, Cleveland Clinic Foundation, Cleveland Heights, OH; [2]Internal Medicine, Cleveland Clinic, Cleveland, OH. (Control ID #3392385)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Conversations regarding risks and benefits of prostate cancer (PCa) screening are important in delivering optimal patient care but providers need guidance to cover the salient points of PCa screening discussions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): -To embed a previously created PCa conversation tool into the electronic medical record (EMR) in our health system to improve PCa screening discussions in primary care.

-To create a best practice alert (BPA) with a link to the conversation tool for men presenting for a primary care office visit who would be eligible for a PCa screening discussion

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Embedding the BPA into outpatient EMR for any man age 55-69 years visiting an internal medicine or family medicine clinic for an annual physical examination within the Cleveland Clinic Health System (CCHS) without a PSA within the last five years. If patients meet the criteria, a best practice alert prompt is activated during the office visit with a link to a conversation tool for PCa screening, as well as the US Preventive Services Task Force PCa screening infographic.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The Shared-Decision Making (SDM-9) 9 questionnaire for patients and clinicians was used to score the engagement in the decision-making process (score 0-45). Tracking with the EMR for BPA use will be performed to analyze conversation tool adoption. The number of prostate specific antigen (PSA) screening tests ordered will be tracked at 6 and 12-months after rollout to all primary care practices to analyze impact.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Creating the BPA and implementing the conversation tool required work with multiple health system informational technology teams. The implementation process required over a year before becoming fully functional. The conversation tool and BPA are now live within one pilot primary care site in the CCHS. A pilot study has currently recruited 13 patients utilizing the conversation tool at the implementation site and 4 patients at a comparison site. Surveys of both patients and clinicians regarding shared decision making have been completed and show both providers (mean=37.2) and patients (mean=38.9) score above the mean regarding engagement in a shared decision when using the conversation tool.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Implementation of an EMR based BPA and PCa screening conversation tool is feasible but requires a lengthy process of internal approvals. Utilizing an EMR based BPA can prompt the use of a conversation tool to improve patient-clinician communication around PCa screening.

EMR BPA alerts for PCa screening discussion when coupled with a conversation tool demonstrate benefits for engagement in shared decision making for both providers and patients.

PROVIDERS ARE PATIENTS TOO: PRIMARY CARE APPOINTMENTS FOR INCOMING INTERNS

Alana Ewen[2]; Rodolfo Villarreal-Calderon[1]; Sara Lynch[3]; Jeffrey Schneider[3]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Graduate Medical Education, Boston Medical Center, Boston, MA; [3]Boston Medical Center, Boston Univ School of Medicine, Boston, MA. (Control ID #3392094)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): A hole in the resident wellness movement—lacking a residency program-based initiative to standardize and exclusively schedule time for interns to receive primary care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): -The PCPAI (Primary Care Provider Appointment Initiative) arranged an initial primary care appointment for interns during orientation week, prior to the inception of clinical responsibilities.

-Sought to directly address the healthcare needs of residents and also explicitly signal to them that their own health is important to the residency program.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : At one academic hospital residency program, all 144 incoming interns (representing 17 specialties) were invited to participate. Interested interns attended individual PCP appointments held at predesignated times during orientation and did not conflict with other orientation or learning activities.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): An electronic survey was administered to all incoming interns and the participating PCPs approximately two weeks following the scheduled PCP appointment date.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Among the 71/144 (49%) interns who responded to the survey, 52% purposed their visit as an important introduction for future appointments, while 15% primarily requested prescription refills. Ninety-nine percent recommended that the initiative be offered again in the future. Seventy-one percent stated that participating in the PCP Initiative definitely/probably led to improvements in their self-care and 76% indicated that participating definitely/probably made them more conscious of their health and well-being.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): PCP visits arranged by the residency program during protected time was met with majority intern participation, positive survey comments, and strong support to continue the initiative. A majority of respondents recommended expansion into services such as mental health, especially relevant for a physician resident population. Primary care is of value and those who care for others must also be cared for themselves.

PROVIDING MEDICATIONS AT HOSPITAL DISCHARGE DECREASES READMISSIONS

Jennifer Xu[1]; Bonnie Stedge[2]; Erica Han[1]; Christa Russie[1]; O'Donnell Christopher[1]. [1]Internal Medicine, Emory University, Atlanta, GA; [2]Emory University School of Medicine, Atlanta, GA. (Control ID #3343582)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Medication nonadherence at hospital discharge is a huge driver for readmissions and poor health outcomes, however, there are limited studies evaluating if providing medications prior to discharge will help readmission rates.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Our study aims to analyze how healthcare systems providing medication at discharge can help readmission rates by eliminating the financial and travel barriers to obtaining medications. We also analyze the effect of readmission rates by diagnosis such as COPD, CHF, pneumonia.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We implemented a multidisciplinary "Meds to Beds" program at Emory University Hospital Midtown. The "Meds to Beds" program provided medications to patients prior to discharge and enrollment was determined by physicians and social workers. In addition, our social services program paid medication copays for under- or uninsured patients for 30 to 90 days using social services funds. This retrospective study compared outcomes of hospital medicine service patients discharged home from Emory University Hospital Midtown between June 2018-May 2019 enrolled in "Meds to Beds" and social services program (n=531) to those who were not (n=6528).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcome was 30-day readmissions and secondary analysis was of 30 day readmissions by admitting diagnosis. Measure of success was a statistically significant decrease in 30 day readmission rates.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Of 7059 HMS patients hospitalized, 739 participated in Social Services program, 714 were in Meds to Beds program, and 531 participated in both. Thirty-day readmissions decreased from 15.5% for patients with no intervention to 11.7% for patients receiving both Meds to Beds and Social Services interventions (p=0.02). Thirty-day readmissions were 12.9% for patients in the Social Services program only (p=0.07 compared to patients with no intervention). Thirty-day readmissions significantly increased between patients with no

intervention and patients in the Meds in Hands program only (15.5% to 18.6%, p=0.03). Secondary analysis by admission diagnosis showed non-significant differences in readmissions.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our study demonstrates that healthcare systems paying for and delivering medications to bedside in uninsured/underinsured patients decreased readmission rates with a relative risk reduction of 3.8%.

QUALITY IMPROVEMENT OF HYPERTENSION MANAGEMENT WITH SINGLE-PILL COMBINATION ANTI-HYPERTENSIVE MEDICATIONS IN INTERNAL MEDICINE CLINIC

Brianna C. Harder, Katherine Gill, Ana Bermudez, Shana Ratner, Jamie Cavanaugh. Medicine, University of North Carolina at Chapel Hill, Chapel Hill, NC. (Control ID #3382290)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Only 68% percent of internal medicine clinic patients' most recent ambulatory blood pressure (BP) measurement was within goal, in spite of available effective therapies.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Develop a standard workflow to identify patients with uncontrolled hypertension (HTN) who may be appropriate for single-pill combination (SPC) anti-hypertensive medication therapy.

2. Promote SPC medications as a HTN management option.

3. Improve HTN control at the population level within clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Internal Medicine Clinic (IMC) cares for over 12,000 patients. The practice includes attendings, residents, and advanced practice providers. The IMC HTN registry includes 4790 patients. HTN control is defined as having the most recent BP <140/90 with the exception of BP <150/90 for patients age 60-85 without diabetes. This intervention was based on a program at the Kaiser Permanente Northern California Health System involving development of an evidence-based practice guideline and promotion of SPC therapy. Multiple Plan-Do-Study-Act (PDSA) cycles were conducted.

We developed standard work using a report from the HTN Registry to identify patients scheduled in clinic who may be appropriate for SPC therapy. A care coordinator was trained to use the HTN Registry report to identify SPC-appropriate patients on a weekly basis and to flag them on the schedule.

We educated providers in person and via email. We collated a list of SPC regimens covered by common insurance formularies and made it available in provider workspaces for reference.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Process measure: Number of SPC prescriptions per month.

Outcome measure: Percent of patients in the HTN registry at blood pressure goal.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the year prior to implementation of the program, September 2018-August 2019, the average number of SPC prescriptions was 16/month. Post-implementation in September 2019-December 2019, the average number of SPC prescriptions increased to 39/month. To date, 278 patients have been flagged for SPC therapy with 159 new SPC prescriptions during this time. The percent of patients in the HTN registry at goal has remained unchanged so far at 68%. However, not all patients started on SPC therapy have had follow up visits to date. Feedback was collected from stakeholders with a survey. Forty IMC clinic providers responded. Most providers (74.4%) had seen the SPC notifications, and 42.5% found them helpful to their clinical decision making. The most commonly identified barriers to prescribing SPC medications were concerns about insurance coverage/cost and limited flexibility of available doses of SPC medications.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This quality improvement project with multiple PDSA cycles showed an increase in SPC prescriptions via provider education, spread of information on cost and insurance coverage, and visit-based prompts to consider SPC therapy. So far HTN control has remained flat in the population. This likely reflects that many of the patients have not yet had follow up, and that multiple other drivers impact population HTN control.

REDUCING INAPPROPRIATE PPI USE AT LOCAL VA

Roger D. Struble[1,3]; Carly Kuehn[2,3]; Iiro Honkanen[1,3]; Behnam Laderian[1,3]; Syndey Bowmaster[1,3]; Amanda Heuszel[1,3]; Noah Williford[1,3]; mackenzie hines[1,3]; Leslie Brettell[3]. [1]Internal Medicine, University of Iowa Hospitals and Clinics, Coralville, IA; [2]Internal Medicine, University of Iowa, Iowa City, IA; [3]Iowa City VAMC, Iowa City, IA. (Control ID #3392020)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Adverse outcomes from polypharmacy are pervasive in medicine with growing concern about adverse events with inappropriate long-term PPI use

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Decrease the number of inappropriately prescribed PPIs in the Internal Medicine (IM) Resident Continuity of Care (COC) clinic at the Iowa City VA Medical Center (VAMC) from 12.9% to below 10% over 3-month period.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : All patients in the IM resident COC clinic at the Iowa City VAMC with active PPI prescriptions were identified. Patients with appropriate use of long-term PPIs on their problem list based on American College of Gastroenterology approved conditions (included 54 ICD-10 codes) were then excluded. Interventions included an educational presentation and a detailed email of de-prescribing strategies sent to all COC residents (N=2,700 patients). Secondly, over 3 months, eligible patients' charts were reviewed weekly and if a patient had a clinic appointment, PPI prescriptions were "flagged" in the CPRS system. The flag prompted a push alert to the provider with expectations to discuss de-prescribing strategies that week. At the end of the 3-month period, medical records were reviewed. This study was deemed HSRD exempt by the VAMC IRB.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The project was evaluated pre and post-intervention by percent of COC patients on PPI without an appropriate indication for PPI use. A secondary measure of success was the number of patients on a decreased dose of PPI. A balancing measure was the number of patients placed back on PPI after attempted deprescribing.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 350 patients of 2,700 were identified without an appropriate indication on their problem list. 101 patients were flagged over a 3-month period before a clinic visit. Of those 101 patients, 15 met appropriate criteria with documentation adjusted by provider. 46 patients were attempted on a de-prescribing strategy, 10 were unsuccessful and placed back on full dose PPI. At the end of the study period, 29 were off a PPI completely, 11 were on a reduced dose which accounted for 42% of patients targeted. Our percentage of potentially inappropriate PPI prescriptions reduced from 12.9% to 11.6%.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The number of inappropriate PPI prescriptions was reduced via a targeted approach of patients most likely to benefit from de-prescribing strategies. We were not able to reach our aim, but 42% of targeted patients had doses reduced and started on de-prescribing process and providers with increased awareness may decrease PPI use in future. Limitations of the study were finding the right way to 'alert' the providers and ability to target only 101 of 350 eligible patients during the 3-month period. Next steps may be to involve pharmacy as they are doing a similar project in a neighboring clinic CBOC inspired by this PPI de-prescribing work, or to roll out a similar project with another medication target for de-prescribing.

REDUCING MISSED APPOINTMENTS IN PATIENTS WITH LIMITED ENGLISH PROFICIENCY

Maarya Pasha[1]; Daniel Tschida-Reuter[2]; Mark L. Wieland[2]; Jane W. Njeru[2]. [1]General Internal Medicine, Mayo Clinic, Apple Valley, MN; [2]Primary Care Internal Medicine, Mayo Clinic, Rochester, Rochester, MN. (Control ID #3390806)

2**STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE):** Work by our group previously showed a higher percentage of missed appointments in patients with limited English proficiency(LEP) than in English speaking patients, and we identified a salient gap in practice as current automatic appointment reminders to all patients are in English.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Using evidence from several studies demonstrating personal reminder calls are effective in increasing attendance, we proposed a quality improvement project with an aim to reduce missed appointments for patients with LEP using personal reminder calls instituted by language congruent interpreters.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Missed appointments were defined as those neither attended by the patient nor previously canceled. During the 1 year intervention period, interpreters called patient using language congruent services the day before their primary care appointments. When calling patients, they informed the patient of location, date, time of their appointment.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Outcome measures were attended appointments. Total number of no shows, and attended appointments were calculated one year prior to and one year post intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our preliminary results (data over 6 months) show an increase in attended appointments after interpreter reminder calls. Prior to the intervention, 80.5% of patients attended their appointment, and after the intervention 90.6% ($p<0.00001$). The no-show percentage decreased from 19.5%, to 9.37% percent of total appointments.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A targeted phone-call in a patient's preferred language can increase appointment attendance for patients with LEP. We believe this work is critically important to improve language-congruent services and increase access to care for the LEP population and will benefit other clinics with similar patient demographics.

REDUCING UNNECESSARY INSULIN USE FOR INPATIENTS WITH WELL-CONTROLLED TYPE II DIABETES

Joseph T. Plugge[1]; Noopur Goyal[2]; Peter Yarbrough[2]; Danielle Babbel[1]. [1]Internal Medicine, University of Utah, Salt Lake City, UT; [2]Internal Medicine, Salt Lake City VAMC, University of Utah, Salt Lake City, UT. (Control ID #3392041)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There is unnecessary inpatient insulin use in patients with well-controlled type II diabetes.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Evaluate the implementation of a novel inpatient diabetes management order set for well-controlled Type II diabetics with A1C of ≤ 8 and only prescribed oral hypoglycemics.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : It is common practice to discontinue oral diabetic medications when patients with type II diabetes are admitted to the hospital. Traditionally these patients are treated with either sliding scale insulin (SSI) or basal bolus insulin (BBI) regimens. Despite the American Diabetic Association guideline recommendation to withhold initial insulin use on type II diabetic patients with a hemoglobin A1C of ≤ 8 who are on oral antihyperglycemic agents alone (cohort group), most of these patients admitted to the Salt Lake City Veterans Affairs Medical Center (SLC VAMC) were prescribed insulin on admission. A retrospective review at the SLC VAMC from November 2018-January 2019 evaluated patients in this cohort. Approximately 25% (23/91) used zero units during their entire inpatient stay. Additionally, 4% (4/91) of these patients used 1 unit of insulin during their stay and 32% (21/91) did not have one blood glucose level >180.

These findings led to the initiation of an updated order set that attempted to limit unnecessary SSI or BBI for well-controlled type II diabetic patients. Implemented in July 2019, the new order set directed providers to order only finger stick blood glucose checks (FSBG) before meals and at bedtime in this cohort. SSI or BBI was only initiated after two readings of >180mg/dl or one above 250mg/dl. This is a post-implementation analysis of that intervention.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Average daily units of SSI for cohort in the pre and post intervention.

2. Unnecessary SSI ordered for cohort pre and post intervention.

3. Average daily hyperglycemic events (FSBG values >180 mg/dl per length of stay) for cohort pre and post intervention.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Average daily SSI use per cohort patient decreased from 2.60 (65.02/25) pre intervention to 1.65 (106.9/64) post intervention. Unnecessary SSI initiation for cohort decreased from 68% of admissions (17/25) to 32% (21/64) post intervention. Average number of times patients had hyperglycemic events over their length

of stay was .88 (22.19/25) pre intervention group vs .75 (48.36/64) post intervention. A difference that is not statistically significant with a Z score of 1.34 with subsequent p-value of 0.177.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Although common practice to start SSI on admission, patients with well-controlled diabetes can be managed safely with FSBG on admission and then SSI or BBI if needed. The brief analysis of this intervention demonstrated decreasing insulin usage without an increase in hyperglycemic events.

RESIDENT-LED GROUP ANNUAL WELLNESS VISITS IN AN UNDERSERVED, PRIMARY CARE CLINIC

Elizabeth Bloemen, Meara A. Melton, Matthew Minturn, Benjamin Trefilek, Cara E. Saxon, Anjali Dhurandhar. Internal Medicine, University of Colorado, Denver, CO. (Control ID #3361687)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can an underserved primary care clinic with resident providers implement a group-style annual wellness visit (AWV)?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Determine the feasibility of implementing a group-style AWV adherent to Medicare reimbursement criteria in a resident primary care clinic; 2) Improve patients' access to preventative care; and 3) Foster an enriching opportunity for patient education focusing on health promotion and disease prevention.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our group-style visit was developed and piloted by resident physicians in an urban, underserved internal medicine outpatient clinic. Patients aged 65 and older who were eligible for a subsequent Medicare AWV were identified.

Prior to the visit, our team reviewed the available literature on shared medical appointments for the AWV, established a process map outlining the visit flow, and developed a novel health risk assessment. We gathered evidence-based education materials on cancer screening, immunizations, diabetic care, and advance care planning for the visit. We reviewed the participants' records prior to the visit to identify preventative care needs and prepare individualized health maintenance plans for each patient.

A diverse group of patients were invited to participate in the group AWV. Initially, patients completed the HRA. Next, residents provided interactive presentations on disease prevention and advance care planning. Then, patients had individual testing of vision, hearing, and mobility. Finally, patients met with the provider to review an individualized healthcare plan and identify areas for further discussion. Documentation was completed using a template to meet reimbursement requirements. Patients completed a feedback form.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The success of this novel group-style visit was measured by assessing participant diversity, attendance rates, and patient satisfaction ratings. We plan to assess patient completion of identified preventative care interventions.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We had 100% attendance for our pilot group-style AWV with a patient group representing varying racial, ethnic, socioeconomic, and health literacy backgrounds. The mean group satisfaction ratings were 4.8/5. Patients rated their individualized care plans with a mean satisfaction score of 5/5 and the likelihood of patients attending the session again received a mean rating of 5/5.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our novel, group-style AWV is generalizable to many primary care clinics, including those with highly complex, underserved patients facing barriers to care. Shared preventative visits offer the opportunity to improve access to care by providing a dedicated opportunity for identifying health risks, enriching patient education, and increasing patient-to- provider ratio to maximize provider efficiency.

RESOLVING CONFLICT AND PROMOTING CONTINUITY BETWEEN PATIENTS AND PROVIDERS: A QUALITY IMPROVEMENT PROJECT AT AN ACADEMIC PRIMARY CARE CLINIC

Sara-Megumi L. Rumrill[1,2]; Ivette Jimenez[3,2]; Lauren Yannucci[3,2]; Sonaz Safari[3,2]; Maya H. Dulay[4]. [1]Division of GIM, Dept of Medicine, San Francisco VA Health Care System, San Francisco, CA; [2]UCSF, San Francisco, CA; [3]San Francisco VA Healthcare System, San Francisco, CA; [4]Medicine, UCSF/VA, San Francisco, CA. (Control ID #3390476)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Conflicts can lead to a patient's request to change their Primary Care Provider (PCP); changing a PCP is disruptive to continuity of care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): We aimed to develop a system for conflict resolution that would reduce the number of Change of Provider (CoP) incidences in our clinic from an average of 27 per month to <20 per month over a 6-month period.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We piloted a change in the CoP process at a large, academic primary care clinic in the San Francisco Veterans Affairs Healthcare System. The clinic is staffed by 23 staff and 43 trainee PCPs caring for >9000 patients. We rebranded the process as a "Request for Resolution" (RfR) to highlight the core value of conflict resolution and continuity rather than simply changing PCPs. We standardized the process for patients, staff, and PCPs to align expectations and increase efficiency and comfort in managing these requests. We created a Communication Tips Sheet to aid staff and providers in conflict resolution. For requests that resulted in a change of PCP, we also created a PCP Best Practices for Handoff Sheet to aid in the transition of patients and a booklet of PCP profiles for patients to pick a best-fit provider up front to reduce future conflicts.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We measured the number of RfR per month and tracked the reasons and outcomes of each RfR.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We reduced the number of CoP requests from an average of 27 per month over the preceding 14 months to an average of 11 RfR per month in the last 8 months. Analysis showed that 13% of RfR were resolved with the patient staying with the same PCP, 67% resulted in a CoP to a PCP in the same clinic, and 7% led to a CoP to a VA PCP in a different clinic. Less than 6% were unresolved due to inability to reach the patient. The top reasons for a RfR were a scheduling conflict (22%), reported poor relationship/communication skills (22%), and trainee status of the PCP (12%). A portion of RfRs involved opioids (7%) and a minority were due to PCP degree (MD vs NP) (1%).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our pilot successfully reduced the number of CoP incidences in our clinic. We attribute success to intentionally taking a step back and addressing the root causes of why patients request a CoP and creating processes that align with the value of continuity. We learned that standardizing the process and training staff and providers to work collaboratively in the new process are critical. Our current process is still time intensive. A study limitation is coding the primary reason(s) for RfR based on patient disclosure and chart review. Next steps include collecting patient and provider satisfaction data on the RfR pilot and evaluating efficiency metrics in our process. We plan to iteratively improve and share best practices with other primary care clinics that are struggling with high CoP requests.

RESPONDING TO HOUSING NEEDS IN PRIMARY CARE: DEVELOPING A TIERED APPROACH USING QUALITY IMPROVEMENT

MaryCatherine Arbour[3]; Christin N. Price[1]; Charline Gay[4]; Lipika Samal[2]; Richard S. Gitomer[3]. [1]Psychiatry, Brigham and Women's Hospital, Brookline, MA; [2]Brigham and Women's Division of General Internal Medicine, Harvard Medical School, Boston, MA; [3]Internal Medicine, Brigham Health, Boston, MA; [4]Brigham and Women's Physician's Organization, Boston, MA. (Control ID #3392794)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): In the Brigham Health Medicaid ACO, 20% of patients have housing-related needs and resources exist to address those needs; the Brigham Social Care Team (SCT) needs to define a strategy to allocate those resources and refine processes to maximize impact.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To determine criteria for classifying types of housing needs and define for each: the best obtainable outcome, the intensity and duration of support needed to obtain that outcome, and the appropriate team member to provide that support.

2. To test and refine processes for responding to housing needs, including a process to triage housing cases to the appropriate member of the SCT and a process for consultation between members of the team that facilitates appropriate escalation of complex cases.

3. To describe the prevalence of housing needs by type, the SCT response, and housing outcomes.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Brigham Health SCT supports 14 primary care practices to address health-related social needs. The team includes community resource specialists (CRS) who provide information to patients about available resources telephonically, community health workers (CHWs) who provide practical, emotional, motivational and system navigation supports over 6 months, and housing advocates with the expertise to accompany patients in court or negotiate with landlords. All members participate in biweekly case review with a lawyer, who provides consultation on complex cases. In November, 2019, the team launched a quality improvement project and defined criteria to classify six types of housing needs: homeless, displaced, eviction with a notice to quit, at risk of eviction prior to notice to quit, housing conditions insufficient, and housed with friends or family. Testing is ongoing of centralized CRS triaging all housing referrals, of different triage questions and role assignment and a 'rapid consult' model for CRS to receive real-time coaching from a housing advocate.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Percent of patients with housing needs that were contacted. In addition, we plan to review these referrals to determine appropriateness, frequency of housing needs by type and percent of cases in which the best obtainable outcome was obtained, via chart review. We also plan to measure SCT team member satisfaction, as measured by a survey (under development).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From April to December, 2019, different clinics tested two processes. One process sent all housing cases directly to the housing advocate: of 463 referrals, 21% could not be reached, 37% needed housing application support, 8% needed shelter, 1% needed eviction prevention. The other process sent housing cases to centralized CRS for triage. Of 231 referrals, 49 were triaged to the housing advocate, 4% of those could not be reached, 38% needed support with housing applications, 2% needed shelter, 29% needed eviction prevention.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A tiered approach with clear processes for triage and escalation across roles should reduce waste and improve impact of existing resources on patients' housing needs and health.

RN-PERFORMED MEDICARE ANNUAL WELLNESS VISITS: A PILOT IN A GENERAL INTERNAL MEDICINE PRACTICE

Claudia Berger, Cristine Gay. Medicine, University of Vermont Medical Center, Burlington, VT. (Control ID #3367417)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can RN-performed Medicare Annual Wellness Visits be integrated into a GIM practice with patient acceptance and maintenance of quality?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Integrate RN-performed Annual Wellness Visits (AWVs) into an outpatient GIM practice

2. Increase the total number and rate of patients receiving Medicare AWVs

3. Maintain or improve the quality of AWVs

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : While registered nurses are able to perform AWVs in outpatient primary care clinics, within the University of Vermont Medical Center system, these exams were being conducted only by primary care providers (PCPs). The AWVs were not getting full attention because they were frequently done at the same time as chronic care follow-up visits. At one outpatient GIM academic practice, we piloted an RN conducting AWVs 2 days per week. The RNs (whose primary role is in phone triage and phone care) were trained to perform the AWV and document in our EHR. Training included how to administer a falls risk assessment and a cognitive screen. Patients were scheduled with their PCP ideally the same day after the RN-performed AWV or within a few weeks of the AWV.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): 1. Total number of RN- performed AWVs

2. Total number of AWVs completed

3. Percentage of RN- versus PCP-performed AWVs

4 Patient satisfaction and provider satisfaction

5. Completion of health maintenance endpoints in patients receiving RN-performed AWVs versus PCP- performed AWVs

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 1. Total number of RN-performed AWVs

a. First year of pilot (3/1/2018-2/28/2019): 127 AWVs

b. Second year of pilot to date/9 months (3/1/2019-12/15/2019): 175 AWVs

2. Total number of AWVs completed during pilot phases a. First year of pilot (3/1/2018-2/28/2019): 1,156 AWVs

b. Second year of pilot to date(3/1/2019-12/15/2019): 877AWVs

3. RN-performed AWVs as a percentage of the site's total AWVs:

a. First year of pilot (3/1/2018-2/28/2019): 11%

b. Second year of pilot to date (3/1/2019-12/15/2019): 20%

4. Patient satisfaction via surveys

a. 23 of 23 respondents rated their RN AWV as being "Great"

b. 23 of 24 respondents were not concerned with seeing an RN versus an MD/APP

c. 23 of 24 respondents felt the nurse had more time to talk with them about their health and wellness than their doctor

5. Provider satisfaction via written feedback shows high degree of provider satisfaction

6. Completion of Health Maintenance Endpoints in patients receiving RN-performed AWVs versus PCP- performed AWVs: Health Maintenance Endpoints data not available at time of abstract submission

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. RN-performed AWVs can be successfully integrated into a GIM primary care practice

2. There is a high degree of patient and provider satisfaction

3. Educating scheduling staff about AWVs and how to schedule is important

4. Educating patients about AWVs is important

5, Our patients seemed to appreciate having an office visit with their PCP after their AWV, ie they were happy to see a nurse as long as they could see their PCP as well

6. Complaints and concerns from patients about being billed for their provider visit after a "free" AWV were minimal

SERVING HEALTH ON MYPLATE: VISUAL TOOLS GUIDE HEALTHY EATING

Chetan Virmani[4,2]; suzette tan[4]; Jessica Perez[4,2]; Zeeshan Sattar[4,2]; Christon Grant[4,2]; Evan Botti[4,2]; Sandra Joseph[4]; Andrew A. Chang[4,3]; David L. Stevens[4,2]; Nadia A. Williams[1]; Melissa S. Lee[4,2]. [1]Ambulatory Medicine, Kings County Hospital, Brooklyn, NY; [2]Internal Medicine, SUNY Downstate Health Sciences University, Brooklyn, NY; [3]Internal Medicine, Internal Medicine Residency Program, SUNY Downstate, Brooklyn, NY, United States, Brooklyn, NY; [4]Ambulatory Medicine, NYC Health + Hospitals/Kings County, New York, NY. (Control ID #3392083)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Will a brief nutritional counseling intervention during the primary care visit impact patient confidence and motivation around choosing healthy foods?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To increase satisfaction in dietary counseling, as well as confidence and motivation to make healthier food choices, among patients in our adult primary care clinics.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : New Yorkers living in our Afro-Caribbean Flatbush/East-Flatbush Brooklyn community have a high incidence of diet-related illnesses such diabetes (15.6%), obesity (34.3%), and hypertension (30%). In 2017, 18% of Brooklyn adults reported consuming less than one fruit or vegetable daily. The current strategy includes referral to a dietician, however in 2018 there was a 39% no-show rate. Access is limited by social determinants of health including transportation, cost, and employment scheduling conflicts.

From July to November 2019, a team of primary care providers (PCPs) counseled patients during scheduled visits using "MyPlate," a standardized visual 9-inch tool recommending the following meal proportions: 50% fruits and vegetables, 25% starch, and 25% protein. This team included an interdisciplinary group of residents and nurse practitioners, formally trained in motivational interviewing and patient-centered communication techniques. These techniques were used in delivery of "MyPlate," and to aid patients in choosing specific diet change goals.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): We used a quasi- experimental design with a pre- and post-intervention survey that utilized a 5-point Likert Scale to assess patient insight into the importance of diet to their health, confidence in their ability to choose a healthy diet, and their motivation to make these dietary changes.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 64 patients were included in the study; 63 answered all questions. Using a paired sample t-test, a statistically significant increase was observed across all patient factors (insight, satisfaction, confidence and motivation). Post-intervention, questions measuring insight increased the average Likert scale from 3.09 to 3.95 ($p<0.001$). Average Likert scales improved for questions assessing satisfaction 3.79 to 4.56 ($p<0.001$), confidence 3.91 to 4.34 ($p=0.020$), and motivation 4.28 to 4.66 ($p=0.004$) after MyPlate counseling.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Utilization of "MyPlate" for brief, directed nutrition counseling during primary care visits is effective in populations where social determinants of health impact viability of traditional methods. When delivered using clinical communication techniques, such as motivational interviewing and patient centered communication, patient confidence and motivation to change increases.

SKILLED NURSING FACILITY CARE AT HOME FOR ADULTS DISCHARGED FROM THE HOSPITAL: A PILOT RANDOMIZED CONTROLLED DELIVERY INNOVATION

David M. Levine[1]; Mary Cueva[1]; David Grabowski[2]; Jeffrey L. Schnipper[3]; Charles T. Pu[4]. [1]General Internal Medicine and Primary Care, Brigham and Women's Hospital, Boston, MA; [2]Health Care Policy, Harvard Medical School, Boston, MA; [3]Division of General Medicine, Brigham and Women's Hospital, Boston, MA; [4]Medicine, Massachusetts General Hospital, Boston, MA. (Control ID #3391341)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Given rapidly accelerating skilled nursing facility (SNF) costs and mixed post-acute care outcomes, can SNF services that would normally be delivered at a facility instead be delivered in a patient's home with the right personnel, technology, and workflows?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Pilot randomized controlled trial of SNF delivery in the patient's home vs usual care in a SNF. Determine feasibility of recruitment and measurement of cost, quality, safety, and experience.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Inpatients on a medical service likely to return to community dwelling status with capacity to consent were assessed for enrollment after inpatient physical therapy (PT) determined necessity for SNF. Exclusions included the need for blood transfusion, IV controlled substances, and significant durable medical equipment not already in the home.

Staff included 24-hour home health aide assistance (tapered following the first 3 days), daily visits from a certified nursing assistant (CNA) for assessment and plan of care check-in, a visit on admission from a nurse to perform medication reconciliation and guide the CNA as needed remotely, and a visit on admission from a physician to establish care and guide the plan of care remotely. Core technologies included remote PT (avatar-directed sessions), automated medication dispensing, and continuous biometric monitoring of vital signs and activity. Patients were discharged when their functional status improved to community dwelling status.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary: cost of the SNF episode. Secondary: length of stay (LOS), 30-day readmission, functional status change, and patient experience.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We randomized 10 patients (2 arms: 5 home; 5 control). Many eligible patients were SNF-averse and therefore could not be enrolled. At baseline, home patients were median age 88, 80% female, 80% White, frail (PRISMA 4), could perform a median of 2/6 ADLs and 3/8 IADLs, and 80% had been admitted within 6 months. Control patients were similar, except for median age 80. Home patients' episode cost a median $11,147 (IQR, $8099) vs $11,360 (IQR, $9490) for controls. LOS for both arms was 14 days. Home patients' median Picker satisfaction score was 12/14 (IQR, 2) vs 7/14 (IQR, 3) for control patients. One home patient was readmitted once vs 2 control patients were readmitted twice each within 30-days of SNF discharge. Zero home patients vs 1 control patient died within 30-days of discharge. Home patients' ADLs improved between admission and 30-days post-discharge by a median of 4 (IQR, 5) vs 1 (IQR, 2) for controls. One home patient was returned to the hospital due to orthopedic hardware malfunction.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A SNF-at-home pilot compared favorably to traditional SNF, with similar cost, greater improvement in functional status, and better patient experience. This SNF delivery innovation could reimagine how we deliver rehabilitative care, although it requires replication in a larger cohort.

SOCIAL DETERMINANTS OF HEALTH SCREENING AND REFERRAL ACROSS A MEDICAID ACCOUNTABLE CARE ORGANIZATION (ACO)

Katherine Schiavoni[2,1]; Kristy Helscel[2]; Trang Hickman[2]; Skye Aaron[2]; Esther Kim[2]; Christine Vogeli[2,3]. [1]Harvard Medical School, Boston, MA; [2]Population Health, Partners HealthCare, Boston, MA; [3]Mongan Health Policy Institute, Massachusetts General Hospital, Boston, MA. (Control ID #3389225)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): How can a Medicaid ACO identify and address social determinants of health (SDOH) across a large and diverse provider network?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To develop workflows to screen all patients in a Medicaid ACO for SDOH using a standardized tool. To provide patients who screen positive with printed resources or navigator referral to assess the availability and capability of social service organizations to address the identified needs. To improve health outcomes and reduce medical spending by collaborating with social service organizations to address SDOH as part of value-based healthcare.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Partners HealthCare Inc. is a large network of hospitals and outpatient practices including both academic medical centers and community providers. Partners implemented SDOH screening for all Massachusetts Medicaid ACO patients in March 2018. There are over 113,000 patients enrolled in the Partners ACO across 9 Regional Service Organizations. In the intervention, primary care patients are screened using a standardized tool that includes 13 questions in 10 domains. Practices may administer the screen with an iPad that populates responses in the Electronic Medical Record (EMR) or on paper and enter responses into a secure database. If a need is identified, the clinical team may offer a resource tip sheet or refer to a community resource navigator who collaborates with social service organizations to address the need.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of success include metrics of implementation, process, and outcomes. Implementation metrics include the number of practices screening and the number of patients who received screeners. Process metrics include the proportion of patients who completed the screen and who indicated a social need, the prevalence of social needs, and the response to needs with printed resource materials or referral to navigation. Finally, analyses are underway to identify outcome metrics such as resolution of identified social needs, chronic disease control (eg HbA1c, BP) and total costs of care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The SDOH screener was adopted by 168 practices across the Partners network. Since March 2018, 43,054 patients completed the screener, or 60.1% of those eligible. 33,553 (78%) indicated at least 1 social need. The most common social needs reported were interest in more education (26%), food insecurity (18%), help with utilities (12%) and housing insecurity (11%). Overall, 15% of patients with a positive screen received a tip sheet or referral to resource navigation that was documented in the EMR. The most frequently referred needs were education, food, and housing.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Screening for SDOH can be implemented in a Medicaid population across a large and diverse provider network. Administering the screening tool using an iPad allows direct flow of data to the EMR and tracking of subsequent responses to identified social needs. Following implementation, additional follow-up work is needed to optimize completion of the screening tool by eligible patients and facilitate connection to social resources.

SPECIAL OPERATIONS: THE OPERATIONS HOSPITALIST AS A BRIDGE BETWEEN FRONT- LINE PROVIDERS AND INSTITUTIONAL RESOURCE STEWARDSHIP

Eliah M. Malka[1,2]; Hilary D. Bollman[1,2]; Corrie A. Stankiewicz[1,3]; Matthew Garin[1,2]. [1]Internal Medicine, Corporal Michael J. Crescenz VA Medical Center, Philadelphia, PA; [2]Medicine, Hospital of the University of Pennsylvania, Philadelphia, PA; [3]Department of General Internal Medicine, University of Pennsylvania SOM, Narberth, PA. (Control ID #3391933)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can incorporation of a dedicated Operations Hospitalist (OH) role reduce length of stay (LOS) without increasing readmission rates on the inpatient medicine service at a VA medical center?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) To build an OH role to support the clinical mission of the inpatient medicine service at a VA medical center

2) To reduce LOS on the inpatient medicine service at our VA medical center without a concomitant increase in readmission rates

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : All medical providers experience the tension of balancing the utilization of resources across a population against advocacy for their primary patients. Hospitalists experience this tension as they attempt to be stewards of institutional resources who also deliver patient-centered care within the same care system. We hypothesized that by separating institutional priorities from primary provider clinical responsibilities that we could decrease LOS without increasing readmission rates on the inpatient medicine service at our VA medical center. We created a dedicated Operations Hospitalist (OH) who is responsible for the longitudinal progress of medicine inpatients through the hospital. The OH is responsible for facilitating admission flow from the emergency department; reviewing inpatient charts for unrecognized, time-sensitive discharge barriers; leading our face-to-face interdisciplinary workgroup (nursing leadership, social workers, case management and direct care providers) to effectively navigate hospital resources; and serving as the clinical lead for daily follow-up on patient progress toward discharge.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures of Success: LOS and readmission rates on our inpatient medicine services were monitored during the year after the implementation of the OH role and were compared to an analogous timeframe from the year prior to implementation.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the year prior to implementation of the OH role (2/1/2017 - 1/31/2018) there were 3,139 admissions to our general medicine ward services totaling 14,685 bed days, generating an average LOS of 4.68 days with a readmission rate of 11.8%. During the year after the implementation of the OH role (2/1/2018 - 1/31/2019) there were 3,034 admissions totaling 9,909 bed days, generating an average LOS of 3.27 days with a readmission rate of 12.5%. This represents a total decrease of 4.776 patient bed days, or a 32.5% reduction in bed days, over a 12-month period with a stable readmission rate.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Incorporation of an OH into the interdisciplinary care team can lead to a significant reduction in LOS without negatively impacting readmissions rates on the inpatient medicine service at a VA Medical Center. Providers in the OH role must have deep institutional knowledge of care systems, facilitate a collaborative approach to problem-solving, and maintain positive working relationships across the hospital system.

STANDARDIZING CERVICAL CANCER SCREENING RESULT NOTIFICATION AND FOLLOW UP AT THE VA THROUGH EMR MODIFICATION AND AUTOMATION

Elizabeth "Betty" Kolod[1,2]; Adelina Fuentes-Ramos[3]; Sritha Rajupet[1,2]. [1]Preventive Medicine, James J. Peters Veterans Affairs Medical Center, Bronx, NY; [2]Environmental Medicine and Public Health, Mount Sinai Medical Center, New York, NY; [3]Medical Informatics, James J. Peters Veterans Affairs Medical Center, Bronx, NY. (Control ID #3366263)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The Veterans Health Administration (VHA) requires each hospital to maintain a standard workflow for addressing abnormal cervical cancer screening results. At James J. Peters (JJP) Veterans Affairs (VA) Medical Center in the Bronx existing processes are varied, time-intensive, and unconducive to population health management.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Create a standard workflow for report and follow up of cervical cancer screening results.

2. Create an eletronic medical record (EMR) tool to streamline this workflow and code data to automatically set due date for next cervical cancer screening.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We convened stakeholders in outpatient cervical cancer screening at JJP. The working group included Primary Care, Gynecology, Informatics, Prevention, Nursing, and System Redesign. The group identified a need to create a standard EMR workflow for reporting Pap smear results, documenting communication of results, setting next cervical cancer screening due date in response to Pap smear results, and ordering referral to Gynecology for colposcopy. We drafted note language in monthly meetings and designed the Pap smear result notification dialogue box through close, frequent collaboration between an internist/preventive medicine resident and an informaticist.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The Pap smear result notification tool is evaluated on simplicity relative to the prior process (fewer mouse clicks and dialogue boxes), inclusion of all required steps in the existing process, and accessability to all providers, standardizing the workflow.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Our intervention met the aim of streamlining the Pap smear result reporting and follow up process, acheiving the utility of the previous process in 1 to 4 mouse clicks, within a single dialogue box. Added benefit includes coding of data for population health management.

The previous steps of the process, though unique to each provider, included drafting a result note, drafting a patient letter if not reached by telephone, setting an EMR due date for next Pap smear in a separate dialogue box (some providers did not complete this step and due date would default to 3 years), and ordering Gynecology consultation in a separate dialogue box, as needed.

The new tool comprises single-click, modular, coded options for each test finding (ie, insufficiency of sample, ASCUS, dysplasia, and HPV) and for next Pap smear due date or follow up with Gynecology for colposcopy. Clicking all that apply generates an EMR result note and a patient letter, sets the EMR due date for next Pap smear, and places a Gynecology consult, as needed.

This tool is accepted by Primary Care and Gynecology and has replaced the previous process, standardizing Pap smear result reporting and follow up at JJP VA medical center in the Bronx.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Multidisciplinary collaboration between physicians and informaticists can yield elegant EMR modifications that reduce complexity while meeting the needs of physicians in a changing primary care landscape. Informatics tools including automation are particularly promising.

TARGETED INPATIENT MAMMOGRAPHY TO REDUCE DISPARITIES IN BREAST CANCER SCREENING RATES

Andrew S. Hwang[1]; Brian Dontchos[2]; Karen Dyer[2]; Jennifer Murray[2]; Jennifer Searl Como[4]; Daniel M. Horn[3]. [1]Division of General Internal Medicine, Massachusetts General Hospital, Cambridge, MA; [2]Division of Breast Imaging, Massachusetts General Hospital, Boston, MA; [3]Department of Medicine & the Massachusetts General Physicians Organization, Massachusetts General Hospital, Boston, MA; [4]Performance Analysis and Improvement, Massachusetts General Hospital, Boston, MA. (Control ID #3372223)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): There are significant disparities in breast cancer screening rates among commercially insured, Medicaid and dual-eligible (Medicare/Medicaid) patients.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. To test the feasibility of performing screening mammograms during hospitalizations

2. To perform screening mammograms for Medicaid and dual-eligible patients during hospitalizations, in order to reduce disparities in breast cancer screening rates.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The intervention was performed among patients admitted to the Medicine service at a large, urban, academic medical center. Patients were eligible for the program if they met all of the following criteria: 1) has a primary care physician who is affiliated with the academic medical center, 2) is overdue for breast cancer screening (i.e. age 50-74 and never had a screening mammogram or >2 years since last mammogram), 3) does not have an outpatient mammogram that is already scheduled, and 4) is insured by Medicaid or both Medicare and Medicaid. Exclusion criteria included any of the following: 1) inability to complete mammogram due to physical disability (e.g. paraplegia), critical illness or altered mental status, 2) admitted involuntarily under Section 12 for psychiatric emergency, or 3) unlikely to benefit from breast cancer screening due to limited life expectancy. Up to three emails were sent to each eligible patient's inpatient providers, asking them to consider completing a mammogram prior to hospital discharge.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary measure of success was the number of patients who successfully completed breast cancer screening during hospitalizations.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Between March and December 2019, 43 potential intervention candidates were identified based on chart review. Emails were sent to the inpatient providers caring for these 43 patients. 33 out of 43 (77%) of providers responded to the emails. 19 patients were deemed appropriate candidates while 8 patients were deemed inappropriate and 6 patients refused. Of the 19 appropriate candidates, 14 patients successfully completed inpatient mammograms. Remaining 5 patients were discharged before inpatient mammogram could be coordinated. Characteristics of patients who completed the mammogram were: mean age 60 years, 10 (71%) on Medicaid, 6 (43%) non-White, and 2 (14%) non-English speaking. All screening mammogram results were negative (BI-RADS Category 1 or 2) except for one where additional imaging evaluation was recommended (BI-RADS 0).

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Improving population health outcomes among those who are difficult to engage in the outpatient setting will increasingly become important as the healthcare system transitions from fee-for-service to value-based payment models. Implementation of an inpatient screening mammogram program can be a valuable tool for improving breast cancer screening rates among vulnerable patient populations and reducing disparities in care.

TELEMEDICINE ENHANCED COMMUNITY PARAMEDICINE: IMPLEMENTATION ACROSS A HEALTHCARE SYSTEM

Christian Escobar[1,2]; Kevin Munjal[3]. [1]Medicine, Icahn School of Medicine, New York, NY; [2]Geriatrics and Palliative Care Medicine, Icahn School of Medicine, New York, NY; [3]Emergency Medicine, Icahn School of Medicine, New York, NY. (Control ID #3384010)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Medicare mainly allows payment for emergency ambulance services when individuals are transported to emergency rooms and hospitals. Most patients who call 911 with an emergency are thus transported to these facilities, even when a lower-acuity home intervention may more appropriately meet an individual's needs.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To effectively and safely assess and treat acutely ill patients in the home through the use of telemedicine enhanced community paramedicine (CP) in partnership with a physician from the medical system. To reduce unnecessary transportation of patients to the ER through the use of CP.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : As we move toward value based models, health systems look toward new multidisciplinary models to improve quality, reduce costs and reduce burden in emergency rooms and hospitals. Community paramedicine (CP) is an emerging field in which paramedics operate in expanded roles in conjunction with a physician. Mount Sinai Health System in New York implemented a telemedicine enhanced CP program servicing a variety of outpatients in NYC, including primary care practices, a heart failure group, as well as those active to home care nursing and hospice programs. Patients call in with an acute issue to their outpatient practice or nursing agency and a CP call can be initiated. CP Trained paramedics from a private ambulance company work in partnership with physicians, either from the primary practice or an emergency department physician through the aid of video conferencing to provide acute care, assessment and triage in the home.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Data on number of calls per program, mean response time, mean paramedic and physician times and frequency of chief complaints was collected. Number of patients transported, 3 day ED visit and 30 day admission rates for those not transported was also collected.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): From 2017 to 2019, 522 CP encounters were recorded. The largest number were initiated from the house calls primary care practice (48.7%), followed by calls initiated from home care nursing for recently discharged patients (18.6%). The remainder came from home hospice (8.2%), other primary care practices (9.2%), the home hospital program (3.4%) and heart failure practice (1.9%). The mean EMS response time was 50min, and the average time on scene was 1hr 27min, with physicians on average spending 40min facilitating the call. The most common chief complaint was shortness of breath (27%), followed by generalized weakness (9.4%) and altered mental status (7.1%). Of CP encounters, 29.5% resulted in transport to the ED. Of those that stayed

home an encounter, 6.9% went to the ED within 3 days and 6.3% who stayed home had a 30 day hospital admission.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Telemedicine enhanced community paramedicine can be a useful tool to outpatient practices to provide effective and urgent evaluation and care in a patient's home and can be a useful model for reducing the burden of overcrowded emergency rooms. Reimbursement models need to change to allow for further implementation and evolution of community paramedicine.

THE DEVELOPMENT OF A NOVEL ED 'SOCIAL MEDICINE' PROGRAM

Jack Chase[2]; Molly Anderson[1]; Jenna Bilinski[4]; Samantha Shapiro[4]; Hemal K. Kanzaria[3]. [1]Internal Medicine, ZSFGH, UCSF Medical Center, San Francisco, CA; [2]Family Medicine, ZSFGH, UCSF Medical Center, San Francisco, CA; [3]Emergency Medicine, UCSF-SFGH, San Francisco, CA; [4]Kaizen Promotion Office, San Francisco Department of Public Health, San Francisco, CA. (Control ID #3392197)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): On average, 10-15% of short-stay ED admissions (~550/year) are requested to manage complex health-related social needs in low medical acuity patients, resulting in negative impacts across our hospital system.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Reduce social needs related short-stay hospitalizations by 50%, or ~20/month. Increase averted admissions from zero per month (at the program's inception) to nine per month. Improve scores across all domains for Lencione's 5 Dysfunctions of a Team for multi-disciplinary team members.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : As a safety-net hospital, Zuckerberg San Francisco General (ZSFG) Hospital cares for a patient population with complex medical, psychological, and social needs. Over one-third of patients admitted through the ED have ≤2-day hospital length-of-stay, with many of these patients being low medical acuity with high social complexity (e.g., homelessness, mental illness, substance use). A lack of an integrated medical-social model of care in the hospital system results in missed opportunities to coordinate care for these patients and decrease potentially preventable inpatient admissions. In response to this problem, we created the ZSFG Social Medicine multidisciplinary team (ED SM) comprised of physicians, social workers, utilization management nurses, and patient care coordinators. We have also developed a close partnership with community partners (e.g., shelter health, Department of Public Health transitions team, homeless outreach). The team meets daily to round, using standard work built collaboratively through regular tests of change. There is also a weekly team meeting to further develop the program and team by using process improvement tools with a data-based, standardized approach to problem-solving.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success is defined by averted admissions and reduced readmissions. Success for efforts to develop the team are defined by improvements in the 5 Dysfunctions of a Team domains.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Since the program started in early 2018, admissions for a social need were decreased by 20 patients/month. Over 3,000 patients were referred to transitional and permanent supportive housing programs, food resources, case management, and protective services. The estimated cost savings from the over 230 averted admissions equaled over $870,000 in 2018. There have also been improvements in four of the five domains in the 5 Dysfunctions of a Team for all team members.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This intervention creates alignment for all care providers in the ED and is widely accepted for this reason. The focus of the team is the patient's self-identified needs. We find it important to focus on what the patient feels is most urgent, which is often different than their presenting medical problem. Our project is successful due to the data-driven, standardized approach to process improvement. This engages all team members, removes barriers for executive support, and supports funding applications. Last, due to complexity, any similar project would require a multi-disciplinary team-based approach to function.

THE IMAGING LEARNING NETWORK: AUTHORING, BUILDING AND IMPLEMENTING IMAGING CLINICAL DECISION SUPPORT (CDS) FOR PAMA AND VALUE-BASED CARE DELIVERY.

Jonathan Darer[1]; Peter J. Greco[2]; William Baughman[5]; Andrew M. Davis[3]; Keith White[4]; Becky Downs[6]; Elizabeth Fitzwater[8]; Eric Gross[10]; Sameer Malhotra[7]; Kevin McEnery[9]; Aman Parikh[10]; Nicholas Riley[2]; Jessica Rotman[11]. [1]Medicalis Clinical Decision Support, Siemens Healthineers, Lewisburg, PA; [2]Internal Medicine, The MetroHealth System, Cleveland, OH; [3]Section of General Internal Medicine, University of Chicago, Chicago, IL; [4]Radiology, Intermountain Healthcare, Salt Lake City, UT; [5]Radiology, MetroHealth, Cleveland, OH; [6]Epic Radiant, MD Anderson, Houston, TX; [7]Internal Medicine, Weill-Cornell Medicine, New York City, NY; [8]American College of Cardiology, Washington, DC; [9]Radiology, MD Anderson, Houston, TX; [10]Emergency Medicine, UC Davis, Sacramento, CA; [11]Radiology, Weill-Cornell, New York City, NY. (Control ID #3389568)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Beginning January 2021, the CMS PAMA mandate requires physicians ordering advanced imaging (CT, MR, nuclear medicine) for Medicare patients to consult appropriate use criteria (AUC) authored by qualified Physician Led Entities (qPLEs). AUC are authored by clinical experts using variable formats and limited consideration for interoperability and informatics resulting in unique challenges when translating AUC into CDS interventions.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The Imaging Learning Network (ILN), formed 2016, is a collaboration between nine health care institutions, six qPLEs, and a clinical decision support (CDS) mechanism seeking to advance the practice and use of imaging clinical decision support. ILN healthcare institutions are located in California, Texas, Utah, Ohio, New York and Illinois, The ILN has four major objectives: a) support the creation of high-quality appropriate use criteria (AUC), b) enhance the imaging CDS end-user experience, c) accelerate learning through benchmarking and evaluation, and d) enable semantic and technical interoperability.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The ILN meets monthly for 90 minutes and at a year retreat to discuss issues in imaging clinical decision support and the development of the ILN Indication Ontology and the ILN Comparative AUC Library. ILN members provide feedback to authoring organizations resulting in improved AUC. Starting in 2020, ILN members will receive provider

specific CDS activity reports, facilitating benchmarking and quality improvement activities.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Each ILN members collects baseline and prospective data enabling evaluation of the impact of CDS upon rates of imaging, alignment with AUC, and imaging order errors. Some ILN institutions also collect data to assess the impact of CDS upon end-user experience.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The ILN has met for over 3 years leading to the development of two major conceptual frameworks - the ILN Indication Ontology and the ILN Comparative AUC Library.

THe ILN Indication Ontology consists of over 4,000 clinical concepts, conceptual relationships, and mappings to external ontologies to support the consistent and efficient authoring of semantically interoperable AUC.

The ILN Comparative AUC library makes use of a structured format enabling comparative review of AUC domains across 6 qPLEs inlcuding the clinical conditions and imaging recommendations.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): No internal medicine or family practice societies author imaging AUC though providers caring for older adults will be substantially impacted. This presentation will highlight the collaboration required between primary care providers, specialists, radiologists, informaticians, guideline authors and vendors to create useful and valid digitally executable interventions, b) the ILN conceptual framework for authoring AUC, and c) a suggested framework for evaluation of impact upon imaging utilization, clinical outcomes, and end-user experience.

THE IMPACT OF COMMUNICATION STRATEGY SESSIONS FOR DIVISIONAL LEADERSHIP ON FACULTY WELL-BEING

Lauren Peccoralo[1]; Jaclyn Verity[1]; Linda Wang[2]. [1]Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [2]General Internal Medicine, Icahn School of Medicine at Mount Sinai, New York, NY. (Control ID #3391538)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Primary Care Providers (PCPs), physicians and nurse practitioners commonly cite communication issues as cause for frustration and fatigue at work, which can lead to burnout.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): To target the communication concerns of PCPs, divisional leadership attended educational workshops focused on communication, leading through change, and individual coaching sessions. The objective was to improve communication between the divisional leadership, nursing and faculty and decrease burnout and improve workplace wellbeing.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Based on feedback from PCP surveys, the Division of General Internal Medicine (DGIM) hired an external consultant (The New Group) to improve communication within the DGIM. The consultant had individual sessions and held 4 educational workshops for leaders: Stakeholder analysis & Communication, RACI: Responsible Accountable Consulted Informed, Change Management, and Leading Successful Change. She also held a flipped Faculty Meeting in which faculty were asked to come up with solutions to improve communication across the division; some of which were implemented. A 1 year follow up survey was administered, mirroring the pre-survey (modified Mini-Z, open-ended). An additional survey was given to leadership to assess the effectiveness of the workshops.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Primary outcomes are level of PCP burnout and wellbeing. Secondary outcomes among physicians include sense of control over workload, teamwork, and desire to cut down on clinical time and leader's uptake of training and implementation of strategies. The quantitative data of the pre- and post-survey was compared using the Chi Squared test. Likert scales were dichotomized.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Overall, 24 PCPs responded to the pre-survey (rr 57.1%) + 27 PCPs to the post-survey (rr 64.3%). There was no significant difference between PCPs reporting burnout in the pre-survey, 39.1%, compared to the post- survey, 42.3%, or in improvement in their wellness within the past 12 months, 29.2% and 15.4% respectively. There was also no difference in agreement with good teamwork in practice: pre 50.0% and post 69.2% and desire to cut down on clinical time: pre 16.7% and post 15.4%. There was a significant decrease in PCPs reporting control over their workload, from 70.8% (pre) to 38.5% (post). The leadership survey yielded a response rate of 27.3%. Two leaders reported the individual meetings to be "Somewhat helpful." One reported the three sessions they attended to be "Somewhat helpful." Another leader reported all six sessions to be "Not at all helpful."

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Contrary to our hypothesis, no significant difference was found among the primary outcomes of PCP's burnout and wellbeing after leadership sessions on communication strategies. In addition, PCP perception of control of their workload decreased significantly. Our data shows that education and training sessions may not be adequate to foster behavior change in leaders or to impact wellbeing in PCPs.

THE MOBILE MEDICAL AND MENTAL HEALTH CARE (M3) TEAM: AN INNOVATIVE, INTEGRATED MODEL OF CARE FOR INDIVIDUALS EXPERIENCING HOMELESSNESS IN AUSTIN, TEXAS

Timothy Mercer[1]; Kristi Kaiser[2]; Ruth Ahearn[2]; Justin Benzer[3]; Maria Correa[4]; Jaimie Hancock[4]; Audrey Kuang[5]; Christine Laguna[2]; Josh Rivera[5]. [1]Population Health, The University of Texas at Austin Dell Medical School, Austin, TX; [2]Integral Care, Austin, TX; [3]Psychiatry, The University of Texas at Austin Dell Medical School, Austin, TX; [4]The University of Texas at Austin Dell Medical School, Austin, TX; [5]CommUnityCare Federally Qualified Health Centers, Austin, TX. (Control ID #3390855)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Individuals experiencing homelessness suffer from complex medical problems, mental illness and substance use disorders, have unmet health-related social needs, and are served by an uncoordinated, facility-centric health care system that creates barriers to accessing care.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The M3 Team aims to:

1. Improve behavioral and physical health outcomes;
2. Meet health-related social needs;
3. Achieve a high level of primary care - behavioral health systems integration

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) :

The M3 Team is an integrated, multidisciplinary team from an academic institution, federally qualified health center, and local mental health authority, implementing a mobile, community-based, integrated care delivery model for adults experiencing chronic homelessness with trimorbidity (chronic medical condition, serious mental illness, and substance use disorder).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A mixed method evaluation plan will be undertaken using the following metrics:

1. SAMHSA-HRSA Center for Integrated Health Solutions Standard Framework for Levels of Integrated Healthcare – evaluate primary care - behavioral health systems integration

2. HEDIS measures – chronic medical conditions

3. Addiction Severity Index (ASI) – substance use

4. Behavior and Symptom Identification Scale (BASIS-24) - mental health

5. Sub-scale of SAMHSA's National Outcome Measures – patient satisfaction

6. Enrollment and maintenance in local and national social service programs (e.g., SNAP Benefits) as well as supportive housing – health-related social needs

7. Case Western's Center for Evidence-Based Practices Fidelity Scale – fidelity to integrated dual disorder treatment (IDDT)

8. Hospitalization and ED visits – health care utilization

9. Qualitative interviews, team observation, and process data – continuous quality improvement

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Level 4-5 (out of 6) integration has been achieved across multiple domains, including care delivery, communication, data sharing, team leadership and staffing, and operations (specific examples will be discussed). 56 patients have been referred and 30 patients have been enrolled to date, with 2-3 visits by team members weekly. HEDIS measures for preventive cancer screening, hypertension, and diabetes have been selected, as well as standard outcome measure from professional society guidelines for heart failure, chronic obstructive pulmonary disease, and cirrhosis. A baseline fidelity assessment of our care model has been conducted (results will be reported). A quality improvement process around enrollment is being undertaken. All enrolled patients have received help accessing or extending SNAP benefits. Seven patients have been successfully navigated into supportive housing.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Systems integration between primary care, behavioral health care, and social services, across academic and community partners, coupled with a mobile, high-intensity care delivery model is critical to providing comprehensive care for the most vulnerable populations in order to meet their needs and break down barriers to receiving equitable, just care.

THE PORT PRACTICES – CONNECTING INDIVIDUALS RELEASED FROM NYC JAILS TO MEDICAL CARE AND SUPPORTIVE SERVICES

Alexandra M. Goodwin[2]; Mat Kladney[3]; Zachary Rosner[4]; Michelle Martelle[5]; Ellie Epstein[6]; Hannah Jackson[1,7]; Amanda Johnson[1,7]; deomattie singh[8]; Janet J. Wiersema[9]; Lucas Dreamer[10]; Isaac Holmes[11]; Ross MacDonald[4]; Patricia Yang[12]; Theodore G. Long[1]; Andrew B. Wallach[1]. [1]Ambulatory Care, NYC Health + Hospitals, New York, NY; [2]General Internal Medicine and Clinical Innovation, New York University, New York, NY; [3]Internal Medicine, Bellevue Hospital, New York, NY; [4]Correctional Health Services, NYC Health + Hospitals, New York, NY; [5]Planning, Evaluation & Reentry Support Services, NYC Health & Hospitals, Correctional Health Services, New York, NY; [6]Planning, Evaluation, and Reentry Support Services, NYC Health and Hospitals/Correctional Health Services, New York, NY; [7]NYU School of Medicine, New York, NY; [8]Ambulatory Care, NYC H+H Kings County, Valley Stream, NY; [9]Monitoring & Evaluation, NYC Health + Hospitals, New York, NY; [10]medicine, Kings County Hospital, Brooklyn, NY; [11]Internal Medicine, NYU, New York, NY; [12]Executive, NYC H+H/Correctional Health Services, New York, NY. (Control ID #3391568)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): People released from jail often struggle to access needed medical care and social services, causing preventable harms

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Assist patients in accessing health and social services during immediate post-release period.

2. Mitigate harms associated with incarceration

3. Transition patients to community-based primary care

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : For people incarcerated in New York City jails existing structural barriers to accessing community-based care and services are compounded by the effects of incarceration, including increased mortality risk in the immediate post-release period.

NYC Health + Hospitals/Correctional Health Services (CHS), in partnership with NYC Health + Hospitals/Office of Ambulatory Care, created the Point of Reentry and Transition (PORT) Practices to directly address the disruption of care in the immediate post-release period. PORT Practices operate in outpatient clinics at two NYCH+H hospitals, offering flexible schedules and walk-in appointments with minimal wait times and no penalties for late/no attendance. Patients can get medication regardless of insurance status and connect with insurance if eligible. PORT Practices are staffed by a team that includes a community health worker (CHW), nurse, medical assistant, and clinician. CHWs have lived experience of incarceration and are the point person to help patients navigate a complex medical system and connect them to social services. Clinicians can access jail-based electronic medical records and many also work in jail- based clinics, improving continuity of care between jail and community and providing additional understanding of the patients' recent clinical and personal context. People leaving NYC jails learn about the PORT Practices from CHS staff or through CHS' dedicated reentry support hotline (PORTline). Patients are also referred by clinicians elsewhere in the public hospital system.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Measures include, but are not limited to: number of appointments generated, number/proportion of appointments attended, average time from release to first PORT visit, quality metrics such as rate of avoidable ED visits, patient satisfaction, and proportion transitioning to general primary care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): In the first six months after clinic launch, 114 patients scheduled or expressed intention to have a PORT visit, 109 of whom were released/in community. Fifty-three (49%) presented for care (122 appointments). Forty- two percent of patients had only one visit; 15% had 5 or more visits; 69% of patients seen missed at least one visit.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Key factors that appear to drive patient engagement and satisfaction with PORT Practices include

- Well-trained CHWs with lived experience who are able to connect patients to existing medical and social services
- Dedicated and informed care team
- CHS physicians incorporated into the outpatient care team
- Availability of jail-based medical records
- Appointment flexibility and low wait time
- Low/no-cost medication
- Access to care regardless of insurance status

THE ROLE FOR MONTHLY INJECTABLE BUPRENORPHINE IN A LOW-BARRIER SUBSTANCE USE DISORDER BRIDGE CLINIC

Marco Tori[1]; Jessica Kehoe[2]; Jessica Taylor[3]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Boston Medical Center, Boston, MA; [3]General Internal Medicine, Boston Medical Center, Boston, MA. (Control ID #3391567)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Monthly injectable buprenorphine (MIB) is a new buprenorphine formulation that has the potential to mitigate some of the complex, multi-level barriers to sublingual buprenorphine/naloxone (SL bupe/nal) adherence faced by patients, but MIB use in bridge clinics has not been described.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Describe the early experience with MIB at a bridge clinic in Boston, MA. Characterize appropriate patients for MIB in the bridge clinic setting

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : This innovation took place at a substance use disorder bridge clinic in Boston, MA located within a large, urban, academic medical center. An early adopter of MIB, Provider A, who works in the clinic one session per week began offering MIB in March 2019.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Early analysis through qualitative interviews show that patients appreciate additional treatment options, though preference for care is highly individualized. Success metrics include administration of MIB to those patients that request it and transition of care to stable office based treatment programs.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): During the first 9 months of MIB availability (3/1/19 – 11/30/19), Provider A saw 173 patients, most of whom had OUD (n=154, 89%). Many (n=65, 42%) were offered MIB in the first or second visit with Provider A. Most (66%) declined, often citing that they did not want an injection. Concern for diversion and preference for the SL formulation was frequently documented in these cases. Among the 18 (27%) who were interested, 6 received one or more MIB injections. All reduced or continued to avoid illicit opioid use in the first month. Continuation of MIB has varied, with patients returning to SL bupe/nal or lost to follow up if not continuing MIB. There was one death that was unrelated to MIB.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): In our early experience, many patients with OUD could be identified as candidates for MIB. Many patients who were not offered MIB had not yet met clinical requirements of stability on SL bupe/nal. Systems interventions that support consistent MIB discussion during follow-up visits have the potential to increase its reach in this population. Concern for diversion was frequently documented in patients declining MIB. Patients struggling with limited resources may see SL bupe/nal – which has street value - as a financial safety net. However, the lack of daily administration and freedom from the task of keeping SL bupe/nal safe appealed to many patients.

Overall, MIB represents a promising new option for high risk patients with OUD, and our early experiences suggest an important role for MIB in the bridge clinic setting. These clinics are a growing setting of care and need advanced infrastructure and pharmacy collaboration to launch MIB services. Data and experience suggest that MIB is acceptable and well tolerated by a subset of patients presenting to a bridge clinic.

TO TEACH, PERCHANCE TO CHANGE: ANOTHER STEP CLOSER TO JOY IN RESIDENT PRACTICE THROUGH AMBULATORY INTERPROFESSIONAL UTILIZATION

Jennifer Verbsky[1]; Daniel J. Coletti[1]; Nancy A. LaVine[2]; Frank Cacace[4]; Jason Ehrlich[3]; Joseph Conigliaro[5]. [1]Medicine, Northwell Health, Plainview, NY; [2]General Internal Medicine, Northwell Health, New Hyde Park, NY; [3]Medicine, Northwell, Great Neck, NY; [4]GIM, northwell health, Great Neck, NY; [5]Internal Medicine, Zucker School of Medicine, New Hyde Park, NY. (Control ID #3391706)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can implementing an educational session on inter-visit work with additional administrative time reduce administrative burden on residents in ambulatory internal medicine and promote interest in primary care careers?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Improve resident ambulatory clinic experience by enhanced training in, and dedicated time for, inter-visit work.

2. Decrease administrative burden by educating residents to better utilize the interprofessional (IP) team.

3. Augment resident interest in primary care careers.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Northwell has completed a second year of resident ambulatory practice transformation to better meet learner needs and improve interest in primary care careers. Based on pilot data, interventions in 2017-2018 included implementation of IP teamlets (residents, medical assistants, and pharmacy students), teamlet huddles, and enhanced exposure to behavioral health, social work, and pharmacy staff members. Despite these improvements, residents reported no change in satisfaction with ambulatory training. In addition, 23% reported reduced interest in a primary care career from the prior academic year, citing administrative burden as a main detractor. Thus in 2018-2019 we set out to reduce the strain of administrative work by holding resident training sessions on efficient completion of inter-visit work and how to better utilize IP team members to complete non-physician tasks. We also allocated weekly dedicated time to complete administrative work.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Residents complete an anonymous battery of questions at the end of each academic year to evaluate their ambulatory training. Questions assess resident interactions with IP team members, perceptions of the training site, workflows, curricula, and interest in primary care.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Results were mixed. The number of residents reporting too much time spent on administrative tasks increased from 39.2% to 46% and those feeling like they were completing work that other team members could do increased from 24.3% to 29.8%. However, residents reporting "support staff provided excellent support with administrative tasks" improved from 24.3% to 28.4% and overall satisfaction with the ambulatory experience improved from 19% to 29.8%. Over one-third (37%) of residents were less interested in primary care, again citing administrative burden. Content analysis of open-ended items highlighted improved support of administrative tasks but also persistent strain from non-clinical work due to inefficient workflows and perceived inadequate staff support, though they also appreciated the protected administrative time.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): While we found clinic satisfaction slightly improved with additional time and support for administrative work, resident education around task management and IP utilization did not significantly lessen the administrative burden. Next steps will aim to make system-level workflow changes to ensure appropriate use of IP team members and decrease frequency of non-physician administrative work for resident providers.

TREATING HEPATITIS C IN HIGH-RISK POPULATIONS: SUCCESS FROM AN INTERNAL MEDICINE RESIDENT PRIMARY CARE CLINIC

Thomas Robertson[3]; Brittany Nolton[1]; Bruce Ling[2]; Courtney Watson[3]; Elizabeth Cuevas[4]; Charlotte Mitchell[3]. [1]Internal Medicine, Allegheny General Hospital, Pittsburgh, PA; [2]Medicine, Allegheny Health Network, Pittsburgh, PA; [3]Internal Medicine, Alleghrny Health Network, Pittsburgh, PA; [4]Internal Medicine, Allegheny Health Network, Pittsburgh, PA. (Control ID #3390340)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): The HCV epidemic is primarily driven by marginalized populations and subspecialists have traditionally treated HCV, but frequently require abstinence from drugs and alcohol for at least 6 months prior to initiating treatment, despite contrary evidence and guideline recommendations, which limits access to treatment and creating barriers to achieving HCV elimination targets.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Create a HCV treatement protcol for marginalized populations from an academic resident primary care clinic 2. Successfully treat hepatitis C in marginalized populations

3. Successfully treat patients who were denied by subspecialists

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We implemented a HCV treatment protocol in our internal medicine resident primary care clinic, which largely cares for marginalized populations. The multidisciplinary team included a resident, attending physician, clinic pharmacist and medical assistant. HCV positive patients were identified through screening, enrolled in the protocol, evaluated, and treated for HCV.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Descriptive quantitative statistics were utilized to summarize our findings from the pilot project. Outcomes assessed included: success of treatment as defined by sustained virologic response at 12 weeks (SVR12), previous sub-specialist contact for HCV, and presence/absence of high-risk features including cirrhosis, ongoing alcohol or drug use, and use of MAT.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Currently, HCV treatment has been initiated in 21 patients. 18 have completed treatment with another 3 still on-going. Of those who have completed treatment, 11 are on MAT and 11 have active alcohol use. Of those 18 who have completed treatment, 9 (50%) achieved SVR12, 7 (39%) who are not yet 12 weeks post-treatment, and 2 (11%) who are awaiting lab results. Of the 21 patients treated in primary care, 12 had previously been referred to and seen by GI for HCV. The majority of those patients seen by GI (11) were not offered treatment for reasons including ongoing alcohol use, drug use, or uninsured status. Of those not offered treatment by GI and subsequently treated in primary care (n=11), 11 have completed treatment. SVR12 was achieved in 4 of these patients, 6 are not yet 12 weeks post-treatment, and 1 is awaiting lab results. There were no complications from treatment. The delay in treatment from the time initially seen by gastroenterology for HCV until being seen in primary care and subsequently treated was at a mean of 937 days and a median 974 days.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Initial results from our clinic suggest that HCV can be successfully and safely treated by a multidisciplinary team in an academic internal medicine resident primary clinic. Even in high-risk populations who lack access to treatment elsewhere or who are declined by GI specialists, SVR12 can be achieved. Patients should not be excluded from treatment due to ongoing alcohol use, drug use, or insurance status.

TREATMENT OF CHRONIC HEPATITIS C IN A PRIMARY CARE OPIOID TREATMENT PROGRAM: SUCCESSES, BARRIERS AND NEXT STEPS

Tanya Nikiforova, Rachel Shuster, Anita Leon-Jhong. Internal Medicine, University Of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3392038)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Patients with opioid use disorder (OUD) have high prevalence of hepatitis C (HCV) but experience barriers to treatment; treatment of HCV in a primary care opioid treatment program (OTP) may increase access and promote cure.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Enable OTP providers to treat patients with HCV in the primary care setting

2. Identify barriers to treatment in order to increase treatment rates and improve outcomes

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Center for Opioid Recovery (COR) at the University of Pittsburgh Medical Center (UPMC) offers buprenorphine and injectable naltrexone treatment to patients with OUD in a primary care setting. The program is staffed by internists, nurses, social workers and peer specialists. In January 2019 the clinic began offering onsite treatment for HCV after recognizing that patients were experiencing difficulties and delays seeking HCV care from specialists. Two physicians and one nurse underwent community-based trainings on HCV treatment, created treatment algorithms, and helped to educate other COR providers.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): For all patients engaged with COR as of December 23, 2019, charts were reviewed for initial HCV

antibody screening, follow-up HCV viral load testing, and subsequent onsite treatment or referral to hepatology. For patients treated onsite, note was made of the treatment outcome as well challenges encountered during treatment. For patients with HCV who did not receive treatment, their COR provider was surveyed to identify barriers to treatment.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The study sample included 218 patients actively engaged in COR. Most patients (93%) were screened for HCV Ab and had viral load testing if appropriate. Of the 202 patients screened, 82 (38%) were diagnosed with chronic HCV. Among patients with HCV, 57% received genotyping and 48% received fibrosis evaluation.

Thirty-two of 82 patients with HCV have received treatment. Of these,17 (53%) were treated by COR between November 2018 and December 2019. Patients treated by COR predominantly had genotype 1a (59%) and most had no fibrosis (82%) or early fibrosis (18%). All patients were treated with Mavyret or Epclusa. Currently, 9 patients have achieved sustained virologic response (SVR), and 8 patients are awaiting SVR confirmation.

Fifty of 82 patients with HCV remain untreated. COR providers identified lack of confidence/familiarity in treating HCV as the primary reason for failure to treat patients. For patients who were treated at COR, challenges included unstable housing, active alcohol and drug addiction, comorbid illness, and lack of reliable phone access.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1. Patients can be successfully treated in a primary care OTP, with the main barrier to treatment being provider knowledge and confidence.

2. A high rate of HCV screening was achieved through nurse-driven protocols. These protocols could be expanded in consult with experienced providers to assure that all patients with HCV are evaluated for treatment.

3. Patients in OTP experience many social barriers to HCV treatment which may be best addressed in primary care setting.

UNDERSTANDING MEASLES IMMUNITY IN AN URBAN FEDERALLY QUALIFIED HEALTH CENTER (FQHC)

Tiffany Chen[1]; Ankita Nagirimadugu[2]; Abhinav Bhalla[1]; Justin T. Gasper[1]; Joan Bosco[3]. [1]Internal Medicine, Mount Sinai Beth Israel, New York, NY; [2]Medicine, Mt. Sinai Beth Israel, New York, NY; [3]Internal Medicine, Mount Sinai Beth Israel, New York, NY. (Control ID #3392368)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): At our urban Federally Qualified Health Center (FHQC), are Advisory Committee on Immunization Practices (ACIP) guidelines for measles vaccinations and immunity screens being followed?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1. Determine the percentage of patients non-immune to measles in our FQHC

2. Determine if ACIP measles guidelines were followed for measles vaccinations and screenings

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Current ACIP guidelines recommend that adults at high risk for exposure and transmission such as college students, healthcare personnel, and international travelers receive two doses of measles vaccine if non-immune, while other adults should receive one dose. Providers should not actively screen adult patients for immunity and should not check post-vaccine measles titers.

This is a retrospective chart review of patients over age 18 who had measles titers checked at a FHQC between January 2016 and July 2019. Patients who had titers checked due to concern for active measles infection were excluded. Our clinic is in the Lower East Side of Manhattan, which is in geographic proximity to the areas of Brooklyn affected by the 2019 measles outbreak that led to mandated measles vaccination for every person living and working in four Brooklyn zip codes.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Patients' country of origin, prior measles immunization status, and measles titer results were recorded. The reason for checking measles titers was also noted. For those found to be non-immune to measles, the number of vaccines subsequently received and whether a post-vaccine titer was checked was also recorded.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 607 patients fit the inclusion criteria with an average age of 37.5. 29.5% of these patients stated that their country of origin was outside of the US. 18.6% of patients were non-immune to measles, with an average age of 33. Of those not from the US, 16.8% were not immune to measles. When assessing the reasons that measles immunity was checked, 57.5% were adherent with ACIP recommendations. The most frequent reason for inappropriate evaluation of measles immunity was for pre-employment clearance for non- healthcare professions. 70% of patients who did not have presumptive immunity to measles received at least one subsequent vaccine, and 27.8% of these patients had post-vaccine titers checked. 59% of healthcare workers, students, or international travelers who were not immune to measles received only one subsequent vaccination, while 15.4% of them inappropriately received vaccination despite prior documentation of at least two vaccination doses.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Evaluating for measles immunity is often done unnecessarily per ACIP guidelines. Increased education of clinicians and patients can lead to increased compliance with these guidelines and reduce unnecessary procedures and financial cost, while also assuring that patients are vaccinated appropriately, especially in light of recent measles outbreaks. In the future, we plan to further analyze the financial cost of non-guideline based titer checking and vaccination.

USING ARTIFICIAL INTELLIGENCE TO IMPROVE THE DIAGNOSTIC ACCURACY OF SKIN CONDITIONS IN PRIMARY CARE SETTINGS

Peggy Bui[1,2]; Ayush Jain[1]; Yuan Liu[1]. [1]Google Health, Palo Alto, CA; [2]Division of Hospital Medicine, UCSF, San Francisco, CA. (Control ID #3381886)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can an artificial intelligence (AI)- based, clinician decision support tool help primary care providers to be more accurate at diagnosing skin conditions?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The purpose of this study is to assess whether use of an AI-based, clinician decision support tool (DermAssist) can improve the accuracy of primary care physicians and nurse practitioners for diagnosing skin conditions.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : DermAssist is an AI-based tool accessible via a computer or mobile phone that provides a differential diagnosis to users based on photographs and basic information about a case (clinical history). DermAssist was developed using machine learning algorithms that trained on 14,021 de-identified cases from 17 clinical sites. In this study, primary care providers were asked to review and provide a differential diagnosis for up to 500

cases each of skin complaints seen in the outpatient setting: half the cases with access to the DermAssist tool and half without. Participants were all outpatient providers who were boarded in internal medicine, family medicine, or were independently-practicing nurse practitioners and varied in geographic location, practice setting (urban v. rural), and years of experience. Clinicians were instructed to approach these cases using any resources they normally would in clinic and provide a differential diagnosis for each case to the best of their ability.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): A reference standard (answer key) for each case was created by a rotating panel of 3 board-certified dermatologists. The DermAssist tool's AI model was blinded to the answer key for the 500 cases in this study. The primary care providers' answers were compared to the reference standard and segmented into cases where the clinician did not have access to the AI-based tool (unassisted) versus cases where the clinician had access to the tool (assisted). The accuracy levels of the unassisted and assisted arms were compared to one another by reviewing the fraction of cases where the top answer provided by the clinician matched the reference standard (top-1 accuracy) and the fraction of cases where one of the top three answers in the clinician's differential matched the reference standard (top-3 accuracy).

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): To date, six clinicians have reviewed 2,014 cases. On average, clinicians had a 9.5% boost in top-1 accuracy using the clinician decision support tool (assisted 0.632, unassisted 0.537, p-value <0.001) and a 9.6% boost in top-3 accuracy using the clinician decision support tool (assisted 0.720, unassisted 0.624, p-value <0.001). This study is ongoing and 34 additional primary care providers are expected to complete their case reviews by the end of March.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): The success of artificial intelligence to inform the differential diagnosis of skin diseases is highly encouraging of such a tool's potential to assist clinicians. Use of an AI-based clinician decision support tool may improve the accuracy of diagnosis at point-of-care for general practitioners who do not have dermatology specialty training.

USING INNOVATIVE PARTNERSHIPS TO IMPROVE BP CONTROL IN OHIO SAFETY NET PRIMARY CARE PRACTICES

Shari Bolen[8]; Suparna Navale[1]; Siran Koroukian[1]; Harry Persaud[1]; Michelle Menegay[2]; Douglas Einstadter[8]; Jackson T. Wright[3]; Randall D. Cebul[1]; Adam T. Perzynski[8]; Catherine Sullivan[4]; Jonathan Lever[5]; Michael Konstan[1]; Dushka A. Crane[2]; Allison Lorenz[2]; Doug Spence[2]; Arun RajanBabu[2]; Tonni Oberly[2]; Xiaokun Qian[2]; Christopher R. Jordan[6]; Melissa Nance[7]; Stephen Albanese[7]; Donald P. Wharton[7]; Mary S. Applegate[7]. [1]Case Western Reserve University, Cleveland, OK; [2]The Ohio Colleges of Medicine Government Resource Center, Columbus, OH; [3]Case Western Reserve University, University Hospitals Cleveland Medical Center, Cleveland, OH; [4]The MetroHealth System, Cleveland, OH; [5]Better Health Partnership, Cleveland, OH; [6]Christopher R. Jordan LLC, Covington, KY; [7]The Ohio Department of Medicaid, Columbus, OH; [8]Center for Health Care Research and Policy, Case Western Reserve University at The MetroHealth System, Cleveland, OH. (Control ID #3387852)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Improving blood pressure (BP) control in disadvantaged populations is challenging.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The program goals were to improve BP control for Medicaid patients within the state's safety net primary care practices.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : The Ohio Department of Medicaid partnered with all 7 Ohio Colleges of Medicine, all 6 Ohio Medicaid Managed Care Plans (MCPs), and 8 safety net primary care clinics to establish a statewide hypertension quality improvement (QI) project (kick-off October 2017). Clinic-level interventions included: 1) accurate/repeat BP measurement; 2) timely follow-up in staff-led visits if BP elevated (>140/90 mmHg); 3) a treatment algorithm promoting once daily BP medications; 4) outreach; and 5) promotion of effective communication. MCPs partnered with clinics to support BP improvement for their enrollees by: 1) assisting patients in obtaining and using home BP monitors; 2) addressing barriers to patient follow-up; and 3) changing coverage of BP medications from 30-day to 90-day supplies. We held monthly webinars with clinics and MCPs to share best practices, review data, and discuss barriers to project success. QI coaches assisted clinics monthly. We collected and displayed electronic health record (EHR) data from the 8 clinics every 2 weeks using run and control charts to support continuous QI.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Using cross-sections of EHR data from control charts, we describe the absolute changes in average BP control (<140/90) and selected process measures (i.e., repeat BP measurement if BP elevated and timely follow up) overall and by subgroup from the pre-intervention 1-year period (10/2016-09/2017) to the last 6 months of the intervention (04/2019-10/2019). Patients with a diagnosis of hypertension and seen at least once by their primary care provider in the last bimonthly reporting period at one of the 8 participating clinics from October 2016 to November 2019 (N=17,574) were included.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Patients were female (55%), on Medicaid (41%), and non-Hispanic black (50%) or non-Hispanic white (46%). The percent of patients under good BP control (<140/90 mmHg) increased from 52% to 60% overall (an additional 591 patients) with this intervention bundle. BP control improved among all measured subgroups: Medicaid (7%), non-Medicaid (7%), non-Hispanic black (6%), and non-Hispanic white (10%). The selected EHR clinic process measures of repeat BP, scheduled follow-up, and attended follow-up within 1-month if BP elevated had absolute improvements of 55%, 5%, and 7% respectively. Baseline disparities in BP control between non-Hispanic black and white patients existed at half the sites (range in absolute differences at these 4 sites: 4-10%) and did not substantially change over time.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Innovative partnerships among primary care clinics, payers, and academic medicine can lead to meaningful improvements in BP control across diverse regions within a state. Future interventions should explore ways of further reducing disparities at safety net clinics where disparities exist.

UTILIZING A HOSPITALIST RUN OBSERVATION UNIT TO COMBAT OPIOID USE DISORDER – AN INNOVATIVE MODEL IMPLEMENTING INTEGRATED CASE MANAGEMENT AND A HOSPITAL-BASED PEER RECOVERY TEAM.

Paul Long[1]; Cherisse Carlo[1]; Chris Manasseh[2]; Samantha Johnson[4]; Eileen Mullaney[3]. [1]Internal Medicine, Boston Medical Center, Salt Lake City, UT; [2]Family Medicine, Boston Medical Center, Boston, MA; [3]Case Management, Boston Medical Center, Boston, MA; [4]Project Trust, Boston Medical Center, Boston, MA. (Control ID #3392636)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can opioid use disorder (OUD) be effectively and safely treated in an observation unit, and if so what innovative treatment models are available?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):

Objective #1: To create an integrated case-management led team model to address OUD incorporating both Family Medicine and Internal Medicine providers

Objective #2: To augment treatment and patient compliance by implementing a substance use peer-recovery team.

Objective #3: To design a large observation unit with reduced limitations on inclusion criteria that can maintain quality and efficient care.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : To combat high patient volumes and bed shortage issues, in 2018 our hospital expanded our observation unit by 2.5-fold (28 bed) and transitioned to a hospitalist led, provider-based discretionary model for patient acceptance into the unit. This has allowed for treatment of non-traditional observation unit patients including patients with opioid use disorder (13.9% of patients accepted to our unit). Patient selection and care coordination has been enhanced, especially for patients with complex social issues and substance use disorder, by incorporating a model whereby case managers serve as team lead and work closely with providers in the same work area.

The observation unit setting provides a unique location for combating OUD allowing for intensive treatment and care coordination beyond what is typically possible in the emergency room setting, as well as access to hospital resources often not readily available in the ambulatory setting. We have designed a treatment team that incorporates case management, peer-recovery, addiction consult services, social work and respite care following discharge when needed (54% of OUD patients in our unit are homeless).

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Success of OUD treatment will be measured quantitatively through highlighting the following points: rates of MAT initiation in the unit, AMA rate, representation/readmission rate, length of stay, in unit overdose (highlighting safety: to date two overdoses with full recovery, no deaths). Qualitative success will be measured by key-informant interviews with select patients treated in our unit and highlighting stories from patients who were engaged with peer-recovery staff.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): Preliminary data shows a low AMA rate, taking into account the high-risk nature of this population, of 10% for patients seen by a peer recovery coach. 46.4% and 27.9% of patients were treated with methadone and buprenorphine respectively. Further findings and data will be discussed at time of presentation.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Lesson #1: Observation units can provide a great environment for safely and effectively treating opioid use disorder.

Lesson #2: An integrated team model with a case manager team leader augments patient care and allows for a broader selection of patients to an observation unit

Lesson #3: Implementing a peer-recovery program for patients with OUD yields a low AMA rate for a high-risk population and provides strong advocacy for patients.

UTILIZING COMMUNITY HEALTH COACHES TO IMPROVE CHRONIC DISEASE OUTCOMES AT AN URBAN RESIDENCY CLINIC

Shruti Anand[1]; Tamara Goldberg[2]. [1]Internal Medicine, Mount Sinai St.Luke's West, New York, NY; [2]Internal Medicine, Mount Sinai St. Lukes West, New York, NY. (Control ID #3372514)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Adequately addressing social determinant of health barriers during an office visit can be challenging for resident providers given the time constraints of a typical encounter. While a free community health coaching service is available to help identify and mitigate such barriers, referral to this service is underutilized by our resident providers. **OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES):** 1. To increase utilization of community health coaches for patients with uncontrolled chronic diseases.

2. To determine the impact of community health coaches on chronic disease outcomes.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : This project was implemented at the Ryan Adair Center, a federally qualified health center in Harlem that serves as a primary care training site for internal medicine residents. Resident surveys revealed that the major barrier for referring patients to the coaching service was the amount of paperwork required by the provider. To address this challenge, a multi-disciplinary group representing both the clinic team and the community-based organization convened to devise a streamlined referral process. Our intervention was the creation of a direct messaging function in our EMR to transfer information between resident providers and the community health coach supervisor.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The number of referrals to the health coaching service was assessed over a three-month period pre and post intervention. The impact on health outcomes was assessed through retrospective chart review by comparing blood pressure and/or HbA1c before and after the referrals. Results were compared between patients who were engaged with the health coaching service and those referred but deemed ineligible / declined services.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The number of referrals increased from 5 pre-intervention to 15 post-intervention, an increase of 200 %.

59.2% of the referrals were for diabetes mellitus, 33.3% for hypertension and 7.47% for asthma and CHF.

55% of the referrals were inactive due to patients' refusal or ineligibility. The average A1c reduction was 1.3 in the group engaged with the health coach versus 0.6 in the group that was referred but deemed inactive. The average systolic BP reduction was 26.3mm Hg in the active group vs 1.6mm Hg in the inactive group.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): This project demonstrated that streamlining the referral process between a community-based organization and resident providers led to increased utilization of heath coaching services for this underserved urban population. We observed a trend toward improved health outcomes for our patients engaged with the coaching service. Future directions include longitudinal trending of outcomes, using the EMR for communication between health coaches and providers and incorporating feedback from coaches to improve documentation of social determinants of health.

WHY DO WE GET READMITTED? RECOMMENDATIONS FROM THE PATIENT PERSPECTIVE

Mary DeSain[1]; Tiffany Basamon[1]; Kaitlin Kyi[2]. [1]Medicine, Univeristy of Rochester, Rochester, NY; [2]Internal Medicine, University of Rochester Medical Center, Rochester, NY. (Control ID #3373257)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): As providers we assume that we know the factors that contribute to readmissions and poor health outcomes but we do not fully understand from a patient perspective how we can address these factors.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): The objective was to identify patient reported factors that contribute to readmissions by completing audio-recorded in-home interviews of patients with multiple readmission from our safety net internal medicine resident continuirty clinic. Once patient reported factors was identified our ultimate goal was to develop interventions in our primary care clinic to address these factors.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Strong Internal Medicine is a safety net academic primary care practice providing care to approximately 11,500 patients with a 30 day readmission rate of 21%. Our interdisciniplinary quality improvement team joined together to develop interventions to reduce our readmission rate. We came to the realization that as providers we do not truly understand what drives readmissions. Therefore our goal was to complete 10 in- home audio-recorded qualitivative interviews with our patients who had 3-9 readmissions during 2017 to improve our understanding of what really drives readmissions and poor health outcomes. The ultimate goal was to use this information to create future interventions in our primary care practice.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Our goal was to complete 10 audio-recorded in-home interviews with our patients who had recurrent readmissions during the year 2017 to gather qualitiative data to identify patient reported themes that contribute to readmissions. Once the themes were identified we implemented a project in our continuity clinic to address these concerns with the ultimate goal to reduce readmissions and improve patient-provider relationship as measured by HCAHPS.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): We identifed 5 major patient reported themes that contribute to readmissions including: patient-provider relationship (trust, respect, listening), patient factors (mental health, social stressors), medications (side effects, polypharmacy), discharge process (unclear, pushed out, waiting) and clinic/community factors (access to care, need for improved community awarenesss). Our continiuty clinic developed an agenda setting tool to address the patient-provider relationship with emphasis on the concern of "not listening". The agenda setting tool identifies the patient's medical concerns but also asks about social stressors that may be a barrier to good health. We conducted a pilot using this agenda setting tool and found that both patients and providers found this form very helpful.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): Our quality improvement project discovered that at the core of high quality care is patient centered care. Our agenda setting tool is unique as it does not only address patient's medical concern for the visit but also starts to explore social determinants of health. The key to this project is having a system in place to address the patient's concerns. We are fortunate to have embedded social work, psychiatry, dietician and medical-legal partnership.

"FROM NO SHOW TO ARRIVED": LEVERAGING MACHINE LEARNING TO BOLSTER PATIENT ATTENDANCE IN RESIDENT CONTINUITY CLINIC

Roma Bhatia[1]; Oscar Marroquin[4]; Zachary Lenhart[2]; Breann Sodini[5]; Janice A. Cunningham[2]; Dang Tran[3]; Gary Fischer[4]; Jaishree Hariharan[5]. [1]General Medicine and Primary Care, Beth Israel Deaconess Medical Center, Boston, MA; [2]General Internal Medicine, UPMC, Pittsburgh, PA; [3]Division of General Internal Medicine, University of Pittsburgh, Pittsburgh, PA; [4]Medicine, University of Pittsburgh, Pittsburgh, PA; [5]Medicine, University of Pittsburgh Medical center, Pittsburgh, PA. (Control ID #3391473)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Despite having an established automated phone reminder system in place for scheduled patients, in one urban academic resident primary care clinic, the annual patient no show rate (NSR) averages 27%.

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): Continuity clinic is a crucial component of internal medicine training. However missed appointments leads to fragmented and poor continuity of care, and also decreases learning opportunities for residents. The primary objective of this study is to determine the impact of a multidisciplinary, machine learning intervention on the NSR in resident primary care clinic.

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : Our study was conducted a busy academic primary care clinic in Pittsburgh, PA with 60 medical residents who see 3100 patients annually. Residents have one full clinic day weekly for 4-week periods, and see a fixed number of patients, typically 10-12 patients per clinic day. All scheduled patients receive an automated phone call/ text appointment reminder, 72 hours prior to their scheduled visit.

In July 2018, the clinical analytics department developed and validated a machine learning algorithm to identify resident clinic patients who were most likely to miss their appointments. Patients predicted to have $\geq 20\%$ risk of no show were contacted by a nurse 48 hours prior to their scheduled appointment in addition to usual care. The intervention took place between Oct 2018- July 2019.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): The primary outcome was annual resident clinic no show rate (NSR), pre and post intervention. We used chi square test to evaluate the impact of the intervention on the change in NSR. Additional secondary outcomes included: 'phone call' outcomes, change in the number of completed clinic visits, revenue value units (RVU), and clinic revenue.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): The overall no show rate decreased by 4%, from 27% pre-intervention to 23% post intervention ($p<0.01$, 95% CI 21.6%-25%), and correspondingly, patient completed visits increased by 4% from 73% to 77% resulting in 283 additional competed visits. Over the 9-month period, 2046 targeted patients at high risk of missing appointments were identified and called and 59% (n=1206) were reached. There was no significant difference observed between the number of scheduled patients in resident clinic annually pre and post intervention. RVUs subsequently increased from 8941.8 to 9658.8, generating an additional $40,000 in clinic revenue.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): A targeted, more personalized approach to appointment reminders using machine learning for patients at high risk of no-show, helped decreased the annual NSR by 4%, increased the overall

completed visits and clinic revenue, and correspondingly increased learning opportunities for the residents. A multi-disciplinary intervention leveraging technology to improve quality patient care is a valuable tool and can be implemented strategically in other ambulatory practices.

"MAKING A LIST AND CHECKING IT TWICE": A HIGH BLOOD PRESSURE ADVISORY IN PRIMARY CARE

Anuradha Phadke[1]; Amelia Sattler[1]; Shreya Shah[2]; Megan Mahoney[3]; Christopher Sharp[1]; Stanley Ng[4]; Michael Kim[4]; Yingjie I. Weng[1]; Nadia Safaeinili[5]; Cati Brown-Johnson[6]; Manisha Desai[1]. [1]Medicine, Stanford University School of Medicine, Palo Alto, CA; [2]Medicine, Stanford University, Mountain View, CA; [3]Medicine, Stanford University, Palo Alto, CA; [4]Stanford Healthcare, Palo Alto, CA; [5]Primary Care & Population Health, Stanford University, Stanford, CA; [6]Evaluation Sciences Unit, Stanford School of Medicine, Stanford, CA. (Control ID #3392167)

STATEMENT OF PROBLEM OR QUESTION (ONE SENTENCE): Can a real-world implementation of an electronic medical record best practice advisory (BPA) improve rates of adult high blood pressure (HBP) diagnosis and management, as seen in prior randomized controlled trials?

OBJECTIVES OF PROGRAM/INTERVENTION (NO MORE THAN THREE OBJECTIVES): 1) Implement a high blood pressure BPA

2) Assess the BPA's impact on the diagnosis and management of uncontrolled HBP

3) Assess care team and clinic-level barriers and facilitators to the BPA's impact

DESCRIPTION OF PROGRAM/INTERVENTION, INCLUDING ORGANIZATIONAL CONTEXT (E.G. INPATIENT VS. OUTPATIENT, PRACTICE OR COMMUNITY CHARACTERISTICS) : We address our aims in a prospective observational study that includes all adult patients presenting to 22 primary care clinics in a regional academic ambulatory care network. The targeted patient population is described as all adult patients presenting to clinic with an in-clinic blood pressure ≥140/90 mm Hg. The intervention includes medical assistant and provider electronic medical record clinical decision support and order set, team training, and audit feedback.

MEASURES OF SUCCESS (DISCUSS QUALITATIVE AND/OR QUANTITATIVE METRICS WHICH WILL BE USED TO EVALUATE PROGRAM/INTERVENTION): Using a variation on an interrupted time series design, we deploy the intervention in a staggered fashion across clinics. For each clinic, we will compare data in the 6-month pre-intervention period and in the 6-month post-deployment period from the same season. Our primary outcome is hypertension control in the clinic setting (<140/90).

Secondary outcomes relate to new hypertension diagnoses, blood pressure rechecks, and home blood pressure reporting. We will employ generalized linear mixed effects regression techniques to measure the impact of the intervention while accounting for other hypertension-focused initiatives ongoing in these sites. To understand barriers and facilitators to the intervention's impact, we will gather data from semi-structured interviews of providers and staff at select clinics.

FINDINGS TO DATE (IT IS NOT SUFFICIENT TO STATE FINDINGS WILL BE DISCUSSED): 19/22 primary care clinics have deployed the intervention. Managers at 13 clinics receive regular feedback regarding staff recheck of blood pressure. Rates of recheck of blood pressure in cases of initial elevated blood pressure have increased from 70 to 93 percent over 5 months in those 13 clinics. In preliminary interviews of 24 staff and providers, interviewees reported increased awareness of elevated blood pressure and adherence to the BPA's blood pressure check protocol. They also identified opportunities for process refinement including improved care team communication and medical assistant documentation templates. We plan to analyze our primary and secondary outcomes at the conclusion of our study in the summer of 2020.

KEY LESSONS FOR DISSEMINATION (WHAT CAN OTHERS TAKE AWAY FOR IMPLEMENTATION TO THEIR PRACTICE OR COMMUNITY?): 1) A high blood pressure BPA may improve adult hypertension diagnosis, measurement, follow-up, and home BP reporting

2) Partnership between quality improvement teams and statistical/evaluation teams allows for more rigorous analysis of real-world QI interventions

A CROSS-DISCIPLINARY APPROACH TO TEACHING DESIGN-THINKING METHODS TO HEALTHCARE LEARNERS

Jack Test[2]; Hannah Park[3]; Ryan Yarnall[2]; Jane Jarshaw[1]; Kaitlyn Norton[1]; Juell Homco[1]; Melissa Van Cain[1]; Audrey Corbett[2]; Blake Lesselroth[1]. [1]Department of Medical Informatics, University of Oklahoma Tulsa School of Community Medicine, Tulsa, OK; [2]Department of Internal Medicine, University of Oklahoma Tulsa School of Community Medicine, Tulsa, OK; [3]School of Architecture and Design, University of Kansas, Lawrence, KS. (Control ID #3391573)

NEEDS AND OBJECTIVES:

In their professional role, physicians may be expected to implement and evaluate quality improvement (QI) solutions including informatics or systems-based innovations. Design Thinking (DT) teaches unique skills such as requirements analysis, user-centered design, and interprofessional collaboration that could help future physicians find novel solutions to healthcare challenges.

We developed an informatics pilot elective for medical students and residents to study DT models and apply techniques to real-world QI projects. We expected learners to: (1) learn a framework for user-centered design; (2) use mixed methods research to identify user and program requirements; (3) participate on design-thinking teams to generate a wide range of solutions; and (4) use standardized rubrics to evaluate solutions.

SETTING AND PARTICIPANTS:

We chartered a formal collaboration between the University of Oklahoma-Tulsa School of Community Medicine (OUSCM) and the University of Kansas School of Architecture and Design (KUSAD). Using virtual classrooms, two medical students and two internal medicine residents worked with 38 design school students on a QI project developing an inpatient shift handoff tool.

DESCRIPTION:

We asked the OUSCM learners to draft a client brief for the KUSAD design students and then work with the design students to gather market research, complete a mini-ethnography, and write technology requirements. The KUSAD students engaged in iterative design work, ultimately producing high-fidelity shift handoff prototypes.

EVALUATION:

We evaluated our rotation in three ways: (1) rating the quality of DT deliverables; (2) assessing the knowledge of learners; and (3) identifying barriers to repeating and scaling the elective. To assess deliverables, we asked OUSCM learners and faculty to score each prototype using a modified usability scoring rubric. We calculated a composite score that ranged from 0-20. Each student gave a presentation on the topic of DT, which was well-received. Faculty members catalogued barriers to reproducing the curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED:

The OUSCM learners crafted 17 needs statements based on interviews and ethnography. The KUSAD students then produced 34 software designs. Design scores ranged from 13.3 to 19.4 (mean 16.2; mode 15.6). Faculty reported barriers to reproducing the curriculum including administrative support, obtaining IRB clearance, and the need for an online collaborative tool.

The pilot allowed learners to work on interdisciplinary teams, gain experience in systems-based practice, and exchange domain expertise. Barriers to scaling the rotation include securing additional faculty, leveraging team collaboration software, and developing a robust curriculum evaluation tool.

CAN YOU PUMP IT? TEACHING RESIDENTS TO ASSESS CORRECT PATIENT METERED DOSE INHALER USE

Matthew Ballenberger[1]; Gray Ballinger[1]; Rebecca Mazurkiewicz[2]. [1]Internal Medicine, Lenox Hill Hospital, New York City, NY; [2]Medicine, Lenox Hill Hospital, New York, NY. (Control ID #3341345)

NEEDS AND OBJECTIVES:

1) Evaluate resident ability to correctly use an and teach patients correct MDI use

2) Teach residents how to correctly use and teach patients correct MDI use

SETTING AND PARTICIPANTS: This exercise was conducted at an academic community hospital in New York City. Interactions occurred after change of shift and during night float rotations. Instructors were the residents who authored this exercise. Participants included internal medicine residents of all postgraduate years.

DESCRIPTION: Residents met one on one with an instructor in resident workrooms. They were provided an MDI and asked to teach the instructor how to use it as if the instructor was a patient. Resident performance was evaluated using a checklist of tasks based on the MDI manufacturer's instructions. The instructor then demonstrated the correct use of the MDI, reviewed the checklist of tasks with the residents and answered questions. The resident repeated the pre-intervention exercise and their post-intervention performance was recorded.

EVALUATION:

Of 91 residents, 32 participated in this study. Before the instructor education, residents performed well when explaining when to use an MDI (78.1%; n=25) and holding the MDI 1-2 inches in front of his or her mouth (n=16; 50%). Residents performed poorly on personal and MDI maintenance, with an average of 17.1% tasks being performed correctly. The task most often missed was instructing the patient to rinse the actuator weekly (12.5%; n=4). Residents also performed poorly at assessing patient understanding, with only 35.9% of tasks being completed, and only 31.3% of residents (n=10) asking if patients had any questions.

A subset of residents had who had prior education on MDI use (n=5) or who personally used an MDI (n=5) performed better overall on the pre-educational evaluation. They performed better in all categories except for assessing patient understating with few asking the patient to demonstrate the technique (n=3, 30%) and asking if the patient had any questions (n=3, 30%).

DISCUSSION / REFLECTION / LESSONS LEARNED:

The pre-education evaluation demonstrates a need for resident education on MDI use by showing that residents performed poorly when assessing and teaching correct MDI use. Residents who personally use an MDI or had prior MDI education are better equipped to educate patients as they performed better overall and were more likely to know how to use an MDI correctly before this exercise. After completing this short educational exercise, all residents demonstrated improved ability to assess and teach patients correct MDI use.

Residents poor education regarding MDI use is likely due to medical school and residency training focusing on diagnosing and treating illness, rather than equipping residents with skills needed to ensure proper use of medical equipment. Gaps in resident knowledge likely extend beyond MDI use and encompass other medical equipment. Further educational assessments and exercises should be employed to improve resident knowledge of medical equipment to ensure correct technique and improve patient outcomes.

PRIMARYCARECHAT: AN INNOVATIVE TOOL FOR LEARNING AND COMMUNITY BUILDING

Gaby Mayer[1]; Stephanie Denise Sison[4]; Indu Partha[6]; Mandi Sehgal[5]; Colleen Christmas[2]; Megan R. Gerber[3]. [1]Medicine, NYU Langone School of Medicine, New York, NY; [2]Medicine, Johns Hopkins University, Baltimore, MD; [3]VA Boston Healthcare System, Boston University, Jamaica Plain, MA; [4]Internal Medicine, Johns Hopkins Bayview, Baltimore, MD; [5]Geriatric Medicine, Florida Atlantic University, Boca Raton, FL; [6]Division of Geriatrics, General Internal Medicine and Palliative Medicine, University of Arizona College of Medicine, Tucson, AZ. (Control ID #3384995)

NEEDS AND OBJECTIVES: The community of Free Open-Access Medical Education (FOAMed) has blossomed into a rich world whose users regularly engage in internet-based learning sessions. Twitter has become a particular FOAMed hub, popularizing bite-sized learning via tweetorials and Twitter Chats. Unlike tweetorials, chats allow for a two-way exchange of ideas by posting questions and asking participants to tweet responses, thereby promoting peer-to-peer learning. To date, Twitter chats have largely been subspecialty focused or addressed more experiential/humanistic topics; few have centered around general medicine knowledge/practice. We created Primary Care Chat (PCC) to promote evidence-based medicine in primary care settings.

SETTING AND PARTICIPANTS:

In August 2019, we created the @PrimaryCareChat Twitter handle, hosting facilitated chats every other week. Participants varied by chat but included any Twitter user who logged on at the appointed time/date.

DESCRIPTION: Chat topics were selected by PCC moderators and announced by a tweet from @PrimaryCareChat. Some chats included an expert discussant who helped create chat questions and provided scholarly resources. Over the duration of the 1 hour chat, prepared questions were posted at set intervals, and participants were invited to respond and interact with others on each question thread. At the end, a summary of learning points was posted from the PCC account. In addition, a post-chat feedback survey was tweeted where participants rated how "useful" the chat was on a scale of 1 (not useful) to 4 (extremely useful). Users were encouraged to comment post-hoc if they were unable to take part in the "live" chat.

EVALUATION: We used the Twitter Analytics dashboard to characterize participant demographics and quantify the impact/engagement of chat topics. We used the "poll" feature to administer the post-chat surveys.

60% of our audience identifies as female and 40% as male. They are 80% American, 9% Canadian and < 2% from other countries. Sample topics include sleep disorders, LGBTQ+ care and trauma-informed care.

Our 10 chats have received an average of 23,384 impressions per topic, ranging from 8,273 (caring for patients with barriers to care) to 35,243 (LGBTQ+ care). N=53 respondents to the post-chat surveys rated chats an average of 3.66/4 (1 being least useful, 4 being most useful).

DISCUSSION / REFLECTION / LESSONS LEARNED:

Twitter chats are a valuable educational tool. They create a space for learning exchanges across multiple institutions, countries, training levels, and practice settings. Our chats have received tens of thousands of impressions (suggesting broad reach). Moreover, chat content was rated highly useful by participants. Together, these findings indicate that PCC facilitates dissemination and discussion of primary care-related knowledge, allowing for academic collaboration and engagement with low overhead and time investment.

ONLINE RESOURCE URL (OPTIONAL): www.twitter.com/primarycarechat

USING SIMULATION-BASED TRAINING TO IMPROVE RESIDENT EDUCATION IN DISCHARGE PRACTICES

Jenna N. Sizemore[1]; Spoorthi Sankineni[1]; Karen Clark[1]; Andrea Bailey[2]; Shanthi Manivannan[1]; Maria Kolar[1]; Mary Warden[1]; Sarah Sofka[1]. [1]Medicine, West Virginia University School of Medicine, Morgantown, WV; [2]West Virginia University School of Nursing, Morgantown, WV. (Control ID #3358867)

NEEDS AND OBJECTIVES: Hospital discharge is a complex process prone to medical errors. Our objective was to implement an effective simulation-based education intervention to improve transition practices in graduate medical education.

SETTING AND PARTICIPANTS: PGY-1 residents from the Internal Medicine and Transitional Year residency programs at West Virginia University completed a discharge simulation within the first two months of their residency.

DESCRIPTION: A lecture on a successful discharge was given prior to the simulation. Two patient scenarios listing a brief patient history, hospital course, and medication list were given to the residents. Case 1 used a patient with a new diagnosis of diabetes mellitus type II requiring insulin and coronary artery disease. Case 2 used a patient with infective endocarditis discharged on anticoagulation and MAT for opioid use disorder. These cases were designed to emphasize geographic healthcare disparities and lack of access to treatment. Residents were observed by a faculty member during the simulation, who completed a case specific discharge rubric.

A resident placed discharge orders in a practice EMR created specifically for this simulation. After completing discharge orders, an observing faculty would describe common pitfalls within the EMR and checks orders for accuracy.

EVALUATION: Participants were randomly assigned to case 1 (n=14) or case 2 (n=22); distribution was unequal based on simulated patient scheduling. Scores for each case were similar at 72% and 69%. Discussing medication obtainment for MAT in case 2 received the lowest score of all rubric categories with an average score of 50%.

Twenty-three residents responded to the post-simulation survey (63% response rate). Residents reported that their confidence in discharging a patient dramatically increased with 91.67% ($p < 0.05$) agreeing the simulation improved their confidence in safely discharging a patient. Eighty-three percent of residents reported increased confidence in using the EMR discharge navigator post-simulation.

DISCUSSION / REFLECTION / LESSONS LEARNED: Post-acute care transitions are a complex process that often leaves patients perplexed. Residents feel that they do not receive formal training in transitions practices and instead learn these processes by peer-to-peer instruction during patient care. We developed our stimulation-based educational intervention to teach a standardized discharge process to our residents. Our discharge rubric was enlightening in that we were able to identify future educational targets during the observed encounters. Discussing medication obtainment for MAT for OUD received the lowest score of all categories; many residents commented they were unaware of prescribing requirements of MAT. Residents also received lower scores when addressing other unique needs of OUD, which included community resources and access to behavioral medicine.

A CLINICAL-REASONING BASED INNOVATION: FERM ROUNDS (FACILITATING EXCELLENT REASONING IN MEDICINE)

Emilie P. O'Neill, Hannah Rosenblum. Internal Medicine, Yale Primary Care Residency Program, New Haven, CT. (Control ID #3391761)

NEEDS AND OBJECTIVES: Based on feedback from residents about the low quality of inpatient education on the general medicine teaching service, a needs assessment was conducted and the following growth areas were determined:

- The intern presented the H&P without direct guidance on content selection and with the patient's ED course and data typically included in the "HPI"

- The culture to avoid interrupting the learner as they presented which was intended to convey consideration created barriers to on-the-fly/transparent feedback on medical decision making

- The supervising resident had the expectation of providing a 'teaching point' at the case's conclusion, but the content of the teaching and the integration with the discussion of the case were not clear

- While the night teams felt like they had the opportunity to learn directly in their role admitting and managing a patient for several hours prior to discussing the case, they did not feel successful in conveying the content of their experiential learning/overnight decision making, and as a result missed out on direct feedback on that decision making

Out of these needs were determined the following objectives:

- Provide a uniform structure for the presentation of the teaching case that identified roles for each participant

- Include interval pauses in the structure of case presentations to eliminate barriers to on-the-fly feedback and create a culture where discussion and questioning are incorporated in the dialogue rather than appearing intrusive

- Educate the residents and faculty on core concepts of clinical reasoning to ensure shared mental model for discussion of medical decision making

SETTING AND PARTICIPANTS: General medicine ward staffed by the residents and attendings of the YPC IM program

DESCRIPTION: FERM rounds was designed with the following structure: the night resident selected the teaching case and classified it according to the highest yield content as a case focusing on diagnosis, management or clinical concepts and pearls. The night resident coached the intern in presenting aliquoted data with structured pauses for group discussion according to predetermined scripts. We designed graphic organizers summarizing the key concepts in clinical reasoning and outlining the scripts for each type of case which were displayed as posters in the team space and provided on individual laminated pocket cards for the housestaff.

EVALUATION: Evaluation of the impact of the changes to the rounding structure was done on an ongoing basis by regularly attending FERM rounds and soliciting feedback directly from participants as well as periodic qualitative feedback from residents through the Program Evaluation Committee.

DISCUSSION / REFLECTION / LESSONS LEARNED: Overall, perception from the residents of the new structure was largely positive, with a substantial increase in the satisfaction ratings for the quality of medical education on the general medicine service. The housestaff and faculty's familiarity and use of clinical reasoning terminology and concepts increased and was reinforced in reports and other contexts.

A COMMUNITY BASED LONGITUDINAL ADVOCACY CURRICULUM FOR UNDERGRADUATE MEDICAL STUDENTS

Paul Eigenberger[3]; Anne Frank[1]; Jennifer Adams[1,2]. [1]General Internal Medicine, Denver Health, Denver, CO; [2]Division of General Internal Medicine, University of Colorado, Aurora, CO; [3]School of Medicine, University of Colorado, Aurora, CO. (Control ID #3392168)

NEEDS AND OBJECTIVES: Undergraduate medical curricula traditionally train students to understand the pathophysiology, diagnosis and treatment of disease, with much less curricular emphasis on topics such the social determinants of health (SDoH), disease prevention and health advocacy. Recognizing this opportunity, a novel community based curriculum was developed with goals of teaching core public health and advocacy principles by engaging with community-based organizations.

A pre-curricular needs assessment survey was administered to past participants of a Longitudinal Integrated Clerkship (LIC) at an urban safety net hospital. Half of respondents reported "little/none" when asked about prior exposure to curricula related to advocacy. Sixty percent of respondents rated their knowledge/understanding of the legislative process related to health issues as "poor/very poor." Seventy-five percent rated their comfort/ability address a health related policy "somewhat/very uncomfortable

SETTING AND PARTICIPANTS: Based on this needs assessment, a novel curriculum was developed and implemented for a class of ten 3rd year medical students in an LIC at an urban safety net hospital. Students chose to collaborate with one of two community organizations: a harm reduction center/needle exchange or a shelter for homeless teens.

DESCRIPTION: The multi-modal curriculum consists of classroom and community components. Students engage in small group didactic content, engagement with a community agency, and reflection activities. Over six months students design and implement a collaborative advocacy project with their chosen community organization. Students present projects and participate in reflection at the end of the academic year.

EVALUATION: The curriculum will be evaluated for knowledge, attitudes, and confidence around advocacy topics, work with community organizations, service orientation, and leadership, using a survey published by Belkowitz et. al. The evaluation uses two pre-exposure LIC cohorts as controls, and will be administered as a pre/post curriculum survey for participating students. The impact on community organizations will be assessed as well as the advocacy projects themselves. Data from the exposure control group and the pre-curriculum survey from the current cohort was collected and pooled (n=20). Post- curriculum data will be collected and analyzed in March, 2020.

DISCUSSION / REFLECTION / LESSONS LEARNED: Incorporating a community engagement curriculum in an already busy LIC curriculum presents challenges related to student motivation and fatigue. The quality of the community relationships and projects is dependent on both student and organization engagement, and therefore depends heavily on mutual commitment and participation.

ADDRESSING SOCIAL DETERMINANTS OF HEALTH IN AN INTERPROFESSIONAL OUTPATIENT RESIDENCY TRAINING PROGRAM

Kimone Lightford[1]; Timica Campbell[2]; Elizabeth Painter[3]; Anton Vehovec[4]; MIchael Purdum[3]; Pamela Lynch[5]; Megan Mcnamara[1]. [1]Internal Medicine, Louis Stokes Cleveland VA Medical Center, Cleveland, OH; [2]Internal Medicine, Louis Stokes VA Medical Center, Cleveland, OH; [3]Psychology, Louis Stokes Cleveland VA Medical Center, Cleveland, OH; [4]Education, Louis Stokes Cleveland VA Medical Center, Cleveland, OH; [5]Social Work, Louis Stokes Cleveland VA Medical Center, Cleveland, OH. (Control ID #3385828)

NEEDS AND OBJECTIVES: Within the US, many health care providers do not understand the full extent or nature of health disparities[i]. Current literature outlines the need for further education on social determinants of health (SDH) in graduate medical education, but there is little evidence on how to approach this within an interprofessional (IP) setting. We developed an SDH curriculum with an emphasis on an IP model of education.

Learning Objectives:

1. Define SDH and understand how sociocultural factors affect patient interactions within healthcare

2. Develop strategies to recognize gaps in care and utilize resources to individualize patient needs

3. Recognize personal bias and its impact on patients

SETTING AND PARTICIPANTS: The Center of Outpatient Education (COE) was developed at the VA to address the need to train future healthcare professionals using an IP team-based model. Trainees within the COE include residents and students from the following fields: Medicine, Nursing, Pharmacy, Psychology and Social Work. Participants of the COE program are educated in a variety of settings including IP didactics, VA clinics and offsite affiliations (i.e. local museums).

DESCRIPTION: IP faculty representing the above professions developed this curriculum by collaborating to create a vision statement along with ideas for relevant content.

Examples of developed lectures and goals:

1. Social Justice: Recognize the impact of legal involvement on patient care

2. Introduction to the US Healthcare System: Describe legal policies and historical events that led to the current insurance market

3. Climate Change and Health: Illustrate the impact of environmental changes on population health and migration

Plans for future content include: 1) A community mapping exercise to help learners understand the effects of community infrastructure 2) Healthcare related to vulnerable populations (e.g. immigrants, LGBTQ patients).

EVALUATION: Our current evaluation system comprises real time feedback after each lecture/activity with the COE chief resident and via minute papers. The minute papers are composed of three 5-point Likert scale questions to assess session usefulness, confidence in presented material and overall presentation. There are also 3 short-answer questions to address suggestions for improvement, remaining questions, and major take- home lessons.

DISCUSSION / REFLECTION / LESSONS LEARNED: The need for high-impact IP learning regarding SDH topics led to the development of this curriculum. As we progressed, it became clear that the content required thoughtful examination to develop an inclusive, manageable curriculum for learners. IP faculty involvement in development was key to ensure that each profession was appropriately represented. We felt it was prudent to cover content that would be relevant on both a local and national scale to prepare learners for their future career paths.

ONLINE RESOURCE URL (OPTIONAL): [1] Gregg J, Solotaroff R, et al. (2008). Health and disease in context: a community-based social medicine curriculum. Academic Medicine. 83 (1):14-9. 10.1097/ACM.0b013e31815c67f0

ADDRESSING THE ACHIEVEMENT GAP IN PRECLINICAL MEDICAL EDUCATION

Alana Jones[1,2]; Alana C. Nichols[2]. [1]Department of Epidemiology, University of Alabama at Birmingham, Birmingham, AL; [2]School of Medicine, University of Alabama at Birmingham, Birmingham, AL. (Control ID #3391150)

NEEDS AND OBJECTIVES: The disparity in academic performance between white and nonwhite students precedes kindergarten and worsens as students progress through the educational system. Medical education is not immune from this disparity. Underrepresented medical students are more likely to experience delayed graduation and failure even after accounting for science GPA and MCAT performance. Moreover, underrepresented medical students are more likely to earn lower scores on licensing examinations, which can have a significant impact on their career trajectory. Given the recent recommendations by the Invitational Conference on USMLE Scoring, there is an urgency in addressing this disparity as the current climate places underrepresented students at a disproportionate disadvantage regarding specialty choice and residency competitiveness. Due to the history of inequity in science education, minority students are at particular risk during the basic science portion of their preclinical curricula. Institutions should be proactive in mitigating those risks that many underrepresented students will face in their coursework. Although some medical schools have previously implemented interventions for at-risk and underrepresented students, none have developed a comprehensive, longitudinal approach. We propose a supplemental academic support program to close the achievement gap in medical education.

SETTING AND PARTICIPANTS: The target audience will be medical students in the preclinical period of their curricula.

DESCRIPTION: We have developed an evidence-based approach that includes a targeted pre-matriculation program, longitudinal tutoring and peer-teaching sessions, and innovative strategies to improve study hygiene and test-taking skills. We also incorporate wellness techniques that address the psychological stressors that are associated with academic underperformance among minorities, e.g. stereotype threat.

EVALUATION: Partial implementation of this program in a small cohort of underrepresented medical students (n=5) has shown initial improvement in preclinical courses and standardized test performance, i.e. NBME assessments. Moreover, a pilot study (n=1) showed significant improvement from Step 1 to Step 2 CK exams, suggesting a possibility of scaling up this program beyond the preclinical stage.

DISCUSSION / REFLECTION / LESSONS LEARNED: Preliminary results have indicated that a longitudinal, integrative support program can significantly improve academic performance among underrepresented medical students when other methods, e.g. basic tutoring, have not been sufficient. Future studies in a larger cohort over a longer period of time are needed to assess the efficacy of the full intervention.

ADDRESSING UNMET NEEDS IN WOMEN'S HEALTH EDUCATION FOR VA CONTINUITY CLINIC RESIDENTS: A HANDS-ON, RESIDENT-TAILORED CURRICULAR INNOVATION

Megha Shankar[1,2]; Matthew Stevenson[3]; Nicole Grant[3]; Suvarna Akki[3]. [1]Health Services and Research Development, VA Palo Alto Health Care System, Menlo Park, CA; [2]Center for Primary Care and Outcomes Research, Stanford University, Stanford, CA; [3]Internal Medicine, VA Palo Alto Health Care System, Palo Alto, CA. (Control ID #3386019)

NEEDS AND OBJECTIVES: ACGME requires women's health education, but access to hands on women's health clinical skills is low for residents with a VA continuity clinic. To address this gap in resident education, we created women's health (WH) sessions that are embedded within an existing, required ambulatory block. The objectives are to (1) practice pelvic and breast exam using "Limbs and Things" models through a case- based curriculum; (2) engage in evidence-based women's health preventive care including cervical and breast cancer screening, intimate partner violence, family planning, sexually transmitted infections, and menopause; and (3) employ gender and culturally sensitive skills in clinical practice.

SETTING AND PARTICIPANTS: The setting is an academic center affiliated VA primary care clinic. The participants are all internal medicine residents with VA continuity clinic on required ambulatory block. Internal medicine attendings lead the sessions with curriculum called Core Topics in Women's Health.

DESCRIPTION: The WH session is a half-day, 1-on-1 workshop. The case-based and hands-on session is tailored to residents' unique gaps in women's health education, including cervical and breast cancer screening, intimate partner violence, family planning, sexually transmitted infections, and menopause. Pelvic and breast models from Limbs and Things LTD Medical Training Models demonstrate a variety breast, cervical, uterine, and vaginal pathologies. Residents engage in case-based learning, developing a plan of care for the patient, choosing diagnostic testing and treatment based on their exam of the pelvic model.

EVALUATION: All residents evaluated the WH sessions within a larger survey for the ambulatory block. Sessions were rated on a scale of 1-5, with 1 as not valuable at all, 2 as somewhat valuable, 3 as valuable, 4 as very valuable, and 5 as extremely valuable. Future evaluation will focus on the impact of the model/simulation-based learning component on resident self-efficacy in women's health clinical practice.

DISCUSSION / REFLECTION / LESSONS LEARNED: After a year of implementation and evaluation, the WH sessions are highly rated with 75% of residents rating the sessions as "extremely valuable." The sessions fill a crucial gap in resident education. The hands-on portion is key, given this may be the first time residents feel an ovarian cyst, determine uterine position, or correctly identify an abnormal breast mass, especially in VA residents with limited exposure. The biopsychosocial model is applied when discussing cases of intimate partner violence, allowing residents to practice trauma informed care in the pelvic exam. The 1 on 1 nature of the sessions are meaningful as sessions are tailored to each resident's unique learning needs. For example, for male residents, the hands-on portion may be one of few learning opportunities for pelvic exam. It is rare for residents across the country with VA continuity clinic to have dedicated and required women's health curriculum that enables them to feel self-efficacious in the clinical care of women.

A GOOD FIT: INTERPROFESSIONAL, TEAM-BASED LEARNING AND CARING FOR VETERANS EXPERIENCING HOMELESSNESS

Anais Tuepker[1]; Carole Warde[2]; Claudine D. Johnson[7,8]; Summer Newell[3]; Shalini Patel[4]; Kristin Kopelson[5]; Stuart Gilman[6]. [1]Division of General Internal Medicine, VA Portland Health Care System/Oregon Health and Science University, Portland, OR; [2]Medicine, Greater Los Angeles VA Health System, North Hills, CA; [3]CIVIC, VA Portland Health Care System, Portland, OR; [4]UCSF/San Francisco VA, San Francisco, CA; [5]HPACT, VA, Los Angeles, CA; [6]Office of Acad Affiliations, US Dept of Veterans Affairs, Washington, DC; [7]Michael E DeBakey VA Medical Center, Houston, TX; [8]Baylor College of Medicine, Houston, TX. (Control ID #3389655)

NEEDS AND OBJECTIVES: Homeless Veterans often have complex and intertwined medical, psychological and social needs. Interprofessional, team-based care models are beneficial in meeting these needs and offer valuable clinical training opportunities across health professions. Formal learning opportunities while caring for homeless patients, supported by well-staffed clinical teams and coupled with interprofessional education, remain rare.

SETTING AND PARTICIPANTS: Since 2011, the Veterans Health Administration (VA) has supported Centers of Excellence in Primary

Care Education (CoEPCE) to advance innovations in interprofessional education (IPE). We evaluated two CoEPCE programs that aim to deliver quality care to homeless Veterans while also providing team-based learning within VA's Homeless Patient Aligned Care Team (H-PACT) clinic model.

DESCRIPTION: Shared COEPCE curricular practices include interprofessional case conferences, expanded team huddling, and alignment of trainee schedules. One CoEPCE employs humanism as an explicit training concept and is composed exclusively of H-PACT teams; the other provides care for both homeless and non- homeless Veterans.

EVALUATION: We conducted a constant comparative analysis of verbatim transcripts of semi-structured interviews with 15 interprofessional learners and 14 interprofessional faculty from advanced practice nursing, internal medicine, psychology, psychiatry, pharmacy, and social work.

DISCUSSION / REFLECTION / LESSONS LEARNED: Perceived benefits and challenges of IPE while caring for homeless Veterans were largely consistent across sites. Faculty and trainees reported that interprofessional teams decreased barriers to care and offered more efficient and higher quality of care, due to the presence of multiple experienced team members to meet more patient needs in one visit with reduced administrative burden. Trainees' confidence in managing complex scenarios in real time was cultivated by the team. Both faculty and trainees described more satisfying professional experiences resulting from patient needs being more likely to be met. Trainees described how caring for these patients created ease and familiarity in applying a Social Determinants of Health (SDH) lens. Enhanced team huddles were emphasized as a particularly useful care and educational tool. Trainees from several professions experienced growth in recognizing their inability to "fix" patients' challenges, and that provider-patient priorities don't always coincide. High no-show rates hampered educational needs; clinics developed context-dependent strategies to address this. Some trainees expressed anxiety that they were not learning enough "medical" management. Faculty described trying not to overwhelm trainees with too many complex cases early on, while ensuring all patients had their care needs met.

A GRADUATE MEDICAL EDUCATION ELECTIVE ON HEALTHCARE FINANCE

Vanneta Hyatt. Internal Medicine, Lewis Katz School of Medicine, Drexel Hill, PA. (Control ID #3392410)

NEEDS AND OBJECTIVES: increase knowledge of health care financing in our Resident physician in a large academic institution

SETTING AND PARTICIPANTS: PGY2 and PG Y3 in the IM residency program

DESCRIPTION: A healthcare finance elective was created to give resident physicians a better understanding of different areas of the financing of a healthcare organization and tools to help them as they complete their training to practice independently. This is a 1-week elective during which the resident physicians meet with several administrative staff to discuss their role in the financial management of the institution. Several topics were covered during these meetings which includes: utilization review/denials and appeal management, the complex relationship between the Health System and the payers, both private and governmental, coding and billing, specific policies on reimbursement for visits and procedures, and physician recruitment to name a few. One of the highlight of this elective was the unique opportunity to spend a day at a major Health Maintenance Organization in city of Philadelphia to gain insight into the management of healthcare expenses from a payers' perspective. Some topic covered were contract negotiation with providers, appeals process, quality improvement initiatives, and the effect of government regulations and the law in delivering health care.

EVALUATION: Resident physicians were required to write an essay on the health care topic of their choice and the impact of the rotation on their training. Qualitative analysis of lessons learned was obtained from the essays

DISCUSSION / REFLECTION / LESSONS LEARNED: Overall the resident physicians reported increase in their general knowledge regarding the role of third party payers such as HMO and government program (Medicare Medicaid,) and their responsibilities as providers of care in the current healthcare system. Their comfort level with various health finance topic also improved and inspired some to seek out other opportunities to continue to build on this knowledge. This elective successfully increased the knowledge of our resident physicians regarding healthcare finance, which in turn gave them a better understanding of the delivery of healthcare in the United States.

A HEALTH LITERATE CARE CURRICULUM: LEVERAGING A PUBLIC-ACADEMIC PARTNERSHIP TO ADDRESS SOCIAL DETERMINANTS OF HEALTH

Lauren Block[1]; Samara Ginzburg[2]; Cindy Brach[3]; Terri Ann Parnell[5]; Marie Petrizzo[2]; Linda Harris[4]. [1]Medicine, Northwell Health, Lake Success, NY; [2]Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [3]Agency for Healthcare Research and Quality, Washington, DC; [4]U.S. Department of Health and Human Services, Washington, DC; [5]National Academies of Sciences, Engineering, and Medicine, Washington, DC. (Control ID #3390051)

NEEDS AND OBJECTIVES: While health literacy is a key social determinant of health, over one third of US adults have limited health literacy. Training to address health literacy by adopting a 'universal precautions' approach is necessary to ensure healthcare professionals meet the needs of patients. A set of knowledge, skills, and attitudes have been proposed to prepare physicians to work with patients of all health literacy levels. To our knowledge, no medical school has adopted this comprehensive approach. Through a public-academic partnership, we leveraged the expertise of government officials to integrate a Health Literate Care Model throughout the curriculum at one medical school.

SETTING AND PARTICIPANTS: Health literacy experts from the US Department of Health and Human Services' Office of Disease Prevention and Health Promotion, the Agency for Healthcare Research & Quality (AHRQ), the National Academies of Sciences, Engineering, and Medicine's Roundtable on Health Literacy, and medical school faculty collaborated over two years.

DESCRIPTION: Through conference calls and a site visit, health literacy experts learned about the curriculum and educated the curricular team about the AHRQ Health Literacy Universal Precautions Toolkit (AHRQ Toolkit). Together they evaluated and aligned the curriculum with the AHRQ Toolkit. The curriculum was mapped to the AHRQ Toolkit. Fourteen of the twenty-one health literacy tools, including 'form a team,' and 'make action plans,' already existed in the curriculum and were enhanced. Seven tools and corresponding assessments were added to the first, second, or third year curriculum. Tools to promote clear communication were incorporated in the quality improvement curriculum. Students reflected on navigation challenges of their own patient portals and critiqued written patient education materials. Students practiced skills to communicate with standardized patients declining vaccination. Students practiced connecting patients to literacy resources. An interprofessional education session focused on interdisciplinary collaboration.

EVALUATION: The curricular enhancements are being implemented with 300 first, second, and third year students during the 2019-20 academic year. Each tool was mapped to a corresponding student assessment. Assessment components include completion of clinical learning

objectives in clinical preceptorships, formative and summative exam questions, and clinical skills encounters.

DISCUSSION / REFLECTION / LESSONS LEARNED: Collaboration between public and academic health literacy experts and faculty from one medical school yielded a Health Literate Care Curriculum integrating each tool from the AHRQ Toolkit. Feedback from health literacy experts ensured each tool was integrated into the curriculum, coupled with an assessment focused on skills and knowledge acquisition. Ongoing collaboration and a site visit ensured health literacy experts understood curricular framework and guiding principles, in order to provide tailored feedback and recommendations.

ALL EARS: WHO IS LISTENING TO INTERNAL MEDICINE PODCASTS?

Justin Berk[1]; Beth Garbitelli[4]; Nora Toranto[5]; Paul Williams[2]; Matthew Watto[3]. [1]Medicine and Pediatrics, Warren Alpert SOM at Brown University, Providence, RI; [2]General Internal Medicine, Temple University Hospital, Philadelphia, PA; [3]Internal Medicine, University of Pennsylvania, Fort Washington, PA; [4]Tufts University School of Medicine, Boston, MA; [5]Internal Medicine, Brigham and Women's Hospital, Boston, MA. (Control ID #3342376)

NEEDS AND OBJECTIVES: A recent trend in both graduate and undergraduate medical education is the incorporation of asynchronous learning and "flipped classroom" pedagogies. Podcasts, in particular, have grown exponentially relative to other medical education resources. Many residents use and prefer podcasts for their medical education. One survey found that 88% reported listening to medical education podcasts at least once a month while another identified podcasts as the most popular form of extracurricular education and as the most beneficial learning resource compared to textbooks, journals, and Google. But who is listening to these podcasts and what episodes are the most popular?

SETTING AND PARTICIPANTS: Individuals from any country can download episodes of The Curbsiders without cost using any podcast player (Apple Podcasts, Spotify, CastBox, Sticher).

DESCRIPTION: Self-reported data were collected from a short questionnaire provided when an individual subscribes to "The Curbsiders" internal medicine podcast mailing list. Internal download data was collected. Statistical analysis was used to fit a model to understand download growth. We then assessed which episodes were above the 95% confidence interval of predicted downloads (i.e. received more downloads than predicted by the model); these were identified as Top Performing Episodes.

EVALUATION: Using self-reported data from a survey of 10,089 subscribers, approximately 38% identified as internists, specialists, faculty, or post-training physicians, 23% as residents or fellows, 20% as advanced practitioners (e.g. physician assistants or nurse practitioners), and 15% as students. Our growth rate suggests we receive 300 more regular downloaders with each episode. Top Performing Episodes that outperformed the model were: #48 Hyponatremia deconstructed, #137 Hyperkalemia, #138 Inflammatory Bowel Disease, #159 Atrial Fibrillation Review, #161 Rash approach.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our data demonstrate that medical education podcasts are being adopted at all levels of training. Our growth rate suggests a linear growth rate of 300 more downloads per each episode is a reasonable fit (R = 0.77). The Top Performing Episodes include Nephrology topics that were recorded with a prominent social media influencer. Perhaps more surprisingly, an episode on rashes: a topic generally thought of requiring visual pedagogies was a Top Performing Episode.

ONLINE RESOURCE URL (OPTIONAL): https://thecurbsiders.com/

AN AMBULATORY NUTRITION CURRICULUM TO ADDRESS CARDIOVASCULAR RISK REDUCTION FOR INTERNAL MEDICINE RESIDENTS

Seema Jain[2]; Robert Feldman[2]; Andrew Althouse[2]; Carla L. Spagnoletti[2]; Siobhan Proksell[1].

[1]Gastroenterology, Hepatology, and Nutrition, UPMC, Pittsburgh, PA; [2]Medicine, University of Pittsburgh, Pittsburgh, PA. (Control ID #3368241)

NEEDS AND OBJECTIVES: Despite increasing rates of chronic diseases for which dietary intervention is a core component of management, only a minority of office visits for these patients include dietary counseling. A major barrier is the lack of nutrition education for physicians in training. We created a curriculum for internal medicine residents in order to improve the delivery of nutrition counseling to patients with hypertension, hyperlipidemia and body mass index (BMI) ≥ 25. We aimed to teach residents to initiate personalized nutrition counseling using behavioral change assessment and to refer appropriate patients for ongoing nutrition counseling.

SETTING AND PARTICIPANTS: Seventy-six internal medicine residents of a single residency program participated in the curriculum, delivered by faculty preceptors and given over two consecutive sessions in small group settings.

DESCRIPTION: Using a scaffolding of patient cases, we discussed nonpharmacologic management of patients with hypertension, hyperlipidemia, and BMI ≥ 25 and reviewed evidence for relevant dietary patterns. We provided resources for dietary referrals available in our health system and illustrated examples of appropriate provider responses based on the stage of behavioral change of the patient.

EVALUATION: We delivered electronic surveys to residents prior to curriculum implementation, immediately after, and 2 months after completion of the curriculum. Aggregate percent correct scores of knowledge questions significantly improved from 67% to 85% in the immediate post survey compared to baseline (n=24 paired responses, p=0.004). For patients with obesity, hypertension, and hyperlipidemia, 75% of residents in the delayed post survey reported providing nutrition counseling to appropriate patients always or most of the time for all three conditions compared to 25% of residents at baseline (n=12 paired responses). We also reviewed electronic health records (EHR) of patients with BMI ≥ 25, hypertension, or hyperlipidemia who were seen in our university resident clinics 2 months prior (n=503) and 2 months after (n=473) curriculum delivery. Documented nutrition counseling provided by residents increased from 35% to 41% in this time period (OR 1.27, 95% CI 0.97-1.67, p = 0.085). Referrals made for dietary counseling did not change in frequency (8%).

DISCUSSION / REFLECTION / LESSONS LEARNED: After delivery of this curriculum, trainee knowledge of nutrition interventions for reducing cardiovascular risk improved. More residents reported providing nutrition counseling for appropriate patients and we observed a trend towards increased EHR documentation of nutrition counseling provided by residents. Further evaluation is warranted to investigate the low rates of dietary referrals made by residents.

A NARRATIVE MEDICINE APPROACH TO MENTAL HEALTH, IDENTITY, AND TRAUMA- INFORMED CARE

Hannah Beaman[1]; Sarah Watanaskul[1]; Archna Eniasivam[2]; Louise Aronson[3]. [1]School of Medicine, UCSF, San Francisco, CA; [2]Internal Medicine, Pediatrics, UCSF, San Francisco, CA; [3]Geriatrics, UCSF, San Francisco, CA. (Control ID #3390852)

NEEDS AND OBJECTIVES: Student evaluations at UCSF show that traditional case-based small groups are inadequate when discussing the intersection of patient and clinician identities with health and healthcare. Students identified emotional gaps and expressed a desire for the integration of personal experience in the course. Considering the effectiveness of storytelling in conveying emotion and experience, we redesigned one seminar using a narrative medicine approach as a pilot for addressing low learner satisfaction and enhancing learning about identity and disparities.

SETTING AND PARTICIPANTS: Two hour small group on "Mental Health, Identity, and Trauma- Informed Care" attended by 12 first-year medical students and facilitated by 1-2 faculty members.

DESCRIPTION: The seminar centered around three excerpts of contemporary first-person narratives:

-"My Mental Illness Did Not Prevent Me From Succeeding, But The Stigma Nearly Did" by Michelle Yang

-Citizen: An American Lyric by Claudia Rankine

-NEJM Perspective: "Resistance and Surrender — Remembering to Bow to Strength, Not Power" by Jennifer Tsai

Selected narratives highlighted intensely individual experiences of mental illness and trauma while also acknowledging the impact of sociocultural factors such as stigma, the experience of discrimination, and clinician bias. Discussion was guided through tailored questions and supplemented by a reader chapter about trends in mental healthcare and associated disparities.

EVALUATION: Student pre/post-seminar surveys were analyzed via paired t-test (n=13). Post-session surveys showed statistically significant increases in student confidence in avoiding biased language (p=0.009) and applying trauma-informed care (p=0.015). Students felt that the narrative-based format helped them meet the session's learning objectives. One student commented: "The narrative-based format of the small group session was so effective at keeping everyone not only educated on the topics discussed, but also actively engaged the entire time on several different levels: mentally, emotionally, etc. I wish the rest of the small group sessions for H&I were run in the same way."

DISCUSSION / REFLECTION / LESSONS LEARNED: Narratives packaged didactic information in an emotionally engaging format and created space for students to share personal experiences. It was difficult to isolate the effect of the narrative approach on student learning since multiple aspects of the seminar changed (format, learning objectives, reader chapter). Furthermore, our likert scale questions may not have captured some aspects of the narratives' impacts (e.g. increased engagement and emotional connection to learning), which may have been better evaluated with qualitative research methods.

Key to this approach is the involvement of students in narrative content curation. Students may be best attuned to their class's needs and well-suited to the time-intensive process of identification of appropriate narratives, creation of tailored discussion questions, and development of facilitator guides.

ONLINE RESOURCE URL (OPTIONAL): https://ucsf.box.com/v/NarrativeSmallGroup

A NARRATIVE MEDICINE WORKSHOP ON END-OF-LIFE CONVERSATIONS: HELPING JUNIOR RESIDENTS TO ENGAGE IN EMOTIONAL PROCESSING

Xi Kathy Chu[1]; Sabrina Esbitt[2]; Deborah Swiderski[1]. [1]Medicine, Montefiore Medical Center, New York, NY; [2]Behavioral Science, Montefiore Medical Center, Bronx, NY. (Control ID #3392162)

NEEDS AND OBJECTIVES: Junior residents are asked to take care of critically-ill patients, whether in the intensive care units or on the general medical wards, and often are assumed the *de facto* provider with whom these patients and their families have goals-of-care and end-of-life (EOL) conversations. Physicians, even at the faculty level, express discomfort and avoidance of these conversations, with one perceived barrier being distress with the emotional intensity around these conversations. Narrative medicine, which uses literature as a source for reflective practice, may provide emotional distance that then allows providers to identify and process their own emotional responses to patients at EOL. We aimed to assess whether a narrative medicine workshop around EOL could facilitate emotional processing in junior residents.

SETTING AND PARTICIPANTS: Junior residents in the primary care track of the internal medicine residency program (PGY2, n=10) at an urban academic medical center located in the Bronx, NY.

DESCRIPTION: A two-hour workshop was created around primary texts on death and dying narratives, which included patient, provider and family perspectives. Written and oral prompts were created around these texts, drawing from available literature on narrative medicine and EOL curriculum. Prompts were open-ended to allow for broad interpretation and discussion.

EVALUATION: Preliminary evaluation suggests high engagement, with high participation in the written exercise (8/10), and in discussion with peers (9/10), although sharing written responses to prompts was low (2/10). Specific patient encounters were shared (4/10). Notable emerging themes included perceived barriers to having EOL conversations (lack of EOL teaching in 3/10, lack of time in 2/10), expression of difficult emotional states (uncertainty in 4/10, guilt in 3/10 and feeling coercive in 2/10), and expression of coping strategies (individual strategies in 2/10, systems strategies in 2/10). Follow-up focus group interviews around perceived effects of the workshop will be conducted in March 2020 with qualitative analysis to be complete by May 2020.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our workshop suggests that within a narrative medicine workshop around EOL, junior residents do engage in discussion of patient encounters and challenging emotions around these encounters. We therefore posit that narrative medicine workshops, using literature as a source of emotional distance, can serve as a powerful and distinctive educational tool to assist in the emotional processing of EOL encounters in junior residents. Subsequent evaluation in focus group interviews may inform whether this narrative medicine workshop can furthermore affect perceived emotional self-regulation, with implications for effective non-judgmental and non-directive EOL counseling.

A NEW TRIPLE AIM FOR RESIDENT QUALITY IMPROVEMENT CURRICULA: ALIGNING RESIDENT EDUCATION, INSTITUTIONAL PRIORITIES AND MEANINGFUL CLINICAL IMPROVEMENT

Andrew T. Harris[1]; Yuri Shindo[1]; Joshua Mauro[1]; Anton Vehovec[2]; Timica Campbell[1]; Mamta Singh[1]; Megan Mcnamara[1]; Corinna D. Falck-Ytter[1]. [1]Internal Medicine, Louis Stokes VA Medical Center, Cleveland, OH; [2]Louis Stokes VA Medical Center, Cleveland, OH. (Control ID #3390598)

NEEDS AND OBJECTIVES: Internal medicine residents are required to participate in quality improvement (QI) activities as part of their training. However, lack of alignment between learner needs and institutional priorities often leads to poor learner engagement and lack of sustainable systems level changes or meaningful improvement in patient outcomes.

Curriculum Goals:

Identify gaps in care and partner with clinical stakeholders to design systems-based interventions Identify at least one quality metric relevant to patient care that can be tracked over time Demonstrate ability to use core QI skills

Design a test of change with the goal of clinically significant improvement

SETTING AND PARTICIPANTS: This curriculum was designed and implemented at the Center of Outpatient Education (COE) at the Louis Stokes Cleveland VA. This interprofessional primary care training program includes learners from medicine, nursing, pharmacy, psychology and social work. Each team consists of 3-4 interprofessional learners and a faculty coach. Projects lasted 12-18 months.

DESCRIPTION: Clinical faculty and facility leadership identified hypertension (HTN) control as a clinical improvement priority. After literature review, we identified MAP (Measure BP accurately | Act rapidly to manage uncontrolled HTN | Partner with patients, families and communities) as an evidence-based population health framework for scoping our improvement efforts. Four projects were selected:

1. Improving BP measurement in clinic
2. Improving HTN treatment
3. Increasing rapid follow-up for uncontrolled HTN
4. Improving home BP measurement

Residents completed Lean Six Sigma Yellow Belt training and were given an additional twelve hours of dedicated time with their QI coach over a year to work through Define, Measure, Analyze, Improve, Control (DMAIC) methodology. Each team identified and approached clinical stakeholders including nurse managers, scheduling managers, providers, prosthetics personnel and pharmacists to include in project teams. Lead clinical faculty (AH) met with QI coaches weekly, and primary care leadership bi-weekly, to address barriers to project implementation. Projects were phased in over time with launch of the initiative in July 2018.

EVALUATION: Twenty-one residents obtained Lean Six Sigma Yellow Belt certification. Each project team developed systems-based interventions and completed one change cycle. The percentage of HTN patients with blood pressure < 140/90 improved from 61% in July 2018 to 72% in January 2020.

DISCUSSION / REFLECTION / LESSONS LEARNED: We present a successful model for a longitudinal ambulatory QI curriculum that aligns resident educational needs and institutional priorities leading to significant, sustained improvement in clinical outcomes. Key success factors include: faculty facilitating bidirectional alignment of learner and clinic operational needs; dedicated curricular time; and project coaching. While appropriately scoping projects is an oft-cited barrier succesful resident QI projects, using an established evidence-based framework such as MAP can be effective.

AN EXPERIENTIAL APPROACH TO NUTRITION EDUCATION IN MEDICAL SCHOOL - A CULINARY MEDICINE CURRICULAR INTERVENTION

Diana Thiara[1]; Tracy Fulton[2]; Emma Steinberg[3]; Andrea Garber[2]. [1]General Internal Medicine, University of California at San Francisco, San Francisco, CA; [2]School of Medicine, University of California, San Francisco, San Francisco, CA; [3]Pediatrics, University of California, San Francisco, SF, CA. (Control ID #3391409)

NEEDS AND OBJECTIVES: Poor nutrition and physical inactivity are the second leading causes of death in the U.S. However, in Undergraduate Medical Education, nutrition education emphasizes biochemistry and not nutrition-based skills for health promotion. While physicians manage comorbidities of poor nutrition and patients believe physicians should provide nutritional counseling, many physicians do not. Less than half of primary care providers report advising patients about nutrition. A local needs assessment of UCSF students showed deficits in nutrition skills despite nutrition didactics. Our objectives were to implement a culinary medicine curriculum in order to bridge the gap between existing foundational science teaching of nutrition and medical students' perceived deficits in practical nutrition skills.

SETTING AND PARTICIPANTS: We implemented a one day culinary medicine intervention in the UCSF School of Medicine. Participants were medical students in clinical clerkship rotations.

DESCRIPTION: The course was delivered over a four hour session: a one and a half hour hands-on cooking session, one hour lunch, and one and a half hour small group case discussion that related cooking methods and materials to diseases and their underlying biochemical processes. For example, encouraging high fiber and low glycemic load foods while avoiding high fructose corn syrup for patients with pediatric obesity and nonalcoholic steatohepatitis.

EVALUATION: The evaluation was a validated questionnaire developed by Tulane Goldring Center for Culinary Medicine given before and after the intervention to assess beliefs, attitudes, and self-efficacy regarding providing nutritional education to patients. 96 (N=180) students completed both pre- and post- surveys. Statistically significant changes were seen in attitudes and beliefs that physicians should include nutrition counseling during appointments (p=0.000) and physicians can affect patients' dietary behaviors (p=0.001). Perceived efficacy to educate patients about nutrition increased in 23 of 25 topics, including: serving size (p=0.001), Mediterranean Diet (p=0.000), DASH diet (p=0.000), and diabetic diets (p=0.001). Intention to improve students' own dietary habits increased in 9 of 13 areas, including increasing intake of: vegetables (p=0.000), lentils/beans (p=0.000), and fruits (p=0.001), and decreasing intake of: red and processed meat (p=0.002), baked products (p=0.001), and calorie-containing beverages (p=0.002). Students reported a 67% increase in likelihood to provide nutrition assessment and counseling to patients (p=0.000).

DISCUSSION / REFLECTION / LESSONS LEARNED: The results of this intervention demonstrate that a one day session in culinary medicine is effective in addressing important gaps in medical education, including self-efficacy, which physicians site as a primary obstacle to nutrition counseling with patients. Future studies are required to examine whether a short-term intervention such as this can have a long term impact on students' clinical practices and/or health outcomes in students and their patients.

A NOVEL ASSESSMENT TOOL FOR SITUATIONAL AWARENESS

Ian Murphy, Eva M. Aagaard. Internal Medicine, Barnes Jewish Hospital, Saint Louis, MO. (Control ID #3375563)

NEEDS AND OBJECTIVES: Situational awareness (SA) is the perception of environmental elements and events, comprehension of their meaning, and projection of their future status (Endsley et al, 2000). SA has been recognized as critical for successful decision-making in health care. (Andreatta et al, 2011) We developed the Situational Awareness Assessment Tool (SAAT) to evaluate SA in Post-Graduate Year 1 (PGY-1) residents. Our objective was to describe PGY-1 SA using the SAAT and assess inter-rater reliability (IRR) of the SAAT in simulated acute care scenarios.

SETTING AND PARTICIPANTS: Internal Medicine PGY-1s at Washington University School of Medicine were invited to participate in acute care scenarios at our simulation center and be assessed using the SAAT. Senior residents directly observed and rated the PGY-1s using the SAAT; attendings assessed resident performance using videos of these encounters.

DESCRIPTION: Participating PGY-1s completed up to six unique simulated critical care scenarios. The SAAT is scored from 0-4: 0(Unable to Assess), 1(Required Complete Guidance), 2(Able to Perform Some Tasks), 3(Mostly Independent), 4(Independent) across six discrete domains: acquires information(AI), comprehends situation(CS), projects needs(PN), prioritizes information(PI), takes actions(TA), and summarizes / re-evaluates(SR). Senior residents provided scores in real time. Attendings provided scores after watching recorded sessions. PGY-1s were evaluated by at least one senior resident and two attendings. Descriptive statistics were used to describe resident performance. IRR was calculated using Spearman's Correlation and Krippendorff's Alpha. Scores of 0 (unable to assess) were excluded from analysis of IRR.

EVALUATION: A total of 53 of 56 PGY-1s participated (94.6%). Residents gave higher mean scores across all 6 domains compared to attendings (Mean +/- SD): AI= 3.1 ±0.8 vs 2.69 ±0.94, CS= 3.1 ±0.83 vs 2.76 ±1.01, PN= 3.0 ±0.79 vs 2.6 ±1.07, PI= 3.2 ±0.75 vs 2.61±1.0, TA= 2.8 ±0.8 vs 2.5 ±1.17, SR= 2.99 ±0.86 vs 2.5 ±1.05. Statistical analysis revealed significant correlation between resident and faculty assessments only in the domain of AI (r_s=0.53) but IRR via Krippendorff's Alpha was non-significant (α = 0.34). Attending within-group measurements were significantly correlated for all domains except TA (r_s = 0.37 to 0.68), and approached significance for IRR using Krippendorff's Alpha (α = 0.451).

DISCUSSION / REFLECTION / LESSONS LEARNED: The correlation results indicate that residents and attendings rank PGY-1 performance similarly across domains, i.e. from less to more independent. However, the ratings do not satisfy a more rigorous standard for acceptable IRR for summative assessment. The differences between resident and attending scores may reflect different standards for competence or differences between real-time and video-based scoring. However, the overall low IRR both between and within groups reinforces the need for enhanced rater training and raises concerns about whether the SAAT should be adopted as a summative assessment tool.

A NOVEL INTERACTIVE TEXT-MESSAGING CURRICULUM FOR INTERNAL MEDICINE BOARD REVIEW

Priyanka Majety[1]; Alexander Rabin[1]; Laura K. Snydman[2]; Joseph Rencic[3]. [1]Internal Medicine, Tufts Medical Center, Boston, MA; [2]Internal Medicine, Tufts Medical Center, Boston, MA; [3]IM, Tufts Medical Center, Boston, MA. (Control ID #3342399)

NEEDS AND OBJECTIVES: Many internal medicine (IM) residency programs use board review conferences with question banks to guide resident preparation for the American Board of Internal Medicine (ABIM) exam. However, duty hour restrictions, patient care responsibilities, and other conflicting priorities often limit attendance at these conferences. Mobile technology, including smartphone applications and text messaging programs, have shown promising results in education and may enhance ABIM preparation. Our aim is to develop a text messaging curriculum, that would be available to all the residents and to help IM residents better prepare for the ABIM exam.

SETTING AND PARTICIPANTS: This curriculum is designed for the IM residents at Tufts Medical Center in Boston, Massachusetts. After IRB clearance was obtained, all the 74 IM residents were approached with this curriculum proposal.

DESCRIPTION: We have developed an interactive online curriculum for IM residents to assist in their exam preparation, which can be accessed by text-messaging or through a smartphone application (Remind). Three relatively underperformed sub-specialties were identified based on a retrospective analysis of in- training exam scores. A pre-test with 12 multiple-choice questions (MCQ) from these subjects was completed by residents. Subsequently, they were added to a text messaging group to receive one MCQ per day (five days per week), to which residents can respond via text messaging or the smartphone application, Remind. They receive the correct answer with an explanation twelve hours after receiving the question. Frequent responders are mentioned in a weekly resident appreciation email. At five months, residents will complete a post-test and a survey gauging participant satisfaction, perceived educational value, and effect on IM board preparation. We will compare the results of the pre-test and post-test to assess the effect on test scores.

EVALUATION: Of 74 IM residents, 64 (86%) responded to the pre-test and 62 (84%) joined the texting group. The interim analysis shows that they received a total of 60 questions over three months. Participation has been variable, with 15-25 (24%-40%) residents responding to the questions on a daily basis. Further data (participant satisfaction survey results and post-test performance) will be available by February 2020.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our smartphone-based board review curriculum has been well-received by IM residents. Participants prefer questions at 6 AM instead of 9 AM, as they can answer the questions during their commute to the hospital rather than answer them during prime rounding time. Preliminary data shows that they find this curriculum useful not only for self-preparation but also as an educational tool for small group learning, especially during morning work rounds with the in-patient team.

APRENDE! A MEDICAL SPANISH CASE BASED CONFERENCE

Yadis M. Arroyo, Elimarys Perez-Colon, Kellee Oller, Marijesmar Gonzalez-Valle. Internal Medicine, University of South Florida, Tampa, FL. (Control ID #3391557)

NEEDS AND OBJECTIVES: Linguistic barriers between Spanish-speaking patients and non-Spanish speaking health care providers is a major issue in the health care system. Such barriers interfere with the quality of care, patient satisfaction and medical compliance. Residencies serving the Hispanic/Latino populations need to enhance communication effectiveness and cultural competency to improve outcomes. The purpose of this project is to increase internal medicine residents' and medical students' confidence when communicating and establishing rapport with Spanish-speaking patients in hopes to diminish barriers in communication and improve overall medical care.

SETTING AND PARTICIPANTS: The conference takes place in the resident didactic/conference room at one of our main teaching sites, Tampa General Hospital. Participants include internal medicine residents, internal medicine-pediatrics residents, internal medicine faculty and medical students.

DESCRIPTION: A one-hour didactic session was allotted for a Spanish case conference presentation. This occurred in place of a traditional "case-based conference," and consists of a simple case presented entirely in Spanish. There is a resident facilitator who acts as the patient and a faculty facilitator who acts as a moderator. Participants are divided into groups and given medical Spanish to English handouts. Participants then craft questions to ask the resident facilitator regarding the patient's history of present illness. The resident facilitator would respond in Spanish. After obtaining the full history, the participants would practice verbalizing common instructions during the physical exam. The conference would finish with a short didactic on a Spanish language or cultural competency topic.

EVALUATION: A post conference survey was used to assess the efficacy of the training session and the interest of medical trainees in future didactic sessions. A total of 28 residents completed the pilot survey. Based on the survey, 89% of the respondents (25/28) believed that discussing Spanish based cases would expand their Spanish vocabulary and 82% (23/28) believe that the Spanish case discussion would increase their confidence when speaking to a Spanish-speaking patient. 17% (5/28) remained neutral.

DISCUSSION / REFLECTION / LESSONS LEARNED: Per preliminary data results, most of the trainees were motivated to improve their Spanish vocabulary and speaking abilities and would welcome further interventions to maximize their language skills. Incorporating Spanish language and cultural competency into residency training has an overall beneficial effect not only to the program and the resident, but it increases patient satisfaction and quality of care. Creating a case-based conference in Spanish was a fun way to integrate such learning during inpatient didactics.

A PROGRAM-SPONSORED ONLINE CURRICULUM IMPROVES RESIDENT ENGAGEMENT WITH DIDACTIC EDUCATION AND ASSESSMENT

Amreetpal Sidhu, Katie Zechar, Geetha Krishnamoorthy. Graduate Medical Education, Internal Medicine, St Joseph Mercy Oakland, Troy, MI. (Control ID #3391879)

NEEDS AND OBJECTIVES: Graduate Medicine Education (GME) programs struggle to establish and maintain adequate levels of learner engagement with didactic activities. With lectures being demonstrated as ineffective towards positive educational outcomes in literature, web and software-based tools have emerged as promising modalities of evidence-based learning but are not commonly used. We aim to evaluate and improve both perceptions of and engagement with online learning environments while clarifying the requirements of effective online curricular interventions, thereby providing a framework for wider implementation.

SETTING AND PARTICIPANTS: PGY1, 2, and 3 residents (n=50) at a community Internal Medicine program during the 2019-2020 academic year.

DESCRIPTION: Learners were surveyed at the start and midpoint of the year regarding study habits, relative value of self-directed study materials, and engagement with program-sponsored didactics hosted online. Throughout the intervention period participants are notified of new monthly interactive content and self-testing tools leveraging evidence-based learning strategies (e.g. active recall, testing effect). Learner engagement is tracked by post intervention surveys, participation in self-assessments, didactic attendance and website traffic analysis.

EVALUATION: Survey data shows overall 102% improvement in learner-reported use of the platform (average 1.4 hrs/week to 2.9). Improved platform use is corroborated by an increase in cumulative tracked online viewing hours (0.65 hrs to 5.8) and participation with assigned monthly assessments (from 77% to 83%). Daily conference attendance remained stable and residents' perception that online learning discourages in-person attendance decreased (2.2 to 1.9 weighted average on a Likert scale). Learner-reported confidence towards clinical duties varied following exposure to interactive scenarios–PGY2 residents reported an increase in confidence towards rapid response scenarios (4 to 4.33) while PGY1 residents reported a decrease (4 to 3.85).

DISCUSSION / REFLECTION / LESSONS LEARNED: GME faces unique challenges training and evaluating learners adapted to learning environments incongruent to current standards in medical pedagogy. In contrast to commercial products, program-sponsored web platforms can stand as cost-effective, evidence- based modalities to improve learner engagement, examine their performance, and tailor curricula to specific needs. Further, our data suggests serial monthly online interventions can be an effective curricular design that augments traditional learning modalities and mitigates the ineffectiveness of lectures. With established engagement with core material and self-assessment tools, future studies will examine the impact of the platform on learner performance, such as board certification rates and in-training exam scores.

ONLINE RESOURCE URL (OPTIONAL): http://sjmoim.com (LOGIN: sgim2020 PASSWORD: sgim)

A SPIRITUALITY IN MEDICINE CURRICULUM: UNDERSTANDING AND LEVERAGING AN OFTEN OVERLOOKED SOCIAL DETERMINANT OF HEALTH FOR PATIENTS AND RESIDENT TRAINEES

Jennifer P. Weintraub[1]; David Fleenor[2]; Amanda Pechman[1]; Lauren Peccoralo[3]. [1]Internal Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [2]The Center for Spirituality and Health, Icahn School of Medicine at Mount Sinai, New York, NY; [3]Medicine, Mount Sinai School of Medicine, New York, NY. (Control ID #3392119)

NEEDS AND OBJECTIVES: As medicine becomes increasingly reliant on technology, there has been a movement towards reconnecting to the humanity and greater meaning in our profession. One proposed solution is to integrate spiritual learning into training. Spirituality curriculums are nearly ubiquitous in undergraduate medical education yet have had a slower uptake into graduate medical education. Studies show that spirituality curriculums during residency not only improve a physicians ability to provide spiritual care but leave positive impacts on professional and personal formation for years to come. The objectives for our curriculum are that primary care (PC) residents will be able to: 1. Integrate spiritual care into their medical care of patients; and 2. Identify and employ their own spiritual resources in an effort to increase well-being and resilience.

SETTING AND PARTICIPANTS: We created six one-hour sessions on topics in spirituality and medicine to be delivered during primary care elective blocks over a three year residency. 18 PC residents will participate, with each session given to six residents at a time.

DESCRIPTION: Session topics: 1. Introduction to spirituality and the chaplaincy; 2. Conversations with chaplain residents; 3. Understanding patients spirituality in treatment and end of life care; 4. Physician experience of death, dying, grief, and guilt; 5. Transference and countertransference; 6. Moral injury, personal spirituality, and effects on caring for the patient. The sessions are developed and delivered by a chaplain educator via brief didactics and structured discussions.

EVALUATION: We conducted a pre-intervention needs assessment, completed by 14/18 of our residents. We will conduct a post-survey to assess whether the learning objectives and needs were met. Results showed that 50% of residents felt comfortable asking patients about their spiritual and/or religious identities. While 85.7% felt they understand the role of a chaplain, only 43% knew when a referral would be helpful. Interestingly, 64% felt they had transgressed deeply held moral beliefs while learning and practicing medicine, and 50% know how to use their own spirituality/religion/worldview to cope with the stress of learning and practicing medicine. Brief interim surveys after our recent session showed this to be the highest rated session in our PC curriculum, with comments that this was "one of the best sessions we have ever had," creating "a safe space to chat" and "very useful."

DISCUSSION / REFLECTION / LESSONS LEARNED: We were surprised to learn that more than half of our residents felt they had transgressed deeply held moral beliefs during their training, and only half know how to use their own spirituality or worldview to cope with the stress of practicing medicine. By providing the opportunity to discuss and explore moral injury, coping strategies, and patient spirituality with an experienced chaplain, residents will gain knowledge and tools to maintain and their own moral compass and utilize the chaplaincy to understand how patients spirituality may impact their care.

ASSESSING LEARNER OUTCOMES IN THE MIGRANT HEALTH ELECTIVE AT THE UNIVERSITY OF MINNESOTA

Emily Syverud[2]; Benjamin Katz[1,3]; Jonathan D. Kirsch[1]. [1]Internal Medicine, University of Minnesota, Minneapolis, MN; [2]University of Minnesota Medical School, Minneapolis, MN; [3]Alaska Native Tribal Health Consortium, Anchorage, AK. (Control ID #3391291)

NEEDS AND OBJECTIVES: Medical and graduate medical education are constrained by profession and geography, with most learning occurring in major academic medical centers. Opportunities to learn about social determinants of health through working with rural, immigrant, and underserved populations are limited. The Migrant Health elective at the University of Minnesota addresses this gap by providing inter- professional, community-engaged experiences and hands-on service learning with migrant farmworkers. A unique curriculum including didactics, workplace site visits, hands-on farmwork and clinical experiences. Participants learn social determinants of health first hand working with a highly marginalized population and equips them to address the assets and needs of vulnerable and underserved populations.

SETTING AND PARTICIPANTS: The 4-week rotation has educated students of medicine, physical therapy, dentistry, pharmacy & food systems alongside residents in internal medicine, internal medicine- pediatrics, family medicine, occupational medicine and emergency medicine, in addition to youth pipeline students from farmworker families. Over 30 learners have participated in the course over 5 years.

DESCRIPTION: The rotation coincides with peak harvest and work migration season. The curriculum includes didactic days dedicated to developing knowledge about social determinants of health specific to the migrant farmworker population and is augmented with readings, films, journal clubs and workshops. Didactic sessions cover risks of farm work, immigration law, access, language, mobile health, narrative medicine, zoonoses, pesticides and care in low resource settings. Clinical education includes travel to rural farming communities to work with primarily Latinx migrant farmworker families. Sustainability is achieved through community engagement with rural non-profits, federally qualified health care centers, labor organizers, and health departments.

EVALUATION: To assess learner outcomes and address areas for improvement we surveyed all participants (28/32, 87.5% response rate). Over 90% of participants rated their overall experience as "outstanding" or "good" and the majority of learners "agree" or "strongly agree" that the course increased their knowledge in areas specific to migrant farm work and underserved populations.

DISCUSSION / REFLECTION / LESSONS LEARNED: Participants gained knowledge of working with migrant farmworkers and developed new skills applicable to a wide variety of underserved populations. The course survey helped identify which sessions and encounters were most useful and which need further development to optimize learner and patient experiences.

ASSESSING NEEDS AND ADDRESSING CLIMATE CHANGE AT GRAND ROUNDS: KNOWLEDGE, ATTITUDES, AND ENGAGEMENT

Harleen Marwah[1]; Emily Youner[2]; Hana Akselrod[3]; Neelima Tummala[2]. [1]School of Medicine and Health Sciences, The George Washington University School of Medicine and Health Sciences, Washington, D.C., DC; [2]School of Medicine and Health Sciences, The George Washington University, Manhasset, NY; [3]Infectious Diseases, George Washington University, Washington, DC. (Control ID #3392382)

NEEDS AND OBJECTIVES: Global climate change has been described as both a threat that could "undermine the past 50 years of gains in public health," as well as "the greatest global health opportunity of the 21st century."(Lancet 2015) Academic medical centers will undoubtedly play a critical role in equipping clinicians to care for patients in a changing climate, and also have an important societal role as trusted sources of information in times of public crises. However, education on these risks has not historically been part of standard medical school curricula. The George Washington University School of Medicine and Health Sciences weekly Internal Medicine Grand Rounds offers an opportunity to incorporate foundational climate change education to reach this varied audience of clinicians at different stages of training and experience.

SETTING AND PARTICIPANTS: Setting: The George Washington University Hospital Participants: 38

DESCRIPTION: The "Global Climate Change: Understanding and Responding to Impacts on Health" lecture provided an overview of climate science and a review of diseases with environmental drivers while educating attendees on how climate change impacts health, which populations face disproportionate risk due to climate change, and what opportunities exist for physicians to become involved with adaptation and mitigation efforts.

EVALUATION: Participants completed a pre-lecture survey to evaluate their baseline perceptions of climate change and the impacts on health. 53% of participants identified the issue of climate change as being "extremely important" to them and 76% of participants identified as being "very worried" about climate change. Nearly all participants (95%) agreed that climate change will affect future generations of people "a great deal." Only 13% of participants felt "very knowledgeable" about the impact of climate change on health and 11% felt "not at all knowledgeable." No participants answered that climate change was unrelated to patient care, with 32% of participants agreeing climate change is directly related to patient care "a great deal."

DISCUSSION / REFLECTION / LESSONS LEARNED: This lecture and assessment of attitudes on climate change and health was the first of its kind done at our institution. With the majority of participants self-describing themselves as being "very worried" about climate change and 11% feeling "not at all knowledgeable," this education was welcomed and relevant. In future iterations, the session's effectiveness could be further assessed through a post-survey to evaluate how perceptions, knowledge, and attitudes were influenced. Our group has been concurrently developing similar needs assessments and modules for medical students, residents, and broader physician audiences. An evaluation of perception and baseline knowledge by career level and focus could allow for more tailored content to ensure participants remain engaged and the information advances their knowledge.

A STUDENT-INITIATED, COMMUNITY-BASED PARTICIPATORY EDUCATION CURRICULUM ADDRESSING STRUCTURAL CHALLENGES & INEQUITIES IN HEALTHCARE DELIVERY

Rohan Khazanchi[1]; Jasmine R. Marcelin[2]. [1]College of Medicine, University of Nebraska Medical Center, Omaha, NE; [2]Division of Infectious Diseases, Department of Internal Medicine, University of Nebraska Medical Center, Omaha, NE. (Control ID #3359832)

NEEDS AND OBJECTIVES: Academic health centers (AHCs) are charged to train future physicians to recognize and address structural forces impacting health outcomes. Inadequately engaging marginalized communities while educating trainees on "health disparities issues" may contribute to misunderstanding the structural contexts for present-day health inequities. We developed an adjunct to the University of Nebraska Medical Center (UNMC) College of Medicine's curriculum focused on

"Structural Challenges & Inequities in Healthcare Delivery." The pilot sought to enhance learners' structural competency by exploring historical and present inequities in Omaha.

SETTING AND PARTICIPANTS: 132 first-year medical students, 18 community stakeholders, and 11 UNMC facilitators.

DESCRIPTION: Lectures and assignments introduced core topics like political determinants of health, unconscious bias, structural racism, and population health. Students also went into the community to learn directly from community leaders in housing, education, policy, and health promotion. Learners and facilitators were surveyed to assess pilot outcomes. Descriptive analyses were performed, with Mann-Whitney tests applied to compare the distribution of grouping variables.

EVALUATION: Of 123/132 (93.2%) students responding to the survey, 76.4% were White and 50.4% male; 29.4% grew up in a rural hometown (population < 50,000), and 38.2% students were identified *post hoc* as having a "background underrepresented in medicine" (URM, LGBTQ+, and/or rural hometown).

The small group community stakeholder conversations (Mean 4.38 on a 5-point Likert scale) and community panel discussion (4.48/5), contributed more to student knowledge gained than lectures (3.87/5) or reflective writing assignments (3.65/5). The curriculum's overall impact on knowledge and skills was positive with 96.7% of students indicating an improved understanding of each of the six curriculum objectives (4.15/5 across individual questions for each objective). 95.9% students indicated that education on the topics covered is important to becoming a good doctor, and 86.2% indicated interest in pursuing additional training on one or more topics. Students from urban areas reported stronger prior knowledge on topics covered than rural students (3.58 vs 3.17, p=0.023), but did not have differing responses regarding the impact of the curriculum. There were no differences between underrepresented racial minority (URM) and non-URM student responses, although only 13 (10.6%) students identified with URM groups.

DISCUSSION / REFLECTION / LESSONS LEARNED: Students indicated improvement in knowledge, skills, and attitudes related to curriculum objectives. Narrative feedback emphasized learners' desire for more direct community engagement integrated into curricula on structural determinants of health. Vertical curricular integration is imperative to ensure that learners continue to demonstrate structural competency throughout all four years. Future plans include longitudinal service-learning projects in collaboration with community stakeholders.

A THREE-YEAR-EXPERIENCE WITH A QUALITY-PATIENT SAFETY ELECTIVE

Jessica Donato. Hospital medicine, Cleveland Clinic, Beachwood, OH. (Control ID #3390702)

NEEDS AND OBJECTIVES: Healthcare systems rely on individuals with interest and skills in quality improvement and patient safety. Many internal medicine trainees seek to develop advanced competency in this field to expand their skillset and advance their academic careers. We developed an annual quality and patient safety (QPS) elective for internal medicine trainees starting in 2017 to provide additional QPS proficiency through dedicated didactic and experiential education.

SETTING AND PARTICIPANTS: A 1-week nonclinical elective is offered annually within our large internal medicine program for second and third year residents starting in 2017. Eight residents enrolled in the initial elective in 2017, 10 in 2018 and 9 in 2019.

DESCRIPTION: The elective involved 3-4.5 hours of interactive educational sessions daily, which included core didactic sessions run by the course director, guest lectures by institutional experts, and journal clubs. Core didactics covered topics such as culture of safety, root cause analysis, and the model for improvement. Expert speakers were recruited from our institution to provide didactics on topics including risk management and high reliability organizations. Didactics and experiential education were modified, added and removed annually based on survey feedback. Experiential education was sequentially added including a pharmacy tour, lab tour, and shadowing experience with inpatient nurses, each with a focus on systems of care and patient safety. Time was allotted for a group debrief on each experience. The participants also observed one or more safety conferences outside of internal medicine, such as urology or general surgery M&M. A project over the course of the week was also completed in which participants completed a root cause analysis (RCA). Residents worked in pairs with protected time for their investigation and dedicated time to check-in with the course director on their RCA work.

EVALUATION: The elective culminated in resident presentations of their RCAs to an audience of faculty and peers. The course director completed an assessment of each trainee during the presentation, which was considered the final deliverable. All trainees showed attainment of competency in RCA methodology. A survey was administered to the elective participants in the 2018 and 2019, with a 90% response rate in 2018 and 89% response rate in 2019. 100% of respondents (2018 and 2019) noted knowledge and skill acquisition from the elective, and 100% (2018 and 2019) found the content of the elective useful for their future career and reported more interest in pursuing work on QPS projects because of the elective.

DISCUSSION / REFLECTION / LESSONS LEARNED: We present a successful QPS elective to provide advanced educational experience directed at trainees with a specific interest in QPS who elect to enroll. This elective has been modified and successful for three years with trainees showing successful knowledge and skill acquisition based on assessment of their final presentations. Surveys also support trainee self-reported knowledge and skill acquisition.

A VIRTUAL PATIENT MODULE FOR TEACHING TELEMETRY MONITORING TO PRE- CLERKSHIP MEDICAL STUDENTS

Talya Mandelkern[1]; Anna K. Donovan[2]; Joshua Levenson[3]. [1]School of Medicine, University of Pittsburgh, Pittsburgh, PA; [2]Medicine, Division of General Internal Medicine, University of Pittsburgh School of Medicine, Pittsburgh, PA; [3]Heart and Vascular Institute, University of Pittsburgh, Pittsburgh, PA. (Control ID #3391737)

NEEDS AND OBJECTIVES: Cardiac telemetry monitoring (CCM), is essential for monitoring heart rate, rhythm, and waveform in hospitalized patients. Accessing and interpreting telemetry data is not typically taught formally, including at University of Pittsburgh School of Medicine (UPSOM), despite its extensive use and convenience in providing immediate data to clinicians. While little data exists on teaching the use of CCM, recent studies show that undergraduate and graduate trainees demonstrate suboptimal interpretation skills and low-level confidence with EKG. This void in knowledge can contribute to adverse patient outcomes. We hypothesize that a brief virtual patient module teaching interpretation of CCM (the curriculum) would improve students' knowledge and reported use of skills with CCM.

SETTING AND PARTICIPANTS: The curriculum and accompanying survey of knowledge, attitudes, and use of skills were distributed to the Class of 2021 during Pre-clerkship Week in May 2019. The Class of 2020, serving as a historical control, participated during May 2018 Pre-clerkship week without exposure to the curriculum. To maximize student completion, students were incentivized with a gift card raffle. Students received a maximum of 4 emails encouraging participation.

DESCRIPTION: The 30-minute curriculum was created using VPSim software, employing 3 interactive clinical cases with sequential

presentation of history, physical exam, lab, and imaging data. Multiple-choice questions with immediate feedback and a tutorial on practical use of CCM were embedded. Both intervention and control groups completed two surveys: a presurvey and a 6-month postsurvey including questions on user demographics, knowledge, and attitudes toward CCM. This curriculum was approved by UPSOM's Research on Medical Students Review Committee and deemed exempt by the IRB.

EVALUATION: Participant comfort and knowledge were assessed prior to and 6 months following the module using RedCap. Content knowledge was evaluated using board-style multiple choice questions with embedded telemetry images. Attitudes were measured using a Likert-type scale.

DISCUSSION / REFLECTION / LESSONS LEARNED: Preliminary and qualitative data suggest that this module was effective in improving students' knowledge. The main challenge to implementation was maximizing student participation and follow up survey response rates. Given its feasibility and acceptability, we plan to include a dedicated classroom session for curriculum implementation during Pre-clerkship week May 2020 with a post-survey session in October 2020. The allocation of dedicated course time to complete the curriculum will hopefully allow for more robust data collection and quantitative evaluation of the intervention.

BEST PRACTICES AND PRACTICAL APPROACHES FOR MANAGING PATIENTS WITH WORK-RELATED CONDITIONS

Esi Nkyekyer. GIM - Occupational & Environmental Medicine, University of Washington, Seattle, WA. (Control ID #3374464)

NEEDS AND OBJECTIVES: Primary care physicians evaluate and manage patients with occupational injuries and illnesses. Training in the care of patients with work-related conditions is however lacking in internal medicine resident education. An expert-guided, group-based case discussion approach was used to deliver a curriculum on best practices for managing patients with work-related conditions. The objectives were for residents to:

-Describe the interplay between work and health and explain the importance of disability prevention.

-Describe the benefits available to patients with work-related conditions through the Workers' Compensation system and the Social Security Disability Insurance system.

-Provide care for patients with work-related conditions using best practices for promoting early and safe return-to-work.

-Describe the life-cycle of a Workers' Compensation claim and the roles played by key stakeholders.

-Navigate internal and external resources for addressing barriers to return-to-work when caring for patients with work-related conditions.

SETTING AND PARTICIPANTS:

The University of Washington (UW) Internal Medicine Residency Program holds a weekly 3.5 hour-long Academic Half Day (AHD) during the academic year for residents on non-admitting rotations. 30 residents participated in this AHD.

DESCRIPTION: A brief overview of a case of a 37 year old male engineered-stone fabricator with silica dust exposure and diagnosis of complicated chronic silicosis was provided. This was followed by a foundational lecture on the: interplay between work and health; importance of preventing work-related injury, disease and disability; the workers' compensation system and life cycle of a claim; best practices for early and safe return to work; role of physician, employer, claim manager, nurse case manager, occupational health nurse and vocational rehabilitation counselor; and the role of social security disability administration in workers' disability. The residents were then split into 3 groups to discuss the case in greater detail facilitated by experts from the Department of Labor and Industries, Social Security Administration Regional Office, UW Claim Services Office, and Harborview Center for Occupational Health and Education.

EVALUATION: The residents completed a 6-item knowledge questionnaire before and after the AHD, and a teaching evaluation. 27 residents completed the pre-session knowledge questionnaire, 24 completed the post- session knowledge questionnaire, and 29 completed the teaching evaluation.

DISCUSSION / REFLECTION / LESSONS LEARNED: This AHD effectively used lecture-based and active learning approaches to introduce residents to key medical and adminsitrative aspects of managing patients with work-related conditions. Through the expert-guided, group-based case discussions, residents were able to discuss basic and complex management concepts and have their questions adequately answered. The residents found the session content useful and practical and appreciated interacting with the experts.

ONLINE RESOURCE URL (OPTIONAL): https://sites.google.com/view/ahdresourcesoem/home

CHASE FILES: UTILIZING UNSCRIPTED CASES TO PROMOTE CLINICAL REASONING

Frances V. Ue[2,1]; Priyank Jain[2,1]; Rachel Stark[2,1]. [1]Harvard Medical School, Boston, MA; [2]Medicine, Cambridge Health Alliance, Cambridge, MA. (Control ID #3392347)

NEEDS AND OBJECTIVES: The evolution of the master diagnostician has been influenced by the overlap of clinical reasoning and cognitive psychology within health care systems (Dhaliwal *et al.,* JAMA 2013). There has been a demonstrated need for innovation in diagnosis education with new approaches to promote diagnostic excellence (Sundberg and Olson, Diagnosis 2019). One approach is the model of utilizing unscripted and spontaneously presented cases to promote clinical reasoning; inspired by UCSF's curriculum (APDIM 2019) and implemented at Cambridge Health Alliance (CHA). CHAse files aim to: (1) effectively teach clinical reasoning to trainees, (2) promote engagement of faculty, and (3) create an interactive and collaborative learning environment amongst trainees and faculty.

SETTING AND PARTICIPANTS: Biweekly teaching sessions with rotating Harvard medical students and sub-interns (2), Internal Medicine residents of all years (24), Transitional year (7) and Psychiatry (8) interns, and core faculty from the Department of Medicine (10).

DESCRIPTION: Two Chief Medicine residents lead and facilitate the sessions. A resident presents an unscripted case where they had a diagnostics and/ or management dilemma. This case is unknown to the facilitators and audience members. The facilitators lead the group through the case engaging trainees in soliciting the patient's history and clinical course from the resident presenter, and engaging faculty when need to provide expert opinion. Key moments when trainees are engaged to collaborate include: (1) development of a problem representation, (2) generation of a schema or approach to the case, and differential diagnoses, and (3) interpretation of key labs or imaging findings. Lastly, the facilitators and resident presenter summarize key learning points.

EVALUATION: Data from surveying trainees who attended these biweekly teaching sessions from 7/1-12/31/2019 have shown that the style has been highly interactive and engaging (mean score= 4.9, scale of 1-5) and content has been appropriate in complexity (mean score= 3, scale of 1-5 from very basic to very advanced). Some qualitative comments have

included: "Excellent, interactive, and applicable content! I like the time to think independently and collaborate as we work through a case. Love CHAse files! Really enjoy the emphasis on clinical reasoning in the curriculum and live application during each session." Next, we plan to conduct a mixed methods analysis. Quantitatively, trainees will be surveyed on their satisfaction with the curriculum and self-assessment of clinical reasoning knowledge. Faculty will be surveyed to evaluate engagement and possible decrease in burnout. Qualitatively, focus groups will be conducted with trainees to glean qualitative themes regarding their educational experience.

DISCUSSION / REFLECTION / LESSONS LEARNED: Although the sessions are meant to teach clinical reasoning to trainees, I have grown as an effective facilitator, clinician educator, and diagnostician. It has been rewarding and humbling to learn with and from our trainees and faculty.

COMMUNICATIONS CURRICULUM TO APPLY THE SPIRIT OF MOTIVATIONAL INTERVIEWING TO USUAL CARE OF COMMON MEDICAL CONCERNS

Sandeep Kapoor[2,3]; Frank Cacace[1,5]; Laura Harrison[4]; Jennifer Verbsky[1,5]; Jeanne Morley[1,5]; Joseph Conigliaro[1,5]. [1]Division of General Internal Medicine, Northwell Health, New Hyde Park, NY; [2]Medicine and Emergency Medicine, Northwell Health, New Hyde Park, NY; [3]Medicine, Emergency Medicine, and Science Education, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [4]SBIRT, Northwell Health, New Hyde Park, NY; [5]Medicine, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY. (Control ID #3391032)

NEEDS AND OBJECTIVES: Our large healthcare system has implemented Screening, Brief Intervention, and Referral to Treatment (SBIRT) as the foundational systematic approach for addressing substance use as part of usual care utilizing skills of the "Spirit of Motivational Interviewing". The content of SBIRT training, including motivational interviewing (MI) skills utilized to conduct a brief intervention, can be applied by healthcare professionals to all conversations. The objective of the educational session was to utilize the SBIRT framework to empower internal medicine residents to have thoughtful, empathetic conversations with patients about substance use and other common health-related concerns and behaviors.

SETTING AND PARTICIPANTS: This session was delivered to internal medicine residents at an ambulatory practice as part of their regularly scheduled education. The session was delivered to each of the five rotating firms for one hour, with a total of 65 residents participating and completing surveys. **DESCRIPTION:** The session content focused on how to apply MI skills to common topics discussed with patients during primary care visits. Prior to reviewing the steps of the brief negotiated interview (BNI), the importance of remaining nonjudgmental and nonconfrontational were explored. Additional communication skills, such as the empathy microskills of reflection, legitimation, and exploration, and how to identify "change talk", were demonstrated and practiced. Finally, participants were led through the steps of the BNI, (1) Raise the subject, (2) Provide feedback, (3) Enhance motivation, and (4) Negotiate and advise; complete with examples for common scenarios in primary care, such as blood pressure, medication management, diet, and substance use.

EVALUATION: Participants completed a "One Minute Paper" at the conclusion of the session, which asked four open ended questions. For the most important concept learned in this session, 29 (45%) of participants responded with empathy microskills, 13 (20%) reported the BNI skills, and 4 (6%) reported identifying change talk. 9 (15%) of participants identified "evocation" (eliciting a patient's feelings) as the concept they still had questions about or found confusing. 15 (23%) reported that empathy was realistic to focus on and apply to their current role, 7 (11%) of participants reported they could apply partnership, and 9 (14%) reported they will allow their patient more time to talk and direct the conversation. Most common suggestions for improvement include more case scenarios and role play.

DISCUSSION / REFLECTION / LESSONS LEARNED: The communication skills were well received by the participants. Their survey responses indicate that they appreciated the value of identifying change talk and applying empathy microskills to their conversations with patients. Though the educational framework was developed to address substance use, participants recognized that the skills could easily be applied to addressing their patients' blood pressure, diabetes, medication adherence, and other health conditions affected by behaviors.

COMMUNITY GRAND ROUNDS: A COMMUNITY AND UNIVERSITY PARTNERSHIP ON CHICAGO'S SOUTH SIDE ADDRESSING SOCIAL DETERMINANTS OF HEALTH THROUGH HEALTH EDUCATION

Natalie Watson, Doriane Miller. Medicine, University of Chicago, Chicago, IL. (Control ID #3390618)

NEEDS AND OBJECTIVES: Community participation in population health improvement can assist academic health centers in addressing health equity by targeting interventions more effectively. Community representatives, medical students and University of Chicago faculty partnered to develop a health education series called "Community Grand Rounds" (CGR). Created in 2010, CGR works with community representatives to: 1) identify health concerns of Chicago's South Side residents, 2) provide information regarding university and community resources that address community health concerns, and 3) provide medical students with the opportunity to learn about health concerns directly from community residents in a community setting.

SETTING AND PARTICIPANTS: Setting: Churches, schools, public housing and youth centers. Participants: Community representatives, called Community Consultants (CC) representing community organizations, medical students and faculty from University of Chicago's' Pritzker School of Medicine, community residents from University of Chicago Medicine's primary service area

DESCRIPTION: CCs meet twice monthly during the academic year with lead faculty and staff to identify CGR topics, recommend a delivery format, and recruit audience participants. In 2017, Pritzker Medical students joined the CGR planning group. Medical students meet regularly with lead faculty and staff and CC's to develop topic specific resource materials that are posted in CGR brochures. Medical students also attend CGR and research resources for CGR participants in real time via smart devices. CGR topics have included: community violence and youth mental health, eating healthy in food desert, impact of youth employment on health, positive parenting and aging issues as well as others. Audience members are surveyed at the end of each session and are asked about the value of content for each CGR. Twice yearly, all partners debrief on the effectiveness of the partnership and program.

EVALUATION: Since 2010, there have been 50 Community Grand Rounds and over 4600 attendees. To date, 93% of audience members report that the content of the Community Grand Rounds is of value and would recommend it to others. Audience members surveyed report knowledge gains about the topics presented, satisfaction with venues and speakers, and support the continuation of the series. CC's surveyed report a commitment to the partnership and to CGR. Medical students report that the series has provided them with valuable opportunities to learn about community health and health equity issues from direct engagement with community members outside of a hospital setting.

DISCUSSION / REFLECTION / LESSONS LEARNED: Community Grand Rounds provides a bidirectional pedagogic platform for community members and medical students interested in learning about community health concerns, along with potential resources that can address these concerns. CGR's success is due to the commitment of its community partners and the university's ability to respond to community needs in a culturally sensitive manner.

COMMUNITY PERSPECTIVES IN MEDICINE: INCLUDING UNDERSERVED POPULATIONS IN MEDICAL EDUCATION

Eric Kutscher[1,2]; Rachel Umans[3]; Laura Deering[4]; Andrea Liu[4]; Catherine Callaway[4]; Clare Burchenal[4]; Linnie Golightly[4]. [1]Internal Medicine, NYU Langone, New York, NY; [2]Internal Medicine, Bellevue Hospital Center, New York, NY; [3]Internal Medicine-Pediatrics, Rutgers NJMS, Rutgers, NJ; [4]Weill Cornell Medicine, New York, NY. (Control ID #3390829)

NEEDS AND OBJECTIVES: 1. Include underserved populations in medical education to ensure physician styles and approaches to patient care can be adapted to fit people of all backgrounds

2. Provide medical students with an opportunity to discuss health disparities with underserved communities as well as with their classmates

3. Develop tangible, actionable items for medical students to adapt their clinical skills

4. Cultivate an environment of cultural humility within academic medicine

SETTING AND PARTICIPANTS: Community Perspectives in Medicine (CPIM) was started at Weill Cornell Medicine in fall of 2015 by medical students in response to the #BlackLivesMatter movement. The course was designed to increase dialogue between underserved populations in medicine and the next generation of physicians by inviting community-based organizations (CBOs) to meet with fifteen first year medical students and discuss their experiences in medicine. Participating CBO organizations represent diverse populations covering a broad spectrum of topics, including sexual orientation, chronic illness, disability, religion, race, incarceration, and immigration status. Students volunteer to participate in the course, and are all in their first semester of medical school.

DESCRIPTION: Each of the five 2-hour sessions is divided into two parts. For each session's first hour, a second-year student facilitates a semi-structured interview of the CBO guests focusing on health disparities within their community, challenges experienced with the medical system, and what they wish doctors did differently. Students are encouraged to ask questions, often resulting in a rich dialogue. The session's second part is a debriefing by the student facilitator over a relaxed dinner (without CBO guests).

EVALUATION: The course has been offered annually from 2015-2019 with 42 course evaluations completed for 2015-2017 (93% response rate). Overall course satisfaction was extremely high, with 98% of participants (41/42) ranking their overall satisfaction as excellent. All participants ranked the course format as excellent (81%) or above average (19%) and course content as excellent (90%) or above average (4%). A current IRB-approved study is evaluating the longitudinal impact of the course on attitudes towards underserved patients.

DISCUSSION / REFLECTION / LESSONS LEARNED: Over the five years of running CPIM, a few themes have arisen in free-text comments. Students particularly enjoy the small class size with continuity of participants, speakers actively involved in advocacy work or patient care (rather than a public-health perspective), and speakers who provide pre-readings with context as to their organization and take-away points. Many opportunities for continued leadership within CPIM have helped keep students engaged with the course beyond its one-semester duration.

ONLINE RESOURCE URL (OPTIONAL): https://www.mededportal.org/publication/10501/

CONTINUOUS IMPROVEMENT ON TEACHING QI – AN EVIDENCE-BASED, MEASURE- DRIVEN QUALITY IMPROVEMENT CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Alvin G. Wong, Sumir Brahmbhatt, Kimberly Bader, Avatar Singh, Jordan Coulston. Internal Medicine, University of Arizona College of Medicine-Phoenix, Phoenix, AZ. (Control ID #3392274)

NEEDS AND OBJECTIVES: In 2014, the Clinical Learning Environment Review Program (CLER) delineated quality improvement (QI) actions that will optimize the clinical learning environment. Their 2019 national report showed while most residents and fellows have participated in QI projects, most have limited knowledge of QI concepts and methods. Their projects are rarely formally assessed, followed up and sustained. Also, most residents and fellows sporadically participate interprofessional QI teams.

In 2018, our residency program launched a resident-led QI curriculum, and its review after 1 year showed the same challenges the CLER report described. Hence, we initiate a QI project to improve the quality of resident's QI projects in 2019. We aim to increase the percentage of QI projects with measurable aims and from 0% in AY2018-19 to 75% in AY2019-20.

SETTING AND PARTICIPANTS: 4 internal medicine residents from a single continuity clinic site at a Veteran Affairs hospital finished the modified QI curriculum.

DESCRIPTION: The new curriculum consists of an orientation didactic, a QI project worksheet and mentoring from a chief resident of quality and patient safety. The QI project worksheet uses the IHI-QI model as a framework and contains selected tools from Lean Six Sigma. The orientation didactic, given by the chief resident, explains the project framework outlined on the worksheet on the first day of the rotation. Residents propose their project idea and fill out the worksheet during the rotation. The chief resident checks in with the resident at least once a week to answer questions and monitor progress.

EVALUATION: Residents are given pre-rotation and post-rotation assessment based on QIKAT-R to assess their QI knowledge, and questionnaire to assess their attitude towards QI before and after their rotation. Their project proposals on worksheets collected at the end of the rotation were assessed using 2 tools, QIPAT-7 and MAQIP.

After starting the new QI curriculum, residents increased their QIKAT-R score from 5.21 to 7.19 (out of 9 points). They self-reported more confidence in their ability to identify systematic issues, writing aim statements, developing measures, proposing changes, tracking and adjusting projects. The percentage of projects having measurable aims increases from 0% to 50%. The QIPAT-7 and MAQIP scores of the residents slightly increased compared to those who underwent the old curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: The new QI curriculum increases the resident's QI knowledge and their confidence in doing a QI project. We confirm using an evidence-based framework with frequent resident check-ins enhance the resident's learning. However, the quality of their QI project did not show significant improvement. The projects lost a lot of points on the assessment tools because the residents could not start PDSA cycle 1, as they ran out of allocated time before obtaining an IRB exemption and data from health informatics timely. Future improvement should include a streamline process to obtain IRB exemption and health data.

CREATING CLINICIAN EDUCATORS: EVALUATION OF A 1-MONTH MEDICAL EDUCATION ELECTIVE FOR SENIOR RESIDENTS

Mauricio Kahn[1]; Carlos Estrada[2]; Ryan Kraemer[1]. [1]Medicine, University of Alabama at Birmingham, Birmingham, AL; [2]Birmingham VAMC, The University of Alabama at Birmingham, Birmingham, AL. (Control ID #3387776)

NEEDS AND OBJECTIVES: Aspiring clinician-educators (CEs) need training in effective teaching skills. Our residency program had a successful residents as teachers program, but residents desired further instruction in teaching techniques. We created a 1-month medical education elective aimed to increase the trainees teaching knowledge, confidence, and skills.

SETTING AND PARTICIPANTS: Internal medicine PGY-2 & 3 residents in a large university training program, 2015-2019.

DESCRIPTION: We designed the elective using Kolb's 4-step experiential learning model: concrete experience, reflective observation, abstract conceptualization, and active experimentation. The elective had 18 interactive didactic sessions, 4 practice teaching sessions, and 3 reflective writing assignments. Course content included educational theories, the cognitive science of learning, and practical medical education topics.

In a pre-post design, participants completed a 19-item survey related to 4 constructs in education (knowledge, confidence, skills, and importance) using a 5-point Likert scale (e.g., 1=very unknowledgeable, 5=very knowledgeable). Survey completion was anonymous, but pre-post surveys were linked using a blinded code. We used a paired T-test to compare the means of the answers in each category (main outcome) and for each question (secondary outcome). We used a $p<0.05$ to examine significance.

EVALUATION: Between 2015 and 2019, 39 residents completed the course, and 100% completed the surveys. Comparing the data from before and after the elective, there was a statistically significant increase in the mean self-rated level of teaching knowledge (2.63 [SD 0.57] vs. 4.43 [SD 0.42], $p<0.0005$), confidence (3.31 [SD 0.4] vs. 4.29 [SD 0.32], $p<0.0005$), and skills (2.9 [SD 0.63] vs. 4.14 [SD 0.38], $p<0.0005$). The difference persisted when individually analyzing each item of the 3 categories. There was no significant difference in the reported importance of having teaching as a major component of their careers.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our study indicates that a 1-month medical education elective increases the self-rated level of teaching knowledge, confidence, and skills in internal medicine residents. To our knowledge, we are the first to report an increase in perceptions of these constructs after completion of a 1-month elective that, importantly, has a strong foundation in adult educational theory.

Our study strengths include our relatively large number of participants and 5 years of data that show a consistent response over multiple cohorts of residents. Our main limitations include being single-institutional and using reaction data for the elective evaluation. However, reaction data is the most common type of outcome information interpreted by researchers that explored the importance of CE tracks in residency programs.

We hope that our detailed curriculum description will be beneficial for residency programs seeking to train aspiring CEs using a 1-month elective. With this training, residents will have the necessary tools to jumpstart a successful CE career.

CRITICAL CARE CURRICULUM FOR INTERNAL MEDICINE RESIDENTS TRANSITIONING FROM INTERNS TO SUPERVISING SENIOR RESIDENTS

Dimple Shah[2]; Karen Friedman[2]; Kyle Katona[2]; John Raimo[2]; Gulrukh Zaidi[1,2]. [1]Pulmonary, Critical Care and Sleep Medicine, Zucker School of Medicine at Hofstra/ Northwell, New Hyde Park, NY; [2]Medicine, Zucker SOM, Manhasset, NY. (Control ID #3387798)

NEEDS AND OBJECTIVES: To implement a critical care (CC) curriculum to address the gap in knowledge in CC education for internal medicine (IM) residents transitioning from internship to the role of supervising senior resident

SETTING AND PARTICIPANTS: Categorical PGY2 and PGY3 Internal Medicine Residents at Zucker SOM Hofstra/Northwelll

DESCRIPTION: We conducted a survey for categorical IM residents and CC faculty which determined there was a perceived gap from both parties in the level of preparedness of rising second year IM residents taking on the role of supervising senior residents in the CC unit, with largest gap in shock and vasopressor management, acute respiratory failure and ventilator management, and acid base disorders. The curriculum was developed under the guidance of CC faculty at our institution. PGY2s were given a knowledge based pre-test and subsequently were disseminated three high yield didactic interactive videos encompassing the aforementioned topics. PGY2s then participated in an OSCE, led by PGY3s, which comprised of three different patient encounters to evaluate and implement appropriate clinical decisions based upon the teachings in the videos. The OSCEs were graded base on a checklist rubric. Upon completion of the OSCE, PGY 2 residents were given a knowledge- based post-test (identical to the pretest).

EVALUATION: 20 IM Residents (60% of PGY2s) participated in the curriculum.

Knowledge based pre/post test: Pre-test knowledge based scores ranged 33-100% (standard deviation [SD] of 20%), averaging 70%. 30% of PGY2s obtained a 100% on the pre-test. Post test scores ranged from 70% to 100% (SD of 8%), with an average of 94%. 80% of the 70% of PGY2s who did not receive 100% on the pre- test, obtained a 100% on the post test and only one PGY2 did not improve his/her score on the post test.

OSCE: Sepsis and pressors average score of 83% with a standard deviation (SD) of 14%; acute respiratory failure score average score 94% with a SD of 14%; acid base average score78% with a SD of 15%. Passing rate was considered >70%, and for each above stated OSCE, the passing rate was 90%, 100% and 70% respectively.

Further statistical analysis is pending.

DISCUSSION / REFLECTION / LESSONS LEARNED: This pilot curriculum aimed to provide key aspects of CC education for rising second year residents. On average, our residents scored 24 points higher on the post test after the CC videos were disseminated and the OSCE conducted. All but one resident achieved a higher (or equal to 100) score on the post test, with 80% of those who did not achieve perfect score on the pretest achieving 100%. The OSCE examination showed that the passing rate for the acute respiratory distress topic was the highest at 100%, followed by vasopressors at 90% and acid/base at 70%. Further statistical analysis will be done on the above stated data. The next steps in the project will be conducting a knowledge- based test 4 months after the curriculum implementation to determine retention of knowledge, and to determine the limitations in the curriculum for further refinement and development.

CULTIVATING STRATEGIES FOR RESIDENT SUCCESS: THE PERSONAL-PROFESSIONAL DEVELOPMENT BLOCK

Kimberly C. Bates, Nidhip Patel, Samuel Shapiro, Jin Lee. Internal Medicine Residency, Northside Hospital Gwinnett, Lawrenceville, GA. (Control ID #3350776)

NEEDS AND OBJECTIVES: By the end of the personal and professional development block, participants should be able to:

Identify behaviors that promote work-life integration and personal/ professional satisfaction

Apply social psychology principles to improve resident performance

Define key skills essential to leadership development and professional identity formation

SETTING AND PARTICIPANTS: PGY 2 categorical internal medcine residents prepare a presentation on one professionalism topic. They read the primary resource and derive learning objectives specific to residency training. Each resident is then responsible for the development of interactive cases and a TED-type talk incorporating the cases to consolidate resident learning of the stated objectives. Assigned core faculty members serve as mentors and reviewers during the development phase.

During the presentation, the resident provides background information, its importance in personal/professional development and strategies for skill development. Utilizing a case based format, they discuss how these skills can be applied to residency training and then end with key lessons and action items for real world application.

DESCRIPTION: Constant self-reflection and targeted goals for improvement are crucial to a physician's success and well-being but may not be taught in residency programs and may be deficient in graduating residents. The Personal and Professional Development (PPD) Block is designed to introduce skills promoting lifelong learning, peak performance, resilience, effective communication, professionalism and leadership.

The curriculum consists of interactive one hour sessions, developed and led by PGY-2 residents under the mentorship of core internal medicine faculty. Resident participants are given a popular social psychology book on an assigned topic. Using a case-based format, residents present a TED-format talk emphasizing key points and provide application to residency training.

EVALUATION: Each resident presenter was assigned a mentor who also read the same book and reviewed the resident presentations. Directly after the discussion, the faculty mentor provided verbal feedback on the following: (1) presentation fidelity to the assigned resource, (2) application to residency training and (3) overall presentation quality.

DISCUSSION / REFLECTION / LESSONS LEARNED: Topics discussed have included development of a growth mindset, optimizing performance, fostering good habits, positive psychology and burnout prevention, enhancing emotional IQ and strategies for personal change to improve professional success. Using popular psychology books such as The Happiness Advantage by Shawn Achor and Mindset by Carol Dweck and other available materials such as TED talks and supplemental online information, residents developed talks that were informative, interactive and entertaining. Resident feedback was positive but suggested introducing topics earlier in the year, so we've moved to a longitudinal curriculum starting earlier in the year. This year we also added a post presentation survey.

CYCLING THROUGH CLINICAL SKILLS EDUCATION: RESULTS OF A NOVEL FORMATIVE ASSESSMENT

Madeline Eckenrode, KeAndrea Titer, Stephen W. Russell. Medicine, University of Alabama, Birmingham, Birmingham, AL. (Control ID #3390329)

NEEDS AND OBJECTIVES: Direct observation with immediate feedback augments physical exam skills of trainees. We found UAB residents value direct observation / feedback but desire more physical exam training. To close this gap, we piloted an "Enhanced Clinical Skills" (ECS) track to offer personalized training in core physical exam skills. We report the formative assessment of residents' clinical skills to better understand their unique educational needs.

SETTING AND PARTICIPANTS: In 2019, 10 residents participated in the ECS Track, a longitudinal program of physical exam education.

DESCRIPTION: *Design*: After a local needs assessment to prioritize content, we designed an educational innovation to test skills: a 5-station Formative Assessment (FA) circuit. For each station, residents examined a patient with known abnormalities (6 min) and then presented their findings to two trained faculty (4 min) present in the same room. Afterwards, residents received individualized feedback. *Measures*: a) *Skills Performance*: Faculty first independently examined the patients, agreed upon expected findings, and filled out standardized score cards of residents' performance; b) *Educational Experience / Self Assessment*: Residents and faculty rated their experiences of the FA and self assessment using a 10-question survey comparing FA to traditional models of resident feedback (10 point Likert scale) *Formative Feedback*: Each residents received a summary T.I.P. sheet on their performance. When the feedback from all residents was compiled, patterns emerged for curriculum development.

EVALUATION: *Skills Performance*: Residents demonstrated the highest competence at the CV station: 8/10 correctly determined abnormal cardiac findings (auscultation, pulses, JVP). Conversely, residents struggled to demonstrate expected skills competency at the NEURO station: 8/10 did not detect abnormalities in tone, gait, or reflexes. In addition, 9/10 did not meet expected standards in bedside ultrasound to detect pulmonary abnormalities.

Educational Experience: Residents rated the FA as more personalized as compared to feedback from ward attendings (mean of 8.63 vs 6.38), more timely (9.75 vs. 6.57) and more credible (9.13 vs. 7.50).

Self Assessment: Residents's self-assessment of ultrasound skills aligned with additional educational need: 6/10 rated their US skills as "unsatisfactory" and 2/10 as "borderline." On a more global self-assessment of physical exam skills, however, none of the residents rated their performance of physical exam skills as "unsatisfactory" in contrast to the assessment of trained faculty who observed them.

DISCUSSION / REFLECTION / LESSONS LEARNED: We offered a needs-based FA for 10 clinically-experienced residents by having trained faculty observe trainees examining actual patients in a timed circuit and then providing real-time feedback. The FA of our ECS Track offers a novel way to meet individualized educational needs and provide clinical education in a personalized, timely, and credible fashion. It also provides a data-driven path for individual and program-wide skills education.

DEVELOPING A CLINICAL SOCIAL DETERMINANTS OF HEALTH CURRICULUM FOR MEDICAL STUDENTS

Surabhi Nirkhe, Margaret Wheeler. Internal Medicine, University of California San Francisco, San Francisco, CA. (Control ID #3390175)

NEEDS AND OBJECTIVES: Accrediting bodies have increasingly called upon medical schools to include social determinants of health (SDH) in their curricula. However, this does not ensure that students learn how to address SDH in a way that improves patient care. A recent systematic review showed that most SDH training occurs in preclinical years or as an elective, but rarely during core clerkships. UCSF School of Medicine has a strong preclinical SDH curriculum, and students are evaluated on patient advocacy during clerkships. And yet, students receive little formal training in how to address patients' SDH. This targeted needs assessment reports stakeholder attitudes toward SDH pedagogy at UCSF, and is part of a larger project to design a skills-based SDH curriculum integrated into the Internal Medicine (IM) clerkship.

SETTING AND PARTICIPANTS: Zuckerberg San Francisco General (ZSFG) is a public hospital and one of three sites for the IM clerkship at UCSF. The needs assessment is based at ZSFG, the pilot site for the curriculum. It consists of interviews with faculty curricular leads across UCSF, medical students currently enrolled in the IM clerkship, and senior IM residents.

DESCRIPTION: Interviews with faculty gage opinions about SDH in the current curriculum, how the curriculum has changed over time, and perceived limitations in content. We conduct focus groups of 5-10 participants with students and residents. Students are invited to reflect on their experience in addressing patients' SDH, their existing SDH training, and areas for development. Residents are asked to reflect on how students currently address SDH, and what training might prepare them to better care for underserved patients.

We then analyze this interview data in two ways: a deductive method allows us to confirm that a majority of stakeholders value SDH training; an inductive method suggests strategies to best accomplish curricular objectives while balancing stakeholder needs.

EVALUATION: This curriculum will be evaluated through student self-assessments, objective evaluator assessments, and a general program evaluation. Prior to implementing the curriculum, a cohort of students will complete pre/post-clerkship self-assessments. This will establish a control for how knowledge and skills evolve with clinical experience. We will then compare the pre/post data of students who complete the curriculum against this baseline.

DISCUSSION / REFLECTION / LESSONS LEARNED: Three key learning theories have influenced medical education: behavioral, in which complex tasks are simplified into steps; cognitive, wherein students build upon conceptual frameworks; and socio-cultural, where guided participation in patient care facilitates learning. Current SDH curricula fall short in each domain. Advocacy skills are not distilled into concrete actions; SDH are not revisited throughout medical school; and learning to care for underserved patients is rarely facilitated. We anticipate stakeholder interviews to illustrate how a clerkship-based SDH curriculum can utilize these theories to best promote workplace learning.

DEVELOPING A CULTURE OF WELLNESS

Desiree Burroughs-Ray[1]; Catherine Clarke[2]; Pooja Jagadish[2]; Amanda Roberts[2]; Christopher D. Jackson[2]. [1]Internal Medicine, UTHSC, Memphis, TN; [2]Internal Medicine, University of Tennessee Health Science Center, Memphis, TN. (Control ID #3389338)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education Common Program Requirements has named addressing resident wellbeing as a core program requirement, tasking Resident Training Programs to mitigate factors that contribute to physician burnout. Physician burnout varies throughout a physician's medical career with prevalence as high as 60% for residents. Residency training raises the risk for burnout due to lack of autonomy, lack of time and decreased environment control. At University of Tennessee Health Sciences Center (UTHSC) Internal Medicine program, a Wellness Champion (WC) was appointed to represent the program on the Graduate Medical Education Well-Being Sub- Committee. This WC conducted a needs assessment to better understand the culture of wellness in the residency. In response, the Resident Wellness Committee (RWC) was formed to promote resident-led initiatives. Through monthly wellness events the RWC sought to promote a culture of wellness within the Internal Medicine residency program.

SETTING AND PARTICIPANTS: All categorical Internal Medicine, Preliminary Interns and Internal Medicine-Pediatrics UTHSC residents were invited to participate in the needs assessment. All RWC events were available to the above residents and entirely funded by the program.

DESCRIPTION: In August 2019, residents received a needs assessment via email which evaluated: self- perceived burnout, the residency's culture of wellness, and preferred wellness initiatives. The results of the needs assessment prompted the development of the RWC comprised of 12 residents, a WC in their last year of training, an Associate Program Director, Program Coordinator, and Chief Resident. The Internal Medicine program is divided into four families, and a representative from each post-graduate year was elected by their respective peers from each family. Monthly after-work activities and Wellness Wednesday Noon Conferences were planned, executed, and promoted by the RWC.

EVALUATION: The needs assessment was emailed to 158 residents, of which 125 were not on either vacation or a Pediatrics rotation; 29 residents completed it (23 % completion rate). The needs assessment was emailed mid-year to residents with 44 of 123 residents not on either vacation or a Pediatrics rotation responding (36% completion rate). Feedback regarding the wellness events has been overwhelmingly positive, highlighting appreciation for events during the workday and an improvement in the program's overall culture of wellness.

DISCUSSION / REFLECTION / LESSONS LEARNED: Ensuring resident representation in designing and implementing program well-being activities improved the culture of well-being at UTHSC. The large size of our program required adaptations to the initial RWC proposal such as expanding from eight residents to twelve residents and developing an Executive Committee to assist the WC.

DEVELOPMENT, IMPLEMENTATION AND EVALUATION OF A NOVEL CASE-BASED SIMULATION GUN VIOLENCE PREVENTION TRAINING FOR FIRST-YEAR RESIDENTS

Chana A. Sacks[1]; Charles Rickert[3]; Sejal Hathi[1]; Gretchen Felopulos[4]; Shannon Scott-Vernaglia[5]; Paul F. Currier[1]; Peter Masiakos[2]. [1]Medicine, Massachusetts General Hospital, Boston, MA; [2]Pediatric Surgery, MGH, Boston, MA; [3]Surgery, Massachusetts General Hospital, Boston, MA; [4]Psychiatry, Massachusetts General Hospital, Boston, MA; [5]Pediatrics, Massachusetts General Hospital, Boston, MA. (Control ID #3391925)

NEEDS AND OBJECTIVES: Gun violence kills more than 39,000 Americans every year. Studies have demonstrated that physicians do not regularly discuss firearm safety with patients. Lack of education about how to have conversations about firearm safety is an important barrier, especially among resident trainees.

The objectives of this training were 1) to demonstrate feasibility of a gun violence prevention training program across disciplines; 2) to address knowledge gaps related to firearm safety counseling and 3) to improve residents' comfort in having such conversations with patients.

SETTING AND PARTICIPANTS: 6 residency programs at one academic medical center in Boston, MA participated and included this training as a 60-90 minute session during intern orientation (5 programs) or at the beginning of the academic year (1 program) in summer 2019. 148 first-year residents participated: 74 (50%) from Internal Medicine, 22 (15%) from Pediatrics, 16 (11%) from Psychiatry, 15 (10%) from Emergency Medicine, 12 (8%) from Surgery, and 9 (6%) from Obstetrics/Gynecology.

DESCRIPTION: The curriculum development team included content experts, simulation and medical education leaders, and attendings and residents from all participating departments. The session began with a 15-minute lecture that reviewed a framework to consider relevant epidemiolgoy, outlined available resources (e.g. how to obtain gun locks) and an approach to patient counseling, and discussed relevant laws (e.g. Extreme Risk Protection Orders that facilitate temporary removal of firearms from the home in certain circumstances).

Trainees then practiced these skills with standardized patients (SPs) using two cases: 1) routine screening for presence of a gun at home, with a focus on counseling on safe storage and 2) a visit with a patient who was worried about a depressed family member. SPs provided trainees with feedback.

EVALUATION: Participants completed a survey before and after the session. 70% reported no prior training in talking with patients about firearm safety. Prior to the training, 99% of participants thought it was important for health care providers to routinely screen patients for access to firearms and to counsel on safe practices; after the training 100% of participants answered affirmatively.

Before the training, 3% of participants reported knowledge of available resources; after the training, 96%. Prior, 3% of participants were aware of Extreme Risk Protection Orders and their appropriate use; after the training 98% reported awareness. On a scale of 1-10 (higher scores indicating more comfort having a discussion about gun safety with patients), trainees initially reported a median score of 5; after the training, median score was 8.

DISCUSSION / REFLECTION / LESSONS LEARNED: It was feasible to implement a case-based gun violence prevention training across departments in our hospital. The program was well received, and nearly all first-year residents felt this was an important topic area. Self-reported knowledge and comfort with conversations related to firearm safety increased after the training.

DEVELOPMENT OF A HOSPITAL MEDICINE TEAM BASED LEARNING AND SIMULATION CONFERENCE

Carolyn Chan[1,2]; Elaine Cruz[2]; Calen Frolkis[1,2]; sandra m. glagola[3,2]. [1]Internal Medicine, MetroHealth Hospital, Cleveland, OH; [2]Hospital Medicine, MetroHealth Medical Center, Twinsburg, OH; [3]Hospital Medicine, MetroHealth Medical Center, Cleveland, OH. (Control ID #3384087)

NEEDS AND OBJECTIVES: Resident trainees are often first responders to acutely decompensating patients on the general medical wards. There is a paucity of educational interventions cultivating these skills. The long-term goal of this project is to develop a novel hospital medicine curriculum that integrates medical knowledge with interprofessional teamwork. This pilot introduced a 1-hour conference utilizing Team Based Learning (TBL) and Simulation activities (SIM) as a first step in the long-term goal. The objectives were:

1. Development of a novel one-hour conference using principles from TBL and simulation to address acute clinical hospital medicine scenarios.

2. Compare internal medicine resident preference for combined TBL and simulation sessions over traditional didactic lectures.

3. Assess learner engagement in sessions.

SETTING AND PARTICIPANTS: Conference occurred in a simulation center and included medical students, internal medicine interns and third year residents rotating on inpatient wards. Each session had 13-14 participants. Two hospital medicine faculty led a total of three sessions.

DESCRIPTION: Kern's six-step approach for "Curriculum Development in Medical Education" was utilized. *Transfusion Reactions* and *Status Epilepticus* were the pilot topics selected. Trainee surveys and faculty feedback were collected after each session. Three plan-do-see-act (PDSA) cycles were performed integrating trainee and faculty feedback. The final conference structure is as follows: Individual readiness assessment, team formation, group readiness assessment, TBL, and simulation (half of learners switch the order of TBL/SIM for smaller group sizes).

EVALUATION: A total of n = 40 anonymous trainee post session surveys were completed. In response to question 1 on the 5-point Likert scale: I was engaged and involved, n = 33, 82.5% of respondents agreed, or strongly agreed to the statement, suggesting that learners were participating in active learning throughout. In response to question 2: I prefer the topic of transfusion reaction (or status epilepticus) in TBL/SIM over a traditional lecture, n = 37, 92.5% of learners agreed or strongly agreed. When asked how comfortable they felt at diagnosing and managing transfusion reactions (or status epilepticus), n = 39, 97.5% responded they felt at least moderately comfortable.

DISCUSSION / REFLECTION / LESSONS LEARNED: This project serves as a pilot for a novel TBL/SIM conference addressing acute hospital medicine scenarios. Feedback suggests that this conference structure increases learner engagement, is preferred over traditional lectures, and increases learner comfort in management of clinical conditions. Next steps include adding interprofessional learners and assessing the impact on teamwork skills of trainees.

DEVELOPMENT OF A STRUCTURED POINT-OF-CARE ULTRASOUND CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Nalinee C. Srisarajivakul[2]; Michael Janjigian[2]; Anne Dembitzer[2]; Daniel Sartori[2]; Khemraj Hardowar[1]; Deborah Cooke[2]; Harald Sauthoff[2]. [1]PRMEIR, New York University, South Ozone Park, NY; [2]Medicine, NYU School of Medicine, New York, NY. (Control ID #3391854)

NEEDS AND OBJECTIVES: Point-of-care ultrasound (POCUS) has expanded in practice amongst hospitalists and critical care physicians for a multitude of reasons: increased diagnostic accuracy and speed, cost reduction, and reduced radiation exposure. Internal medicine (IM) residents are exposed to POCUS at all stages of their training. These experiences drive the IM residents' interest in learning POCUS. Our curriculum seeks to train IM residents to safely integrate POCUS into clinical practices.

SETTING AND PARTICIPANTS: The participants are 55 PGY-2 internal medicine residents across 4 academic hospitals.

DESCRIPTION: The curriculum consists of three phases:

1. Pretest: Residents complete a knowledge quiz, an opinions survey, and a hands-on POCUS test.

2. Training workshops: Residents participate in a workshop series consisting of lectures and hands-on training on human models covering views of the heart, lungs, abdomen, and lower extremity vessels. At the conclusion of the last workshop, residents complete a satisfaction survey, a retrospective pre-post confidence survey and repeat the knowledge test.

3. Skill building: For the remainder of the academic year, residents will participate in weekly scanning sessions with local experts, monthly conferences, and online feedback on uploaded images. At the end of the academic year, residents will repeat the surveys, online knowledge test, and the hands-on test.

EVALUATION: In the hands-on portion of the pretest, no resident scored ≥80% well done; for reference, to pass the equivalent faculty course, the attending's score must be ≥80% well done. In the image interpretation portion of the pretest, the average resident score was 53%. Of residents who responded to the pre-course survey, 6 residents (20%) reported receiving training in POCUS, however 17 (58%) reported using POCUS in their practices. 76% of residents believed POCUS should be a standard part of the IM resident curriculum.

After the workshop, overall confidence in image acquisition and interpretation with POCUS significantly increased. In addition, there was a statistically significant increase in the image interpretation quiz score to 78%. The residents' overall rating of the course was 4.5/5.

DISCUSSION / REFLECTION / LESSONS LEARNED: Despite low hands-on pre-intervention scores in image acquisition and interpretation, more than half of residents report using POCUS in their clinical practice. This underscores the need for a structured curriculum to teach and supervise the use of POCUS in training programs. Our next steps will

be to complete the skill building phase of the curriculum and assess resident retention of abilities and knowledge following the completion of the full year course.

DOES A ONE-HOUR INVESTMENT IN FINANCIAL WELL-BEING PAY OFF FOR TRANSITIONAL YEAR RESIDENTS?

John C. Christensen[1,2]; Meredith A. Gaufin[5]; Sarah J. Beesley[3]; Larissa Shuppy[4]. [1]Department of Medicine, Intermountain Medical Center, Murray, UT; [2]Department of General Internal Medicine, University of Utah School of Medicine, Salt Lake City, UT; [3]Medicine, Intermountain Medical Center, Murray, UT; [4]Department of Family and Preventative Medicine, University of Utah, Layton, UT; [5]Graduate Medical Office, Intermountain Medical Center, Provo, UT. (Control ID #3385816)

NEEDS AND OBJECTIVES: An overlooked source of anxiety for new medical school graduates is the change in financial situation as they move from accruing student loans to earning a wage and entering repayment of student loans. This transition may adversely affect resident wellness just as much as duty hour overages, high patient census, and poor work-life balance. The goal of this study was to determine if a free 1 hour financial planning lecture would improve the financial well-being of new interns.

SETTING AND PARTICIPANTS: In June of 2019, all 10 incoming transitional year residents to Intermountain Medical Center in Murray, Utah participated in the study.

DESCRIPTION: In June of 2019, all incoming transitional year residents were asked to anonymously complete the validated, ten question Consumer Financial Protection Bureau (CFPB) Financial Well-Being Scale. The following week, during their new-intern human resources orientation, the incoming interns received a free, one-hour lecture about financial planning and preparedness provided by a certified financial planner from the Utah Medical Association (the intervention). The same CFPB Financial Well-Being Scale was administered again 1 month after the intervention and again at 3 months after the intervention. Responses to the survey were kept anonymous. The surveys were administered via Survey Monkey and emailed to the potential respondents. The raw data was summarized and an average financial well-being score was calculated for each administration of the survey.

EVALUATION: Nine out of the ten potential respondents completed the baseline (pre-intervention) survey; eight completed the one-month post intervention survey and four completed the three-month post intervention survey. The financial well-being before the intervention was averaged with a score of 58 (out of 100). There was an improvement of 6.9% to 62 in the raw Financial Well-Being Score from pre-intervention to one-month post intervention. This was statistically significant with a p-value of 0.02884. Additionally, responses were consistently improved across all 10 questions of the CFPB Financial Well-Being Scale from pre-intervention to one-month post intervention.

DISCUSSION / REFLECTION / LESSONS LEARNED: As the cost of medical education continues to increase rapidly, the transition from medical school to residency can be an anxiety provoking time as student loans enter repayment. We sought to mitigate this anxiety with a 1 hour financial planning session which resulted in improved financial well-being of the interns. It is notable that even the smallest of modifications to new intern orientation curriculum can have a significant impact. This addition of a non-traditional topic in the orientation curriculum, highlights the importance of a holistic approach to resident education and stewardship.

DUAL IMPACT IN TEACHING SOCIAL MEDICINE: USING REFLECTIVE WRITING FOR BOTH LEARNERS AND TEACHERS

Theresa H. Liao[1]; Gretl Lam[2]. [1]General Medicine, Portland VA- OHSU, Portland, OR; [2]Internal Medicine Residency, Oregon Health Sciences University, Portland, OR. (Control ID #3390846)

NEEDS AND OBJECTIVES: Residency training focuses on medical care, which accounts for only 10% of health, while Social Determinants of Health (SDOH) account for 40%. We developed a 3-week block to improve knowledge, skills and attitudes relating to SDOH. Curriculum evaluation response rates are only about 30%, so we sought to enhance evaluation through qualitative analysis of reflective writing samples that are required during this rotation.

SETTING AND PARTICIPANTS: All Internal Medicine interns (Primary Care Track [PCT] and non- PCT]) participate in the Social Medicine rotation.

DESCRIPTION: Components include: (Clinical:) addiction medicine, home-based primary care, wound care clinic, homeless clinic; (Community-based:) recovery groups, volunteering; (Additional low-resource activities:) online Medication-Assisted Training and SDOH modules, brief readings, thought experiments, and reflective writing.

All interns complete a 1-2 page reflection. Several prompts are offered; open-ended reflection is also welcome. On submission, interns indicate whether they give permission for (anonymous) inclusion in an analysis of the rotation. 19 of 34 (56%) indicated yes. Local IRB exemption was obtained.

Included reflection pieces were de-identified and analyzed by two independent readers who each compiled a set of core themes identified from analysis of all the readings. The readers then met to establish concordance on a set of central themes. They then re-read the reflections and coded readings to these themes for the final analysis.

EVALUATION: Prevalent themes included: 1) appreciating a larger picture: seeing the patient as a whole person, the impact of SDOH, and the importance of community; 2) the power of patient stories; 3) the prevalence of emotional discomfort in working with SDOH, including frustration, bias and uncertainty; 4) the positive impact of exposure to novel experiences and populations; 5) the impact of time to connect with patients and allow reflection; and 6) insights into self in working with SDOH, including ignoring SDOH because of perceived lack of skill/ability; as well as reconnection with meaning and purpose, including being reminded why one chose to enter medicine in the first place, aspirations for one's future, and gratitude for new experiences/insights during the rotation.

DISCUSSION / REFLECTION / LESSONS LEARNED: From our analysis, the rotation appears to have a positive impact on knowledge, skills and attitudes relating to working with SDOH. Many interns reflected on reconnection to their mission in medicine and a more holistic approach to health and well-being, which felt particularly important during an otherwise very hectic, medically-focused and hospital-oriented first year. Regarding specific curricular components, the impact of recovery groups and personal stories of recovery appear particularly impactful. The slower pace of the rotation enables greater reflection and connection with patients. Finally, reflective writing provided important insights into impact for learners, beyond our standard rotation evaluations.

EDUCATIONAL T.I.P.S. FOR IMPROVED CLINICAL SKILLS: A NOVEL APPROACH TO CURRICULUM DEVELOPMENT

KeAndrea Titer, Madeline Eckenrode, Stephen W. Russell. Medicine, University of Alabama, Birmingham, Birmingham, AL. (Control ID #3390397)

NEEDS AND OBJECTIVES: Residents report low confidence in physical exam aptitude and low satisfaction with physical exam teaching (*South Med J*. 2016; 109: 747). Hence, we piloted the "Enhanced Clinical Skills" (ECS) training track to offer personalized training in core physical exam skills. To create the curriculum, we identified learner deficits using a formative assessment, which uncovered personal and program-wide educational needs.

SETTING AND PARTICIPANTS: *Participants*: 10 upper-level residents participated in the ECS Track to receive dedicated teaching of clinical skills. During the first month, each participated in a Formative Assessment (FA) of their clinical skills.

DESCRIPTION: *Formative Assessment Design*: Following the UK(MRCP) PACES format and Johns Hopkins APECS model, patients with actual physical exam abnormalities were recruited to sit in one of five exam stations (CV, MSK, NEURO, GI, PULM). Two trained faculty independently examined each patient and agreed upon pathologic findings. Residents then rotated through a timed circuit, having 6 minutes to examine and 4 minutes to present findings at each station before the observing faculty. At the end of the circuit, faculty provided real-time feedback on each resident's performance. *Measures*: Residents filled out a 10-point Likert scale assessing the educational experience and a self assessment of their performance. Faculty also assessed each resident's performance. *Curriculum Development*: Aggregate scores helped identify areas for curriculum design.

EVALUATION: The combined feedback revealed patterns for curriculum development. *Autonomy*: expected clinical skills were demonstrated by 80% in CV, 50% PULM and 50% GI. *Emerging Autonomy*: 20% demonstrated expected skills with the NEURO exam. Using bedside POCUS, 30% identified CV and 10% identified PULM abnormalities. *Self Assessment*: None rated their performance of physical exam skills as "unsatisfactory," in contrast to the assessment of faculty who observed them. *Curriculum Development*: residents received a T.I.P. Sheet (Targets to Improve the Physical exam) for self-directed learning. The T.I.P. Sheet highlighted areas of strength ("ready to teach others") and emphasized areas growth ("work on technique") related to the physical exam. An aggregate TIP Sheet for all residents allowed for identification of educational focus. Eight monthly sessions paired learners and faculty with actual patients to meet demonstrated need. Three months focused on POCUS, two months focused on NEURO, two more months taught MSK, and one month emphasized GI. Residents were encouraged to used the comments on their personal T.I.P. Sheet to augment their own education and reinforce skill.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our ECS Track piloted a novel way to teach clinical skills based on demonstrated learner need using a formative assessment with specific feedback.

Monthly sessions using patients and faculty taught to demonstrated deficits. Future directions of the ECS program could involve retesting the residents in timed circuits after completing the annual curriculum.

EFFECTIVE CLINICAL TEACHING: DO YOU KNOW IT WHEN YOU SEE IT?

Zoë Gottlieb[4]; Jeff Min[2]; Arielle Medford[3]; Ryan Flanagan[3]; Alyson Kaplan[5]; Jacob H. Johnson[1]. [1]Infectious Diseases, Brigham and Women's Hospital, Boston, MA; [2]Medicine, Massachusetts General Hospital, Cambridge, MA; [3]Department of Medicine, Massachusetts General Hospital, Boston, MA; [4]Mount Sinai Hospital, New York, NY; [5]Weill Cornell, New York, NY. (Control ID #3391982)

NEEDS AND OBJECTIVES: An Objective Structured Teaching Exercise (OSTE) parallels the commonly utilized Objective Structured Clinical Examination (OSCE) by observing residents in structured teaching encounters with standardized trainees. We previously developed a generalized assessment tool of clinical teaching using OSTEs that performed well with regards to reliability and validity. This 15-point assessment tool spans 5 clinical teaching domains and each item is measure on a 1-5 Likert scale with behavioral anchors. One barrier to implementation is training faculty reviewers on the 15-point tool and the time commitment to fill out the form. This study compares the use of an unanchored single-item global assessment rating by an untrained faculty member to the comprehensive assessment tool.

SETTING AND PARTICIPANTS: Internal Medicine residents in the Resident-as-Teacher (RaT) elective at Massachusetts General Hospital participated in this study.

DESCRIPTION: The global assessment form contained a 16 cm line where raters marked an X indicating overall resident teaching performance (the "global rating"). Aside from a smiley and frowny face, no anchors were given. Next, the raters completed the 15-point assessment form and were unable to change their global rating. These raters received frame-of-reference training on the assessment form and no training on the global rating. For the global scale the X was measured to the nearest 1mm. A % of the max score was calculated for each method. We assessed test characteristics of the two scales.

EVALUATION: Twelve Internal Medicine residents participated in the RaT elective and 11 completed both the pre- and post- OSTE assessment (4 cases each). One resident only completed the post. One case was not scored due to technical issues; thus, there were 91 measurements. Four faculty members scored the cases. The mean global rating was 49.6% (SD 16.4%) versus 46.0% (SD 11.8%) for the 15-point scale. The global scale used a larger portion of the scale (from 5.1% to 82.2%) compared to the 15-point scale (18.3% to 68.3%). Both were normally distributed. The teaching case scores between methods were highly correlated (0.81 Pearson's r; $P < 0.001$). This correlation held across all four cases and all four faculty reviewers (0.81 to 0.86; all $P < 0.001$). Final teaching scores per resident (mean across all four cases) were highly correlated (0.88; $P < 0.001$). When comparing changes in resident scores before and after the RaT elective, both measures showed similar effect sizes by Cohen's d [Global Scale (0.77; $P = 0.03$), Assessment Scale (0.79; $P = 0.02$)].

DISCUSSION / REFLECTION / LESSONS LEARNED: The single-item global rating scale without specific training performed well compared to the previously developed 15-point assessment tool. In settings where summative assessment is desired, the global scale is an efficient alternative to decrease the barriers to implementation. The 15-point assessment tool provides more granular detail in various domains of teaching and may remain superior for formative assessment.

EHR SUMMER CAMP: A HANDS-ON CME WORKSHOP TO ENHANCE EFFICIENT USE OF THE EHR THROUGH CUSTOMIZATION

Gary Fischer. Medicine, University of Pittsburgh, Pittsburgh, PA. (Control ID #3377833)

NEEDS AND OBJECTIVES: Our EHR has many customization options, but review of user proficiency data showed our faculty and residents have low use of customizations.

After completing the workshop, MDs were expected to

1. Understand opportunities for customization in the EHR,

2. Customize at least 4 features to improve the efficiency of their daily work

3. Improve efficiency using the EHR.

SETTING AND PARTICIPANTS: Setting: Division of GIM at the University of Pittsburgh outpatient clinic

Participants in pilot workshop: 15 faculty MDs

DESCRIPTION: The workshop is a 2 hour, hands-on, workflow-based experience in a computer lab, where participants log into their EHR accounts and customize features guided by a GIM and clinical informatics MD. Each of 7 topics begins with a demonstration of ideal workflows incorporating customizatized features, followed by a build session wher participants are guided through their own customizations, with specific content suggestions. By the end, participants set up (1) diagnosis, level of service, and documentation speed buttons, (2) favorite order sets, (3) order detail defaults, (4) personalized order panels, (5) letter defaults, and (6) "quick actions" to communicate normal inbasket results. The workshop was offered twice in August, during a time slot usually devoted to faculty development activities, suspended for the summer. S'mors were distributed at the end of the session. We chose to pilot as a CME faculty workshop to improve faculty experience and so precepting faculty could assist residents.

EVALUATION: Our vendor provides proficiency metrics monthly. We compared participants' metrics before and 3 months after the workshop. Changes in proportions were tested using chi-square test, and in continuous variables using paired t-test. The vendor-defined 'proficiency score,' (range 0-10) measuring use of time-saving features went from mean 4.61 to 7.12 ($p<0.01$). Mean numbers of time-saving features increased: chart review user-built filters (0.73 to 1.53, $p< 0.01$), inbasket 'quick actions' (1.4 to 2.4, $p< 0.05$), and user-created order defaults (65.5 to 73.3, $p < 0.05$). Orders placed without changing defaults per encounter, measuring effectiveness of customization, increased from 0.84 to 0.90 ($p<0.05$). Percent of providers with personalized billing (from 67% to 100%) and diagnosis (from 13% to 93%) buttons ($p< 0.05$ for each) increased. The number of 'quick actions' used per day did not increase (0.14 to 0.13, p NS). The vendor-provided PEP score, a metric of time spent compared to workload, improved from 5.35 to 5.81 ($p< 0.05$). Time spent in the system per day and from 7 pm to 7 am did not change, but there was a trend towards decreased time spent outside scheduled hours (58.7 to 50.2 mins, p=0.08).

DISCUSSION / REFLECTION / LESSONS LEARNED: An interactive workshop to increase EHR customized tools is feasible, acceptable, and results in an increase in EHR customization by users. Vendor-provided metrics are useful in evaluating for programs aimed at EHR use. Follow-up interventions may be needed to improve subsequent use of customized tools.

ENHANCING INTERVIEW SKILLS FOR GME FACULTY

Rachael W. Hayes[1,2]; Nina Blachman[3]; Sarah J. Moore[4]; Suparna Sarkar[5]. [1]Internal Medicine, NYU, New York, NY; [2]Internal Medicine, NYU Family Health Centers, New York, NY; [3]Medicine/Geriatrics, NYU School of Medicine, Mamaroneck, NY; [4]Internal Medicine- Bellevue Hospital Center, NYU School of Medicine, New York, NY; [5]Pathology, NYU, New York, NY. (Control ID #3389405)

NEEDS AND OBJECTIVES: Although many medical schools use behavioral-based interviews, most residencies and fellowships still use unstructured interviews. The literature suggests that structured interviews help both in reducing bias and selecting the best fit applicants. Most faculty who interview residency and fellowship applicants lack formal training. We created a faculty development workshop to teach GME faculty how to conduct interviews more effectively.

SETTING AND PARTICIPANTS: Participants included 15 GME faculty across various departments participated in a workshop at our institution's "Medical Education Day".

DESCRIPTION: GME faculty participated in a workshop with a group OSCE where they reviewed an applicant's CV and letter of recommendation, and observed an unstructured interview followed by a structured interview that utilized behavioral based questions. After each simulation, faculty rated the applicant. We taught faculty about different styles of interviewing including how to evaluate behavioral based questions, and reviewed literature supporting each method. We discussed the prevalence of unconscious bias and illegal questions from the NRMP. Participants worked together to create behavioral based questions tied to the particular needs of their own programs.

EVALUATION: Faculty rated the candidate in the unstructured interview favorably with 87% responding that the candidate was above average or excellent. Following the structured interview, 78% of faculty rated the candidate average or below average, and were concerned about the potential behavioral issues including a lack of empathy toward a difficult patient and limited insight. In a post-workshop survey, only 50% of faculty reported that their department provides training for interviews, and 50% thought they should have detected a previous problematic candidate at their interview. 100% of faculty reported motivation to change their interviewing style, and 92% of faculty reported the workshop was moderately, very, or extremely effective in providing tools for interviews.

DISCUSSION / REFLECTION / LESSONS LEARNED: This workshop enabled GME faculty to reflect on their ability to tailor questions to their program's needs. We successfully taught faculty how to utilize structured interviews to choose optimal candidates for their programs. These structured questions, created with the ACGME milestones, were designed to improve the interview reliability and validity by increasing standardization.

EQUIPPING INTERNISTS TO MEET A GREAT NEED: CONTRACEPTION COUNSELING EDUCATION IN A PRIMARY CARE CLINIC

Samantha J. Allen. Internal Medicine, University of Colorado, Denver, CO. (Control ID #3392042)

NEEDS AND OBJECTIVES: Compared to other industrialized nations, the unintended pregnancy rate in the US is notably high. Furthermore, It is known that that well below half of internists routinely discuss contraception with women of childbearing age at preventive visits. Commonly cited reasons for failing to counsel patients are lack of time, knowledge, and training. To close this knowledge gap, we created a contraceptive counseling education tool and implemented it in an internal medicine residency clinic. Our aims are improvement in the residents' perceived self-efficacy with the topic and increased frequency of contraceptive counseling.

SETTING AND PARTICIPANTS: This intervention included 30 internal medicine trainees in a continuity clinic where they are divided into four groups that rotate in the clinic for a month at a time. Each month of clinic includes a half day per week of education, during which our intervention was implemented.

DESCRIPTION: The teaching session was developed and led by a senior resident with an interest in women's health and supported by faculty. The curriculum included instruction in best practices for contraceptive counseling and a detailed review of contraception methods, as well as introduction of the WHO tiered chart and the CDC medical eligibility criteria app, which are practical and effective tools for contraception counseling and education. High-yield points were reviewed using hypothetical cases and open- ended questions, which allowed participants to practice using these tools.

EVALUATION: Prior to the intervention, residents were emailed a ten-question online survey assessing frequency of contraception counseling (four-point Likert scale), level of confidence with the topic (four-point Likert scale), and barriers to counseling (multiple choice and open-ended). The majority reported that they provide contraception counseling less than half of the time, indicated lack of confidence with the topic, and said they would be more likely to counsel if they had more knowledge of the topic.

Three months after their respective intervention, we will survey each group again. We will use a Wilcoxon signed-rank test to compare the pre-

and post-education survey results to assess whether residents' confidence with the subject matter has improved and if they are providing contraception counseling more often.

DISCUSSION / REFLECTION / LESSONS LEARNED: To date, we have reached more than 20 residents. Participation has been enthusiastic and attendees have responded favorably, which may be at least partially because they are receiving instruction from a peer and feel more comfortable asking questions and seeking advice. This aspect of our intervention may not be reproducible at all institutions.

EQUIPPING MEDICAL STUDENTS WITH SKILLS TO ADDRESS SOCIAL RISK FACTORS THROUGH A STUDENT-LED LEARNING EXPERIENCE

Masis K. Parunyan[1]; Leah Hollander[1]; Janhavee Deshpande[1]; John Hayden[1]; Carolyn K. Kan[1]; Christopher Lyons[1]; Kirsten Mojziszek[1]; Divya Satishchandra[1]; Mara Eyllon[2]; Marna Stack[2]; Thea James[1,2]; Stephanie Losi[2]; Pablo Buitron de la Vega[1,2]. [1]Boston University School of Medicine, Boston, MA; [2]Boston Medical Center, Boston, MA. (Control ID #3376954)

NEEDS AND OBJECTIVES: Social risk factors (SRF) are adverse social conditions associated with poor health, such as food insecurity or housing instability. Medical schools commonly teach SRF as immutable realities rather than actionable circumstances that should be addressed with specific tools. To address this gap, students developed an educational experience to equip third-year medical students (MS3) with tools to address SRF during their Internal Medicine (IM) clerkship. After piloting it during the 2018-'19 academic year (AY), we revised the project to improve its feasibility, acceptability, and efficacy for all stakeholders.

SETTING AND PARTICIPANTS: MS3 at the Boston University School of Medicine completing their IM clerkship at Boston Medical Center (BMC).

DESCRIPTION: MS3 during the '18-'19 AY used THRIVE, BMC's 9-domain SRF screening tool and resource referral directory, to screen patients for SRF and provide information on social resources. Two-weeks later, students conducted follow-up phone interviews with patients to assess their experience connecting with resources. Analysis of pre- and post-experience assessments indicated improved MS3 confidence in providing resources to help patients with SRF. However, the initiative had low completion rates (27%) due to challenges including insufficient instruction on Electronic Health Record (EHR) documentation, heavy clerkship workload, lack of integration with existing workflows, and lack of support from residents. During the '19-'20 AY, we developed new orientation materials for students, streamlined MS3 workflow by simplifying the screening tool and patient selection, and eliminating follow-up phone calls. To better integrate with existing workflows, we instructed MS3 to review resources with residents and attend interdisciplinary care management rounds. To increase resident support, we worked with a chief internal medicine resident to include information on the educational experience in resident orientations.

EVALUATION: Student leaders conduct mid-clerkship huddles with MS3 to elicit real-time feedback about challenges and ideas for improvement. MS3 complete a pre- and post-experience self-assessment measuring their attitudes towards and confidence in addressing SRF. The post-assessment also elicits feedback on using the THRIVE tools and completing the experience. MS3 self-assessment completion rates, EHR documentation rates, and THRIVE tools usage are evaluated to measure learning experience feasibility.

DISCUSSION / REFLECTION / LESSONS LEARNED: Despite equipping MS3 with the skills to use BMC's THRIVE tools, students still felt inadequately prepared and unsupported to address SRF. Even if this new interdisciplinary workflow better supports MS3, it is critical that students begin to develop skills to address SRF during preclinical years. This calls for significant changes in medical school curricula to better balance learning activities focused on providing biomedical care with those related to addressing SRF.

EVALUATING THE EFFECTIVENESS OF A STRUCTURAL COMPETENCY AND BIAS IN MEDICINE CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Erica V. Tate, Melanie Prestidge. Internal Medicine, Tulane University, New Orleans, LA. (Control ID #3390717)

NEEDS AND OBJECTIVES: Residency programs focus on developing a physician's clinical skills, however little time is dedicated to exploring the structural factors that influence a patient's well-being. Therefore, we have instituted a longitudinal curriculum focused on structural competency, structural racism, implicit bias, microaggressions, and cultural humility.

We expect residents to recognize structural barriers that exist in our society which contribute to poor patient health outcomes. Understand historical and structural factors that contribute to health inequality for the residents of their city (New Orleans). Understand the concept of implicit bias and how it plays a part in clinical interactions. Learn to communicate professionally with colleagues concerning issues of racism, bias, and social inequality.

SETTING AND PARTICIPANTS: The course was presented to Tulane Internal Medicine residents at the PGY 2,3 level. The course was taught by Tulane Internal Medicine faculty. Residents completed pre- and post-surveys to assess changes in their knowledge and attitudes concerning structural competency, institutionalized racism, and bias.

DESCRIPTION: The course was offered to 64 residents in five didactic sessions, each lasting 60 minutes. Residents were provided with optional additional reading to explore after the presentations. These materials were available online from the STFM Resource library: Teaching About Racism Toolkit.

EVALUATION: The study surveyed 2nd and 3rd year IM residents prior to the start of the course using a Structural Competency-adapted version of the previously-validated Clinical Cultural Competency Questionnaire (CCCQ)-Pre. The CCCQ, although originally developed to assess cultural competency of medical professionals, has been adapted and applied to pharmacy students, nursing students, and medical students in previous studies. The adapted tool, the Clinical Structural Competency Questionnaire (CSCQ)- Pre, was administered to internal medicine residents to assess baseline knowledge, attitudes and skills. The original CCCQ utilized a Likert scale, so additional question formats (dichotomous, rank, etc.) were added, as well as questions adapted from the most current structural competency literature. Students were asked to complete the CSCQ-Post at the end of the course. This study was exempt by the Tulane University IRB.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our curriculum encourages residents to examine their own cultural background and biases. It also allows residents to examine the societal structures that contribute to health care inequality.

Many residency programs offer little if any training concerning these topics, some barriers to implementation include faculty availability and available time for didactic sessions for residents. However, with institutional support more of these types of didactic sessions can be implemented.

In the future expanding sessions to include resident led discussions or literature review could improve resident knowledge and comfort with these topics.

EVALUATION OF THE THIRD YEAR MEDICAL SCHOOL EDUCATIONAL ENVIRONMENT BEFORE, DURING AND AFTER AN ACADEMIC MEDICAL CENTER TRANSITION

Theresa A. Townley[1]; Anna Maio[2]; Ryan Walters[2]; Bruce L. Houghton[2]; Henry Sakowski[2]; Jason E. Lambrecht[1]. [1]Internal Medicine, Creighton University, Omaha, NE; [2]Internal Medicine, Creighton University School of Medicine, Omaha, NE. (Control ID #3392421)

NEEDS AND OBJECTIVES: Educational environment has an impact on students' perceived well-being, satisfaction, and educational achievement.[1] During the 2016-2017 academic year, Creighton University School of Medicine transitioned its Academic Medical Center from an inner city location to a midtown area, and from entirely resident led teams to a mix of private practice, mid-level and academic teams. This affected the educational environment of third-year medical students.[WRW1] Therefore, we surveyed four cohorts of third-year medical students in 2016 to 2019 (i.e., both before and after the transition) to measure the educational environment and atmosphere as well as student self-perceptions.

SETTING AND PARTICIPANTS: Following IRB approval, all third-year medical students were asked to complete a brief demographic questionnaire as well as the Dundee Ready Education Environment Measure (DREEM).[2] The survey request was sent in April each year.

DESCRIPTION: Although the DREEM consists of five subscales, we were most interested students' perception of learning environment (12 items), students' academic self-perceptions (8 items), and students' perceptions of educational atmosphere (12 items). Items within each subscale were summed and one-way ANOVA with Tukey-adjusted post-hoc tests were conducted to test differences within each subscale across years.

EVALUATION: We averaged a 52% response rate. Across years, all subscale scores followed nearly identical trajectories with subscale scores increasing from 2016 to 2017 and steadily decreasing from 2017 through 2019. Specifically, perceptions of learning environment increased by 7.3 points from 2016 to 2017 (95% CI: 4.0 to 10.6, $p < .001$) and then decreased 5.0 points from 2017 to 2019 (95% CI: 1.3 to 8.7, $p = .003$). Academic self-perceptions increased by 3.0 points from 2016 to 2017 (95% CI: 0.7 to 5.2, $p = .004$) and then decreased 3.3 points from 2017 to 2019 (95% CI: 0.8 to 5.9, $p = .004$). Likewise, perceptions of educational atmosphere increased 5.4 points from 2016 to 2017 (95% CI: 2.0 to 8.7, $p < .001$) and then decreased by 4.7 points from 2017 to 2019 (95% CI: 1.0 to 8.5, $p = .007$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Creighton University School of Medicine recently transitioned from an academic medical center led entirely by academic teams to a center previously organized by private practice-based physicians. This center has now melded academic, mid-level and private- practice-based care. In addition, the geographic location and the payor mix have changed. In preparation, care was taken to ensure that students would be engaged in patient care and that the new Academic Medical center would maintain a culture of care for the underserved. Despite this complicated transition, results of our survey suggest that the educational environment continued to provide a stable and positive learning environment for third-year medical students.

EXPANDING THE DIVERSITY OF THE GIM WORKFORCE: CREATING A FELLOWSHIP FOR ADVANCED PRACTICE PROVIDERS IN GENERAL INTERNAL MEDICINE

Elena Lebudska[1]; Matthew J. Moles[2]; Mary W. McCord[1]; Huong M. Lam[1]; Hillary Chrastil[3]; Frances Palmer[1]; Mary Kozloski[4]; Carmen L. Lewis[5]. [1]Internal Medicine, University of Colorado, Denver, CO; [2]Medicine, University of Colorado, Denver, CO; [3]General Internal Medicine, University of Colorado, Aurora, CO; [4]General Internal Medicine, University of Colorado Denver, Aurora, CO; [5]Internal Medicine, Univesrity of Colorado, Denver, CO. (Control ID #3390197)

NEEDS AND OBJECTIVES: There is a dearth of primary care providers in the United States. One solution to this problem is diversifying the primary care workforce by welcoming Advanced Practice Providers (APPs) to this field. Doing this requires increased education and training for our APP colleagues. We are hoping that by creating an APP fellowship we can help advance this goal. We have created a one-year APP fellowship specifically geared at advancing APP knowledge and comfort with primary care. Many new APP graduates find it challenging to secure employment without having experience, and additionally feel uncomfortable with independent practice especially in broad fields like internal medicine. Our objectives for the fellowship were to: improve clinical knowledge of common primary care topics, improve comfort with independent practice, and to add well trained APPs to our academic institution.

SETTING AND PARTICIPANTS: This APP fellowship takes place at a large academic medical center within the GIM department. Preceptors include primary care general internists and select Internal Medicine subspecialists. One applicant is enrolled per year.

DESCRIPTION: The APP fellow works 7 half days a week paired with one of 5 attending internists at one of two primary care clinics. During the first six months the fellow sees patients in partnership with an attending in a co-management structure. During the second six months, the fellow strategically progresses to more independent practice while always having attending support. There are options to perform two-week subspecialty rotations outside of primary care based on the fellow's interest. Fellows attend weekly formal interdisciplinary case conferences and weekly GIM grand rounds.

EVALUATION: Informal feedback is given after each session to the fellow by their attending preceptor on: billing, notes, clinical decision making, time management, and diagnostic evaluation. Attending preceptors and the fellowship coordinator have phone meetings every 2-3 months to discuss the progress of the fellow. Feedback sessions are also conducted by two of the fellowship preceptors with the fellow every 2 months where ACGME milestones are used to assess the fellow's progress towards unsupervised practice and gain feedback on the program.

DISCUSSION / REFLECTION / LESSONS LEARNED: We are currently in our third year of this APP fellowship. Our fellows have been highly sought after for jobs after completion of this extra training, and we have been able to retain two of our current graduates. Barriers to implementing a fellowship like this include: funding sources for the fellow, attending preceptor availability, and the need for fellowship coordination. Every year we have many exceptional applicants with much more interest then we have spots available. We feel this has been a successful endeavor and in the future hope to expand our program and help other institutions institute a similar educational experience. We hope to look at physician attitudes towards APPs and see if this changes based on our fellows and their involvement in our program.

FACILITATED GROUP MENTORING FOR WOMEN TRAINEES AT AN ACADEMIC INSTITUTION

Iris Lee[1]; Maria Baggstrom[3]; Rakhee Bhayani[2]. [1]Rheumatology, Washington University in St Louis School of Medicine, St Louis, MO; [2]Medicine, Washington University in St Louis School of Medicine, St Louis, MO; [3]Oncology, Washington University in St Louis School of Medicine, St Louis, MO. (Control ID #3345441)

NEEDS AND OBJECTIVES: The under-representation of women in leadership positions has long been recognized. Due to this under-representation, the traditional dyadic mentoring schema may not be possible for women trainees. Furthermore, literature suggests programs to

help women faculty acquire and strengthen specific skills necessary in academic medicine are beneficial. Professional development initiatives directed at women trainees are lacking.

SETTING AND PARTICIPANTS: Women trainees in the department of medicine at Washington University in Saint Louis.

DESCRIPTION: We developed the "Forum for Women in Medicine" (FWIM) program in 2014 to empower women trainees in the department of medicine with skills for successful careers. FWIM is a facilitated group mentoring program that hosts a series of professional skill-building workshops for women residents, fellows, and junior faculty. The sessions were a combination of lectures, small-group discussions, and self-reflection exercises among trainees and faculty facilitators. Participants also attended lunches with prominent women leaders in a multiple of fields both within and outside of medicine.

EVALUATION: Participants varied from 4-19 (average 11) trainees and 11-24 faculty facilitators (average 17) per session between 2017 and 2018. Pre- and post-year and post-workshop surveys were conducted. For workshops between 2017 and 2018, 100% of residents felt that the curriculum vitae (31/31), letter of recommendation (24/24), and conflict resolution workshops (17/17) provided information that was beneficial for the trainee. In 2018 surveys, women trainees felt more comfortable handling interpersonal conflict in post-2018 surveys compared to pre-2018 surveys (75.8% vs 58.6% agreed or strongly agreed, $p = 0.085$). Male trainees over the same period of time did not have a significant increase in comfort with handling interpersonal conflict (84.3% vs 79.5% agreed or strongly agreed, $p = 0.370$). In post workshop surveys, trainee's comments resolved around themes of finding mentorship and networking, sharing and exchanging ideas, and learning new skills.

DISCUSSION / REFLECTION / LESSONS LEARNED: Mentorship for women trainees in academic medicine is a unique situation warranting a unique solution. Women trainees had improved confidence in conflict management after our 2017-2018 series of workshops compared to male trainees. Facilitated group mentoring in our institution provides avenues for skills building and networking outside of the archetypal dyadic mentoring relationship.

FACING FAILURE: REVITALIZING M&M CONFERENCE IN THE AMBULATORY SETTING

Shivani Desai. General Internal Medicine, UT Southwestern, Dallas, TX. (Control ID #3390392)

NEEDS AND OBJECTIVES: Our IM residency currently has no forum for trainees to review outpatient cases where a safety lapse has occurred. This results in missed opportunites to improve clincial safety for our under-served patients in our safety net clinic and contributes to the perception that ambulatory education is under-valued in GME. The absence of an ambulatory-based patient safety conference also inadvertently perpetuates a culture of fear and blame surrounding medical errors.

1. Residents will identify, report, and analyze adverse patient safety events that have occurred in the resident continuity clinic.

2. Create a positive culture surrounding patient safety events via discussion, self-reflection, and deliberate practice.

SETTING AND PARTICIPANTS: Internal medicine residents' noon conference during their ambulatory week.

DESCRIPTION: M&M Conferences are incredibly powerful opportunities for self-reflection and learning. As patient safety becomes a growing area of ACGME focus, such conferences can serve as valuable tools to enhance a graduate medical training program.

By piloting a new ambulatory M&M conference, we hope to bridge some of the perceived value gap between inpatient and outpatient education in our training program. Our curriculum will review patient safety concepts while monitoring attitudes and event reporting of ambulatory safety events. Measuring culture change is inherently difficult; the evolution of attitude assessments and an increase in event reporting should serve as surrogate markers for culture change surrounding resident perceptions of ambulatory patient safety.

EVALUATION: We will utilize baseline and post-intervention surveys to assess attitudes regarding this fundamental question: are residents able and willing to identify cases in which a safety lapse has occurred? Simultaenously, we will carefully monitor numerical data on the number of safety events reported to institutional leadership.

DISCUSSION / REFLECTION / LESSONS LEARNED: Developing an ambulatory-based M&M conference emphasizes the importance of patient safety in the clinic setting, ensuring a more even playing field between the inpatient and outpatient aspects of graduate medical training. An initial basic needs assessment revealed that residents were not even aware of *how* or *where* to report patient safety events that occur in their continuity clinic. Baseline survey data indicates that current resident attitudes likely hinder robust self- reflection and attention to ambulatory patient safety.

Interestingly, subsequent curriculum changes to introduce a new ambulatory M&M conference have led to a significant spike in event reporting from the resident clinic, suggesting increased attention to and interest in identification of ambulatory patient safety events. Increased interest in leading the ambulatory M&M conference by multiple resident volunteers also highlights evolving attitudes on this topic. In combination, we hope these data sets serve as surrogate markers for much needed culture change.

FACULTY COACHING TO IMPROVE TEACHING SKILLS: TRANSFORMING ANXIETY INTO COMPETENCE THROUGH TRUST AND PRACTICE

Tyra Fainstad[1]; Beth Ebel[2]. [1]Internal Medicine, University of Washington, Seattle, WA; [2]Pediatrics, University of Washington, Seattle, WA. (Control ID #3341300)

NEEDS AND OBJECTIVES: Most faculty, having acquired deep clinical competency, have had little or no formal training or mentoring in teaching and are expected to "naturally" develop these skills. Faculty members with negative teaching evaluations have few resources to remediate deficiencies, which can be demoralizing for an otherwise competent faculty member and challenging for leaders accountable to both residents and faculty. This presents a quandary – how to effectively and durably correct the teaching skills of an established faculty member? One such situation arose in our institution. An expert in feedback on teaching ('coach') was asked to coach a receptive faculty member ('host').

SETTING AND PARTICIPANTS: Observation and coaching was conducted one-on-one in the context of the host's clinical teaching environment.

DESCRIPTION: A longitudinal coaching model was created based on purposeful, theoretically sound evidence around observation, structured feedback and development of a host-coach alliance. The program was piloted for optimization in 3 conceptual domains: 1) establishment of a host-coach relationship; 2) a shared mental model around best teaching practices; and 3) effective delivery, reception, and use of feedback. Strategies included: encouraging the host to guide initial coaching direction, establishing host-identified goals, keeping feedback formative, and taking the time to build a trusting relationship. Our shared model was the Stanford Faculty Development Program (SFDP) teaching framework. Six half-day observation sessions occurred over three months in the host's clinical teaching environment. Each session was immediately followed by 30 minutes of feedback. Content was reinforced in a follow-up email, and an email prior to each session outlined the next SFDP theme. The host and coach routinely reflected on progress and

created a plan for maintenance. The coach was compensated for 0.1 FTE for 6 weeks by the host's division.

EVALUATION: Host self-assessment upon conclusion and 3 months follow-up included increased: 1) confidence in teaching ability, 2) in-the-moment feedback skills; 3) time efficiency; 4) capacity to support residents' autonomy; and 5) a framework to elicit learner goals. Trainee assessments reflected the host's improvement in terms of approachability, level of autonomy given, and overall learning culture.

DISCUSSION / REFLECTION / LESSONS LEARNED: Using established tools from medical education this coaching program created a collegial environment with beneficial results. Lessons learned include: 1) time is a critical ingredient in coaching for remediation: adult learning theory hinges on a strong relationship, a credible teacher, and a positive learning environment, all of which require time to build, 2) process transparency is important to creating an educational alliance, 3) power differences between coach and host were diminished by their joint commitment to creating a collegial relationship using structured sessions.

FIREARM SAFETY… WHAT IS MY ROLE AS A PHYSICIAN?

Ceyda Sablak, Rahul Mhaskar, Max Feldman. University of South Florida, Tampa, FL. (Control ID #3390336)

NEEDS AND OBJECTIVES: Firearm related homicide and suicide ranks among the top 10 leading causes of death of Americans for most of the lifespan. In 2017, firearm related violence was responsible for 115,000 non-fatal injuries and 39,773 deaths[1]. Studies have shown that counseling from a healthcare provider can reduce adverse outcomes related to firearms[2,3]. Despite this, medical students infrequently receive training about firearm safety and injury prevention[4]. Commonly cited barriers include lack of educational resources, lack of trained personnel, and concerns over the topic's relationship to politics[5,6]. We created an interactive small group module designed to teach medical students about the role of a physician in reducing firearm related injury and death in a politically neutral context.

SETTING AND PARTICIPANTS: The module was implemented in a small group setting to first year medical students during their "On Doctoring" course. One hour of time was dedicated to the module. Faculty preceptors attended one hour of faculty development, but otherwise had no specific training or expertise on the subject. The student to faculty ratio was 8:1.

DESCRIPTION: Doctoring preceptors used a PowerPoint presentation to guide their groups through a discussion on firearm safety. First, basic background information such as public health implications, physician rights, ownership statistics, ownership laws, and public health implications were introduced. Next students were asked to consider and discuss as the a group the following questions:

As a physician,

May I discuss firearm safety with patients? Should I discuss firearm safety with patients?

What must I discuss regarding firearms with patients?

Preceptors moderated the conversation using the PowerPoint to help guide the conversation and provide accurate answers. Faculty were encouraged to share their own personal practices on inquiring and providing counseling to patients on firearm safety. Lastly, specific strategies for initiating and navigating this conversation were introduced.

EVALUATION: Participants' knowledge and perception on counseling of patients on firearm safety was assessed before and after the firearm safety curriculum using 5-point Likert-type scale questions. Students were asked the below questions:

I understand Florida Laws surrounding gun ownership and sales.

I can define "safe firearm storage practices".

I understand when a physician can ask patients about firearm access and safety.

I feel comfortable asking a patient about access to firearms.

I feel comfortable counseling a patient about safe firearm storage practices.

DISCUSSION / REFLECTION / LESSONS LEARNED: Of the 163 students invited to participate in the survey, 154 (94.5%) responded with both pre- and post-survey questionnaires. Students showed a statistically significant improvement in all five of the pre and post curriculum questions. Additionally, 96% of respondents felt that the curriculum was presented in an unbiased manner.

FORMATIVE AND SUMMATIVE ASSESSMENT OF A RESIDENT-AS-TEACHER COURSE USING OBJECTIVE STRUCTURED TEACHING ENCOUNTERS (OSTE)

Ryan Flanagan[2]; Victor Chiappa[3]; Joshua C. Ziperstein[4]; Jacob H. Johnson[1]. [1]Infectious Diseases, Brigham and Women's Hospital, Boston, MA; [2]Department of Medicine, Massachusetts General Hospital, Boston, MA; [3]medicine, Massachusetts General Hospital, Boston, MA; [4]Medicine, Massachusetts General Hospital, Boston, MA. (Control ID #3382281)

NEEDS AND OBJECTIVES: The Resident-as-Teacher (RaT) course at the Massachusetts General Hospital (MGH) is an intensive two-week elective aimed at improving resident teaching ability through didactics, teaching experiences, and feedback. Evaluation of the effectiveness of such courses has been limited to subjective resident evaluations. The use of Objective Structured Teaching Encounters (OSTE) allows for objective measurement of changes in resident teaching and can identify previously unknown strengths and weaknesses of the RaT curriculum.

SETTING AND PARTICIPANTS: Eleven PGY1-3 Internal Medicine residents at MGH participated in the RaT course and completed the pre- and post- OSTE assessments.

DESCRIPTION: A previously developed 45-minute OSTE and assessment tool with strong validity evidence was administered before and after the RaT elective. The OSTE was comprised of four scenarios: *Teaching on Rounds, Teaching at the Bedside, Giving a Chalk Talk, and Giving Feedback on an HPI.* Each case had two versions that varied in clinical content to allow for different pre- and post- examinations. Trained faculty members rated each encounter using a 15-item tool spanning 5 domains of teaching including: *creating a positive learning climate, effectively communicating goals, accurately assessing the level of the learner(s), effectively controlling the teaching session, and providing effective feedback to the learner(s)*. Each item was rated on a 5-point Likert scale, with higher scores indicating better performance. Case teaching scores were calculated by taking the mean of all 15-items. The overall teaching score was the mean across all cases.

EVALUATION: Overall teaching scores increased from 2.74 to 2.91 (pooled SD = 0.23, P=0.016) with an effect size of 0.76 (Cohen's d, large effect). Correlation between pre-OSTE score and absolute improvement was strong (r = -0.76), indicating the highest impact of the course was on lower performing baseline teachers. Residents improved most in *Teaching on Rounds* (effect size: 0.79; P = 0.03), *Giving Feedback on an HPI* (0.58; P = 0.09), and *Giving a Chalk Talk* (0.52; P = 0.11), while performance declined on *Teaching at the Bedside* (-0.35, P = 0.32). Effect sizes were positive for all domains [Learning climate (effect size 0.66; P = 0.05), Control (0.61; P = 0.08), Goals (0.47; P = 0.15), Assess (0.40; P = 0.22), Feedback (0.36, P = 0.27)].

DISCUSSION / REFLECTION / LESSONS LEARNED: This study provides objective evidence of the benefits of this RaT elective and argues for it's continued inclusion into a busy residency curriculum. Additionally, the OSTE identified four specific areas for improvement in RaT: 1) Improving already talented teachers, 2) Increasing bedside teaching experiences, 3)

Focusing on how to give feedback during teaching scenarios and 4) Adding content on assessing the level of learner. Future OSTE studies will measure the impact of these curricular changes on RaT course effectiveness and include a control group to address the possibility that residents may improve simply by being more familiar with the OSTE format.

FROM CONFRONTATION TO COLLABORATION: AN INTERPROFESSIONAL, COMMUNICATION SKILLS CURRICULUM FOR CHALLENGING PATIENT ENCOUNTERS

Jennifer Rodriguez[1]; Carla L. Spagnoletti[2]; Julie Childers[3]; Allison DeKosky[4]. [1]Internal Medicine, UPMC, Pittsburgh, PA; [2]Medicine, University of Pittsburgh, Pittsburgh, PA; [3]Division of General Internal Medicine, Section of Palliative Care and Medical Ethics, University of Pittsburgh, Pittsburgh, PA; [4]Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3391807)

NEEDS AND OBJECTIVES: Physicians and nurses often encounter patients that wish to leave the unit against medical advice. These encounters are challenging and contribute to provider burnout. There are a number of reasons why providers may feel that it would be unsafe for a medical patient to leave the floor. This ranges from patients who are fall risks to those for whom there is a concern for substance use. These encounters require a high level of interpersonal and interprofessional communication skills in order to manage them successfully.

SETTING AND PARTICIPANTS: Our curriculum focused on training physicians and nurses on communication skills central to successful management of encounters in which patients wish to leave the unit AMA. This pilot initiative recruited 18 providers total and including 9 hospitalist physicians and 9 registered nurses. Our curriculum goals were to improve nurse and physician knowledge, attitudes, and skills surrounding this type of encounter.

DESCRIPTION: In order to assess skills prior to and after the curriculum, we conducted a pre- and post- intervention OSCE (Objective Structured Clinical Examination) with an SP. In order to assess attitudes we administered pre and post surveys. We then conducted training sessions which included both physicians and nurses. Each of these sessions included didactic training on policies and skills and then practice of communication skills with SP's in a group setting.

We focused on the following five communication skills 1) establish a common goal using "we" statements, 2) outline the plan of care and consequences using "if-then" statements, 3) explore patient concerns using open- ended statements, 4) express empathy using "NURSE" statements and 5) verify the patient's understanding using "teach-back".

EVALUATION: It was challenging to coordinate hospitalist and nurse schedules for providers to accommodate all portions of the study. This ultimately limited our sample size. We measured Cohen's d as estimates of effect sizes for the skills pre and post assessments. We found that the curriculum had a very large effect (1.79) on the overall mean. Providers completed pre and post surveys to assess attitudes and comfort. They reported increased comfort after participating in the curriculum (3.2 pre vs 4.2 post, p=0.0085).

DISCUSSION / REFLECTION / LESSONS LEARNED: We found that our curriculum was effective in increasing overall provider skills in these communication strategies. Providers felt more comfortable having conversations with patients that wish to leave the unit against medical advice after this training. Anecdotally, hospitalists and nurses appreciated the opportunity to train together on these skills and to discuss the various issues that come up in these encounters.

We focused on patients wishing to leave the unit against medical advice. However, the communication skills in the curriculum are helpful in a multitude of challenging patient encounters, and especially encounters where limits need to be set with patients.

FROM FAMILY VIOLENCE TO TRAUMA INFORMED CARE: A MULTIDISCIPLINARY WORKSHOP FOR MEDICAL STUDENTS

Victoria Timmel[2]; Marie Petrizzo[1]; Santhosh Paulus[1]; Dana Kaplan[1]; Lauren Block[1]. [1]Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [2]Medical School, Zucker School of Medicine at Hofstra/Northwell, Levittown, NY. (Control ID #3390837)

NEEDS AND OBJECTIVES: Violence is tragically common across all age groups, and frequently goes unreported. While screening for child abuse (CA), intimate partner violence (IPV), and human trafficking (HT) is recommended, rates of screening and reporting are low in primary care. Training improves screening and referral to community resources. Through a session on family violence, we introduced medical students to the related topics of CA, IPV, and HT.

SETTING AND PARTICIPANTS: 100 second year medical students at one medical school in New York in 2019.

DESCRIPTION: A two hour interdisciplinary workshop included an introduction to the definition of, risk factors for, red flags of, and prevalence of CA, IPV, and HT. A patient advocate shared a testimonial, and social workers and educators from a nonprofit advocacy organization provided screening, documentation, and reporting strategies. A child abuse pediatrician described the rationale for mandatory reporting, while a faculty expert in HT outlined screening and reporting techniques and tenets of trauma-informed care. Students were then asked to screen for IPV and CA in outpatient preceptorship experiences.

EVALUATION: Students completed a pre- and post-session survey including knowledge and attitudinal elements from a validated questionnaire. Assessment included a question on the final essay exam and clinical skills encounter. Fifty students completed both the pre- and post-session surveys. Student reported ability to detect and respond to cases of IPV and CA increased significantly following participation (mean 3.9 vs. 1.9 on 1-5 scale, $p<0.01$) as did comfort identifying red flags of HT (1.9 vs. 1.3 on 1-3 scale, -<0.01). Following the session, more students identified risk factors for IPV (65% vs. 32%, $p<0.01$) and warning signs of abuse (92% vs. 62%, $p<0.01$). Following the session 71% of students identified appropriate ways to ask patients about IPV. While 75% of students reported awareness of trauma-informed care after the session, no students correctly identified its four principles. Fewer than half of students received full credit for eliciting IPV on the OSCE exam (32%) or differentiating the approach in CA and IPV on the final essay (28%). Student evaluations of the session were a mean of 4.7 of 5. Students appreciated the family perspective and integrative approach as "eye opening," "powerful" and "touching and chilling," and requested additional skills practice and content on HT.

DISCUSSION / REFLECTION / LESSONS LEARNED: This interdisciplinary workshop introduced students to principles of screening and trauma informed care in cases of CA, IPV, and HT. The multi- stakeholder approach including patients, community leaders, and clinical faculty increased student knowledge and confidence to address violence in patients' lives. Small group debrief and practice of these challenging topics is important in developing skills.

GAMIFICATION OF RESIDENT JOURNAL CLUB TO INCREASE ENGAGEMENT AND CRITICAL APPRAISAL SKILLS

Steven Allon[1]; Joanna Zurko[2]; William Morgan[1]; Ryan Kraemer[1]. [1]Medicine, University of Alabama at Birmingham, Birmingham, AL; [2]Medicine, Medical College of Wisconsin, Milkwaukee, WI. (Control ID #3374778)

NEEDS AND OBJECTIVES: Critical appraisal skills are essential to internal medicine practice. Nonetheless, the medical education literature is replete with studies demonstrating the suboptimal critical appraisal skills of residents. Graduate medical educators have an opportunity to cultivate these skills during internal medicine residency. Resident journal club is a frequently employed mechanism to imbue these skills, but resident engagement can be variable. We developed a journal club curriculum for an internal medicine residency program predicated on gamification to increase resident engagement and enhance critical appraisal skills.

SETTING AND PARTICIPANTS: Internal medicine residents at the University of Alabama at Birmingham participated in the new journal club curriculum from June 2018 to May 2019.

DESCRIPTION: Monthly journal club sessions arranged residents into competing groups. A case vignette with a clinically relevant question was disseminated to resident groups by e-mail at least two weeks prior to each session. Then, each group selected an empiric study of their choice to answer the clinical question. During the journal club session, each resident group presented a critical appraisal of their chosen study and discussed its applicability to the patient scenario. A faculty expert discussant was present to facilitate critical review and give a brief didactic on a biostatistical topic relevant to the studies (e.g., significance testing of baseline characteristics). A winning group was selected at the end of each session and was awarded a small prize.

EVALUATION: Participants were surveyed at the end of the academic year preceding and following the 12- month intervention to evaluate the quality of the journal club curriculum. Response rates to the pre- and post-intervention surveys were 22.5% and 24.3%, respectively. Both the pre-test (n=25) and post-test (n=27) included eight survey questions that explored participants' rating of various characteristics of journal club on a Likert scale (e.g., "journal club is a good use of my time," and "journal club has increased my confidence when evaluating medical literature"). We used two-sided Fisher's exact test to compare responses before and after the intervention. Residents' self-reported critical appraisal skills significantly improved following the intervention (p=0.005). Four additional survey questions included in the post-test asked participants to directly compare the intervention to the previous curriculum. A majority (73.3%) of residents reported the new curriculum was either "probably" or "definitely" better than its predecessor.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our results suggest that gamification of resident journal club is a reasonable strategy to increase resident engagement in the curriculum and residents' self-reported critical appraisal skills. Further study is needed to investigate the correlation between self-reported and objectively assessed critical appraisal skills.

GETTING BANG FOR YOUR BUCK IN CLINICAL REASONING: INNOVATIVE PEER-TO-PEER TEACHING UTILIZING FEEDBACK LOOPS AND METACOGNITION

Megan McGervey[1]; Abby Spencer[2]; Ali Mehdi[1]. [1]Internal Medicine, Cleveland Clinic, Cleveland, OH; [2]GIM, Cleveland Clinic, Chagrin Falls, OH. (Control ID #3392198)

NEEDS AND OBJECTIVES: Adult learners require different teaching modalities not regularly employed in residency programs. Large programs rely heavily on large group didactics that have proven to have low retention rates. The importance of metacognitive strategies and dynamic feedback loops has been studied in adult learning. Utilizing a metacognitive approach, this program aims to improve clinical and diagnostic reasoning capacity among internal medicine residents, increase collaboration and utilize a peer to peer approach to build diagnostic schema, improve learning environment and normalize diagnostic error, and utilize metacognition and direct feedback loops to shed light on medical knowledge deficits and implicit bias.

SETTING AND PARTICIPANTS: Sessions take place at a large academic medical center that hosts over 180 internal medicine residents. All residents take part in the monthly sessions that occur during a protected academic noon conference.

DESCRIPTION: Our innovation utilizes simulation case-based learning and peer to peer collaboration and teaching with feedback loops and the use of metacognition and a cognitive root cause analysis in an interactive monthly conference. Conferences are based on true cases presented by a resident led "Clinical Reasoning Team" with a staff mentor to highlight complex diagnostic schema, diagnostic error, and cognitive biases.

Small groups evaluate a patient with facilitators providing "real-time" lab, imaging, and pathology results. Groups then report out on their approach and challenges encountered. The actual patient course and diagnostic dilemma with a focus on cognitive error is then revealed. The groups then utilize metacognition to reflect on implicit bias and knowledge deficits that led to the diagnostic error. Residents then reflect on their own thinking to shape clinical reasoning using an iterative feedback loop.

EVALUATION: Evaluation of the innovation is underway with a mixed methods design. Focus group data were collected to triangulate the data.

A questionnaire with 102 responses showed that the conference is very well received. Written resident reflections point towards processes and behaviors indicative of transformational learning with a paradigm shift in perspectives. Survey data showed that over 90% of the residents reported that the conference makes them more aware of their cognitive biases, improve their clinical approach and decision making, help them become better clinicians, and that clinical decisions have changed after attending these sessions.

DISCUSSION / REFLECTION / LESSONS LEARNED: Clinical reasoning requires constant feedback and integration in order for young clinicians to learn. We have observed that trainees embrace curricula that prepare them to tackle diagnostic dilemmas. This innovation has changed the culture of our program by normalizing attention to cognitive errors, integrating biases discussions into rounds, and emphasizing metacognitive strategies in the face of uncertainty. Several clinical reasoning tools have been used in the wards since their introduction during conference.

GIVE THEM WHAT THEY WANT!: A NEEDS BASED CAREER DEVELOPMENT CURRICULUM

Megan McGervey[1]; Abby Spencer[2]. [1]Internal Medicine, Cleveland Clinic, Cleveland, OH; [2]GIM, Cleveland Clinic, Chagrin Falls, OH. (Control ID #3392470)

NEEDS AND OBJECTIVES: Internal medicine residency programs should provide a framework to guide, shape, and motivate residents to explore and develop skill sets that can lead to different career paths and subspecialties. Despite available mentorship programs and research opportunities, residents craved more support with teaching, delivering feedback, exploring career paths, networking, and building relationships with mentors. Our curriculum aimed to work hand in hand with residents to create career development sessions during their protected academic time.

SETTING AND PARTICIPANTS: This innovation takes place at a large academic center hosting over 180 internal medicine residents. All residents participate in the curriculum.

DESCRIPTION: In direct response to resident feedback, we worked with residents to form a curriculum called "The Career Development Series." The resident leadership group performed a needs based

assessment to identify topics residents felt were useful for career development. We sought advice from other programs in addition to our local fellowship Program Directors, job recruiters, research mentors, and curriculum developers in order to create the series. We provide information on fellowship preparation, interviewing skills, research opportunities, mentorship, coaching, job searching, and networking in addition to skills based sessions on feedback and teaching. Our curriculum includes several targeted sessions for different PGY levels, sessions for peer mentorship, fellowship program director panels, personal statement workshops, skill building workshops, individual mock interviews and a debriefing session for an audience of residents. In addition, we hosted research mentorship speed dating events, and provided instruction on contract negotiations and job search tactics. We also employed the use of a coaching program to facilitate direction when residents want to explore undeveloped interests and mature in their career interests.

EVALUATION: Data was obtained using a mixed methods design. We collected data from the local fellowship program directors, research mentors, and residents. All sessions were very well attended. Survey data showed that 100% of mock interviewees felt the session was helpful, over 70% agreed that the fellowship preparation sessions were helpful, and over 61% of residents who matched used the "Guide to Fellowship" document created. After the feedback skills session, evaluations for faculty increased. The residents felt that the peer mentoring was extremely helpful in identifying career and research mentors.

DISCUSSION / REFLECTION / LESSONS LEARNED: Working with the resident body to create curricula based on their feedback and needs has had an overwhelming positive response. Residents are more invested and readily give feedback when they feel included in development of sessions. Residents have responded so positively to the Career Development Workshop Series that an Director was appointed to run the sessions for residents. Residents continually provide ideas to expand the curriculum in the future.

GLOBAL HEALTH LEADERSHIP CURRICULUM

Geren Stone[1,2]. [1]Medicine, Massachusetts General Hospital, Boston, MA; [2]Medicine, Harvard Medical School, Boston, MA. (Control ID #3391630)

NEEDS AND OBJECTIVES: Within global health training, leadership development occurs almost exclusively through ad hoc learning and informal mentorship. In response to this gap, we have created an innovative curriculum in leadership development focused on the unique aspects particular to leadership in global health.

Through our curriculum, our trainees will be able:

-To identify and understand the importance of leadership skills within global health

-To develop their own skills of emotional intelligence and cultural humility in global health through self- reflection and feedback

-To apply leadership skills in developing and maintaining collaborative relationship on global health teams

SETTING AND PARTICIPANTS: Our program is a combined training program in internal medicine and global health. It is a 4-year program consisting of a 3-year residency and 1-year fellowship. There are 2 trainees in each class with a total of 8 trainees. These trainees participate in clinical, research, and academic rotations both locally and globally during their training.

DESCRIPTION: Over four year, our trainees participate in our global health leadership curriculum. The curriculum introduces and develops leadership skills through small group discussions, self-reflection, readings, mentorship, and experiential learning.

The curriculum's foundation is to build community and the practice of self-reflection through small group discussions. Discussions occur by class as well as program-wide meetings throughout the year.

Our first-year trainees also participate in a 4-week course focused on health equity and leadership led by our senior global health trainees. The trainees gain pragmatic clinical and leadership skill while our senior trainees gain valuable experience in curriculum development and teaching.

Integrated with these all experiences, our global health trainees participate in robust global health rotations that allow for active practice and engagement in leadership skill. In these experiences, our trainees practice self-reflection and seek feedback on their leadership skills.

EVALUATION: We will seek qualitative feedback from trainees on their experience. Through this feedback, we hope to demonstrate growth in their knowledge and practice of leadership skills.

We will also seek to engage with our global health partners for feedback on our trainees' leadership skill development, and utilize a series of global health case vignettes to assess the trainees' leadership skills over time.

DISCUSSION / REFLECTION / LESSONS LEARNED: Leadership skills need to be developed, nurtured, and assessed over time, as well as applied in the active practice of leadership. We want to demonstrate that global health leadership skills can be developed. Our hope is over time to demonstrate leadership skill development through self-assessment and reflection, feedback from colleagues, and assessment via standardized case vignettes. We believe that development of these skills will equip our trainees to be more effective leaders, partners, and teammates for health equity.

GLOBAL IS LOCAL: AN IMMERSIVE CLINICAL ROTATION IN RURAL TENNESSEE

Jonathan N. Pumilia[4,1]; Emily Partin[3]; Tracy Rabin[2]. [1]Internal Medicine, Erlanger Baroness Hospital, Chattanooga, TN; [2]Internal Medicine, Yale University School of Medicine, New Haven, CT; [3]Grundy County Schools Family Resource Center, Tracy City, TN; [4]Internal Medicine, University of Tennessee College of Medicine Chattanooga, Chattanooga, TN. (Control ID #3386799)

NEEDS AND OBJECTIVES: Medical residents tend to train in urban tertiary care centers, without significant clinical exposure to rural community clinics. At the same time, rural areas, often close to urban centers, have less access to care and significantly worse health outcomes. We created an immersive rural elective in Tennessee to introduce residents to the challenges facing patients and providers in remote, under- resourced communities.

SETTING AND PARTICIPANTS: To date, four PGY3 residents from the Yale New Haven Hospital internal medicine residency programs have completed this elective in Grundy County, one of the poorest counties in Tennessee. Residents worked with local providers in a variety of clinical settings, with an emphasis on the Beersheba Springs Medical Clinic (BSMC), which provides primary care and medications completely free of charge to uninsured residents of Grundy County and the surrounding area.

DESCRIPTION: Residents learn about the structural and socioeconomic determinants of health in rural communities through a predeparture orientation. They live in Grundy county, and are hosted by a local community member who serves as a guide and liaison. Residents see patients alongside a nurse practitioner at BSMC, and at three additional clinical sites. Two clinics are run by local physicians, whose patients have a mix of public and private insurance, and residents assist with intake exams at the county jail. Additionally, residents speak at local schools, participate in board meetings at BSMC, and attend health classes at the clinic and

other community events. Upon their return, residents compose a written reflection, and share a case- based presentation about their experience.

EVALUATION: In their written reflections and during a post-elective discussion, residents expressed appreciation for the learning opportunities provided by seeing a breadth of disease, and serving as the primary manager of complex chronic disease, which is uncommon in the resource-rich settings they are accustomed to. They also valued the fact that they were helping to fill a crucial role in the health of the community, while having deep misgivings about their inability to offer the standard of care they are used to providing. One resident wrote that he felt "ethically conflicted," and "struggled to communicate to [his] patients what standards of care would be and what was possible due to their insurance status." All residents admired the resiliency of their patients and the dedication of the medical staff, and believed they had a deeper understanding of structural barriers to health.

DISCUSSION / REFLECTION / LESSONS LEARNED: We believe the immersive nature of this elective provides a unique opportunity for medical trainees to develop a more personal and nuanced understanding of the challenges confronting patients and providers in rural America. We hope to inculcate in residents the humility necessary to serve in an unfamiliar cultural environment, and inspire them to champion equitable healthcare delivery in the future.

HAVE A MINUTE? RESIDENT ENGAGEMENT WITH AMBULATORY TEACHING MINUTE (ATM) EXERCISES—BRIEF, CASE-BASED EBM TEACHING FOR THE CONTINUITY CLINIC

Devin Oller. Medicine, University of Kentucky, Lexington, KY. (Control ID #3387836)

NEEDS AND OBJECTIVES: The continuity clinic can be a stressful learning environment for residents (Nadkarni et al 2011), and evidence based medicine (EBM) teaching is limited in this setting (Tiburt et al 2008). The Ambulatory Teaching Minute (ATM) was developed to address the need for high-yield teaching on EBM topics in busy resident continuity clinics. In this preliminary work, I assessed resident engagement to assist in developing best practices for facilitation of ATMs.

SETTING AND PARTICIPANTS: At the University of Kentucky, EBM-focused didactics have traditionally been integrated into the residency-wide noon conference series (journal club or traditional lecture formats). ATMs were designed to complement this existing curriculum, centering content in the ambulatory setting. 4 preceptors served as facilitators of ATM exercises to 24 residents over the course of 3 months, delivering 4 ATMs to each of these learners during their one month ambulatory rotation.

DESCRIPTION: The one-page ATM handouts (see resource URL) consist of four sections: 1) a case description, 2) a guided discussion that asks learners to develop a meaningful research question and outline the ideal study to answer the question posed by the case, 3) a brief synopsis of a recently published study that addresses this question, and 4) a brief facilitator-facing discussion guide.

In an effort to standardize facilitation of ATMs, preceptors opting in received an instructional video reviewing the ATM 2 weeks prior to facilitation. In the week prior to completing their ambulatory month, residents and their preceptors received an invitation to participate in an optional survey to measure resident engagement.

EVALUATION: Surveys to measure resident engagement using a modified STROBE instrument (O'Malley et al 2003) were completed by all 4 preceptors and 6 residents (100% and 25% response rates, respectively). The average engagement score of 3.81 (out of a maximum of 5). 60% of respondents reported the exercise taking between 6-10 minutes, with the next most frequent response (20% of respondents) being 2-5 minutes. In response to the question of "How frequently would it be realistic for you to complete an ATM exercise?" 60% responded once per week.

DISCUSSION / REFLECTION / LESSONS LEARNED: The positive engagement scores seen in this preliminary work point to the Ambulatory Teaching Minute's potential as an additional tool in the preceptor's toolbox to address EBM knowledge gaps among residents. Two lessons learned should be highlighted to inform others interested in using ATMs. First, narrowing the scope of the ATM to *either* a clinical pearl or a key EBM takeaway would likely lower ATM development and facilitation time. Second, future work should include assessments that ask participants to rank the various features of the ATM they find most helpful or engaging to better understand how ATMs can be streamlined.

HEALTH DISPARITIES CURRICULUM IMPACT ON RESIDENT OWNERSHIP OF SOCIAL DETERMINANTS OF HEALTH

Benjamin Quick, Bethany Ramm, Jane Broxterman, Leigh Eck, Becky Lowry. Internal Medicine, The University of Kansas Health System, Kansas City, KS. (Control ID #3375919)

NEEDS AND OBJECTIVES: A curriculum for social determinants of health is critical in addressing health disparities and plays a pivotal role in comprehensive patient care and medical education. The American College of Physicians (ACP) recently called for the integration of health disparities into all levels of medical education. Furthermore, the Clinical Learning Environment Review (CLER) program emphasizes residents identify and address health care disparities unique to their institution. Our academic internal medicine residency program implemented a systematic curriculum on health disparities and evaluated its effect on resident's ownership of assessing social determinants of health in clinical practice.

SETTING AND PARTICIPANTS: The University of Kansas Health System Internal Medicine Residency Program is a large training program that includes inpatient and outpatient experiences in a large academic medical center, Veterans Affairs health system, and a safety net clinic. The program has 69 categorical internal medicine residents and 10 internal medicine-psychiatry residents.

DESCRIPTION: A systematic curriculum was formed to educate and enable categorical internal medicine residents to address health disparities. To solidify core concepts, residents completed an online learning module. Subsequently, small group sessions investigated the role of physicians in addressing health disparities and reviewed system resources in both the ambulatory and inpatient settings of our health system.

EVALUATION: Residents were surveyed pre- and post-small group discussion to evaluate their perceived responsibility to identify social determinants of health and whether its training should be included in graduate medical education or incorporated into clinical practice guidelines. Responses were recorded on a five-point Likert scale with scores of five indicating the highest level of agreement. Following the intervention, residents felt a higher level of responsibility to identify social determinants of health (3.9 vs. 4.3, $p < 0.002$), felt health disparities training was necessary (3.7 vs. 4.4, $p < 0.001$), and should be incorporated into clinical practice guidelines (3.7 vs. 4.4, $p < 0.001$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Creating a health disparities curriculum based on ACP-CLER priorities was feasible for our program. While ACP-CLER priorities demonstrate requirement to educate on health disparities, our research suggests residents also find value in this type of education and its integration into graduate medical education.

HERE'S TO SPEAKING CONFIDENTLY: A TOASTMASTERS PUBLIC SPEAKING WORKSHOP FOR RESIDENTS

Adam Lalley[4]; Sneha Shrivastava[1]; Amanda M. Simone[3]; Lauren Block[2]. [1]General Internal Medicine, Northwell Health, Westbury, NY; [2]Medicine, Northwell Health, Lake Success, NY; [3]Internal Medicine, Allina Health, Minneapolis, MN; [4]Zucker School of Medicine, Hempstead, NY. (Control ID #3385744)

NEEDS AND OBJECTIVES: Physician interpersonal and communication skills, which have been shown to correlate with improved patient outcomes, comprise one of the six core competencies for Internal Medicine residents outlined by the Accreditation Council for Graduate Medical Education (ACGME). Public speaking falls within this realm, yet many residents endorse some degree of public speaking anxiety, creating an opportunity for a validated training curriculum. Furthermore, public speaking and presentation delivery is an integral part of a successful academic physician's career. We designed a workshop for Internal Medicine residents and medical students based on Toastmasters International, which describes itself as "a non-profit educational organization that teaches public speaking and leadership skills through a worldwide network of clubs."[1]

SETTING AND PARTICIPANTS: There were 35 participants in this workshop. 24% (n=8) were medical students, 43% (n=14) were PGY-1, 21% (n=7) were PGY-2, and 12% (n=4) were PGY-3. No prerequisite knowledge, skills, or resources were required to attend or participate. The workshop was held in a classroom with tables set up to work in groups, facilitating learner engagement.

DESCRIPTION: We chose an interactive workshop model to enhance learner engagement and promote reflection and sharing. A 60-minute public speaking workshop included a mini-didactic that outlined public speaking skills, styles and strategies, identification of flaws and pitfalls, and a Toastmasters public speaking activity with peer feedback. Pre- and post-workshop surveys consisted of questions pertaining to prior public speaking training, anxiety, and confidence levels. Anxiety and confidence levels were assessed on a 6-point Likert scale (1=extremely calm or extremely unconfident, 6=extremely anxious or extremely confident).

EVALUATION: Pre-workshop public speaking anxiety level was 3.86 (SD 1.02), with no significant difference between interns (2.93, SD 0.88) and PGY 2 and 3 (3.45, SD 1.30, p=0.26). Pre- and post-workshop public speaking confidence levels were 3.94 (SD 1.18) and 4.14 (SD 1.01), respectively (p=0.18). Pre- workshop confidence among interns (3.77, SD 1.47) and PGY 2 and 3 (3.91, SD 1.08) did not differ (p=0.83). Pre-workshop confidence was inversely correlated with anxiety (R= -0.58).

DISCUSSION / REFLECTION / LESSONS LEARNED: Graduate medical education requires public speaking on rounds and in conferences. Although not statistically significant, the mean public speaking confidence level rose after this workshop. There was no correlation between confidence and training level, confidence and prior public speaking training, anxiety and training level, or anxiety and prior public speaking training. The inverse correlation between trainee anxiety and public speaking confidence suggests that including anxiety reduction techniques may augment public speaking workshops and trainee confidence in public speaking.

ONLINE RESOURCE URL (OPTIONAL): 1. https://www.toastmasters.org/about/all-about-toastmasters

HOME VISITS DURING INTERNAL MEDICINE RESIDENCY: REINFORCING THE IMPACT OF SOCIAL DETERMINANTS OF HEALTH ON PATIENT CARE

Jayne M. Peterson[2,1]. [1]Internal Medicine, Banner University Medical Center Phoenix, Phoenix, AZ; [2]Internal Medicine, University of Arizona College of Medicine Phoenix, Phoenix, AZ. (Control ID #3357476)

NEEDS AND OBJECTIVES: Our internal medicine resident's training on social determinants of health (SDoH) has been in the form of an on-line module and scattered lectures. It's direct connection to patient care has been inconsistent. Home visits have been well established forms of evaluating unique patient needs but have not previously been a part of our General IM program. This innovation was developed to provide a practical approach to understanding SDoH within the resident's own practice. Objectives: 1. Provide experiential learning opportunity for residents to better understand the impact of SDoH on their patient's health. 2. Identify SDoH triggers for providing resources to improve care 3. Demonstrate appropriate documentation and billing codes for home visits

SETTING AND PARTICIPANTS: Ambulatory setting with IM Residents

DESCRIPTION: As of July 2017, all PGY 2 Internal Medicine residents receive an introductory discussion on the impact of SDoH on patient outcomes during their required BUMCP ambulatory rotation. Residents then review their patient population, identify, contact and schedule one patient to visit in their home. Common reasons for choosing the patient included concerns regarding medication adherence, recent falls, and uncontrolled chronic conditions. The home visit included the resident, a supervising attending, and our social worker whom addressed key questions around insurance, income, and transportation needs. Additional participants included medical students and pharmacy residents when available. Beginning May 2018, residents also completed a reflection on what they learned from the home visit.

EVALUATION: As of October 2019, 43 of 46 residents have participated in a home visit with their own patient or as part of the team. Common reflection themes noted after the visit included the lack of nutritious foods, barriers and cost of transportation, medication reconciliation and adherence issues, patient safety concerns, health literacy, family support for the patient, and previously undiagnosed depression or dementia. Since May 2018, the home visit also provided an opportunity to address advance directives in 11 of 26 patients (42.3%). Alternative assignment (3) included visiting a community resource (Area Agency on Aging) local office.

DISCUSSION / REFLECTION / LESSONS LEARNED: Home visits provide invaluable direct experience in understanding how SDoH impact resident's own patient's daily care. Residents learned to work collaboratively with our social worker to identify and address transportation, patient home safety, housing, food insecurity/choices and financial barriers to care. They noted the limitations of medication reconciliation done without actual prescription bottles in identifying duplicate prescriptions, use of OTC medications, and patient health literacy. Self-reflection questions help to solidify lessons learned. It allowed for advance directive discussions. Unexpectedly, we found that many patients are reluctant to have physicians visit their home. Next steps would be to identify some of the patient barriers to this type of visit.

HUNGER AND HEALTH TRAINING PROGRAM: AN INNOVATIVE CURRICULUM IN FOOD INSECURITY AS A SOCIAL DETERMINANT OF HEALTH

Kristin M. Collier[1]; Shaira Day[2]; Markell Miller[2]. [1]Internal Medicine, University of Michigan, Bloomfield Hills, MI; [2]Food Gatherers, Ann Arbor, MI. (Control ID #3346324)

NEEDS AND OBJECTIVES: In 2017, an estimated 1 in 8 Americans were food insecure. Food insecurity is associated with poor health outcomes and therefore is an important social determinant of health, yet is often neglected in graduate medical education curricula. Our goal was to partner with a local community food bank to provide specialized training on food insecurity for our residents that included experiential and service-learning

components. Our three objectives were the following: 1. Train the next generation of health professionals on food insecurity as a key social determinant of health. 2. Recognize the role that health care providers play in helping patients connect to food resources. 3. Increase comfort with routine screening, consultation and referrals for food insecurity.

SETTING AND PARTICIPANTS: Internal Medicine Residents at the University of Michigan, as part of an underserved elective, participated in the Hunger and Health Training program at Food Gatherers, the food rescue and food bank program serving Washtenaw County, Michigan.

DESCRIPTION: Our Internal Medicine Residents can elect a two week 'underserved medicine' rotation during the course of their training. In academic year 2018-2019, we partnered with Food Gatherers, the community food bank, to include training in food insecurity and incorporate a half day of service-learning at a local food pantry during this rotation. Food Gatherers' Hunger and Health Training program includes approximately 12 hours of specialized training on food insecurity and contains a mix of small group lecture and discussion, hands-on service learning opportunities at the community soup kitchen and local food pantries, self-study activities, and an invitation to participate in the SNAP challenge, an activity which helps to illustrate hunger in the US and the essential role food banks and healthcare providers play in the fight against hunger.

EVALUATION: Evaluation of Food Gatherers' Hunger and Health Training Program was obtained through written feedback obtained at the end of the rotation. Comments have been uniformly positive: "Learning about food insecurity at Food Gatherers was very beneficial. It was an area about which I previously had little knowledge, and which will be very relevant for my practice going forward." "This was an incredibly humbling and fulfilling experience and helped me remember my calling to medicine."

DISCUSSION / REFLECTION / LESSONS LEARNED: Food insecurity is common and a known social determinant of health. Curricula on the nuances of food insecurity and collaboration with community partners, however, is often lacking. The incorporation of specialized training in food insecurity at a local food bank was perceived as beneficial to the residents who participated in the rotation. The well-received participation in a half day of service at a food pantry nicely illustrates an education model which occurs outside of a traditional setting. The positive feedback on the non-MD instructors also demonstrates that education of our trainees by non-physician colleagues can be well received if done well.

IMERSD: INTERNAL MEDICINE EXPERIENCE FOR RESIDENTS IN SOCIAL DETERMINANTS OF HEALTH

Robert J. DeGrazia[1]; Taylor Phillips[2]; Valien Kondos[3]; Jenna Laughlin[1]; Himani Divatia[4]; Gretchen Rickards[4]. [1]Internal Medicine, Christiana Care Health System, Aberdeen, MD; [2]Internal Medicine, ChristianaCare, Newark, DE; [3]Internal Medicine and Pediatrics, Christiana Care Health Systems, Wilmington, DE; [4]Medicine, Christiana Care Health System, Newark, DE. (Control ID #3389662)

NEEDS AND OBJECTIVES: The social determinants of health include the social, economic, environmental, cultural systems and structures that shape the conditions of a person's daily life. While these concepts are often introduced during medical school, exposure among incoming interns tends to be quite variable. We implemented an immersive community tour during intern orientation to enhance residents' understanding of the social determinants of health, as well as to foster awareness of local demographics and available community resources

SETTING AND PARTICIPANTS: Wilmington Hospital is an urban hospital in Wilmington, Delaware and is the primary care training site for multiple residency programs. The hospital is located in the most impoverished zip code in the state and serves a very economically and racially diverse patient population. A total of 23 internal medicine interns participated in this activity.

DESCRIPTION: All interns participated in a 3-hour community tour of the city of Wilmington. The tour included visits to 3 community partners including a homeless shelter, a low-income housing unit, and a community center focused on workforce development and food insecurity. A scripted didactic program highlighting local health statistics and community health outcomes was presented during travel between sites. A handout outlining additional community services was provided at the conclusion of the tour.

EVALUATION: Data included pre- and post-tour knowledge-based surveys regarding the identification of key social determinants of health as well as local demographics, health outcomes, and community resources. The response rate was 100% for the pre-tour survey and 83% for the post-tour survey (N=23). Pre-survey data indicated that despite all residents reporting previous experience working with underserved populations, only 17% (4/23) were able to accurately identify the key social determinants of health and their associated impact on health outcomes. Post-tour surveys indicated a significant increase in both the identification of social determinants (15/23, 65% of participants) as well as the awareness of local resources. The residents also reported an increased level of comfort in understanding the surrounding community and the adversities affecting their patients.

DISCUSSION / REFLECTION / LESSONS LEARNED: These findings suggest that an immersive community tour can greatly enhance resident understanding of the social determinants of health, local population factors, and available community resources. In future iterations, we hope to broaden the offering to all residents and evaluate the impact on community resource utilization and patient outcomes.

IMMIGRANT AND REFUGEE HEALTH: LEGAL, PSYCHOSOCIAL, AND NARRATIVE PERSPECTIVES

Meha Semwal[1]; Bijan Ghaffari[1]; Janine Young[1]; Jennifer Adams[2]. [1]Dept. of Medicine, Colorado University School of Medicine, Colorado Springs, CO; [2]General Internal Medicine, Denver Health, Denver, CO. (Control ID #3384889)

NEEDS AND OBJECTIVES: The primary need of this curriculum is to help students develop expertise in immigrant and refugees, with a focus on the legal, social, clinical, and narrative determinants of health. The course utilizes mixed methods and flipped classroom modalities. The primary objectives include student exposure to the following: (1) Didactics on the Social and Legal Determinants of Health and Clinical knowledge of Refugee health, (2) Experiential Learning with Refugee and Immigrant patients interviews, (3) Narrative Medicine for Refugee and Immigrant Storytelling, (4) Cultural Humility Training.

SETTING AND PARTICIPANTS: This curriculum takes place within the Denver Health Longitudinal Integrated Clerkship (LIC) classroom. The participants of the study are third-year medical students who participate in the Longitudinal Integrated Clerkship (LIC). The students work longitudinally at Denver Health for a year; they interact with immigrant and refugee patients in emergency, inpatient, and outpatient settings. Denver Health is a safety net, level-one trauma center that serves a large population of urban underserved patients, including those who are uninsured/under-insured, Medicare and Medicaid, LGBTQ*, immigrants and refugees.

DESCRIPTION: Didactics are a PowerPoint on Social and Legal Determinants of Health on basic facts of refugee and immigrant populations; an expert in refugee medicine provides further context. Narrative medicine course is flipped classroom, and includes close reading of literature pertaining to immigrants and refugees. The students have an experiential learning project, interviewing refugee and immigrant patients, and reflectively writing about this.

Finally, the curricula concludes with a cultural humility workshop and group debrief on reflective writing pieces.

EVALUATION: Qualtrics pre- and post-survey in three parts. Part one includes statements on a five-point Likert scale from strongly disagree to strongly agree: (1) I view narrative medicine as a tool for providing better clinical care, (2) I use narrative medicine to find meaning in my work, (3) Narrative medicine helps me reflect on what matters most to my patients, (4) When I feel burnt out in medicine, I can cope with writing, (5) I feel comfortable exploring personal stories with immigrant and refugee patients, (6) I feel comfortable publicly sharing stories about what impact migrant populations have on me, (7) I feel personally connected to immigrants and refugees. Part two is the Perceived Stress Scale 4 (PSS-4). Part three is participant information and feedback.

DISCUSSION / REFLECTION / LESSONS LEARNED: This curriculum has impactful. Students gave real-time feedback that the didactic components of legal and medical are challenging; the discussion, reflection, reading, and writing assignments are most beneficial. The sessions have also brought up discussions about burnout, and ideas on sustainable practice in taking care of underserved patients with complex needs at Denver Health. The hope is that this curricula can be incorporated into school-wide and national curricula.

IMMIGRANT HEALTH: BUILDING BRIDGES IN MEDICAL EDUCATION

Brandon Allport, Aliza Norwood, Megan Gray. University of Texas at Austin Dell Medical School, Austin, TX. (Control ID #3391233)

NEEDS AND OBJECTIVES: Rapidly changing US immigration policy and the complexity of the healthcare system make it difficult for immigrants to access quality care. To become effective clinicians, learners must be fluent and confident in addressing immigrants' unique concerns. We created an elective to teach students about these topics. By the end of the course, students:

- Identify physical and mental health concerns specific to immigrant patients and implement evidence-based screening guidelines

- Design a management plan incorporating local resources and best practices for immigrant health

- Describe current national, state, and local immigration policy and its impact on health

- Explain the role of physicians as advocates for immigrant patients

SETTING AND PARTICIPANTS: Four 4th-year medical students participated in this 2-week course at an academic medical center in Austin, Texas.

DESCRIPTION: Each morning, students attend didactics (e.g. infection screening, common mental health concerns, pathways to permanent residency, asylum interview training) or community visits (e.g. refugee resettlement agency, nonprofit orgs., law school immigration clinic). On 4 afternoons over the 2 weeks, students attend community clinics and see only 1-3 immigrant patients per day to allow for deep exploration of each patient's immigration experience. On other afternoons, students participate in moderated small-group discussions on immigrant health hot topics and participate in writing accountability groups to produce course deliverables.

EVALUATION: Students complete four assignments for assessment:

- Two de-identified reflection pieces on patients they saw during the elective, discussing how their stories relate to larger epidemiological patterns or policy issues and proposing potential solutions. Reflections are assessed on writing quality, depth of reflection, and the innovation of proposed solutions, and are meant to be the basis for an op-ed or publication.

- Short final presentation expanding on one of these reflections.

- As a group, students create an immigrant health resource toolkit for use in a local clinical setting. Submissions are assessed on completeness and practical utility.

The course is evaluated by students on effectiveness of teaching methods, quality of speakers, and salience to their medical education and careers.

DISCUSSION / REFLECTION / LESSONS LEARNED: By providing students with direct experiences with immigrant patients, we illustrate how a comprehensive social history can be critical in a variety of clinical scenarios, and we humanize people who are often maligned or stereotyped in society and political dialogue. The course strengthens the medical school's ties to other disciplines and community organizations, reinforcing the importance of team-based care and demonstrating how interdisciplinary collaboration can improve health. One lesson learned is that immersion in these topics can be emotionally draining for participants; future iterations of the course will carve out more time for debriefs and discussions of self-care when caring for vulnerable populations.

IMPACTING THE OPIOID CRISIS THROUGH PROJECT ECHO

Vimal Mishra[1]; Gerry Moeller[2]. [1]Internal Medicine, Virginia Commonwealth University, Midlothian, VA; [2]Department of Psychiatry, Virginia Commonwealth University, Richmond, VA. (Control ID #3391861)

NEEDS AND OBJECTIVES: The widespread incidence of morbidity and mortality associated with Opioid Use Disorder (OUD) has resulted in a national crisis. One component of this public health epidemic includes a lack of an adequately trained healthcare workforce to provide opioid case management, prescribing, and dispensing. Strategies are needed to address these deficits in service delivery.

SETTING AND PARTICIPANTS: Primary care providers (PCPs) are at the forefront of caring for patients who are misusing or addicted to substances and are typically the point of referral to subspecialist consultation. Although data have shown that early intervention is correlated with more positive health outcomes, PCPs often have no specialized training in treating OUD or managing addiction. There remains a dearth of physicians equipped to adequately treat individuals with substance use disorders. This is most often the case in rural areas, where access to providers experienced in medical management of patients with OUD, is severely limited.

DESCRIPTION: Project ECHO is a tele-mentoring, medical education and care delivery model, which uses hub-and-spoke knowledge-sharing networks, led by expert teams at academic medical centers who use telehealth multi-point videoconferencing to conduct virtual clinics with community providers. Every clinic involves a short didactic session given by an expert in the group that hosts the meetings (or "the hub" team), followed by case-based discussions of de-identified real cases presented by practitioners in the community (or "the spokes"). Through access to experts for medical consultation and collaboration, existing community providers can provide more specialized care, ultimately diminishing barriers that patients often face when needing treatment for chronic and complex health conditions

EVALUATION: As Project ECHO seeks to provide continuing education to health care providers, Moore's framework was utilized to evaluate the level of impact on individual practitioners. Data collected included Participation & engagement, Satisfaction, Learning, and performance.

DISCUSSION / REFLECTION / LESSONS LEARNED: Project ECHO has the potential to improve access to expert specialist care in isolated communities, disseminate knowledge to healthcare professionals

without displacement or high cost, increase current and relevant medical knowledge, reduce health disparities, promote evidence-based and high-quality care for complex conditions, and increase job satisfaction and retention in providers. Few studies have been published to-date regarding the impact of OUD-specific tele-ECHO clinics on provider and patient. Given the documented need for highly trained providers and a range of comorbid conditions that prevail in patients with OUD and SUD, the dissemination and provision of Project ECHO focused in this area should be a priority.

ONLINE RESOURCE URL (OPTIONAL): https://www.vcuhealth.org/for-providers/education/virginia-opioid-addiction-echo/va-opioid-addiction-echo

IMPACT OF AN ADDICTION CURRICULUM ON RESIDENTS' PERCEPTION OF TREATING OUD

Maria Robles[1,3]; Marianne S. Matthias[2]. [1]IM, Eskenazi, Indianapolis, IN; [2]HSR&D, Roudebush VAMC, Indianapolis, IN; [3]Indiana University School of Medicine, Indianapolis, IN. (Control ID #3370684)

NEEDS AND OBJECTIVES: To understand the impact of a Medication Assisted Treatment (MAT) curriculum on Internal Medicine residents' perceptions of Opioid Use Disorder (OUD) and MAT

SETTING AND PARTICIPANTS: PGY2 and PGY3 internal medicine residents in an outpatient, academic, safety-net clinic

DESCRIPTION: Addiction Week provided hands-on experiences with patients receiving MAT. The curriculum included the following: didactics on addiction and buprenorphine (mostly web based), readings about addiction, direct observation of addiction counselors counseling patients receiving MAT, direct discussion with patients receiving MAT, observation of a group therapy session, and informal discussion with providers who prescribe MAT.

EVALUATION: Two themes emerged.

1) Increased understanding and empathy for patients with OUD: Residents described the value of interacting directly with patients functioning well on MAT, which helped to reduce judgment and foster empathy: "After seeing people change, successfully going through treatment, I'm less likely to brush over somebody's opiate use disorder or judge the person...." Residents gained a deeper understanding of addiction and increased appreciation for those suffering from this disease.

2) Increased confidence using MAT: Residents felt more confident to discuss addiction with patients: "I ..would probably start with a conversation about treatment with suboxone ...which is a little bit easier to do now that I've seen people going through the program."

Many residents described feeling more inclined to prescribe MAT in the future: "I feel like I found out that my role in all this could be to prescribe ... I don't think I had that perspective before this."

DISCUSSION / REFLECTION / LESSONS LEARNED: OUD is a national crisis. Although MAT is the standard of care, access is very limited. Providers may be reluctant to prescribe MAT because they lack knowledge or believe it is ineffective. Internal Medicine residents typically do not receive formal education about either OUD or MAT. After completing Addiction Week, residents described the curriculum as helping them to achieve deeper insight into addiction and treatment, which fostered greater understanding and empathy for patients with OUD. Seeing patients treated in stable outpatient settings helped to cultivate enthusiasm for MAT. This enthusiasm translated into a willingness to begin prescribing MAT. Intentions have been shown to predict future behavior; however, more research is needed to study the long-term outcomes of the curriculum.

IMPACT OF A TRAUMA-INFORMED CARE WORKSHOP ON INTERNAL MEDICINE RESIDENTS' KNOWLEDGE, ATTITUDES, AND BEHAVIORS REGARDING TRAUMA AND TRAUMA-INFORMED CARE

Deepa Ramadurai[1]; Julie Knoeckel[3]; Ellen Sarcone[3]; Roger Stace[2]; Jennifer Perlman[4]; Sarah A. Stella[3]. [1]Internal Medicine Residency Training Program, University of Colorado, Denver, CO; [2]University of Colorado Denver, Denver, CO; [3]Department of Medicine, Denver Health, Denver, CO; [4]Colorado Coalition for the Homeless, Denver, CO. (Control ID #3353855)

NEEDS AND OBJECTIVES: There is a high incidence of trauma among adult patients cared for in primary care or hospital settings. The experience of trauma has been shown to negatively impact physical, mental, and socioemotional health, limit access to health care, and reduce lifespan. Trauma-informed care (TIC) is a framework for recognizing, understanding, and acknowledging patients' experiences of trauma, which emphasizes compassion and avoidance of re-traumatization. While TIC curricula have been introduced within undergraduate medical education, implementation within Graduate Medical Education has been limited. We found no published reports describing such curricula in Internal Medicine (IM) residents.

Accordingly, we performed a pilot study to evaluate the impact of TIC training on IM residents' knowledge, attitudes and behaviors on this subject.

SETTING AND PARTICIPANTS: The TIC workshop was held during a required educational session for a subset of IM residents (PGY2 and PGY3) enrolled in the Health Equity Pathway in the University of Colorado IM Residency.

DESCRIPTION: The intervention consisted of one 3-hour workshop, led by a psychologist with expertise in TIC, and was held during a required educational session for a subset of IM residents enrolled in the Health Equity Pathway in the University of Colorado IM Residency. Fourteen residents in this pathway voluntarily completed surveys before and after participation in the workshop in order to assess the impact of the workshop on self-reported knowledge, attitudes, and behaviors. Twenty-two residents who did not participate in the workshop also completed identical surveys (control group). Survey data was collected anonymously via Qualtrics and analyzed in Excel utilizing multiple regression. This study was approved by the Colorado Multiple Institutional Review Board.

EVALUATION: Of the 14 residents completing the pre-workshop survey, 10 also completed a post- workshop survey (71% response rate). We observed a statistically significant improvement in residents' self- reported knowledge and attitudes regarding trauma and TIC ($p<0.0001$), but not in skills ($p=0.3$). The greatest change was seen in residents' perceived ability to identify various types of trauma, confidence in inquiring about traumatic experiences, and ability to identify appropriate patient resources. Nineteen of the 22 residents (86%) in the control group desired specific training on TIC.

DISCUSSION / REFLECTION / LESSONS LEARNED: TIC training is an important gap in IM residency with the majority of residents reporting desire for this training. An innovative TIC workshop influenced residents' self-reported knowledge and attitudes, but not skills related to this topic. Additional interactive sessions may be necessary in order to have residents practice skills related to implementing TIC in their clinical practice.

IMPACT OF COMPREHENSIVE CARE CLINIC (C3) ON GRADUATE MEDICAL EDUCATION

Angie Seo, Dino A. Messina. General Internal Medicine, Alpert Brown School of Medicine, Providence, RI. (Control ID #3386121)

NEEDS AND OBJECTIVES: Continuity clinic provides an opportunity for residents to care for patients in an ambulatory setting. Many of these patients are complex, high-risk, and with multiple socioeconomic challenges. This can be overwhelming for residents when they inherit a panel of clinic patients at the start of residency. Models of care similar to our Comprehensive Care Clinic (C3) can be used to help residents provide quality and personalized care for our most vulnerable patients in a complex and fragmented healthcare system.

SETTING AND PARTICIPANTS: C3 began in September 2017. High-risk patients were identified as those with poorly controlled diabetes, hypertension, or high utilizers (greater than 3 emergency room visits or 2 hospitalizations in the prior year). It was designed as a multidisciplinary visit with the attending and resident physicians, nurse care manager, pharmacist, and social worker. To date, over 200 patients and 40 residents have experienced C3.

DESCRIPTION: Our nurse care manager identifies high-risk patients and schedules hour-long C3 visits with their resident physicians during their ambulatory block. Members of the C3 team review patient charts in advance with the goal of identifying barriers to care. Once a patient arrives, attending and resident physicians introduce the C3 approach and assess the patient's goals. The pharmacist does a complete medication reconciliation, including affordability and adherence. The social worker explores social determinants of health, including living situation, income source, support systems, transportation, mood, and health confidence. A post-huddle is performed allowing the team to come up with individual, targeted interventions. The nurse care manager then shares the plan with the patient to wrap-up the visit and often checks in with him or her in between clinic visits to provide ongoing coaching and guidance.

EVALUATION: We used a 5-point Likert scale survey to evaluate resident thoughts on care of high-risk patients (n=17; 8 with C3 and 9 without C3 experience). Both groups found it overwhelming to take care of complex patients in clinic, but more C3 residents agreed that they had a good understanding of their patients' barriers to care, living situation, and health literacy. Qualitative responses indicate many enjoyed the multidisciplinary team approach and appreciated the amount of time they had with their patient.

DISCUSSION / REFLECTION / LESSONS LEARNED: Getting a comprehensive assessment of complex patients and their social determinants of health can be overwhelming and challenging as resident physicians in typical clinic sessions. C3, however, promotes team-based care, continuity, population management, care coordination, and patient-centered medical home. Its potential role in improving resident experience and curbing burnout in clinic is worth evaluating.

IMPLEMENTATION OF AN INTERPROFESSIONAL LONGITUDINAL ADDRESSING SUBSTANCE USE CURRICULUM: DESCRIPTION AND EVALUATION OF MEDICAL STUDENT PRE-CLINICAL CURRICULAR EXPERIENCES

Sandeep Kapoor[1,2]; Laura Harrison[3]; Megan O'Grady[4]; Judith M. Brenner[5]; Joseph Conigliaro[6,5]; Lauren Block[6,7]. [1]Medicine and Emergency Medicine, Northwell Health, New Hyde Park, NY; [2]Medicine, Emergency Medicine, and Science Education, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [3]SBIRT, Northwell Health, New Hyde Park, NY; [4]Health Services Research, Center on Addiction, New York, NY; [5]Medicine, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [6]Division of General Internal Medicine, Northwell Health, New Hyde Park, NY; [7]Medicine and Science Education, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY. (Control ID #3391090)

NEEDS AND OBJECTIVES: Substance use is a prevalent public health issue. Due to gaps in education and clinical training, many healthcare providers are uncomfortable addressing the topic, and few patients report discussing substance use with their healthcare providers. Screening and brief intervention (SBI) for substance use is recommended for all patients in healthcare settings. Barriers to SBI adoption include provider discomfort, lack of training and experience addressing substance use.

SETTING AND PARTICIPANTS: An iterative approach was used to build a four-year, longitudinal undergraduate curriculum at a large health system's affiliated School of Medicine; this study describes the 2017-2018 rendition of pre-clinical first and second year sessions.

DESCRIPTION: The first-year (MS1) curriculum addresses knowledge, skills and attitudes related to screening for alcohol use using the transtheoretical model of behavior change and the evidence-based Alcohol Use Disorders Identification Test (AUDIT). As an experiential component, students attend an Alcoholics Anonymous meeting and write a reflection. Assigned reading and a large group didactic session focus on the spectrum of alcohol use, health consequences of alcohol use, the importance of normalizing the topic, and universal screening across healthcare settings. Role-plays in small groups using standardized patients (SPs) allow students to practice screening skills. The session is integrated into liver physiology and pathology curriculum.

The second year (MS2) curriculum, part of the neurology unit on addiction, expands on first year skills by focusing on brief intervention and drugs. Assigned readings and a large group didactic session concentrate on interventions for patients who screen positive for drugs utilizing the evidence-based DAST-10 screening tool. To develop SBI skills, students learn and practice a brief intervention using the brief negotiated interview (BNI) framework with SBIRT faculty, health coaches, and SPs.

EVALUATION: MS1 knowledge and attitudes were assessed using pre- and post-surveys, with 1-5 Likert scale questions analyzed using paired-samples t-tests. 85 MS1 survey pairs were included in analysis. The largest increases were in confidence to screen patients for alcohol/drug problems (+1.08; $p<0.001$) and familiarity with SBIRT for substance use (+1.31; $p<0.001$). MS2 post-surveys asked four open-ended questions. Common responses included for main concepts learned were how to normalize the topic and speak to patients in a non-judgmental way. There was confusion about how to integrate the screening into a patient encounter, but incorporating screening tools was what students felt they could apply to their current roles.

The most frequent suggestion for improvement would be to have more time to practice with the SPs.

DISCUSSION / REFLECTION / LESSONS LEARNED: More experiential opportunities for students to practice skills would be beneficial. Longitudinal evaluation of the entire four-year curriculum is needed to better assess knowledge, attitudes, skills, and impact on clinical practice.

IMPLEMENTATION OF A NURSE SHADOWING EXPERIENCE FOR INTERNAL MEDICINE RESIDENTS

Robert M. Weingold[2]; Zakeih Chaker[1]; Freda White[2]; Jenna N. Sizemore[2]; Sarah Sofka[2]; Nathan Lerfald[2]. [1]Internal Medicine, West Virginia University, Morgantown, WV; [2]Medicine, West Virginia University School of Medicine, Morgantown, WV. (Control ID #3391482)

NEEDS AND OBJECTIVES: Improve quality of care and patient safety through improved interprofessional communication.

Optimize long term resident and nursing wellness through improved workplace collaboration.

Examine impact of short shadowing experience on resident and nursing attitudes.

Validate on a small scale for use with other subspecialties, in addition to longitudinal interprofessional development for residents during their later training.

SETTING AND PARTICIPANTS: Study was designed and set in a large, tertiary academic medical center in Morgantown, West Virginia. Survey participants included Internal Medicine Residents in their first year of residency training (pre n=16, post n=14) and Medical/Surgical nursing colleagues (pre n=17, post n=5).

DESCRIPTION: We implemented a nurse shadowing program among post-graduate year one Internal Medicine resident physicians to facilitate communication between healthcare team members. Residents would have one protected shadowing experience consisting of 3 hours as part of their inter-professional education curriculum. Residents observed nursing electronic medical record workflow, routine nursing evaluations, and nursing interactions with other members of the healthcare team.

EVALUATION: Both residents and nurses were offered opportunity to complete a validated survey (Jefferson Scale of Attitudes Toward Physician-Nurse Collaboration) both prior to and after completing the shadowing experience. Data were collected and analyzed for statistically significant changes as well as non- significant trends in survey response on individual questions as well as pooled results.

DISCUSSION / REFLECTION / LESSONS LEARNED: Nurses and physician attitudes were found to be significantly different before and after the nurse shadowing experience. Potential impacts as well as limitations of this survey in context of our institution were examined. Due to voluntary nature of survey and relative low number of respondents, there is insufficient power for statistical significance, but did demonstrate trend towards positive attitudes toward collaboration. This pilot intervention's resultant improvements could likely be magnified by increased exposure over various levels of training. Elucidation of future directions including longitudinal interprofessional education among residents as well as implementation in residencies outside of internal medicine would likely be beneficial. This program is easily implementable and could serve as a model for other programs.

IMPLEMENTATION OF A POINT-OF-CARE ULTRASOUND CURRICULUM AT A COMMUNITY-BASED INTERNAL MEDICINE RESIDENCY PROGRAM

Joseph Hong[1]; Andrea Porrovecchio[2]. [1]Medicine, Montefiore Medical Center, Bronx, NY; [2]Medicine, Montefiore Medical Center, Bronx, NY. (Control ID #3391240)

NEEDS AND OBJECTIVES: Point-of-care ultrasound (POCUS) training has become increasingly integrated in internal medicine residency programs. Recent professional guidelines have stressed the need for hands-on training and longitudinal exposure. However, there is significant heterogeneity in curriculum design and content for residency POCUS training. Smaller community-based residency programs may also perceive a lack in elective/training time or resources for a POCUS curriculum. Our objective was to develop an effective pilot POCUS program at a community hospital-based residency program utilizing the existing elective format.

SETTING AND PARTICIPANTS: In 2019 we developed a pilot POCUS program utilizing selected internal medicine residents on low volume consultation services. Our pilot was based at the Montefiore Medical Center Wakefield campus, which is a 345-bed community hospital in the Bronx, New York.

DESCRIPTION: Residents were grouped into three cohorts of three to four residents paired with one instructor. Prior to the start of the pilot each cohort was required to take a POCUS test of knowledge to establish a baseline for comparison. Cohorts then underwent two weeks of morning lectures on diagnostic abdominal, cardiovascular, and pulmonary ultrasound and supervised hands-on training first with a standardized model (the primary author), then on admitted patients. One week after the conclusion of the pilot each cohort then repeated the test of knowledge to assess for improvement in scores. Scores from the test of knowledge were collected anonymously through Google Survey (Google, Mountain View, CA) and analyzed in Excel (Microsoft, Redmond, WA) using a two-sample *t* test with unequal variance to compare pre- and post-elective test of knowledge scores.

EVALUATION: All residents who participated in the pilot took the initial test of knowledge. 70% of residents completed the repeat test of knowledge one week after the pilot. The average and median score on the pre-pilot test of knowledge was 63% and 60% respectively, with a score range of 44% to 84%. The average and median score after the pilot rose to 83% and 80% respectively, with a score range of 72% to 100%. The difference in average scores was statistically significant with p-value of 1.4×10^{-6}.

DISCUSSION / REFLECTION / LESSONS LEARNED: An effective POCUS teaching curriculum that does not require a significant reallocation of resources or residents is feasible in a smaller community-based residency program. A combination of small cohort size, didactics and supervised hands-on training led to a significant increase in POCUS knowledge. Challenges remain in instituting a longitudinal POCUS experience in the future.

IMPLEMENTATION OF SOCIAL DETERMINANTS OF HEALTH (SDH) CURRICULUM WITH INTERNAL MEDICINE RESIDENTS – REVIEW OF RESIDENT FEEDBACK ON TOPICS RELATED TO TRANSPORTATION, STRUCTURAL RACISM AND ADVOCACY

Mahala Schlagman[1]; Clare Park[1]; Rachel Yull[3]; Carlos Irwin Oronce[2]. [1]Internal Medicine, University of Rochester Medical Center, Rochester, NY; [2]Medicine, Greater Los Angeles VA Healthcare System / UCLA, Los Angeles, CA; [3]University of Rochester Medical Center, New York, NY. (Control ID #3390066)

NEEDS AND OBJECTIVES: Rochester, NY has the most individuals living below half the federal poverty level of any mid-sized city in the US. The University of Rochester Medical Center (URMC) Internal Medicine (IM) resident practice serves this population, providing care to 73% Medicare, Medicaid or Dual Eligible individuals. The goals of our curriculum are 1) to develop data-driven attitudes surrounding SDH and 2) to introduce resources available to address patient needs.

SETTING AND PARTICIPANTS: We developed a didactic curriculum to educate IM residents about SDH. All 69 IM residents participated in the curriculum.

DESCRIPTION: Resident responses were tallied mid-curriculum, which has previously been reported, and post-curriculum, using average Likert scales. Qualitative data was obtained through open-ended questions. Previous results demonstrated increased self-reported empathy in working with an underserved patient population and increased awareness of how cost may impact patient choices. Post-curriculum survey results focused on the 2nd half of the course which addressed transportation, structural racism and advocacy. A paired T-test was used to assess for significance comparing mid- and post-curriculum survey results.

EVALUATION: At both mid-year and post-curriculum feedback 81% (56 of 69) of residents completed a survey. Average resident comfort with addressing patient transportation needs increased from 5.7 to 6.5 on a 10-point Likert scale ($p = 0.05$), and comfort with discussing structural racism increased from 5.0 to 6.5 ($p = 0.002$). Further, 92% said they would definitely recommend the curriculum to an incoming intern. Open- ended questions asked how residents thought the curriculum would affect their practice in the future. Over half spontaneously reported a better understanding of individual needs and resources in the community. Residents also reported a more comprehensive understanding of contributors to illness, a desire to refer to community resources, and a recognition that

they have the power to advocate for their patients. One individual did note that recognizing the vast need in our community contributed to feelings of hopeless.

Another reported plans to incorporate care for the underserved into their practice as a result of the curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: The URMC SDH Curriculum for IM residents has transformed resident attitudes and beliefs surrounding barriers to care and provided residents with increased awareness of community resources. Helping residents understand historical injustice and barriers surrounding issues like transportation and primary care practice development has the potential to impact how residents view patient need and thus work as advocates for the underserved. Areas for further work include addressing the risk for hopelessness that accompanies work on SDH, incorporating a narrative on rural care, and determining whether the curriculum influences long term practice.

IMPROVING ACGME SURVEY COMPLIANCE WITH "EDUCATION NOT COMPROMISED BY EXCESSIVE RELIANCE ON NON-PHYSICIAN OBLIGATIONS" BY DECREASING INPATIENT MEDICINE CLERICAL BURDEN

Natalie Marte[1]; Leslie L. Seijo[1,2]; Daniel Steinberg[1]; Christina M. Cruz[1]. [1]Medicine, Mount Sinai Beth Israel, New York, NY; [2]Pulmonary Medicine and Critical Care, University of California, San Franciscio, San Francisco, CA. (Control ID #3392399)

NEEDS AND OBJECTIVES: 1. Identify sources of non-physician obligations that compromise education

2. Implement a discharge coordinator service on the inpatient medicine teaching service to decrease clerical burden

3. Improve compliance on the ACGME resident survey with "Education not compromised by excessive reliance on non-physician obligations"

SETTING AND PARTICIPANTS: Participants include 99 Internal Medicine residents (PGY1-3) at a University Hospital in New York City. Discharge coordination services were implemented in October 2018.

DESCRIPTION: Increased clerical burden is a well-recognized risk factor for physician burnout. As such, the ACGME Resident Survey asks residents to rate program compliance with "Education (not) compromised by excessive reliance on non-physician obligations". In multiple annual ACGME Resident Surveys our program compliance with "Education (not) compromised by excessive reliance on non-physician obligations" measured below the national average. We set out to design an intervention to address compliance with this measure. Via resident surveys, we identified discharge coordination from the Internal Medicine Inpatient Teaching Service as a source of increased work intensity, non-physician obligations and burnout. We designed and implemented a discharge coordination service as a way to decrease work intensity, improve compliance with "Education (not) compromised by excessive reliance on non-physician obligations" on the ACGME Resident Survey and decrease burnout.

The residency program managed the hiring, implementation, orientation of the discharge coordinator and orientation of residents to the intervention process. Daily communication between the residents and our discharge coordinator occurred primarily through Cureatr, a web based messaging application linked to patients records. Once discharge appointments were made the discharge coordinator entered these into the inpatient electronic health record.

EVALUATION: Pre-intervention baseline data was collected and compared to post-intervention data. Data collection occurred via well-established survey processes (ACGME Resident survey, MSBI Wellness survey and annual internal anonymous surveys via New Innovations). This project received IRB exemption.

DISCUSSION / REFLECTION / LESSONS LEARNED: 1. Compliance with "Education not compromised by excessive reliance on non-physician obligations" improved by 11% on the 2019 ACGME Resident Survey as compared to the 2018 survey, from 26% in 2018 to 37% in 2019.

2. Compliance with an "80 hour" work week improved by 11% on the 2019 ACGME Resident Survey as compared to the 2018 survey, from 82% in 2018 to 93% in 2019. During this time, we saw a decrease in residents identifying "Paperwork" as "reasons for exceeding clinical experience and educational work rules" from 18% to 10%.

3. The implementation of the discharge coordination service allowed new collaboration with discharge coordination and readmission programs.

4. Burnout Survey data analysis pending.

IMPROVING MEDICAL EDUCATION AND ACADEMIC HOSPITAL MEDICINE FACULTY DEVELOPMENT THROUGH A STRUCTURED FACULTY EXCHANGE

Amith Skandhan[2]; Krystle D. Apodaca[1]. [1]Internal Medicine, University of New Mexico, Albuquerque, NM; [2]Southeast Health Center, Dothan, AL. (Control ID #3392196)

NEEDS AND OBJECTIVES: Each academic medicine program varies resulting in distinct strengths and unique challenges in faculty development.

The quality of medical education is directly linked to faculty development. Improving the quality of medical education requires a multifaceted approach. The complex factors affecting medical education and faculty development are further complicated by geographic location, patient characteristics, and professional growth opportunities.

Overcoming these obstacles requires an innovative and collaborative approach. The authors from two institutions, with the support of a national society, researched the characteristics of individual academic hospital medicine groups (HMG) to determine if a structured faculty exchange involving physicians and nurse practitioners/physician assistants (NPs/PAs) would lead to improved medical education and faculty development through increased engagement.

SETTING AND PARTICIPANTS: University of New Mexico (UNM) is a 553-bed hospital in Albuquerque, NM, a city in the high altitude desert, with an ethnically diverse population of 545,000. UNM has a well-established internal medicine (IM) residency program, an academic hospitalist program, and an NP/PA fellowship program. UNM HMG has 26 physicians and 11 NP/PAs.

Southeast Health (SEH) is a 420-bed hospital, located in Dothan, AL, a town of 80,000 people next to the Gulf of Mexico. SEH has an affiliated medical school and an IM residency program. SEH HMG has 28 physicians and 5 NP/PAs.

Participants from each institution included physicians and NP. The visit was a week long.

DESCRIPTION:

The tailored itinerary generated collaboration and mentoring opportunities.

SEH faculty observed team rounding and met with UNM HMG leadership. Discussions included faculty education, quality improvement (QI) curriculum, and addressing practice challenges. SEH faculty also presented a QI project from their institution and established collaborative relationships.

UNM faculty observed SEH NP/PA hospitalist team models, discussed innovations, established mentor relationships with leadership, and discussed the QI projects at SEH. They also participated in women in

medicine events by providing talks on communication and interdepartmental relationships and were invited as judges for a poster competition.

EVALUATION: The evaluation process involved interviews, a survey, and the establishment of shared QI projects in mutual areas of challenge. The survey provided feedback and lessons learned.

Collaborative QI projects currently underway as a result of the exchange include paging etiquette, quality of sleep for patients, and onboarding of NPs/PAs in HMGs.

DISCUSSION / REFLECTION / LESSONS LEARNED: Support from a national society provided visibility to this innovation and expanded the professional network of participating institutions. HMG group faculty exchanges are uncommon. This initiative enhances faculty development to improve medical education. The exchange supports SGIM's mission to cultivate educators and clinicians to improve the health of patients and caregivers.

INNOVATIVE INTERACTIVE EDUCATIONAL APPROACH TO TEACH SOCIAL DETERMINANTS OF HEALTH TO FIRST YEAR MEDICAL STUDENTS

Stephanie Berger[1]; Caroline Harada[2]. [1]Pediatrics, UAB, Birmingham, AL; [2]Medicine, UAB, Birmingham, AL. (Control ID #3391096)

NEEDS AND OBJECTIVES: To address health disparities, future physicians must understand the role of social determinants of health (SDOH), but teaching SDOH can be challenging. We created a curriculum on SDOH using an authentic experience with four real myocardial infarction (MI) patients.

SETTING AND PARTICIPANTS: Participants are first year medical students enrolled in *Patient, Doctor, and Society* (PDS) course that occurs in the first weeks of medical school at the University of Alabama School of Medicine in Birmingham.

DESCRIPTION: The curriculum, *Birmingham Stories,* took place over six days. Day 1: Students participated in a poverty simulation to help sensitize them to basic SDOH. Day 2: students interviewed one of our patients, focusing on the medical history surrounding the patient's MI. The patients were selected in advance because of a common history of MI, but they differed widely in terms of background, occupation and socioeconomic status. Day 3: students met in small groups and shared their patient's medical history with their peers, such that at session end, all four patient stories were familiar to all. Day 4: students drove to their patient's neighborhood and completed a windshield survey. Students then interviewed their patient a second time, this time focusing on how life and social circumstances may affected their health, health outcomes, and self-care. Day 5: Students gave formal presentations about their patient to their small groups, with a focus on SDOH. Group discussion followed each presentation, highlighting and reinforcing the role of SDOH. Day 6: group debriefed the experience and written reflections on SDOH were due.

EVALUATION: End of course evaluations were reviewed; with a 92% response rate, 95.6% of students agreed or strongly agreed that the experience was effective for learning. Of the 16 experiences in the overall PDS course, the 3 components of *Birmingham Stories* ranked 2nd, 3rd & 6th highest. Common themes from analysis of the written reflections were "realness", "seeing first hand", "student safety" and "appreciation for SDOH."

DISCUSSION / REFLECTION / LESSONS LEARNED: The curriculum design optimized the student's experience allowing for a deeper appreciation of SDOH as students compared and contrasted their patient's story to that of their peers. The windshield survey experience was profound as the students were able to understand the environmental factors affecting their patient. Student safety was a concern throughout the course, and raised unexpected responses from students.

INTEGRATING A MUSCULOSKELETAL SUBSPECIALTY CLINIC INTO AMBULATORY ROTATIONS

Mayce Mansour, Emily Carroll. Internal Medicine, Icahn School of Medicine at Mount Sinai, Brooklyn, NY. (Control ID #3391616)

NEEDS AND OBJECTIVES: Primary care patients are often referred to specialists for diagnosis and management of musculoskeletal (MSK) concerns due to limited time in a primary care visit, limited procedural support, increased patient complexity, and primary care physician (PMD) lack of training. We have integrated an internal referral MSK clinic as part of our intern (PGY1) ambulatory curriculum in order to address long wait times for patients and improve resident comfort with MSK concerns.

SETTING AND PARTICIPANTS: PGY1s at Mount Sinai Hospital in East Harlem, New York rotate in a hospital-based practice primary care practice, serving a majority Medicaid-insured patient population. During their ambulatory rotation block every six weeks, PGY1s have one 2.5 hr MSK clinic session in which they have a 30-minute didactic followed by patient encounters. The clinic is precepted by a chief resident, a rehab-trained physician and a general internist.

DESCRIPTION: While patient wait times for our rehabilitation and orthopedic specialists routinely range from 3-6 months, wait times for this clinic are often 1-2 weeks. Patients are referred to MSK clinic via our EMR. As this is an internal clinic, our front desk staff can make these appointments without coordination with other departments. Prior to seeing patients in MSK clinic, residents receive six 30-minute didactic sessions consisting of: 1. General approach to MSK evaluation, 2. Knee exam, 3. Shoulder exam, 4. Knee injections, 5. Shoulder injections, 6. Jeopardy-format game.

EVALUATION: Due to feedback that PGY1s received variable exposure via patient evaluations, we introduced the six 30-minute didactic sessions. As a result of this curriculum being introduced, resident satisfaction scores increased by approximately 0.9 points on a 5 point likert scale (from 3.5 to 4.4). The clinic structure did not otherwise change during that time.

DISCUSSION / REFLECTION / LESSONS LEARNED:

Evaluation of MSK concerns is important for general internists. Despite a majority of our residents having received MSK teaching during medical school, the still cited lack of time and lack of knowledge as major barriers to addressing MSK concerns. Our MSK clinic addressed time by allowing PGY1s to complete a focused history and physical related to knee and shoulder concerns only. It addresses knowledge by dedicated teaching of exam and joint injections. Initially, our approach was to allow patient experiences guide resident teaching; we were given feedback that this led to sporadic learning due to inconsistent exposure. In order to address this limitation, a hands-on, interactive didactic series was developed to create a more uniform exposure for all residents, fill in knowledge gaps, and prime learners for their patient evaluations.

As a result of this intervention, resident satisfaction with our MSK clinic improved by approximately 1 point out of a 5 point scale. This addition did not require additional resources, and did not impact patient care with respect to patient volume or wait-time access to the clinic.

INTELLIGENCE MINDSET AND PERFORMANCE ON THE INTERNAL MEDICINE RESIDENT IN-TRAINING EXAMINATION: A RETROSPECTIVE OBSERVATIONAL STUDY

Stephen Fuest[1]; Justin Chen[1]; Angela Fink[2]; Regina F. Frey[3]; Patricia Kao[1]. [1]Internal Medicine, Washington University School of Medicine in St. Louis, Saint Louis, MO; [2]CIRCLE, Washington University in St. Louis, St. Louis, MO; [3]Chemistry; Center for Integrative Research on Cognition, Learning, and Education, Washington University in St. Louis, St. Louis, MO. (Control ID #3344378)

NEEDS AND OBJECTIVES: Carol Dweck's Theory of Intelligence describes the concept of a growth versus a fixed mindset. Learners with a growth mindset characterize intelligence as being malleable and modifiable through effective practice. Those with a fixed mindset view intelligence as being pre-determined and immutable. Published studies show learners with a growth mindset have a tendency towards higher grades and performance in STEM courses. Only three prior known studies have examined intelligence mindset in a Graduate Medical Education (GME) population. To our knowledge, no studies have been published that have explored the relationship between intelligence mindset and objective measures of GME performance. The goal of this study was to determine if having a growth mindset during Internal Medicine residency training correlates with higher performance on the Internal Medicine In-Training Examination (IM- ITE).

SETTING AND PARTICIPANTS: All categorical internal medicine residents at Washington University in St. Louis/Barnes-Jewish Hospital were invited to participate in this study during the 2018 to 2019 academic year.

DESCRIPTION: Intelligence mindset was assessed with the validated Theories of Intelligence Scale.

Demographics collected included PGY status, sex, race, and marital status. Statistical analysis for demographics used two-sample t-test for continuous variables and Chi-square test for dichotomous variables. IM-ITE percentile scores were directly reported to the residency program and made available for research purposes by resident consent. Analysis of IM-ITE percentile association with intelligence mindset was performed with simple correlations and t-test.

EVALUATION: 44 residents consented to participate in this study. 14 were female and 28 male. PGY-1 residents composed 23 of the total, with the remaining 21 being split between PGY-2 and PGY-3 residents.

Overall 10 had a fixed mindset, 5 were indeterminate, and 29 a growth mindset.

The association between intelligence mindset and gender, PGY status, URM status, or marital status did not achieve statistical significance. When using mindset as a categorical variable there was a non-significant interaction between mindset and IM-ITE ($t(37) = 0.09$, $p = 0.93$). There was a trend towards growth mindset having a positive effect on women's IM-ITE performance and a negative effect on men's ITE performance. A secondary outcome of the study was that gender was found to be associated with IM-ITE percentile, while other demographics were not associated.

DISCUSSION / REFLECTION / LESSONS LEARNED: In an Internal Medicine resident population there was no association between mindset and IM-ITE performance. A trend between gender, mindset, and IM-ITE performance appeared and is a possible area of future study. IM-ITE scores evaluates a specific set of medical knowledge and has limits as a measure of knowledge competence. Further studies are needed to evaluate correlation of intelligence mindset with other core competency domains.

INTER-INTERVIEWER INDEX: A NOVEL INTERVIEWER BIAS TOOL FOR MEDICAL SCHOOL ADMISSIONS

Jon A. Torres[2]; Melody Carroll[2]; Rachael Tan[2]; Ian Carroll[2]; Nichole G. Zehnder[1]. [1]Department of Medicine, University of Colorado School of Medicine, Aurora, CO; [2]School of Medicine, University of Colorado, Aurora, CO. (Control ID #3392452)

NEEDS AND OBJECTIVES: Making the admissions process more equitable can lead to improved outcomes. Frequently, admissions committee members know little about the bias and tendencies of interviewers and the recommendations they submit. By providing real-time quantification of inter-interviewer variance to admissions committees, we aim to provide better context for the recommendations made by interviewers provided improved equity for applicants.

SETTING AND PARTICIPANTS: At the University of Colorado School of Medicine, interviewers interact with applicants across different settings including a group exercise, group interview, and individual interview, then provide ratings of "fit" between the applicant and the CUSOM to the Admissions Committee. 94 interviewers and 3,930 recommendations from the '18-19 application cycle were analyzed. This is a Colorado Multiple Institution Review Board certified exempt study.

DESCRIPTION: Interviews are utilized to evaluate applicants to medical schools all across the country. By design, admissions committees rely on the interpretations and final recommendations of interviewers. However, while interviewers are given a basic framework to conduct the interview their interpretations and logic for final recommendations are not standardized and can lead to significant inter-interviewer variability. While variability may promote diversity of thought, it may also invite interviewer bias to give certain recommendations more frequently compared to other interviewers. We propose a standardized metric of real-time informativeness, leniency, and harshness: The Interviewer Index.

EVALUATION: Interviewers can normally give ratings of either Strong Agree (SA), Agree (A), Neutral (N), Disagree (D), and Strong Disagree (SD). Using retrospective rater data, we calculated baseline measurements of interviewer leniency/harshness and informativeness. All Interviewer recommendations were analyzed via several statistical models including a mixed-effects linear, an ordinal logistic regression, and a unidimensional Item Response Theory model with graded responses. Estimates of interviewer ability were obtained from posterior distributions of ability for each subject. Item response curves were created to evaluate rater informativeness.

DISCUSSION / REFLECTION / LESSONS LEARNED: Interviewer recommendations can vary substantially. The Interviewer Index proposes a method of quantifying inter-interviewer variance allowing admissions committees to put interview recommendations into better context and provide more holistic admissions decisions.

INTERPROFESSIONAL EDUCATION THROUGH HEALTHCARE HOTSPOTTING: UNDERSTANDING SOCIAL DETERMINANTS OF HEALTH AND MASTERING COMPLEX CARE THROUGH TEAMWORK

Iris S. Cheng[1,2]; Dulce Mange[3,4]. [1]Internal Medicine, University of North Carolina School of Medicine Charlotte Campus, Charlotte, NC; [2]Internal Medicine, Atrium Health, Charlotte, NC; [3]Social Work/ Medical Education, Atrium Health, Charlotte, NC; [4]Social Work, University of North Carolina Charlotte, Charlotte, NC. (Control ID #3391968)

NEEDS AND OBJECTIVES: Healthcare systems continue to explore novel models to care for the most socially and medically complex patients who account for a disproportionately large percentage of medical services and costs. We developed a curriculum for interprofessional (IP) student teams to learn about caring for the most complex patients of a large, urban healthcare system while developing skills in collaborative care. Our six month program includes learning about topics relevant to complex care including the social determinants of health (SDOH) and teamwork. Clinical care experiences take place within our health system and in our patients' homes or community. Our students also learn to serve as patient advocates and agents of change.

SETTING AND PARTICIPANTS: We developed our program at the flagship hospital of a large healthcare system in Charlotte, NC. Our program involves prelicensure students from medicine, nursing, social work, pharmacy, advanced clinical practice (NP and PA) and health

psychology from various regional institutions. After identifying the neediest patients of our health system, we created IP student teams to care for them.

DESCRIPTION: We developed a 6-month program involving meetings twice a month which include interactive discussions and time for teamwork. Our first session introduces healthcare hotspotting and a video of the work of Jeffrey Brenner, the visionary who introduced this concept. Subsequent sessions focus on SDOH screening methods and tools, building interprofessional teams, geographic information systems (GIS) mapping to learn about health as a reflection of place, trauma informed care, implicit bias, poverty simulation and other topics.

EVALUATION: We developed a survey to assess the student experience including improved knowledge about the SDOH. The questions were answered on a 5 point Likert Scale. We also developed open ended questions for feedback about our program.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our program resulted in our students developing skills to work on IP teams and learn ways to care for complex patients. Team members were engaged in addressing SDOH of their patients. Our students learned that addressing non-medical needs was often more impactful on health outcomes than simply addressing medical concerns. Allowing these students to understand the patients' lived experiences helped them understand the need to individualize treatment. In nearly every case, our patients saw reduced healthcare utilization and cost.

The students also learned how to advocate for their patients while also innovating around new methods of chronic care through home visits. Attending national webinars allowed students to recognize common themes of complex patients (i.e. housing or food insecurity, unemployment, low health literacy) whether these patients resided in Boston, Oakland, Philadelphia or Charlotte.

In our fifth year, we are enlisting the expertise of a graduate program in public health to do a more formal assessment of our program using validated questionaires and focus groups.

INTERPROFESSIONAL EDUCATION THROUGH THE LENS OF MOTIVATIONAL INTERVIEWING: A SESSION FOR SECOND-YEAR MEDICAL AND SOCIAL WORK STUDENTS

Jennifer P. Weintraub[1]; Beverly Forsyth[2]; Emma Sollars[3]; Nancy Xenakis[3]. [1]Internal Medicine, Icahn School of Medicine at Mount Sinai, New York, NY; [2]Infectious Diseases, Icahn School of Medicine at Mount Sinai, New York, NY; [3]Social Work, Mount Sinai Hospital, New York, NY. (Control ID #3388545)

NEEDS AND OBJECTIVES: As we enter the next decade of medical practice, an emphasis on team-based interprofessional practice (IPP) is at the forefront. The question is: how do we prepare medical students to function effectively in an interprofessional setting? The Liaison Committee for Medical Education (LCME) accreditation standard now requires that medical schools provide a core curriculum to prepare medical students to function on interprofessional teams. Our IPE session was developed for medical and social work students to: 1. Identify and describe the unique roles of physicians and social workers in an interprofessional team; 2. Recognize the use of patient-centered language common to all team members; 3. Discuss aspects of IPP during a standardized motivational interviewing case.

SETTING AND PARTICIPANTS: We created a two-hour IPE session during the second-year doctoring course at the Icahn School of Medicine at Mount Sinai. 140 second-year medical students and 28 second-year social work students participated. The students were divided into four classrooms running simultaneously. Each room was further subdivided into groups of approximately 10 medical and 2 social work students to promote deeper interprofessional collaboration.

DESCRIPTION: The session was co-developed and co-facilitated by physician and social work faculty. A scenario between a physician, social worker, and standardized patient was utilized to demonstrate IPP via discharge planning and motivational interviewing. The facilitators used "time-outs" to focus on: communication and motivational interviewing skills, the individual but overlapping roles of social workers and physicians, and nuances of IPP. During "time-outs," students worked in their smaller groups to respond to discussion questions and then shared key learnings with the larger group.

EVALUATION: 121 students (97 medical, 24 social work) completed electronic surveys after the session.

76% felt that IPE sessions enhanced their future ability to work on interprofessional teams, and 74% felt that working with students from other health professions enhanced their education. A theme from the written comments was that students wished there was more time to learn about the other profession's training and roles.

DISCUSSION / REFLECTION / LESSONS LEARNED: Most students felt that IPE sessions will improve their ability to function on interprofessional teams. We learned that an effective IPE session must allow time for students from different disciplines to learn about one another's training and roles, and we will build in time for this in future sessions. A longitudinal component to the curriculum may be useful as students enter their clinical years and begin to work in interprofessional teams.

INTERPROFESSIONAL SYMPOSIUM ON CONTROVERSIES AND BEST PRACTICES IN PAIN MEDICINE

Robert Duarte[3,4]; Yili Huang[3,4]; Stephen Butkus[5]; Laura Harrison[5]; Joseph Conigliaro[6,4]; Jay Enden[7,4]; Sandeep Kapoor[1,2]. [1]Medicine and Emergency Medicine, Northwell Health, New Hyde Park, NY; [2]Medicine, Emergency Medicine, and Science Education, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [3]Pain Management, Northwell Health, New Hyde Park, NY; [4]Medicine, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY; [5]SBIRT, Northwell Health, New Hyde Park, NY; [6]Division of General Internal Medicine, Northwell Health, New Hyde Park, NY; [7]Medicine, Northwell Health, Bay Shore, NY. (Control ID #3391121)

NEEDS AND OBJECTIVES: Acute and chronic non-cancer pain are among the most common presenting symptoms to healthcare clinicians, yet there are an insufficient number of pain management specialists. The Department of Health and Human Services estimates pain costs the United States $560 to $635 billion annually, and that improving education on pain and treatment for patients, caregivers, and providers is needed to enhance care. An interprofessional symposium on the controversies and best practices in pain medicine was developed to provide continuing education on the multidisciplinary aspects of pain management for the healthcare team. Objectives were to explore non-opioid therapies and dissect and discuss guidelines for evidence-based judicious opioid prescribing.

SETTING AND PARTICIPANTS: The symposium was hosted at a flagship teaching hospital, and attended by 39 participants, including physicians, physician assistants, nurse practitioners, and pharmacists. Attendees represented multiple departments, including neurology, pain management, internal medicine, emergency medicine, anesthesia, and quality.

DESCRIPTION: A group of key interprofessional and multidisciplinary stakeholders designed a three hour symposium. Weekly planning calls allowed presenters to define learning objectives and coordinate messaging. Content included case discussions of inpatient, outpatient, and cancer pain management, and a complex pain management debate.

EVALUATION: Attitudes and knowledge were assessed using pre- and post-session surveys; 27 (69%) participants were included in analysis.

Likert-scale questions were analyzed using paired samples t-tests. On a scale of 1 (strongly disagree) to 5 (strongly agree), participants reported a 0.44 point increase in understanding of pain management ($p<0.001$), a 0.78 point increase in having enough information to manage chronic pain ($p=0.002$) and a 0.85 point increase in having enough information to manage cancer pain ($p=0.003$). 84% indicated they planned to make changes in their clinical practice, including use of pain contracts, increased use of adjuvants, a multi-modal approach, and titrating up the dose of gabapentin. Reported barriers included patient perceptions and limited access to pain management specialists.

DISCUSSION / REFLECTION / LESSONS LEARNED: There is both need and opportunity for education around evidence-based pain management strategies and innovative approaches clinicians can integrate into usual practice. Education on pain management techniques, judicious opioid prescribing guidelines, and managing complex patients is beneficial across all professions and departments. The symposium provided a platform for interdepartmental networking, allowing clinicians to share similar experiences and challenges.

INTERPROFESSIONAL VIRTUAL REALITY TRAINING TO ADDRESS SOCIAL DETERMINANTS OF HEALTH IN THE CLINICAL SETTING

Pablo Buitron de la Vega[1]; Aliza Stern[2]; Noelle Dimitri[3]; Priya S. Garg[4]; Heather Miselis[5]; Suzanne Mitchell[5]; Suzanne Sarfaty[7]; Stephanie Losi[6]; Thea James[8]; Linda Sprague Martinez[9]. [1]General Internal Medicine, Boston Medical Center / Boston University School of Medicine, Boston, MA; [2]Physician Assistant Program, Boston Medical Center / Boston University School of Medicine, Boston, MA; [3]Boston University School of Social Work, Boston, MA; [4]Pediatrics, Boston University School of Medicine, Boston, MA; [5]Family Medicine, Boston Medical Center / Boston University School of Medicine, Boston, MA; [6]Boston Medical Center, Boston, MA; [7]Boston University School of Medicine, Boston, MA; [8]Emergency Medicine, Boston Medical Center, Cambridge, MA; [9]Macro Department, Boston University School of Social Work, Boston, AL. (Control ID #3389353)

NEEDS AND OBJECTIVES: Define social determinants of health (SDH) and discuss resources needed to address them

Identify roles and responsibilities of physician assistants, physicians, and social workers in addressing SDH Demonstrate interprofessional collaboration skills needed to address patients with adverse SDH

SETTING AND PARTICIPANTS: Voluntary second year social work students (N=7), second year medical students (N=5) and first year physician assistant students (N=3) at Boston University

DESCRIPTION: SDH account for up to 70% of variation in health outcomes. Physician assistant (PA) and medical students (MS) are often not equipped to address SDH and some believe that SDH are beyond their scope of practice. Social work students (SW), on the other hand, are trained explicitly to address SDH in addition to medical conditions, spanning health care delivery settings and the broader community. We believe that it is critical for emerging health professionals to have the necessary tools to identify and mitigate SDH using a collaborative interdisciplinary approach. We aimed to improve the knowledge skills and attitudes of health professional students in addressing SDH by using a virtual reality (VR) simulated learning experience (SLE).

In preparation for the VR SLE, 15 students attended 3 web-based video conferences to learn about health equity, team-based models of care and tools to address SDH in the clinical setting. Subsequently, they will participate in a VR SLE where student dyads (a MS or PA with a SW) collaborate to address a patient's SDH. The SLE starts with the MS/PA using a VR headset to enter a virtual hospital room where they practice exploring a patient's SDH. The patient role is played by a faculty. Subsequently, the MS/PA moves to a different VR room where they consult the SW to find SDH resources. Finally, the MS/PA and SW go back to the patient's room to provide information about resources.

EVALUATION: Students completed a pre and post test about knowledge, skills, and attitudes towards addressing SDH. The interprofessional collaborative competencies attainment survey is part of the post test. Students will participate in focus groups to explore their experiences with VR SLE. ANOVA will be used to analyze quantitative aggregated data for the three student groups. The qualitative data will be coded, analyzed and summarized. All students have completed the web based conferences and will complete the VR SLE and evaluation by January 27th 2020.

DISCUSSION / REFLECTION / LESSONS LEARNED: Adequately addressing SDH in the clinical setting is critical to improve health outcomes and reduce health care costs. Health professional training programs need to equip students with skills to address SDH by developing learning experiences that mirror the interdisciplinary nature of our current healthcare system. Web based video conferencing and virtual reality learning scenarios can be used as tools to create engaging, real life experiences where students can practice collaborative problem solving and identify the expertise of the other disciplines when addressing SDH.

INTRODUCTION TO MEDICAL EQUIPMENT CURRICULUM

Aula Ramo[1]; Joshua D. Collins[2]; Chaun Gandolfo[1]. [1]Internal Medicine, Henry Ford Hospital, Detroit, MI; [2]Internal Medicine, Henry Ford Hospital, Detroit, MI. (Control ID #3386783)

NEEDS AND OBJECTIVES: As it stands, there is a lack of a standardized introduction to medical equipment for medical students at our institution. This highlights a gap in achieving Liaison Committee on Medical Education (LCME) learning objectives including educating medical students about the role of medical equipment in patient safety and a lost opportunity to practice critical thinking in the interprofessional setting. We sought to design, implement, and assess the efficacy of an Introduction to Medical Equipment Curriculum in achieving the objectives of increasing medical students' knowledge, increasing comfort level with medical equipment, and increasing ability to apply knowledge to patient plan and disposition.

SETTING AND PARTICIPANTS: An interactive, image-based lecture was delivered to each group of third-year medical students in the first week of their internal medicine clerkship. The lecture discussed common equipment (types of venous access, oxygenation, catheters, etc), focusing on indications, contraindications, and the potential effect on patient plans and disposition.

DESCRIPTION: Students were surveyed with Likert scale-based survey ranging from 1 to 5 before the lecture (T1), immediately after the lecture (T2), and at the end of the clerkship (T3) to assess their perceived knowledge level, perception of being overwhelmed upon entering a patient room, and their ability to identify the role of medical equipment in patient plan and disposition. One hundred and ten medical students were surveys with 79 completing the pre-survey, 70 completing the immediate post-survey, and 45 completing the post-clerkship survey. Fixed effects regressions were used to compare how responses varied at the three different time points.

EVALUATION: On average, the individual student improved by 1.70 points in their perceived knowledge, decreased perception of feeling overwhelmed by 1.00 point, and improved ability to identify the role of equipment in patient plans and disposition by 1.00 point from T1 to T2 ($p<0.001$). Self-reports increased significantly from time 1 to time 2 and did not change by a statistically significant amount from time 2 to time 3.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our project suggests the utility of delivering a curriculum to introduce medical equipment to medical students. It appears to increased their knowledge level,

improve their comfort level, and allows them to integrate their knowledge with practical medical decisions regarding patient plans and disposition.

ONLINE RESOURCE URL (OPTIONAL): https://drive.google.com/file/d/1QZmQP1l-AiWpXwQOZ9eHwvVmJFPCegUG/view?usp=drive_web

LEADING WITH INTENT: CREATING A LEADERSHIP CURRICULUM FOR PRIMARY CARE RESIDENTS

Catherine Burke[1]; Katherine Julian[2]. [1]Department of Medicine, University of California, San Francisco, San Francisco, CA; [2]Medicine, UCSF, San Francisco, CA. (Control ID #3392264)

NEEDS AND OBJECTIVES: Physicians regularly adopt leadership roles despite receiving limited formal leadership training, causing many physicians to identify as "accidental leaders." Although physicians may passively develop leadership skills during residency, the results can be varied and ineffective. It is imperative that internal medicine residency training incorporates intentional leadership development into its curriculum in order for early physicians to flourish in modern clinical settings. In the rapidly evolving setting of outpatient medicine, deliberate leadership development in future primary care physicians could allow for more rapid and effective innovation and utilization of resources. We conducted a needs assessment of primary care internal medicine residents to understand their leadership experiences and gaps in their leadership development. We will then develop a longitudinal leadership curriculum for UCSF Primary Care (UCPC) Internal Medicine residents.

SETTING AND PARTICIPANTS: The leadership needs assessment was conducted with 30 UCPC residents across three years of training, spanning ages 25-40. Resident outpatient training occurs at the University-based clinic, and residents are split into three cohorts (all first-year residents together, and two groups of mixed second- and third-year residents) that spend alternating months in the outpatient setting.

DESCRIPTION: Using a survey adapted from a validated tool from Harvard University, data was collected from UCPC residents to determine gaps in leadership skills to inform the design of a leadership curriculum. "Authentic leadership" theory was utilized to guide trainees through reflection of personal strengths, weaknesses, and goals and allow for individual and honest leadership styles to emerge. Based on survey data, the leadership curriculum will focus on topics such as relationship-building, adaptation, mentoring, conflict resolution, and career development. These sessions will align with the needs of residents in various stages of training.

EVALUATION: The survey data will directly inform the design of a leadership curriculum for UCPC residents. Each session within the curriculum will include pre-survey and post-survey data collection in order to tailor the curriculum to the current needs of residents and ensure that objectives are met.

DISCUSSION / REFLECTION / LESSONS LEARNED: Calls for formalized leadership training in medical education have been made for several decades, though only in the last 10 years have efforts toward developing physician-targeted leadership curricula increased. Existing educational interventions are varied in regard to their target audience, definition of leadership, and evaluation methods. Many existing interventions lack an explicit grounding in leadership theory, and focus on skill-based teaching rather than holistic leadership development. With a clear understanding of learners' needs and use of the authentic leadership framework, UCPC graduates will be poised to enter the workforce with core qualities and skills required of modern-day physician-leaders.

LEARNER PERCEPTIONS OF A NOVEL APPROACH TO CHIEF RESIDENT-LED JOURNAL CLUB IN THE ERA OF CLINICAL PRACTICE GUIDELINES

Brian W. Locke, Josephine Wright, Marja Anton, Sonja Raaum, Caroline Milne. Internal Medicine,

University of Utah, Salt Lake City, UT. (Control ID #3390560)

NEEDS AND OBJECTIVES: Journal club is a long-standing method of teaching critical appraisal in graduate medical education where trainees and faculty meet to discuss a scientific article. However, escalating statistical complexity, accelerating pace of study publication, and increasing reliance on clinical practice guidelines (CPGs) led us to question the effectiveness of the traditional journal club format. We share trainee perceptions of a redesigned Chief Medical Resident (CMR)-led outpatient journal club intended to provide residents the skills and knowledge to navigate the modern landscape of medical literature.

SETTING AND PARTICIPANTS: Our medium-sized academic internal medicine residency has a weekly, 45-minute journal club that is led by a CMR and attended by all housestaff on ambulatory medicine rotations.

DESCRIPTION: Four changes were implemented: a patient vignette is chosen to frame the discussion of a clinical practice guideline (CPG) and a supporting piece of primary literature; two housestaff each use a critical appraisal worksheet to evaluate and present the article and CPG; study design-specific facilitator's guides were created to help prepare teaching points; and the same topic is repeated for each +1 cohort. An example topic might be a case involving a patient with 10-year risk of atherosclerotic cardiovascular disease of 7.4% but preference against statins, the 2018 ACC/AHA lipid management guideline, and a cohort study on outcomes after coronary artery calcium scoring.

EVALUATION: Five months after implementation, an anonymous e-mail survey was distributed to 48 eligible PGY2-3 residents who had attended both formats of journal club. 14 responded. Residents rated the relative effectiveness in each learning domain on a continuous scale from -5 (markedly worse with new curriculum) to 5 (markedly improved), with 0 indicating no difference.

In each of the 3 knowledge/skill domains (Biostatistics, Appraisal of Primary Articles, Interpretation, and Application of CPGs), residents favored the new curriculum (mean 0.9±2.4 std dev, 2.0±2.3, 3.7±1.3, respectively). Interest in EBM improved (2.7±1.5), as well as development of habits to stay up-to-date (2.2±2.2). Enjoyment of sessions (3.3 ±1.5), assessment of the value of time spent (3.3±1.7), and overall impression (2.9±1.6) ratings also favored the new format.

DISCUSSION / REFLECTION / LESSONS LEARNED: Resident ratings improved across all domains. The most novel change is selection of an illustrative patient scenario and CPG to accompany an article. This refocuses discussions on external validity, inferences supported by study findings, and assessment of parameters influencing whether a recommendation should be followed in a given case. These tasks emulate the application of evidence at the bedside, which may explain why the largest improvements were seen in knowledge relating to CPGs, enjoyment of sessions, and the value of time spent on journal club.

LEARNING ABOUT SOCIAL DETERMINANTS OF HEALTH BY WALKING IN THE PATIENTS' SHOES: INSIGHTS FROM AN URBAN NEIGHBORHOOD TOUR FOR RESIDENTS

Iniya Rajendran[1]; Davis N. Bradford[1]; Lindsay B. Demers[2]; Jennifer Siegel[1]. [1]Internal Medicine, Boston Medical Center, Boston, MA; [2]Medicine, Boston University, Boston, MA. (Control ID #3391801)

NEEDS AND OBJECTIVES: Neighborhoods in which individuals live have a major impact on health. Though residents indirectly learn about social and environmental obstacles from their patients, residents rarely witness how navigating these unfold in their patients' lives. To address this need, we developed a neighborhood walking tour where residents visited various community sites to more directly discover some of the health challenges in our own backyard

SETTING AND PARTICIPANTS: This tour was conducted around Boston Medical Center, New England's largest safety-net hospital, predominantly serving patients from underserved populations. The participants of the tour were first year internal medicine residents (n = 42).

DESCRIPTION: The tour was part of a mandatory academic half-day during the fall of 2018. An introductory didactic session included a brief history of the neighborhood, a description of local services for the homeless, and an introduction to harm reduction principles. As our neighborhood's story has been integrally tied to the addiction epidemic, the second half of the didactic session focused on harm reduction strategies for patients who inject drugs (PWID). With this foundation, residents then visited the Boston Health Care for the Homeless Program's medical respite facility, a local homeless shelter, and our hospital's preventive food pantry.

EVALUATION: The program was evaluated using pre- and post-surveys consisting of 15 items. There were five Likert-type items on awareness of resources and comfort withcounseling patients affected by some of the social determinants of health (SDOH) discussed. The other 10 items were short-answer knowledge questions on the content from both the didactic and tour session. A few examples of knowledge questions include location of methadone clinics, safe injection use strategies, and eligibility for medical respite. We saw a statistically significant improvement in all but 5 knowledge questions. Notably, residents scored fairly high at baseline on these items, thus it is possible that there was a ceiling effect given that these are common issues that arise within our patient population

DISCUSSION / REFLECTION / LESSONS LEARNED: Our results showed increases in resident awareness of resources related to housing instability and substance use disorders and in resident self-efficacy with harm reduction counseling. To achieve resident engagement on complicated topics such as SDOH, innovative educational practices are required, and we believe that the neighborhood tour benefited residents who have never practiced in an urban setting. Although we only chose to study improvement in knowledge, we believe that exposure to the community, through foot, has better equipped the residents to practice socially competent medicine. Our limitations include small sample size, lack of validated instruments and high baseline knowledge.

LEARNING CARE IN THE NEIGHBORHOOD: COMMUNITY-ENGAGED CURRICULUM DEVELOPMENT OF A REQUIRED COMMUNITY ENGAGEMENT ROTATION

Elizabeth P. Griffiths[1]; Naomi Chapman[1]; Lynda Boyer-Chu[2]; Patty Caplan[3]; Sam Dennison[4]; LaSaundra Owens[5]; Devi Beck-Pancer[1]; Roxana Garcia[1]; Naomi Wortis[6]. [1]Medicine, UCSF, Sacramento, CA; [2]San Francisco Unified School District, San Francisco, CA; [3]Mission Neighborhood Health Center, San Francisco, CA; [4]Faithful Fools, San Francisco, CA; [5]YMCA, San Francisco, CA; [6]Family & Community Medicine, UCSF, San Francisco, CA. (Control ID #3388420)

NEEDS AND OBJECTIVES: Prior surveys of UCSF medical students highlight a need for more robust education and opportunities in community engagement and advocacy. We sought to design a required fourth-year medical student community engagement rotation (CER) with students and community partners, in order to locate learning in the community, ensure mutual benefit, and build trust for future collaboration.

SETTING AND PARTICIPANTS: The CER will begin as a small pilot in February 2020 and expand to a larger pilot in the 2020-21 academic year before becoming a required course for fourth year medical students in 2021-22. We created a working group, including four community partners and two students, which meets monthly for a half-day to guide design of the new rotation.

DESCRIPTION: In 2016, UCSF School of Medicine launched a new curriculum, which will include a required CER. To design a service learning rotation that serves communities and medical students, it is imperative that community partners and students are engaged in the curriculum development process. The working group has designed a four-week rotation in which students spend the majority of the time working with community partners on a project as well as providing interdisciplinary clinical care. The rotation also includes weekly group engaged learning sessions.

EVALUATION: Evaluation of the pilot will include surveys and focus groups with students and community partners. Goals of the evaluation include: (1) determining if the goals of the CER experience were met, (2) exploring student and community partner perceptions of the course, and (3) collecting educational continuous quality improvement data to assess benefits and ways to improve for the required rotation.

DISCUSSION / REFLECTION / LESSONS LEARNED: Community-engaged curriculum development is unusual in medical education, and community partners are rarely compensated for their valuable time. This curriculum development process is designed to amplify the voices of those who live the consequences of health disparities, but this remains difficult given longstanding assumptions about who is an expert. Additionally, community partners and students who choose to join the working group or participate in the pilot may have different perspectives from other members of their respective groups.

LEARNING THEORY VS. PRACTICE: HOW DO INTERNAL MEDICINE RESIDENTS STUDY?

Priyanka Majety[1]; Yazan Daaboul[1]; Alexander Rabin[1]; Joseph Rencic[2]. [1]Internal Medicine, Tufts Medical Center, Boston, MA; [2]IM, Tufts Medical Center, Boston, MA. (Control ID #3342921)

NEEDS AND OBJECTIVES: Learners in high-performing settings such as residency training are presumed to have the learning skills needed to be successful. Currently, there is no standardized curriculum to teach learning principles during medical training. Understanding the study habits of residents may improve study habits and improve board preparation. Our aim was to evaluate the study habits of Internal Medicine (IM) residents to better understand how they apply key learning theories for the American Board of Internal Medicine (ABIM) exam preparation.

SETTING AND PARTICIPANTS: The study was performed at Tufts Medical Center in Boston, Massachusetts. Following IRB approval, all 75 IM residents were approached via e-mail and were asked to complete a curriculum survey.

DESCRIPTION: The survey included 12 questions on IM resident study habits for the ABIM exam. Data were collected on demographics [gender, post-graduate year (PGY), USMLE Step 2 CK score range], perceived level of preparedness, confidence in test-taking, resources used to study, application of spaced learning, interleaving and retrieval practices. Likert scales were used where applicable.

EVALUATION: Of 75 residents, 69 (92%) responded to the survey and 34 (49%) were males. Question banks (90%) were the most frequently used study resource followed by textbooks (37%) and online videos (31%). Most residents (68%) started studying at least 3 months prior to the exam. A majority (61%) of the residents felt they were "not at all prepared" for the exam; the proportion of these residents decreased with

increasing levels of training (84% of PGY1 residents, 65% of PGY2 residents and 33% of PGY 3 residents). Of the respondents, 46 (69%) applied spaced learning, 44 (64%) applied interleaving, 44 (66%) applied retrieval, and 32 (48%) residents applied elaboration practices for exam preparation. There was a significant association between USMLE Step 2 CK score and use of the elaboration technique (p=0.017), but not with other study techniques. There was no significant correlation between gender and perceived level of preparedness or confidence.

DISCUSSION / REFLECTION / LESSONS LEARNED: We analyzed how IM residents apply key learning strategies in their ABIM exam preparation: spaced learning, interleaving, elaboration & retrieval practice. A significant proportion of residents use learning theories to improve their knowledge retention.

Although spaced learning and retrieval practice are often built into question banks, the high percentage of residents reporting the use of interleaving suggests that most have an awareness of this learning theory. Our study reveals that despite more than 2 years of residency training, 33% of PGY3 residents report being "not at all prepared." This suggests that some residents believe clinical training does not adequately prepare them for succeeding on the ABIM certification examination. The association of elaboration practice with higher Step 2 CK scores is hypothesis-generating and requires further study.

LEGISLATIVE "HILL DAY" FOR INTERNAL MEDICINE RESIDENTS

Ayrenne Adams, Priscilla Wang, Fabiola Molina, Jennifer Hong, Maria Patanwala, Zoe Tseng. Internal Medicine, Brigham and Women's Hospital, Boston, MA. (Control ID #3392656)

NEEDS AND OBJECTIVES: Physicians witness the human impact of an imperfect healthcare system and are ideally positioned to be patient advocates. The majority of internal medicine residency training, however, focuses on biologic disease interventions without explicit curricula teaching physicians how they can address social barriers to health. Effective patient advocacy includes the ability to advocate for and against health policies that will have significant implications for patient health.

The primary objective of this curriculuar component is to enable internal medicine trainees to graduate residency equipped with foundational knowledge and skills necessary to advocate for patients at the legislative level.

SETTING AND PARTICIPANTS: Primary care PGY-1, PGY-2, and PGY-3 residents at Brigham and Women's Hospital (26 individuals)

DESCRIPTION: We designed a peer-led legislative advocacy curriculum grounded in adult learning theory with active participation. Each session included (1) a brief didactic component, (2) interactive breakouts, and (3) a group activity to build an advocacy tool-kit

Sessions include:

1) Structured education about patient stories

2) Guidelines for meeting with legislators

Didactic sessions culminated with Hill Day, allowing residents to participate in pre-organized meetings with state legislators about a health topic and practice skills learned during educational sessions.

EVALUATION: Residents completed a pre-survey prior to the curriculum, followed by post-session feedback forms. Pre and post-responses were matched and compared using anonymous personal identifiers. Additionally, we collected qualitative feedback regarding resident experience with Hill Day and its related didactics. Themes in the post-survey and qualitative feedback included appreciation of interactive sessions and the focus on practical applications.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our Hill Day demonstrates that resident comfort with legislative advocacy can be increased through concise, practice-based sessions as well as experiential learning

LET'S DEBATE THE GUIDELINES! ENGAGING INSTRUCTIONAL DESIGN

Cary J. Blum[1]; Rachael W. Hayes[2]; Jennifer Adams[3]. [1]Internal Medicine, NYU School of Medicine, New York, NY; [2]Internal Medicine, NYU, New York, NY; [3]medicine, NYU School of Medicine, New York, NY. (Control ID #3389543)

NEEDS AND OBJECTIVES: Primary care physicians often find themselves navigating disparate clinical practice guidelines (CPGs). To reconcile conflicting guidelines, physicians must understand the supporting data, and the value systems underlying the recommendations. However, most internal medicine residency curricula do not address critical appraisal or comparison of CPGs, leaving physicians at risk of using an uninformed approach (Akl, 2009).

Our objective was for participants to appraise and apply CPGs using a debate format as a way to engage the learner. In addition to becoming familiar with the data informing CPGs, participants were challenged to consider how recommendations in CPGs may be tailored to accomodate different paitent preferences.

SETTING AND PARTICIPANTS: As part of our resident ambulatory care didactics, we held three debates with groups of six to twelve residents and three faculty moderators.

DESCRIPTION: Participants received an introduction to the activity one week in advance, and were divided into teams of three. Each team was assigned a breast cancer screening CPG—specifically those published by the US Preventative Services Task Force, the American College of Obstetrics and Gynecology, and the American Cancer Society. Teams were given dedicated time to research their guidelines and prepare for the debate.

The 90-minute debate began with opening statements from each team, describing their CPG and the evidence that was used to create it. Subsequently, the moderators directed questions at each team in a rotating fashion, challenging them to argue in support of certain aspects their guidelines, such as age cutoffs and screening modalities. After a round of closing statements, the moderators deliberated and determined a winner based on how well each team's arguments supported their recommendations.

EVALUATION: About a week after the debate, participants took part in an OSCE involving a 42-year old woman requesting mammogram screening. The standardized patient scored the participants on an array of case-specific skills, including assessing risk factors, counselling on risks and benefits of screening, and deftly arriving at an appropriate shared decision.

In a preliminary analysis performed on a convenience sample, residents who participated in the debate prior to the OSCE case scored higher on this composite score than control residents who did not (71.1% vs 59.6%, p = 0.12, n = 10).

DISCUSSION / REFLECTION / LESSONS LEARNED: In reflecting on the exercise, debate participants felt more prepared to counsel their patients in an evidence-based fashion regarding mammogram screening.

One resident stated that after the debate, she "was able to discuss major screening guidelines with confidence in the context of shared decision making." Another resident stated that the debate made her feel more prepared to discuss the various pros and cons of screening.

LEVERAGING OPEN-ACCESS DIGITAL CONTENT FOR DIAGNOSTIC REASONING EDUCATION

John Penner[1]; Daniel Minter[1]; Emma H. Levine[2]; Sharmin Shekarchian[1]; Stephenie Le[1]. [1]Medicine, University of California, San Francisco, San Francisco, CA; [2]School of Medicine, University of California, San Francisco, San Francisco, CA. (Control ID #3390729)

NEEDS AND OBJECTIVES: Medical educators have emphasized the need for learner-centered innovations, such as open-access online content, and have additionally recommended teaching diagnostic reasoning (DR). We aim to leverage web-based platforms to disseminate open-access DR education.

After participating in this innovation, learners will be able to:

-Describe core principles of DR

-Perform DR in simulated cases

-Apply problem representations, diagnostic schemas, illness scripts, and Bayesian reasoning in their own DR

-Evaluate educational DR content

SETTING AND PARTICIPANTS: This innovation occurs on three of the Clinical Problem Solvers' (CPS) web-based platforms: (1) Twitter (2) website and (3) phone app. Participants include the CPS' Twitter audience (~11,000 followers at the time of submission), website visitors (500 unique visitors/day), and phone app users (3,500 downloads). This includes trainees and clinical faculty at medical centers across 143 countries.

DESCRIPTION: This innovation uses web-based DR content on the CPS' Twitter page, website, and phone app. Twitter content focuses on learning and applying DR through clinical cases. The website and phone app feature diagnostic schemas, illness scripts, and blog posts focused on utilizing diagnostic frameworks and applying DR principles.

EVALUATION: We use pre and post-test multiple choice questions on Twitter to assess learners' understanding and application of DR principles in simulated cases. We also use free-response, survey-based feedback, and plan to use focus groups to elicit how learners apply and analyze DR tools, such as diagnostic schemas and illness scripts.

DISCUSSION / REFLECTION / LESSONS LEARNED: Web-based educational innovations expand the classroom to learners across many institutions while maintaining direct communication between learners and educators. Crowdsourcing feedback supports rapid, peer-reviewed refinement of DR content, learner participation in the creation and appraisal of DR content, and community development.

This learner-centered, multimedia approach allows for spaced and "just-in-time" learning, and increased DR practice. Learners appreciate the ability to access materials regardless of location or clinical duties. Several residency programs have incorporated our web-based content into structured learning sessions, such as morning report. Clinical faculty report using web and app-based content as a clinical and teaching tool during rounds with housestaff. The "unregulated classroom" is a limitation of this innovation that makes it difficult to assess individual learner progress.

ONLINE RESOURCE URL (OPTIONAL): https://clinicalproblemsolving.com

LONGITUDINAL CARE OF A VIRTUAL FAMILY- NOVEL WAYS TO ENHANCE STUDENT LEARNING OF HEALTH SYSTEMS SCIENCE AND PRINCIPLES IN CHRONIC DISEASE PREVENTION AND MANAGEMENT

Mrinalini Kulkarni-Date[2]; Luann Wilkerson[1]. [1]Internal Medicine/Medical education, Dell Medical School at the University of Texas, Austin, TX; [2]Internal Medicine/Medical education, Dell Medical School at the University of Texas, Austin, TX. (Control ID #3392465)

NEEDS AND OBJECTIVES: Rising healthcare costs and demands related to chronic care demands adequate physician training to address chronic disease in a collaborative and cost-effective manner. While specific disease states are addressed in the curriculum through problem-based learning cases and organ system lectures, the health system science (HSS) dimensions essential to chronic disease management and prevention (CPDM) are not addressed. Medical students get little exposure to longitudinal care experiences which are the key settings in which chronic disease care occurs. To address this curricular gap we created a longitudinal case-based curriculum employing a virtual family affected by chronic disease using the CDPM learning objectives created by the Accelerating Change in Medical Education (ACE) Consortium[1], which are based on Wagner's Chronic Care Model [2,3].

SETTING AND PARTICIPANTS: Dell Medical School at the University of Texas, during an accelerated first year preclinical curriculum, which includes an integrated basic science courses integrated with clinical medicine, interprofessional education, clinical skills and leadership courses. Students begin clinical clerkships during July of the second year.

DESCRIPTION: A virtual Latino family affected by type 2 diabetes and other chronic conditions was created with members at different stages of life and disease. Students 'meet' the family on the first day of medical school, learning about the family's socioeconomic and health status, and family dynamics. Encounters occur with different family members, and students follow evolving clinical scenarios throughout the patients' lifespan. There are 10 class sessions with clinical and basic science faculty, and interprofessional care team members from local community groups. Assignments include developing and modifying a patient- centered care plan, considering changing clinical conditions and family needs. Cases are strategically interspersed throughout the first year and purposefully incorporate the learnings of the basic science curriculum and are also woven through the pre-existing problem-based learning cases.

EVALUATION: Over two years of implementation, 94 students completed the evaluation survey. Mean scores were similar across both years with means ranging from 4.0 to 4.5. In both cohorts, 96% of students strongly agreed or agreed that they had learned the influences of socioeconomic factors, access to resources and family support in diabetes care

DISCUSSION / REFLECTION / LESSONS LEARNED: The curriculum has provided a unique systems perspective closely integrated with the basic and clinical science curriculum. Further curriculum development includes continuing the family experience during the primary care clerkship didactic sessions in year two. We also plan to expand the evaluation to assessment of the chronic disease OSCE given in year 3, specifically comparing the performance of the 2 classes that completed the curriculum to the one that did not.

MAKING EPIC YOUR FRIEND IN THE CLINIC

Galina S. Tan[1,2]. [1]Internal Medicine, Cambridge Health Alliance, Somerville, MA; [2]Instructor in Medicine, Harvard Medical School, Boston, MA. (Control ID #3369297)

NEEDS AND OBJECTIVES: It is well established that electronic medical records (EMRs) are an important factor in the epidemic of provider burnout in the United States. Resident trainees are even more susceptible to EMR burnout given competing priorities to learn clinical medicine in various settings. As a former chief resident and current PCP at my institution, I identified a need for a longitudinal curriculum to teach residents practical EMR optimization in the primary care setting, which is not currently a standard offering in internal medicine (IM) training programs. This innovation aims to increase EMR efficiency, improve physician- patient clinical interactions, and to mitigate burnout.

SETTING AND PARTICIPANTS: Target participants are first year IM residents at the Cambridge Health Alliance (CHA), which is a Harvard-affiliated training program that has a strong emphasis on primary care training. Due to the 4+2 block schedule, the residents are split into 3 ambulatory cohorts and practice in 3 different clinics at CHA, all of which use Epic as the EMR.

DESCRIPTION: At the beginning of each intern cohort's first ambulatory block, I co-teach a session with an IT trainer to orient interns to the ambulatory context of Epic. During this session, I demonstrate a clinic visit encounter and share note templates and shortcuts. We also review in-basket management, telephone calls, results management and medication refills.

During the interns' early ambulatory blocks, I lead didactics and direct observations in the clinic. Didactics often take place in a computer lab, and are open-ended sessions to reinforce previously taught skills/topics and address any ongoing questions and problem areas.

I also observe each intern during one clinic session, giving them feedback on how they are using the EMR during their visits with patients while continuing to reinforce core topics of the curriculum. Towards the end of the intern year, I offer optional in-clinic refresher sessions for those interested in further optimizing their use of Epic in the clinic.

EVALUATION: The interns receive formative feedback during direct observations in the clinic. The curriculum is evaluated based on surveys and feedback forms from the interns. Reviewing trends in interns' Epic efficiency data was considered but this was limited due to the parameters of data collection.

DISCUSSION / REFLECTION / LESSONS LEARNED: Currently in its 3rd year, the curriculum has been well received, especially with the addition of co-training with IT and direct observations in clinics. There were challenges associated with having to teach 3 intern cohorts in 3 different clinics. It also revealed the need for better longitudinal training for faculty PCP's, for whom I acted as an informal resource. Besides EMR skills, this curriculum has also been able to naturally integrate other skills such as physician-patient communication and working with care teams in a patient centered medical home.

ONLINE RESOURCE URL (OPTIONAL): https://docs.google.com/document/d/1L1BrtUKUju-uErGGkrGdD-aXcSl4sOD9Cn96SjL7X1Q/edit?usp=sharing

MAKING POPULATION HEALTH MORE POPULAR: IMPROVING PREVENTIVE HEALTH THROUGH A NOVEL PERSONALIZED PANEL MANAGEMENT CURRICULUM

Elizabeth Wahlberg[1,2]; Emily Hadley Strout[1,2]; Amanda Kennedy[1,2]; Halle G. Sobel[1,2]. [1]Department of Medicine, University of Vermont Medical Center, South Burlington, VT; [2]The Robert Larner, M.D. College of Medicine, Burlington, VT. (Control ID #3388472)

NEEDS AND OBJECTIVES: Panel management (PM) within primary care is a proactive, preventive care delivery model that continues to be optimized with the advent of the electronic medical record (EMR). Previous PM curricula for Internal Medicine (IM) residents have demonstrated improved resident confidence in PM with associated improvements in quality metrics. To our knowledge, IM resident PM curricula have not fundamentally utilized integrated EMR-based tools. We sought to improve our PM curriculum through a novel redesign utilizing EMR-developed weekly individualized performance feedback reports in conjunction with resident-directed goal setting.

SETTING AND PARTICIPANTS: The curriculum was delivered to 35 IM residents at all levels of training during their continuity clinic week, which is structured in a 4+1 block schedule.

DESCRIPTION: The curriculum included an introductory educational session, once-weekly 30-minute preceptor-attended sessions, individualized resident performance reports of care gap closure, direct access to resident panel registries and reference guides highlighting current evidence-based standards of care for health maintenance topics. Residents were surveyed to ascertain perceived successes and barriers to PM, as well as resident confidence in care delivery. During the 30-minute sessions, residents review their individualized performance reports, developed personalized PM goals for that clinic week and strategized subsequent self-study, in-reach and out-reach to accomplish their goals.

EVALUATION: Analysis of success will include both qualitative and quantitative analyses of resident responses to the curriculum and patient outcomes. After 4.5 months of the curriculum, preliminary results demonstrate a significant increase in closure of patient care gaps (baseline=16±7%, 3-month follow- up=24±13%, $p<0.01$). Additionally, we have observed an improvement in residents' confidence in performing PM on a scale of 0-100% (baseline=42±22%, 3-month follow-up=54±17%, $p<0.001$). Subjective feedback from residents and direct observation during this time has highlighted unanticipated outcomes, including increased knowledge sharing amongst residents and increased sense of panel ownership.

DISCUSSION / REFLECTION / LESSONS LEARNED: Implementation of the curriculum has led to improvements in completion of quality metrics, as well as increased confidence amongst residents in practicing PM. Future assessments are planned to evaluate the impact of this curriculum on patient disease- related outcomes. Additionally, we plan to incorporate resident feedback to revise the curriculum, such as improving interdisciplinary coordination between medical assistants, support staff and clinic preceptors.

MAKING THE CONNECTION: AN INDIVIDUALIZED MENTORSHIP PROGRAM FOR JUNIOR HOSPITALISTS

Neha Deshpande, Helene Starks, Elizabeth Kaplan, Shobha W. Stack, Somnath Mookherjee. Medicine, University of Washington, Seattle, WA. (Control ID #3389783)

NEEDS AND OBJECTIVES: Mentorship is critical for junior faculty scholarship, career advancement, retention, and job satisfaction. Effective, longitudinal mentoring can be challenging for hospital medicine (HM) faculty given the field's paucity of senior hospitalists and heterogenous scholarly interests. New faculty often lack a network of experienced faculty who are ideally suited to serve as mentors. Assigned mentorship dyads are rarely durable or effective. Our aim was to create an individualized, sustainable mentorship program for junior hospitalist faculty.

SETTING AND PARTICIPANTS: All 38 hospitalist faculty at the University of Washington Medical Center were eligible for the survey; 29 were eligible for the mentorship program (excluding the HM director, author ND, HM fellow, and departing faculty).

DESCRIPTION: Thirty-six (95%) faculty responded to an online, anonymous survey to assess current mentoring relationships, satisfaction, desires, and obstacles. 31% reported having a mentor and being satisfied with their mentorship. Most desired features of mentoring were "promotes career growth" (92%), offers "guidance on projects" (83%), "increases professional visibility and opportunities" (81%), and provides a "longitudinal relationship" (75%). Major obstacles to mentorship were "finding a mentor" (72%) and "time to engage in mentoring" (75%). Faculty preferred finding a mentor through "facilitated connections" (40%).

These data supported our proposed strategy to establish 7 mid-career HM faculty as "Connectors," who use their robust colleague networks and institutional knowledge to connect junior faculty to well-suited senior mentors. In a 1 hour workshop, Connectors were trained to elicit junior faculty professional goals through exploration of career and personal histories, authenticity and meaning, and specific professional interests. Junior faculty (21/22) were randomly assigned to a Connector. Connectors meet individually with junior faculty to assess their needs and aspirations, refer them to senior faculty with the goal of establishing longitudinal mentoring relationships, and follow up on the success of the connection.

EVALUATION: Connectors scheduled meetings with 20 junior faculty; 13 meetings have occurred to date. After the Connector meeting, 90% (9/10) of junior faculty agreed that their professional goals were identified and appropriate mentorship referrals were made. The majority of Connectors agreed that they had accurately identified their junior faculty's professional goals (83%), what brings them satisfaction (83%), and a suitable mentor (75%).

DISCUSSION / REFLECTION / LESSONS LEARNED: Based on confidence of connectors and satisfaction of junior faculty, it appears that Connectors can be quickly trained to effectively elicit the career goals and mentorship needs of junior faculty. The durability, efficacy, and satisfaction associated with mentoring relationships will be reassessed one year after program implementation.

MAXIMIZING FEEDBACK ON FACULTY DIDACTIC LECTURES WITH QUICK RESPONSE (QR) CODES

Desiree Burroughs-Ray[1]; Christopher D. Jackson[2]. [1]Internal Medicine, UTHSC, Memphis, TN; [2]Internal Medicine, University of Tennessee Health Science Center, Memphis, TN. (Control ID #3389364)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education mandates that residency training programs (RTPs) provide regularly scheduled didactic sessions. Noon conference is a core educational activity across most RTPs. However, residents express concern that these didactic sessions are not always board relevant; moreover, mechanisms to give constructive feedback regarding content are not robust. Additionally, faculty have commented on the lack of feedback given to improve their didactic presentations. On the 2018 University of Tennessee Health Sciences Center (UTHSC) annual faculty survey, internal medicine faculty requested more feedback regarding didactic presentations given as part of the Internal Medicine Noon Conference curriculum. As such, we endeavored to use a QR code survey that faculty members embed in their lectures to obtain real time feedback from residents with a customizable report given to faculty by the end of the month during which they presented their lecture.

SETTING AND PARTICIPANTS: All categorical UTHSC internal medicine and internal medicine- pediatric residents who attended weekly noon conference sessions were included in this intervention along with the presenting faculty.

DESCRIPTION: The QR code survey consisted of a five item survey. Four items were Likert scale questions assessing the organization, presentation, audience interaction, and overall value of the didactic presentation. The fifth item was an open response box for comments. The survey results were collected into Google Forms with results exported to Microsoft Excel. Individualized feedback reports were provided to each faculty member based on the individual survey responses.

EVALUATION: During this six-month period, 66 unique lectures were provided by faculty members with residents providing feedback on 51 lectures (77% response rate). Fifty-four lectures were provided by unique faculty and ultimately, 75% of participating faculty received resident feedback. In the previous academic year, only 3% of faculty presenting in noon conference received feedback. Twenty-one of 39 faculty receiving feedback completed an evaluation regarding the usefulness of this feedback (54% response rate). Overwhelmingly, faculty found the feedback helpful and actionable. Specific comments on improvement from surveying faculty included making their lecture more clinically based or tailoring it to the allotted time.

DISCUSSION / REFLECTION / LESSONS LEARNED: Using QR codes during faculty didactic lectures has significantly increased the percentage of faculty receiving individualized feedback regarding their presentations. Additionally, residents also have an anonymous mechanism to give feedback to faculty regarding their presentations.

MAXIMIZING YOUR AMBULATORY MORNING REPORT CURRICULUM IN A X+Y STRUCTURE

Christopher D. Jackson[1]; Tracey D. Dabal[1]; Nathan A. Summers[1,2]; Catherine Clarke[1]; Laura R. Sprabery[3]. [1]Internal Medicine, University of Tennessee Health Science Center, Memphis, TN; [2]Infectious Disease, University of Tennessee Health Science Center, Memphis, TN; [3]Medicine, UTHSC, Memphis, TN. (Control ID #3389355)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education requires residency training programs (RTPs) to balance exposure to inpatient and outpatient internal medicine. However, RTPs struggle to ensure appropriate exposure in these two arenas while ensuring breadth and depth in training. The University of Tennessee Health Science Center (UTHSC) Internal Medicine Residency Program transitioned to a "3+1" schedule in 2016, increasing both the amount and regularity of ambulatory time. In the fall of 2018, we collectively engaged internal medicine residents and faculty to review our ambulatory education efforts. Faculty and residents expressed the need for dedicated time for formal didactic sessions on ambulatory medicine topics. In response, we created an ambulatory morning report curriculum described here. The new morning report incorporates podcasts, interactive case discussions, and online self- paced ambulatory modules. This multi-modal approach to ambulatory education is novel and has not previously been described in the literature.

SETTING AND PARTICIPANTS: All categorical UTHSC internal medicine residents were included in the intervention, which was implemented in the resident schedules starting August 2019

DESCRIPTION: The central aim of our Ambulatory Morning Report Curriculum is to maximize learning of core ambulatory topics via a multimodal approach. The ambulatory faculty and chief residents chose 10 core ambulatory medicine topics that would be taught in four-week blocks to residents during their respective ambulatory week. Each topic was addressed in three ways: an internal medicine podcast relevant to the topic, case-based teaching, and corresponding online ambulatory modules. A podcast served as the first point of engagement with the topic. After listening to the podcast, all residents were expected to come to ambulatory morning report at their respective site. During this report, residents worked in teams through cases created by our ambulatory medicine faculty highlighting key pearls for diagnosis and management within the specific topic, with the final case emphasizing the application of evidence-based medicine (EBM) principles in clinic. The third component was having residents complete the corresponding online module on the topic of the week after attending the morning report.

EVALUATION: Feedback from residents and faculty have been overwhelmingly positive, noting an enriched learning environment and greater emphasis on didactic education in the ambulatory setting. Additionally, residents find the morning report content applicable to their practice. Constructive feedback regarding ambulatory morning report logistics have been addressed.

DISCUSSION / REFLECTION / LESSONS LEARNED: Beyond simply implementing a 3+1 system with regularly spaced ambulatory

time, weekly didactic sessions using adult learning principles improved the teaching environment during ambulatory weeks. Utilizing multimedia formats such as podcasts and modules together with in person case-based teaching improves residents' educational experience.

MEASURING THE DIFFERENCE IN RESPONSE TO ONLINE STRUCTURAL COMPETENCY TRAINING BETWEEN MEDICAL RESIDENTS AND PUBLIC HEALTH STUDENTS

Farah Rahman[1,2]; Max Jordan Nguemeni Tiako[3]; Janice Sabin[4]; Dowin Boatright[5]; Aba Black[6]; Inginia Genao[6]. [1]Loyola University Stritch School of Medicine, Maywood, IL; [2]Health Policy, Yale School of Public Health, New Haven, CT; [3]Yale School of Medicine, New Haven, CT; [4]Biomedical Informatics and Medical Education, University of Washington, Seattle, WA; [5]Emergency Medicine, Yale School of Medicine, New Haven, CT; [6]Internal Medicine, Yale School of Medicine, New Haven, CT. (Control ID #3391500)

NEEDS AND OBJECTIVES: Structural competency equips healthcare providers with tools to understand how societal structures produce worse health outcomes for racial and ethnic minorities. There is a gap in the medical education literature on best practices for structural competency training for learners. We administered an online healthcare disparities course to resident-physicians and public health students, and measured changes in awareness of structural determinants of health and the role of implicit bias on health outcomes before and after the course.

SETTING AND PARTICIPANTS: Participants were selected from the Yale Internal Medicine residency program and a Health Disparities course at the Yale School of Public Health (YSPH). The online course was introduced and partially completed in person. Participants were asked to complete the modules and the post- module survey after a two-week period.

DESCRIPTION: The course used for this intervention was the "Healthcare Disparities" course published in the AAMC's MedEdPortal. We included a pre-course survey, 3 training Modules on (1) Introduction to Racial & Ethnic Disparities in Healthcare, (2) Unconscious Associations, and (3) Patient-centered communication, and a post-course survey.

The pre-course survey and Module 1 were conducted in person with internal medicine residents. Residents were asked to complete Module 2 and the post-course survey, with a $25 Amazon gift card as an incentive.

Our control group consisted of YSPH graduate students enrolled in 'Health Disparities'—a seminar focused on structural determinants of health. The pre-course survey and Module 1 were conducted in class. Faculty required Module 2 and the post-course survey to be completed without financial or academic incentive. After the completion of the modules and post-module survey, students engaged in a group discussion based on the course's required supplemental readings.

EVALUATION: Forty-nine residents completed the pre-course survey and Module 1. The average score of the initial survey was 16.3/25 points. Nineteen residents (39%) completed the post-course survey with an average score of 16.7/25 (sd=4.78). In the control group, 22 students took the pre-course survey, averaging a score of 16.3/25. After completing the Modules, 17 students took the post-course survey (88%). Their average score was 19.6/25 (sd=4.38). YSPH students' post-course survey average was higher than that of the medical residents with statistical significance (t=4.06, p=.000137).

DISCUSSION / REFLECTION / LESSONS LEARNED: Our findings suggest that integrating structural competency training with core curricular activities may contribute to further engaging learners. While initial scores were similar, there was a substantial increase in the control group's post-course completion scores. Standardizing of this teaching method in medical training may improve learners' structural competency and contribute to addressing health inequities reified by implicit bias.

MEASURING THE IMPACT OF AN INTERACTIVE COMMUNICATION SKILLS CURRICULUM ON INTERNAL MEDICINE RESIDENTS: A CLUSTER RANDOMIZED EDUCATIONAL STUDY

David Harris[1]; Katie Neuendorf[1]; Mary Beth Mercer[3]; Jennifer Ramsey[4]; Sabahat Hizlan[5]; Susannah L. Rose[2]. [1]Palliative Medicine, Cleveland Clinic, Cleveland, OH; [2]Department of Bioethics, Cleveland Clinic, Cleveland, OH; [3]Office of Patient Experience, Cleveland Clinic, Cleveland, OH; [4]Critical Care, Cleveland Clinic, Cleveland, OH; [5]Office of Patient Experience, Cleveland Clinic, Cleveland, OH. (Control ID #3383449)

NEEDS AND OBJECTIVES: Effective communication with patients is recognized as an essential skill for healthcare providers and as a core competency in medical education. Yet it is unclear which postgraduate communication skills curricula result in improve communication in real patient interactions. Thus, we conducted a cluster-randomized controlled trial to compare a novel communication curricula for internal medicine residents to a standard curricula and measured patients' perceptions of their communication skills.

SETTING AND PARTICIPANTS: This study was conducted at a single academic medical center in the United States. Participants were PGY2 and 3 internal medicine (IM) residents and their primary care clinic patients.

DESCRIPTION: This cluster-randomized controlled trial compared a novel communication course (intervention) to a standard communication course (control) for internal medicine residents and measured their communication skills as rated by patients.

The intervention course focused on specific skills used in communication (reflective listening, responding to emotion, and providing information) and was taught using interactive techniques inspired by improv comedy. The control course focused on common communication challenges (bad news, prognosis, and talking to patients about pain) and was taught using traditional didactic techniques. Both control and intervention course consisted of three, hour-long sessions delivered over a 4-month period.

EVALUATION: The primary outcome was the Communication Assessment Tool (CAT), a 15-item survey measuring communication as perceived by patients. As secondary outcomes, we collected patient PHQ-9 scores, blood pressure, and frequency of missed appointments, cancelled appointments and hospitalizations, before and after their clinic appointment. 72 of 107 eligible residents (67%) consented to participate in the study. 339 of 913 (37.1%) eligible patients completed surveys. The mean CAT Score was 4.3 (95% CI 4.2-4.4) for the control group and 4.3 (95% CI 4.2-4.4) for the intervention group. There were no statistically significant differences between groups in secondary outcomes.

DISCUSSION / REFLECTION / LESSONS LEARNED: This study used rigorous methods such as the inclusion of a control group, and given that the courses were mandatory, selection bias was reduced. Furthermore, the same lecturers taught both courses, and our patient population was diverse. The study's chosen outcome of patient-reported quality of communication is arguably a more meaningful outcome than the intermediate endpoints often reported in the literature, such as resident self-report or results of standardized patient encounters. Despite these strengths, scores on the primary outcome from both groups were indistinguishable. While it's possible that finding no difference in CAT scores between the two groups was due to study limitations, we conclude that no meaningful differences existed and future research should investigate this finding.

MEDICAL EDUCATION EPIDEMIOLOGY IN RESIDENCY: PRACTICE HABITS AS A DRIVER OF CURRICULAR INNOVATION

David Rhee, Anna Kim-Baazov, Daniel Sartori. Medicine, NYU Langone Health, Brooklyn, NY. (Control ID #3382043)

NEEDS AND OBJECTIVES: Residency training requires both structured didactics and clinical exposure. While didactics can deliver diverse core content in a standardized manner, ensuring a similarly diverse complementary clinical experience is challenging. We developed a method to track inpatient practice habits and clinical exposure based on American Board of Internal Medicine (ABIM) content areas and describe how this strategy can foster rational curriculum design.

SETTING AND PARTICIPANTS: The study period was Jul 1 to Dec 31, 2019. Participants included house-staff in the Internal Medicine Residency Program at NYU Langone Hospital-Brooklyn. Inpatient structured didactics were daily noon conferences and weekly afternoon reports. Inpatient clinical exposure was based off our institutional analytics dashboard and included general medicine patients on the teaching services. The ABIM certification exam is based on a blueprint of 18 content areas.

DESCRIPTION: Didactics were categorized into one of 18 content areas based on the subject matter. Clinical exposure was determined by the patient's primary problem ICD-10-CM code at discharge using a conversion table (Table 1). Combined, this provided program-wide inpatient practice habits data for our residency (Fig. 1).

Individual attendance at didactics was recorded using unique QR codes synced with New Innovations. And attribution of patient diagnoses to housestaff was possible by cross-referencing among their call schedule, assigned attendings, and the analytics dashboard. Combined, this provided individual-level inpatient practice habits data (Fig. 2).

EVALUATION: Program-wide, the frequency of content areas taught through didactics closely mirrored content areas seen in clinical practice. ABIM content areas associated with inpatient medicine like cardiovascular disease or infectious disease were most common in didactics (21% and 15%) and in patient exposure (16% and 17%, respectively), while underrepresented areas included Allergy/Immunology, Obstetrics/Gynecology, Ophthalmology, and Otolaryngology. Individual resident data was variable, driven by attendance and their respective rotation schedules.

DISCUSSION / REFLECTION / LESSONS LEARNED: In this pilot observational study, we mapped how residents are exposed to required core content through their inpatient experience – whether through didactics or patient care. We revealed similarities as well as discrepancies in the frequency of representation of content in our explicit curriculum and our patient population. Our program-wide data will help generate a rationally-designed inpatient didactice curriculum and our individual resident data will help tailor individualized learning plans and has the potential to augment remediation. Next steps will target the limitations of this study, notably the lack of outpatient practice habits and the crude methodology to convert ICD-10 codes to ABIM content areas.

MICROAGGRESSION RESPONSE TRAINING WORKSHOP FOR INTERNAL MEDICINE RESIDENTS

Herrick Fisher[1]; Paula Chatterjee[2]; Jo Shapiro[3]; Joel T. Katz[4]; Maria Yialamas[5]. [1]Hospital Medicine Unit, Department of Medicine, Brigham and Women's Hospital, Boston, MA; [2]General Internal Medicine, University of Pennsylvania, Philadelphia, PA; [3]Massachusetts General Hospital, Boston, MA; [4]Brigham and Women's Hospital, Boston, MA; [5]Medicine, Brigham and Women's Hospital, Boston, MA. (Control ID #3392426)

NEEDS AND OBJECTIVES: Microaggressions, defined as verbal or non-verbal communications that convey hostility, invalidation or insult based on an individual's marginalized status in society, are ubiquitous and harmful, polluting the clinical learning environment. Prior work has shown that microaggressions remain difficult to respond to, especially for trainees. The objectives of this workshop were to increase internal medicine residents' comfort with identifying microaggressions, understanding of their impact, and confidence in responding to them using a Microaggression Response Toolkit.

SETTING AND PARTICIPANTS: The workshop was led by a PGY3 resident (HF) and delivered three times to approximately 85 residents (15 to 40 residents per session) of mixed post-graduate years during April and May 2019.

DESCRIPTION: The workshop lasted 50 minutes. Participants read aloud excerpts from published narratives to prompt small-group discussions on definitions and impact. This was followed by a brief review of the literature and large-group discussion of barriers to response. We then introduced the Microaggression Response Toolkit, which was developed based on literature review and in consultation with a resident working group and describes strategies for responding to microaggressions experienced as a target or witness. The participants practiced using the Toolkit to respond to scenarios developed from examples in published works and prior resident-reported microaggressions.

EVALUATION: We administered optional pre- and post-surveys to participants, with a total of 55 responses to the pre-workshop (65% response rate, N = 85) and 37 responses to the post-workshop surveys (44% response rate). In comparing post- and pre-survey responses on a 1-5 Likert scale, residents reported increased comfort with identifying microaggressions (mean 4.1 post- vs 3.1 pre-), improved understanding of the impact of microaggressions (mean 4.3 post- vs 3.6 pre-), and increased confidence in responding to microaggressions (mean 3.7 post- vs 2.5 pre-). On the pre-survey, 75% of residents agreed or strongly agreed that training on microaggressions should be part of the residency curriculum, and on the post-survey, 97% of residents agreed or strongly agreed that the workshop was a worthwhile use of their time (rated as 4 or 5 on a 1-5 Likert scale).

DISCUSSION / REFLECTION / LESSONS LEARNED: Participation in this workshop using a Microaggression Response Toolkit was associated with improvements in residents' self-reported comfort identifying microaggressions, understanding their impact, and confidence in responding to them. Participants found the workshop valuable and strongly desired such training in the residency curriculum. Future work is needed to determine the durability of these benefits and whether reported comfort and confidence translates into real-world experiences.

MIND THE GAP: TEACHING LIFELONG LEARNING THROUGH METACOGNITIVE AWARENESS

Margaret Horlick[1,2]; Patrick M. Cocks[3]; Barbara Porter[3]. [1]Medicine, NY Harbor VA Healthcare Center, Brooklyn, NY; [2]Medicine, NYU Grossman School of Medicine, New York, NY; [3]Medicine, NYU School of medicine, NEw York, NY. (Control ID #3391533)

NEEDS AND OBJECTIVES: Clinical practice provides multiple opportunities for medical trainees to identify gaps in knowledge and skills, yet these learning opportunities are often missed. The objectives of this curriculum were to: 1) explicitly reframe the conflict of service *versus* education into service as educational opportunity, 2) identify metacognitive strategies that can be incorporated into a lifelong learning curriculum, 3) recognize the importance of knowledge gap identification in lifelong learning and 4) develop the shared mental model of patient care as learning opportunity.

SETTING AND PARTICIPANTS: Large academic medical center. 200 internal medicine PGY-1s, 2s and 3s over five years.

DESCRIPTION: Three paired sessions of curriculum are presented over the intern year. Each pair of sessions consists of an introductory workshop in which two patient cases are presented and interns generate as many clinical questions as possible. Questions are prioritized and four are chosen to investigate in small groups. At the second of the paired sessions, each small group discuss their assigned clinical question, presenting search strategies, answers, and conclusions. Similar sessions continue in the PGY-2 and PGY-3 years with resident-generated cases and prioritized questions through peer discussions. They individually search and present the answers to these questions.

EVALUATION: Chief residents conducted focus groups (two with interns and two with second year residents) to obtain qualitative feedback on the curriculum. Transcripts were anonymized and coded for themes. Across both training years, themes included an expectation that gaps in knowledge exist and are expected, patient care drives identification of knowledge gaps, and active participation in learning is effective (examples included teaching a poorly understood topic and considering "what ifs"). In addition, residents commented that the existence of the curriculum increased awareness of their own learning process, that the curriculum gave the role of resident context and set the expectation for lifelong learning. Interns identified differences between learning as a medical student and as a resident.

DISCUSSION / REFLECTION / LESSONS LEARNED: A curriculum on learning as a practicing clinician is an effective means to raise trainees' metacognition and implementation of effective learning strategies. Explicit clinical question-asking is one means to bring out these skills. With priming from this curriculum, residents develop a strategy for identifying knowledge gaps in the midst of patient care in both the inpatient and outpatient setting, leading to understanding and appreciation of these concepts and skills. Thus, it is important to develop a shared mental model among faculty in diverse clinical settings to have the greatest impact on medical trainees.

MITIGATING BIAS TOWARDS TRANSGENDER PATIENTS: CURRICULAR DESIGN FOR EMPATHY DEVELOPMENT

Ryan Smith[3]; Joseph Canarie[3,2]; Tracy Rabin[3,1]; Katherine A. Gielissen[3,1]; Stephen J. Huot[4,1]. [1]Department of Medicine, Section of General Internal Medicine, Yale School of Medicine, New Haven, CT; [2]Medicine- Pediatrics Residency Program, Yale School of Medicine, New Haven, CT; [3]Internal Medicine Primary Care Residency Program, Yale School of Medicine, New Haven, CT; [4]Graduate Medical Education, Yale School of Medicine, New Haven, CT. (Control ID #3343105)

NEEDS AND OBJECTIVES: Barriers transgender persons face accessing healthcare include insufficient insurance, mistreatment and bias by clinicians, and clinician discomfort and inexperience. Needs assessment identified a paucity of literature on strategies to educate physicians and assessment of our internal medicine curriculum identified that transgender medicine was not found in the established curriculum in the prior 2 years. We sought to address the educational deficit by creating a curriculum based on guidelines from the AAMC, WPATH, and UCSF Transgender Center of Excellence.

OBJECTIVES:

- Appreciate the range of experiences transgender persons have with the health care system

- Gain confidence in asking a patient's gender identity

- Develop communication skills based in cultural humility to lead discussions about gender identity

- Understand the differences in sex, gender identity and sexual orientation

- Identify ways you can reduce stress and anxiety for transgender patients in a clinical setting

SETTING AND PARTICIPANTS: A 90-minute required multi-modal education session for Internal Medicine Traditional, Primary Care, and Medicine-Pediatrics residents. Sessions were facilitated by residents with faculty oversight. Each session contained 15-30 residents.

DESCRIPTION: The curriculum was developed to increase residents' knowledge of transgender medicine and augment empathy. We included the following empathy building strategies based on literature review: communication skills training, role playing, humanities and Balint training. The session contains communication skills and pertinent terminology and concepts, a doctor-patient roleplay with debrief, and a panel discussion with individuals with diverse gender identities and expressions.

EVALUATION: Evaluation was by a pre-post online survey where participants rated comfort in "communicating with patients about their gender identity" and optional free text comments. On a scale of 1-100, the mean resident rating of personal communication comfort on the pre-survey was 45 (n=57) with a standard deviation of 20. Post-survey mean score was 70 with a standard deviation of 16 (n=11).

DISCUSSION / REFLECTION / LESSONS LEARNED: The framework for a resident curriculum based in empathy-building exercises is feasible and reproducible. The most positive feedback was about the opportunity to ask questions of persons from the transgender community. While our quantitative data suggests a trend toward improved self-perceived comfort communicating with this population, response rate is too low for conclusions. To address these issues, we have instituted a raffle incentive for survey completion and are using a validated survey instrument, the Transgender Knowledge Attitudes and Beliefs Scale.

MOCK ROOT CAUSE ANALYSIS TO ACTIVELY ENGAGE RESIDENTS IN MORBIDITY AND MORTALITY CONFERENCE

Jessica Donato. Hospital medicine, Cleveland Clinic, Beachwood, OH. (Control ID #3390700)

NEEDS AND OBJECTIVES: Morbidity and mortality (M&M) conferences have been a tradition in patient safety education, taking multiple structures and forms ranging from in-depth reviews of adverse events to quick fire pearls from safety events. The goal of safety conferences like M&M is to educate trainees about patient safety terminology, methodology and to promote open discussion and education from adverse events and near misses. In order to enhance trainee patient safety knowledge, we introduced a novel conference during our M&M, which included a brief patient safety didactic and resident completion of a mock root cause analysis (RCA).

SETTING AND PARTICIPANTS: This novel conference was presented during our monthly 1-hour M&M conference, which targets all post-graduate levels (1-3) in our large internal medicine training program in October of 2019.

DESCRIPTION: The one-hour conference started with a brief didactic, which reviewed key patient safety terminology including culture of safety, adverse events and near misses. The didactic also included an overview of safety event reporting and root cause analysis including the purpose, steps and key tools such as fishbone diagrams and 5 why's. The trainees in attendance then completed a mock root cause analysis in small groups of 5-8 residents led by a peer facilitator. Our facilitators were chief residents, core faculty or residents who volunteered and completed a 45-minute training session prior to the conference. The facilitators utilized a facilitator guide to coach participants through the steps of a RCA. The groups utilized post-it notes to complete a fishbone diagram on a poster board, and then identified the root causes for the case with utilization of the 5

why's. The conference concluded with a large group debrief of the fishbone diagrams, root causes and overall experience. The case utilized for the conference was a near-miss case at our institution with a root cause analysis previously completed so that all information provided during the mock RCA was accurate.

EVALUATION: There were 66 trainees in attendance (41% PGY1, 35% PGY2, 24% PGY3). Eight facilitators and groups participated in the session. Feedback from participants and facilitators was positive.

DISCUSSION / REFLECTION / LESSONS LEARNED: Patient safety is a key component of systems based practice education. We incorporated a mock Root Cause Analysis into our longitudinal M&M conference as a means of educating our residents on key terminology and methodology through experiential and standardized learning. Experiential education on root cause analysis is ideal, but many large training programs struggle with meaningful involvement of trainees in the completion of root cause analyses. A mock RCA allowed for experiential learning to solidify understanding of the methodology to a large group of trainees, and use of a real case allowed accurate consideration of institutional culture and processes.

MONEY TALKS: PROMOTING FINANCIAL WELLNESS AT 3 INTERNAL MEDICINE RESIDENCY PROGRAMS

Patricia Ng[1]; Sreekala Raghavan[2]; Christiana M. Zhang[3]; Jing-Yu Pan[4]; Paul O'Rourke[5]; Rachel Wong[6]. [1]Internal Medicine, Stony Brook University School of Medicine, Port Jefferson Station, NY; [2]Medicine, Zucker School of Medicine at Hofstra/Northwell, Glen Oaks, NY; [3]Department of General Internal Medicine, Johns Hopkins University, Ellicott City, MD; [4]Medicine, Montefiore Medical Center, Broxy, NY; [5]Division of General Internal Medicine, Johns Hopkins University, Baltimore, MD; [6]Internal Medicine, Stony Brook Medical Center, East Setauket, NY. (Control ID #3391369)

NEEDS AND OBJECTIVES: Financial wellness education has become a topic of interest among Internal Medicine (IM) residency programs as studies have shown high educational debt is associated with increased burnout and lower quality of life. A 2018 survey of IM trainees revealed that residents have a strong interest in receiving financial education, but data are lacking on how to best deliver these curricula. We assessed the efficacy of financial wellness programs at three university-based IM programs to improve resident financial planning skills.

SETTING AND PARTICIPANTS: 277 residents from Stony Brook (SB), Montefiore, and Johns Hopkins Bayview IM residency programs were invited to participate in financial wellness programs at their institutions between June 2017 and June 2019.

DESCRIPTION: Financial wellness programs included a 90-minute interactive workshop that covered various topics such as loan repayment, budgeting, and retirement planning. Workshops were led by 2 faculty champions at each institution. Financial advisors were present at the SB and Montefiore workshops. At SB, residents had a mid-year financial wellness check-in with program directors. Residents were provided education materials including investigator-created financial planning checklists and resources at their local institutions.

EVALUATION: Participants were invited to complete a pre- and post-workshop survey and year-end survey to assess for change in financial behaviors. Surveys were based on the modified Financial Industry Regulatory Authority (FINRA) Investor Education Foundation questionnaire used in Wong et al's 2018 study.

Survey completion was 135/227 (48.7%) pre-workshop, 130/227 (46.9%) post-workshop, and 61/227 (22%) at year-end. Most participants were interns (86.7%) and had $100,000 or more in student debt (74.3%). The most frequent financial planning actions taken after the workshop were saving for an emergency fund (27.6%), budgeting (22.4%), and consolidating loans for Public Service Loan Forgiveness (20.7%). Among PGY1s, there was an increase in emergency funds (38.3% vs 60.9%, p=0.0065) and retirement contributions (11.2% vs 47.8%, p= 0.0004). Workshop feedback was positive, as 96% of participants found the program helpful and 97.6% requested additional workshops.

DISCUSSION / REFLECTION / LESSONS LEARNED: Financial wellness programs are important in residency programs, but more research is needed to assess optimal delivery. Our findings suggest that early intervention at the PGY1 level can improve positive financial planning behaviors and that debt level can influence content needs. Residency programs should consider performing a targeted needs assessment to tailor financial workshop topics and implement programs early in training.

MONTHLY MUST READS IN MEDICAL EDUCATION: HELPING YOU KEEP UP WITH RELEVANT MEDICAL EDUCATION SCHOLARSHIP

Alaina C. Chodoff[1]; Sean Tackett[2]; Elizabeth Ryznar[3]; Benjamin Roberts[4]; Scott Wright[2]. [1]Internal Medicine, Johns Hopkins, Baltimore, MD; [2]Internal Medicine, Johns Hopkins School of Medicine, Baltimore, MD; [3]Psychiatry, Johns Hopkins, Baltimore, MD; [4]Palliative Care, Johns Hopkins, Baltimore, MD. (Control ID #3392262)

NEEDS AND OBJECTIVES: Medical education research output is expanding. Clinical evidence reviews and digests help providers keep up with advances in clinical care yet there is nothing comparable in medical education. Our objective is to alert medical educators to some of latest and most disruptive advances in medical education scholarship

SETTING AND PARTICIPANTS: In October 2019, our team, including assistant to full Professors, fellows, and a nursing educator, applied a systematic method of identifying the most impactful peer-reviewed medical education publications from the prior month

DESCRIPTION: Our plan was developed and revised based on feedback from local medical education experts, intended to be implemented without external funding, and designed to be feasible to replicate monthly. After consultation with an informationist, PubMed was searched for articles published from the prior month using education-related keywords (e.g."education, medical, health professional"). Many recently published articles were not immediately indexed by search engines, so we also included articles from 8 prominent medical education journals. All titles and abstracts were loaded into the Covidence systematic review platform. Each reviewer independently voted to advance articles for further consideration based on 3 criteria: rigor, novelty and relevance to a broad audience of medical educators. Full texts were retrieved for articles receiving multiple votes. In this second phase, each criterion was rated on a 5-point scale by all team members. A meeting to review scores and achieve consensus was held.

EVALUATION: 385 titles and abstracts were identified and screened. 13 articles (3%) garnered 2 or more votes and had their full texts reviewed and rated across the 3 criteria. After discussion, we reached consensus on 4 articles. We plan to refine our approach and disseminate the first public monthly "must reads" on our website and Twitter by the time of the annual SGIM meeting. Over time, we will validate our selection process using measures including Altmetric scores and citation rates.

DISCUSSION / REFLECTION / LESSONS LEARNED: While we developed the process to address an unmet need among medical educators, our team found that the process of reviewing the medical education literature for practice-changing articles was edifying. Over time, we hope to recruit an even more diverse group of individuals to screen articles; this will increase the likelihood that the 'must reads' will be of interest to a broad audience.

NARRATIVE ETHICS IN MEDICAL EDUCATION: USING LIFE STORIES TO PROMOTE PHYSICIAN WELL-BEING

John D. Yoon[1,2]. [1]Medicine, The University of Chicago, Chicago, IL; [2]Medicine, Mercy Hospital & Medical Center, Chicago, IL. (Control ID #3345309)

NEEDS AND OBJECTIVES: In this study, we wanted to assess a "proof-of-concept" and determine whether trainees who recount their experiences using a more redemptive mindset might be demonstrating a sort of inner resilience that has a protective effect with regards to burnout.

SETTING AND PARTICIPANTS: In the narrative ethics literature, life stories often contain basic narrative sequences that can be analyzed and correlated with measures of well-being. For example, people who tend to narrate life stories using redemption sequences tend to tell stories in which initially-bad situations are seen to produce a positive outcome. In contrast, people might tend to tell life stories using only what are called contamination sequences. These are narratives in which good situations become spoiled by negative events. Research suggests that people who tend to narrate their life experiences using only contamination sequences tend to be more depressed, more burned out, and less generous to others. In this presentation, we will present preliminary results from the Project on the Good Physician in which we collected qualitative data from 21 U.S. medical trainees across multiple medical schools. Based on this research, we also implemented pilot "life story" wellness workshop for an internal medicine residency program in a midwest community hospital (Jan-Feb 2018).

DESCRIPTION: For the research study, we collected life stories in a structured manner and adapted the McAdams Life Story Interview which provided a standardized way to elicit various experiences of a person's life journey through medicine, coding for the presence of Redemption Sequences and Contamination Sequences. We also developed a wellness workshop intervention that narrated a "life story" parable with content that contained redemptive mindset sequences in the narrative.

EVALUATION: Our initial findings from the national study suggest that medical trainees who recount their experiences using a more redemptive mindset might be demonstrating a sort of inner resilience that has a protective effect with regards to burnout. Moreover, our workshop findings also found that 98.2% residents [n=52] reported that the workshop addressed issues relevant to their "overall sense of well-being." Pre-and post-survey results showed statistically significant improvements in comfort level with addressing ethical and professional challenges at work.

DISCUSSION / REFLECTION / LESSONS LEARNED: Initiatives to reduce burnout should extend beyond the immediate medical school context and invite physicians-in-training to cultivate a redemptive mindset - learning to narrate "negative events" during their training in such a way that they can identify how such events contributed redemptively to their personal growth. Given the increasing awareness of shame and vulnerability in medical education, life stories from role model physicians may promote physician well- being.

ONLINE RESOURCE URL (OPTIONAL): Jenkins TM, Yoon JD. Stressing the journey: Using Life Stories to Study Medical Student Burnout and Resilience. Advances in Health Science Education. 2018 May 5.

NARRATIVE ONCOLOGY: AN INTERVENTION TO PROMOTE RESIDENT WELLBEING AND PATIENT-CENTERED CARE ON AN EMOTIONALLY EXHAUSTING INPATIENT ROTATION

Matthew Stevenson[3,1]; Lauren Edwards[2]; Yeuen Kim[2]; candice kim[2]; Tyler Johnson[1]; Donn Garvert[1]. [1]Internal Medicine, Stanford Hospital & Clinics, Menlo Park, CA; [2]Medicine, Stanford University, Los Altos Hills, CA; [3]VA Palo Alto, Medical Service, Medical outreach section, Stanford University School of Medicine, Palo Alto, CA. (Control ID #3392467)

NEEDS AND OBJECTIVES: Physicians' ability to connect with patients' stories is a crucial competency and source of meaning that is undertaught and sometimes undermined in the time-constrained environment of Internal Medicine residency. Humanities training, including in Narrative Medicine, has been shown to improve burnout, empathy, and patient-centered attitudes among physicians, but data among Internal Medicine (IM) residents are lacking. We sought to integrate a thematically relevant Narrative Medicine curriculum into a demanding inpatient rotation, and to rigorously assess its impact on physician wellbeing and perceptions of meaning in work.

SETTING AND PARTICIPANTS: IM residents on an inpatient oncology service at an academic medical center.

DESCRIPTION: Inpatient oncology at our institution is considered a uniquely formative, stressful, and meaningful rotation for IM residents.

In AY 2017-2018 (Year 1) and 2018-2019 (Year 2), we administered wellbeing surveys to residents on their first and last weeks of inpatient oncology and peroidically to the entire residency program. In Year 2, just before completing post- surveys, oncology residents attended 45-minute Narrative Medicine workshops facilitated by humanities-trained faculty members. Workshops included an introdution to Narrative Medicine theory, close reading of cancer-related literary works, and guided writing about experiences on the rotation, which residents were then encouraged to share. At year's end, workshop participants also completed qualitative surveys.

EVALUATION: Wellbeing was measured using the Physician Well-Being Index (PWBI), chosen for its brevity and its ability to assess wellbeing across multiple domains. PWBI scores correlate inversely with wellbeing, and scores >=4 suggest severely low wellbeing.

In Year 1, mean wellbeing decreased (2.68->3.25) during inpatient oncology and the percentage of residents with severely low wellbeing increased (26.3->43.7%). In Year 2, mean wellbeing remained stable (3.25->3.39), and the percentage of residents with severely low wellbeing decreased (50.0%-> 39.3%). In small cohorts who completed both pre- and post-surveys, rates of severely low wellbeing tripled in Year 1 (1/5→3/5) and remained stable in Year 2 (1/5→1/5). In qualitative surveys, residents described workshops as helping them to "remember how to pause and reflect" and "to process emotions related to pain and suffering of others."

DISCUSSION / REFLECTION / LESSONS LEARNED: Our study confirmed that inpatient oncology poses emotional challenges which can be measurably mitigated with a humanities intervention. In qualitative surveys, this intervention was felt to promote the empathy, connection, and reflection that are essential to patient and provider satisfaction.

Limitations include low return rates for our surveys, which, because we strove for brevity, measured a limited number of outcomes. Outcomes such as meaning in work and patient-centeredness were not directly measured.

NEAR-PEER COACHING: USING SMALL GROUPS TO FACILITATE SELF-REFLECTION ON STRESS MANAGEMENT TECHNIQUES TO PREVENT BURNOUT

Emily Moore[2]; Serra Akyar[2]; Kristen Kim[3]; Urvya Iyer[2]; Mary-Anne Hennen[2]; Samuel Gavzy[1]; Y.J. Lee[4]; James Hill[2]; Novneet Sahu[2]; Manasa Ayyala[2]. [1]University of Maryland School of Medicine, Baltimore, MD; [2]Rutgers New Jersey Medical School, Newark, NJ; [3]University of California San Diego, San Diego, CA; [4]McGaw Medical Center/ Northwestern University, Chicago, IL. (Control ID #3379754)

NEEDS AND OBJECTIVES: Burnout is prevalent among medical students. Though the literature is robust on the prevalence of burnout, there is limited evidence available to guide meaningful interventions to prevent and address this problem. Near-peer wellness initiatives can be a positive intervention and offer students the autonomy and self-efficacy to lean on their peers. In addition, this focus on peer support may be protective if continued into training and beyond. We developed and implemented mandatory small group sessions led by fourth-year medical students for third-year medical students focused on self-reflection to improve stress management techniques.

Our objectives are:

1) To evaluate student engagement and satisfaction with the use of near-peers to help guide self-reflection of stress management techniques in a mandatory small group format in the clerkship year

2) To determine if small group sessions led by near-peers can facilitate self-reflection on stress management techniques and burnout prevention among medical students

SETTING AND PARTICIPANTS: The setting was a U.S. medical school. The participants were third- and fourth-year medical students.

DESCRIPTION: Using a coaching model, fourth-year medical students each facilitated small groups of approximately 10 third-year medical students. Third-year students were prompted using a vignette to reflect on signs of burnout and stress management strategies to prevent it. Responses were recorded in an open-ended pre-session survey. Next, the fourth-year students facilitated a discussion about these topics and also invited third-year students to share suggestions on how the medical school administration could improve student wellbeing. Students completed a similar survey post-session.

EVALUATION: Evaluations of the sessions by third-year students were overwhelmingly positive. Key positive themes included appreciation of near-peer leadership and facilitation of the small group sessions. Students identified many stress management techniques.

DISCUSSION / REFLECTION / LESSONS LEARNED: Small group sessions of third-year medical students led by fourth-year medical students can serve as an ideal opportunity for near-peers to reflect and discuss stress management techniques. Near-peer-led small group sessions can be implemented and highly effective during the clerkship years. Scheduling can be challenging if students do not have shared time. Additionally, the quality of a session depends on student participation and may vary.

NUTRITION EDUCATION MODULE FOR HEALTH PROFESSIONS STUDENTS

Jeffrey Xia, Sergio Aleman, Jessica Davis. Medicine, UT Health San Antonio, San Antonio, TX. (Control ID #3388607)

NEEDS AND OBJECTIVES: Nutrition is the greatest risk factor for all-cause mortality in the U.S., indicating the need for health professionals to have a good understanding of nutritional counseling. The objectives of this project are to demonstrate efficacy of a recorded lecture intervention on nutritional counseling in improvement in two areas: objective nutrition knowledge and self-reported confidence in providing nutrition counseling.

SETTING AND PARTICIPANTS: Students from the following health professions schools at The University of Texas Health San Antonio (UTHSA) were invited as volunteers to participate in the study: Medicine, Nursing, School of Health Professions. Preliminary data is presented in this abstract as data collection is continuing. As of abstract submission, 16 students completed the intervention.

DESCRIPTION: A 45 minute lecture on nutritional epidemiology, motivational interviewing, and basics in nutritional counseling was created with principles from the USDA Dietary Guidelines, USDA MyPlate, and DHHS Physical Activity Guidelines, and input from selected faculty (UTHSA Culinary Medicine co- directors: Kenneth Stone, MD and Jason Rocha, MD; Registered and licensed dietician Liset Vasquez, PhD, RD, LD). The lecture was recorded, uploaded to YouTube, and presented within a Redcap survey that allowed for administration of a pre- and post-intervention survey.

EVALUATION: Evaluation of the intervention was assessed by a survey composed of a 14-question knowledge assessment (KA) based on the lecture intervention and a 15-question self-reported confidence assessment. Confidence assessment questions were formatted on a 7-point Likert scale, and confidence was assessed in 4 areas: providing nutrition counseling to others, using nutrition guidelines (USDA, DHHS), counseling evidenced based diets (DASH, Mediterranean), and satisfaction with current nutrition knowledge. Pre-/post-intervention data was analyzed using paired t test and 95% confidence intervals.

DISCUSSION / REFLECTION / LESSONS LEARNED: In our sample size of 16, an average self- satisfaction score of 3.3 on a 7-point Likert scale suggests overall dissatisfaction with students' current level of nutrition knowledge. Watching the lecture intervention significantly improved the KA score by 2 points ($p<0.01$, $t=5.16$, 95% CI [1.31, 2.69]). Confidence in providing nutrition counseling to strangers significantly improved by approximately 1 point on a 7-point Likert scale ($p<0.01$, $t=2.80$, 95% CI [0.28, 1.59]). Furthermore, confidence in providing nutrition counseling utilizing USDA and DHHS guidelines, motivational interviewing, dieticians, and DASH and Mediterranean evidence-based diets all significantly improved from baseline at the $p<0.05$ level after the lecture intervention. These results indicate that the health professions students in our sample were able to significantly improve their confidence and knowledge in nutrition counseling, allowing them to be more comfortable to start dietary conversations with patients. **ONLINE RESOURCE URL (OPTIONAL):** Survey link: https://redcap.uthscsa.edu/REDCap/surveys/?s=D88K7T8WD4

OP-ED WRITING AS AN INTERPROFESSIONAL TEAM PROJECT

Anna Reisman[1,2]; Leila Haghighat[3]; Sumit Kumar[1]; Rene Russell[4]; Caroline Falker[1]; Benjamin Lu[1]; Devin Pray[2]; Matthew Ringer[1]; Christine Hsueh[1]; Rebecca Brienza[2,1]. [1]Internal Medicine, Yale School of Medicine, New Haven, CT; [2]Internal Medicine, VA Connecticut Healthcare System, West Haven, CT; [3]Internal Medicine, Yale New Haven Hospital, New Haven, CT; [4]Kansas University, Kansas City, KS. (Control ID #3391325)

NEEDS AND OBJECTIVES: 1. Describe purpose and structure of an op-ed.

2. Identify a topic of interest to an interprofessional team.

3. Collaborate in small groups to co-write sections, and edit as a large group.

4. Pitch and submit to one or more publications.

SETTING AND PARTICIPANTS: VA-based Center of Education (CoE) in Interprofessional Primary Care; two interprofessional groups of trainees on immersion block schedule.

DESCRIPTION: As part of the interprofessional CoE, two groups of internal medicine residents and nurse practitioner residents participate in intermittent immersion blocks that include half-days of required didactics. Writing sessions in this program have included narrative writing,

reflective writing, and op-ed writing. We developed a model for writing a team op-ed due to limited time outside didactics as well as varied enthusiasm for writing individual op-eds. The goal was to write a draft in one or two 2-hour sessions. Groups of 9-12 residents were oriented to the basic elements of an op-ed. Afterward, they brainstormed potential topics and divided into subgroups of 3-4. Each subgroup researched and wrote one of the op-ed sections. Toward the end of the session, the group reconvened and reviewed the draft piece as a whole. After the session, two residents provided additional edits, with continued faculty mentoring and feedback from group members, and submitted the op-ed for publication. Some op-eds were published in lay publications and others in health professions publications.

EVALUATION: Informal feedback from the residents was generally positive. One group published three large team-authored op-eds in 2018 and 2019. Topics included deprescribing, the importance of taking a military history, and a critique of "wellness". The other group published several smaller co-authored op-eds, including why tampons are an essential healthcare item and why residents should receive buprenorphine training.

DISCUSSION / REFLECTION / LESSONS LEARNED: Team-written op-eds can provide an opportunity for lively debate and collaboration in an ultimately democratic process among residents of different training levels and backgrounds. Having responsibility for a smaller chunk of a written piece appeals to group members who have limited time to complete a writing project, or who may be less confident about their writing skills. With some groups, a modified goal of several smaller co-authored op-eds is an alternative to the team-authored approach. Learning to create an op-ed as a team, through consensus, is valuable whether or not residents remain in an academic setting.

OPTIMIZING CLINICAL TEACHING AT A NEW ACADEMIC MEDICAL CENTER: A FACULTY DEVELOPMENT WORKSHOP

Julie L. Machen[1]; Jadranko Corak[1]; Saurin Gandhi[1]; Clarissa Johnston[1]; Beth Miller[1]; Deepa Mittal[1]; Holli T. Sadler[1]; Sherine Salib[1]; Victoria Valencia[2]. [1]Internal Medicine, Dell Medical School, University of Texas at Austin, Austin, TX; [2]Medical Education, Dell Medical School at The University of Texas at Austin, Austin, TX. (Control ID #3368269)

NEEDS AND OBJECTIVES: Since the creation of an affiliate medical school four years ago, our Internal Medicine (IM) faculty have experienced more teaching responsibilities. As a former community-based hospital, there was no existing faculty development (FD) program within the Department of IM. A 2018 survey indicated that 85% of IM faculty were satisfied with FD to supervise and educate residents, compared to a national average of 96%. This year, IM faculty ranked medical education as their top priority for FD programming. Therefore, we created a FD Workshop with the following objectives:

1. Improve IM faculty confidence in bedside teaching
2. Build IM faculty skills in coaching for performance improvement and feedback
3. Improve IM faculty satisfaction with FD to supervise and educate residents

SETTING AND PARTICIPANTS: Workshop topics were determined by student and resident evaluations, in which IM Faculty ranked below national means in expectation setting and feedback. We developed a half-day workshop, hosted by the Department of Hospital Medicine, open to all IM Faculty. Our 30 attendees consisted of hospitalists, primary care providers, subspecialists, and chief medical residents.

DESCRIPTION: Our 4.5-hour workshop contained three core sessions: 1. Building & Setting Expectations, 2. Effective & Efficient Clinical Teaching, and 3. Coaching for Performance Improvement. Each session was led by a separate faculty member. Sessions began with a brief lecture, followed by reflection, small-group discussion, and/or role play with standardized patients and learners. Lunch was provided, and we offered CME Credit for one session.

EVALUATION: Participants completed pre- and post- workshop surveys to assess their knowledge of topics addressed in the workshop and their confidence in clinical teaching skills. Initial results are promising, indicating a positive response in both categories. For example, before the workshop, 15% of participants were "very confident" that they could prepare for teaching at the bedside, compared to 56% of participants post- workshop. Course evaluations have also been positive, with 100% of participants agreeing that "the information presented will be useful in my practice." We have been invited to host a Spring Workshop based on this positive feedback.

DISCUSSION / REFLECTION / LESSONS LEARNED: By first demonstrating that IM Faculty wanted FD in clinical teaching, we were able to gain institutional support from the medical school, residency program, and Department of IM. This strengthened our workshop because it enabled us to utilize leaders from across the medical center, and it gave us access to resources such as standardized patients. We were pleased by the diversity of IM faculty that attended, and we hope to expand to other departments in the future.

OSCE CASE BANK INVENTORY 2001-2018: PROGRAMMATIC EVALUATION OF PERFORMANCE BASED ASSESSMENT CASE CHARACTERISTICS

Amanda Mari, Adriana Kulusic-Ho, Amanda Bostwick, Harriet Fisher, Lisa Altshuler, Colleen Gillespie, Jeffrey Wilhite, Kathleen Hanley, Richard E. Greene, Jennifer Adams, Sondra R. Zabar. Division of General Internal Medicine, New York University School of Medicine, New York, NY. (Control ID #3392112)

NEEDS AND OBJECTIVES: Objective Structured Clinical Examinations (OSCEs) are commonly used to teach and evaluate clinical skills. These cases provide a standardized curricular approach to ensure all learners have the same opportunity to interact with a Standardized Patient (SP) trained to consistently portray a case. Until recently, case trends and evolution of cases within our medicine training programs remained undocumented. We sought to catalogue and describe trends in an OSCE case bank created to provide training and assessment to Primary Care (PC) residents in an urban based residency program from 2001-2018 (n=181).

SETTING AND PARTICIPANTS: An internal medicine residency training program located within an urban-safety net hospital system. All cases from 2001-20018 were catalogued.

DESCRIPTION: Using a structured framework, research assistants characterized OSCEs cases. Cases were organized by SP demographics, encounter type, domains of learner assessment, and social determinants of health. Descriptive analysis of cases, instructions and checklists were conducted using SPSS and Microsoft Excel.

EVALUATION: Average SP age was 45.6 years old (range: 19-87). The most common ethnicity was Hispanic (12%), though 78% of the cases did not specify. Most cases focused on cisgender female or male- related care (52% and 42%, respectively), but 2% of cases focused on transgender care. 55% were heterosexual-care specific. 13% included LGBTQ care; none of which were female.

A majority of cases took place in-person (86%). Smaller percentages have were via phone call (13%) or video (1%). 39% of the cases were located in the Urgent care/ walk-in clinics, 44% outpatient and 17% inpatient settings. Most cases were direct patient-provider interaction (76%), while other types included teaching/ precepting (15%) or interprofessional interactions (5%).

Every OSCE case assessed core communications (information gathering, rapport building and patient education) and case specific items and global ratings. In addition 53% of cases included specific patient education assessment, while 57% had treatment plan/management assessment, and 30% specific history gathering assessment. Some included interprofessional collaboration, physical examination, and professionalism domains (9%, 14%, and 17%, respectively).

Since inception, cases have included aspects of social determinants of health (SDOH) to introduce learners to the unique needs of the patient population within the safety-net hospital system. The most common SDOH in cases were employment/income insecurity (37%), social isolation (14%), health care challenges (access/insurance) (10%) and education/literacy challenges (6%); only one case included food insecurity.

DISCUSSION / REFLECTION / LESSONS LEARNED: While we had initially intended to create a case inventory for internal tracking and sharing, we realized we may not have as diverse a set of SP and case characteristics as we intended. Introducing a case cataloging system will expose explicit and implicit programmatic trends and help to plan future cases to meet the needs of the community.

OVERVIEW OF AN ARTS-BASED CURRICULUM ON MITIGATING BURNOUT IN MEDICAL TRAINEES

Vanisha P. Patel[1]; Savannah Brackman[1]; Unsa Shafi[1]; Laurie Melnik Allen[2]; Angela Dittmar[2]; Adera Causey[3]; Mukta Panda[4]. [1]University of Tennessee Health Science Center, Memphis, TN; [2]Southeast Center for Education in the Arts, Chattanooga, TN; [3]Hunter Museum of American Art, Chattanooga, TN; [4]Department of Internal Medicine, University of Tennessee, Chattanooga, TN. (Control ID #3391569)

NEEDS AND OBJECTIVES: Physician and trainee burnout is an epidemic within the medical community. Recognizing the significance of burnout, the Association of American Medical Colleges and the Accreditation Council for Graduate Medical Education both advocate for well-being and resiliency initiatives during training. In recent studies, interventions that employ narration and communicating one's experiences are described as potential methods of increasing empathy and emotional awareness. Building on these principles, our institution developed and studied a student well-being curriculum.

SETTING AND PARTICIPANTS: The University of Tennessee College of Medicine Chattanooga partnered with Hunter Museum and Southeast Center for Arts Education to develop a curriculum that uses creative exercises and narrative medicine to provide resiliency and well-being training. Third and fourth-year medical and physician assistant students participate in a monthly 3 hours session with 15-20 participants.

DESCRIPTION: The program identifies and addresses issues that cause burnout, provides a safe space for reflection, informs about healthy coping strategies, and fosters a community. Sessions focus on a theme that is used to select a work of art from the museum collection or develop a creative exercise. The facilitators employ an emergent curriculum that adapts discussions to the dynamic needs of participants. Students reflect on their mood with three words before and after the experience, participate in group activity and discussion, and respond to prompts related to the theme. We performed qualitative data analysis on written open response questions.

EVALUATION: Between August 2016 and August 2019, 369 students participated in sessions centered around themes such as empathy, the bystander effect, and sensitivity to patients etc. Seventy-three participant surveys showed students transitioned from feelings of being tired (n=29, 39.7%), excited (n= 19, 26.0%), and curious (n=11, 15.1%) to feeling more relaxed (n=58, 79.5%), happy (n= 15, 20.5%), and creative (n=9, 12.3%). Students noted that the sessions provided a safe setting and built solidarity amongst peers.

DISCUSSION / REFLECTION / LESSONS LEARNED: This program had similar findings to other studies that employed art-based practices in reducing emotional exhaustion, increasing emotional awareness, and developing a sense of community. Students participated in activities such as writing, drawing, and taking pictures which highlight potential communication tools and coping mechanisms to deal with stressors of medical training. Through group sharing, a community develops among participants which decreases feelings of loneliness, also noted to be an independent driver of burnout.

PANEL MANAGEMENT: A VENUE FOR TEACHING AND IMPROVING POPULATION HEALTH

Andrew T. Harris, Joshua Mauro, Mamta K. Singh, Megan Mcnamara. Internal Medicine, Louis Stokes Cleveland VA Medical Center, University Heights, OH. (Control ID #3386645)

NEEDS AND OBJECTIVES: Panel management (PM), a core function of high performing primary care practices, is a venue for teaching improvement in population health. Learners feel empowered to improve by reviewing data on their patients. We piloted a curriculum using Performance Based Learning and Improvement (PBLI) competencies to help learners reflect on their practice patterns and test changes to improve clinical outcomes.

Resident Learning Objectives:

Reflect on performance on a population level

Identify deficiencies in care delivery and systematically address them

Apply evidence-based care to a specific patient panel

SETTING AND PARTICIPANTS: The curriculum was constructed at the Center of Outpatient Education (COE) at the Louis Stokes Cleveland VA from July – December 2019. The weekly two hour curriculum is delivered to IM and NP residents over a longitudinal 12-week rotation by didactive, interactive discussion, reflection, and case-based learning. Learners practice in Patient Aligned Care Teams (PACTs) with continuity panels of approximately 200 patients.

DESCRIPTION: Each learner is given a performance report card (PRC) for their continuity panel with quality metrics for chronic disease management, access and continuity. In a faculty led session, learners reflect on their PRC, select a metric for improvement, and consider a practice change. Before implementation, learners solicit feedback from their PACT during weekly team huddles. In subsequent sessions, learners develop a Performance Improvement Plan (PIP) based on the Model for Improvement and perform at least one Plan, Do, Study, Act (PDSA) cycle during the rotation. During implementation, learners receive individualized coaching from QI faculty with a special emphasis on hypothesis testing. An updated PRC is distributed monthly to follow progress.

EVALUATION: On a Likert scale of 1-5, residents reported that the curriculum facilitated self-reflection on practice patterns (4.1/5) and analysis of clinical data (4.3/5) to improve practice. We collected clinical outcomes data for 15 residents on the same rotation from July 1 to October 1, 2019. Each resident selected one primary metric for improvement. Over the 12-week block, 13/15 (87%) improved [their] selected metric. Overall, residents improved their selected metrics and to a greater degree than those who worked on other metrics. For example, residents who chose hypertension (n=8) had 4.1% improvement in average percentage of patients with blood pressure < 140/90, versus -1.4% change amongst peers (n=7).

DISCUSSION / REFLECTION / LESSONS LEARNED: A PM curriculum for interprofessional ambulatory learners linked to a PBLI framework led to meaningful clinical improvement. Residents valued

feedback from performance report cards, were motivated to improve, and were engaged in the process. We recognized that real-time coaching led to more robust and directed hypothesis testing. Future directions include developing a scalable model for delivering the curriculum in a variety of ambulatory settings.

PATIENT SAFETY DAY: A RESIDENT-LED, INTERDISCIPLINARY, INTERPROFESSIONAL APPROACH TO QUALITY AND PATIENT SAFETY EDUCATION AND SCHOLARSHIP IN A LARGE, MULTI-HOSPITAL ENTERPRISE

Stephanie Braunthal[1]; Aaron Hamilton[2]; Kyle Henchar[3]; Megan McGervey[4]. [1]Internal Medicine, Cleveland Clinic, Cleveland, OH; [2]Hospital Medicine, Cleveland Clinic, Cleveland, OH; [3]Graduate Medical Education, Cleveland Clinic, Cleveland, OH; [4]Internal Medicine, Cleveland Clinic, Cleveland, OH. (Control ID #3346789)

NEEDS AND OBJECTIVES: Objectives are threefold: First, encourage trainees to engage in patient safety, high-value care, and just culture. Second, promote an interdisciplinary, interprofessional collaborative approach to solving complex issues within healthcare delivery systems. Third, highlight the patient safety and quality improvement projects pioneered by medical trainees and other healthcare professionals.

SETTING AND PARTICIPANTS: The event takes place at the tertiary care center of a large, multi-hospital enterprise. All caregivers are invited to attend, including administration, nursing, pharmacy, and information technology. The Steering Committee is an interprofessional team of medical trainees, staff physicians, nurses, nursing leadership, pharmacists, and administrative staff from the departments of risk management and Graduate Medical Education. The committee is led by a resident. Subcommittees, also each led by residents, focus on abstract peer-review, workshop development, advertising, and communication.

DESCRIPTION: Patient Safety Day is a resident-led annual half-day event composed of an external keynote speaker, a peer-reviewed poster competition, and an interprofessional workshop. Speakers focus on Steering Committee-selected topics: high performance teams, psychological safety in high reliability organizations, and the impact of human error. Speakers include a former Navy SEAL, a documentary filmmaker, and a NASA human systems engineer. Interactive workshops focus on interprofessional team building, conducting a mock root cause analysis, and recreating different patient safety initiatives that have succeeded within the hospital enterprise.

EVALUATION: A survey is sent to all participants regarding feedback from the day, with data compiled at the end of each year and presented to the hospital's QPS committee and used to guide change for the following year's event. Of the 66 survey responders from 2019, over 90% said that the day was well worth their time and that they will return the following year. Just fewer than 90% said that the day gave them an appreciation of teamwork and the utility of interdisciplinary projects within QPS. Over 70% said they are now more likely to get involved in a QPS project, and they are more likely to take an interprofessional approach.

DISCUSSION / REFLECTION / LESSONS LEARNED: As the data suggest, Patient Safety Day is a successful platform to provide education and garner enthusiasm for quality and patient safety initiatives within the hospital. The past three years have focused on expanding to include the regional hospitals, diversifying trainee participation, and improving the impact of the poster session. Involvement of departmental representatives in 2020 has proven essential to garnering input from a variety of trainees, spreading the word to satellite campuses, and creating an event that is both meaningful and amenable to different resident schedules. Increasing abstract submissions requires a variety of modes of commucation, including direct email, electronic bulletins, and the help of program leadership.

PAUSE: A TOOL FOR STRUCTURED DEBRIEFING IN AN INTERNAL MEDICINE RESIDENCY PROGRAM

Allison Vise[1]; Anne Duckles[1]; Sophia Bellin Warren[1]; Laura Nicholson[1]; Andrew Lawton[3]; Subha Ramani[2]. [1]Internal Medicine, Brigham and Women's Hospital, Brookline, MA; [2]Medicine / General Internal Medicine, Brigham and Women's Hospital, Harvard Medical School, Boston, MA; [3]Brigham and Women's Hospital, Dana Farber Cancer Institute, Boston, MA. (Control ID #3388399)

NEEDS AND OBJECTIVES: Residents who train at academic medical centers are at the frontline of patient care. They are frequently involved in high stakes clinical events such as delivering bad news, participating in rapid responses and codes, and pronouncing patient deaths. There is often little time to debrief these emotionally challenging events. Few residency programs provide dedicated training for residents to lead post-event debriefings. Therefore, such debriefings are often happenstance, unstructured, and focus on aspects of clinical care rather than clinicians' emotions. If unaddressed, the emotional impact of these events can contribute to burnout and a sense of isolation. It is critical to remedy this gap in medical training.

With this in mind, we developed an innovative curriculum, with four main objectives: 1) Create a tool (called PAUSE, which stands for: Prepare, Analyze, Understand, Sentiment, Educate) to facilitate debriefings after high stakes events, 2) Train residents to lead debriefings using the tool, 3) Implement the training on inpatient services to encourage interdisciplinary debriefings, 4) Examine PAUSE's utility and its effect on resident wellbeing.

SETTING AND PARTICIPANTS: PAUSE is being piloted at Brigham and Women's Hospital among residents in the cardiac ICU and inpatient medicine teams. The pilot includes other interprofessional clinical staff (nurses, pharmacists, and patient care assistants) who are critically involved in these events, and participate in PAUSE.

DESCRIPTION: The project consists of collaborating with Medical Education and Palliative Care experts to design the PAUSE tool, developing training materials via an instructional video and in-person training, teaching residents to use the tool, and inviting participants to give their opinion regarding its impact through surveys and focus groups.

EVALUATION: Residents who lead the debriefings, and other team members who participate in the debriefings, are invited to complete a confidential survey on the tool's usefulness, its influence on communication between team members, and fostering of feelings of support and decreasing burnout. Residents also will be invited to participate in focus groups to offer in-depth qualitative perspectives and suggestions.

DISCUSSION / REFLECTION / LESSONS LEARNED: This project has garnered support from the Internal Medicine Residency Program and Partners Graduate Medical Education leadership. Using literature and expert advice, we have developed the tool, created training materials, and embarked on the implementation phase. We anticipate initial survey data in Spring 2020.

PGY-2 BOOTCAMP: A NOVEL CURRICULUM FOR IM RESIDENTS' TRANSITION TO THE PGY-2 YEAR

Seema Kumar[1]; Jeremey Walker[2]; Jordan Crocker[1]. [1]Internal Medicine, UAB, Birmingham, AL; [2]Infectious Disease, UAB, Birmingham, AL. (Control ID #3391279)

NEEDS AND OBJECTIVES: Traditionally our residency program has a focused one day retreat in PGY-2 year that provides basic tools for the difficult transition from internship to supervising resident, but time constraints have limited expansion to additional concerns. Practical skills including work-flow efficiency, addressing interpersonal conflicts, and

assisting struggling interns were identified through resident feedback as specific PGY-2 challenges. Our goal was to provide a series of interactive sessions to address these common concerns.

SETTING AND PARTICIPANTS: 41 PGY-1 Residents at University of Alabama Hospital

DESCRIPTION: Our curriculum was developed using Kern's model including a targeted needs assessment through a 20 question survey identifying the current PGY-1s confidence of handling common scenarios faced by a supervising resident. This survey was developed internally through feedback from current residents. Questions ranged in content addressing efficiency, reflection, intra-team dynamics, inpatient skills, and outpatient management. Responses were measured on a 5 point scale (1-very unconfident to 5- very confident). Three one-hour sessions addressing the main areas of concern were created and held during the final month of the PGY-1 year. The sessions were led by our program leadership and chief medical residents. The first session was "Difficult Conversations", the second "Efficiency on the Wards", and the final was "Helping the Struggling Learner". All sessions were a combination of brainstorming, foused cases, brief lecture and small group discussion followed by debriefing. The same questions from the pre-survey were sent to participants after completion of the third session as a post survey.

EVALUATION: There was a 97.5%(39/40) response rate with the pre-survey and a 57.5% (23/40) response rate on the post-survey. All questions had an increase in confidence level of the resident on the post-survey responses. The question with the highest post-survey response level regarded co-managing a ward team including overseeing a patient list. We noticed the largest improvement in confidence scores with questions regarding the utilization of available resources at our clinic site, managing personal clerical work while managing a team, and leading the team in debriefing when the unexpected occurs.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our results suggested improved confidence of residents across all questions. The multimodal approach allowed reinforcement of key ideas and concepts and individual tailoring. Our residents felt least confident about logistical aspects of PGY-2 year, and most confident about their ability to reflect on experiences. Our study is limited by the decrease in response rate between the pre and post survey, as we are unable to demonstrate statistical significance. However, the improvement seen in post-survey responses with this intervention is promising. We felt the most important component was providing a space for our interns to discuss concerns and share ideas for tackling expected challenges about their new responsibilities.

PHARMACOGENOMICS: CLINICAL REASONING FOR THE 21ST CENTURY MEDICAL STUDENT

Megan B. Raymond[1]; Mylynda Massart[2]; Philip Empey[3]. [1]University of Pittsburgh School of Medicine, Pittsburgh, PA; [2]Family Medicine, University of Pittsburgh School of Medicine, Pittsburgh, PA; [3]Pharmacy and Therapeutics, University of Pittsburgh School of Pharmacy, Pittsburgh, PA. (Control ID #3388559)

NEEDS AND OBJECTIVES: The next generation of healthcare providers will be tasked with implementing genomic technology into the front-lines of clinical care through the delivery of precision medicine (Powell KP et al., 2012). The integration of genomics education into medical education has been slow and inadequate. Only five U.S. medical schools offer a curriculum on precision medicine in undergraduate medical education (Caryn Kseniya Rubanovich et al., 2018). Pharmacogenomics (PGx) is an important topic as over 300 drugs have FDA approved PGx information in their labeling and 85-95% of the population will have an actionable PGx variant (Bush WS and Crosslin DR et al., 2016). No formal core curriculum about genomics and precision medicine exists in the pre-clinical years at the University of Pittsburgh School of Medicine (UPSOM). To address this gap, we created a mini-elective to teach medical students about PGx as a use case for the application of practical genomic skills early in their academic careers.

SETTING AND PARTICIPANTS: The Test2Learn™ program uses a participatory genomic testing model developed at the University of Pittsburgh School of Pharmacy. Learners use real genetic data to learn about PGx and clinical decision making within an online platform. The curriculum has been adapted for various audiences, and was modified to fit the UPSOM mini-elective structure. The course was led by two expert faculty from the School of Pharmacy and the Department of Family Medicine. We used anonymized real genetic data from the Test2Learn™ educational platform as opposed to medical student data for this first deployment.

DESCRIPTION: The mini-elective consisted of four weekly two-hour evening sessions. Sessions had a didactic portion led by faculty followed by a small-group workshop for application of concepts. Students accessed the Test2Learn™ online portal for practical experience analyzing real, anonymized PGx data. Course objectives included:

- Develop a nuanced understanding of the opportunities and limitations offered by PGx testing
- Practice and apply fundamental pharmacokinetic and pharmacodynamic principles
- Demonstrate competency in interpreting PGx information
- Discuss ethical, legal, and social issues inherent within precision medicine

EVALUATION: 5 MS-1 and 1 MS-2 students enrolled and completed the course. It was well received by students in a post-class survey. One student reported "This mini elective fit so well into MS1 because we already had a working knowledge of pharmacology and genetics and were able to apply these concepts to incredibly current and relevant issues."

DISCUSSION / REFLECTION / LESSONS LEARNED: This innovation is an exciting way to incorporate clinical decision making skills early on in undergraduate medical education. It highlights the clinical relevance of basic science concepts and allows students to develop connections between genetics and pharmacology. Early exposure and competency in understanding and applying PGx information will benefit medical students of many different future spectialties.

ONLINE RESOURCE URL (OPTIONAL): https://www.test2learn.org/

PILOT ASSESSMENT OF A SELF-DIRECTED PUBLIC HEALTH LEARNING MODULE FOR PRECLINICAL MEDICAL EDUCATION

David S. Edelman[1,2]; Gregory Karelas[1,2]; Sarah Godfrey[3]; Rachel Gordon[1,3]; Benjamin Lebwohl[1,3]. [1]Vagelos College of Physicians and Surgeons, Columbia University, New York, NY; [2]Mailman School of Public Health, Columbia University, New York, NY; [3]Department of Medicine, Columbia University Irving Medical Center, New York, NY. (Control ID #3387130)

NEEDS AND OBJECTIVES: Teaching social determinants of health is necessary to train medical students to address health inequity as future physicians and leaders. One challenge is integrating public health material into preclinical curricula. We created an online, interactive learning module that teaches public health topics relevant to existing content in the preclinical curriculum. We hypothesized that the module would offer an appealing self-directed way to increase students' knowledge of public health concepts.

SETTING AND PARTICIPANTS: Potential pilot participants included all second-year medical students at Columbia University Vagelos College of Physicians and Surgeons. All students received an online learning module on infectious diarrhea that they could complete independently while enrolled in their required "Microbiology/Infectious Disease" block.

DESCRIPTION: The module was a case-based sequence of ten interactive multiple-choice questions. It focused on global burden of disease, malnutrition, and water, sanitation, and hygiene via a hypothetical case of acute diarrheal illness in Nigeria. Users received instruction through immediate, detailed feedback on each question. Participation was voluntary and anonymous.

EVALUATION: Two single-best-answer, knowledge-based questions were provided as pre- and post-test assessments for each module question. Mean scores were calculated. For subjects who completed both assessments, paired t-tests tested change in assessment score. Time to complete the module was calculated in minutes with median and interquartile range (IQR). Likert scores were reported as percentages.

DISCUSSION / REFLECTION / LESSONS LEARNED: All students who completed the module improved their score. Of 140 eligible students, 21 (15%) completed the pre-test, 18 (13%) completed the post-test, and 16 (11%) completed both. For paired subjects, scores increased from 3.1/10 to 9.0/10 (mean change 5.9, 95% CI 4.8-6.9, $p<0.0001$). Median completion time of the module was 6.6 minutes (IQR 5.1-12.7). Of 16 students who completed the survey, 13 (81%) were satisfied with the difficulty, material presented, and effectiveness of the module; 12 (75%) with the time to complete the module; 11 (69%) with outside resources and relevance to medicine; and 10 (62%) with the connection to lecture material.

While limited by low voluntary participation, we anticipate significantly higher student uptake with formal, grade-based inclusion into the preclinical curriculum and expansion into other preclinical courses.

PILOT THEMATIC ANALYSIS OF WEEKLY PSYCHOSOCIAL ROUNDS CASES IN PRIMARY CARE RESIDENCY: FOR WHICH CHALLENGES DO RESIDENTS SEEK HELP AND SUPPORT?

Davis Boardman, Jessica Tanenbaum, Lisa Altshuler, Mack Lipkin. General Internal Medicine, NYU School of Medicine, New York, NY. (Control ID #3392159)

NEEDS AND OBJECTIVES: A challenge during residency is learning to cope with complex medical and psychosocial situations in order to manage patient care and maintain wellness. Psychosocial rounds (PSR) are a defining element of NYU School of Medicine Internal Medicine Primary Care Residency Program (PC), and allow residents to share difficult issues and reflect on their own reactions. They receive peer and faculty support and problem-solving guidance in response to their challenge. We use notes from PSR discussions to understand some of the issues that residents struggle with most from their own perspective, and how they process them.

SETTING AND PARTICIPANTS: PSR is facilitated by a faculty member and Chief Resident who take semi-structured notes. During the session 1-2 residents (of 8-15 in attendance) volunteer to share challenging experiences with patients or team-members, then receive support and feedback from the group. Faculty and Chiefs' notes were compiled into a deidentified database of 191 cases spanning 2010-2019.

DESCRIPTION: A pilot sample of 23 cases have been analyzed by a team, including a Clinician-Educator, psychologist, and data associate, using a thematic qualitative approach to understand the kinds of issues that residents self-identify as challenging. The team analyzed notes individually, developed codes to categorize the case themes, and compared and refined codes in an iterative process. The pilot codebook contains 19 parent codes with 1-8 sub-codes.

EVALUATION: "End-stage care" was the most prevalent code, occurring in 39% of cases (n=9). "Patient-provider relationship" occurred in 35% of cases (n=8). Code co-occurrence indicates that existing patient or provider issues exacerbate residents' ability to care for dying patients. 7 of 9 (78%) PSR cases about end- stage care also included "Poor patient/family understanding", "Ethics" (using life-prolonging measures), or "Medico-legal concerns." In one case representative of the ethical and psychosocial complexity residents often raise during PSR, the wife of a Chinese man with metastatic prostate cancer asked the medical resident to deliver a less "serious diagnosis" to "protect" him. Faculty and residents asked questions such as, "Is it legal" to misinform a patient about their diagnosis?, "Do they have a right *not* to know" their diagnosis?, and how cultural difference affected the situation. Through this discussion the resident was able to reframe the experience and modulate her emotional reaction in order to refocus on patient and family care.

DISCUSSION / REFLECTION / LESSONS LEARNED: Analysis of PSR notes indicates that end-stage care prompts high levels of emotional/moral distress among PC residents. They repeatedly seek peer and faculty guidance to assist in their care of dying patients, especially when there are complicating psychosocial factors. As we code further other challenging situations will be identified, allowing for a deeper understanding of issues residents face, and intervention in areas in which residents may be underprepared for independent practice.

POCUS FACULTY I-SCAN PROGRAM DESCRIPTION AND ONE-YEAR EVALUATION

Michael Janjigian[1]; Anne Dembitzer[1,2]; Caroline Srisarajivakul-Klein[1]; Khemraj Hardowar[1]; Deborah Cooke[1]; Harald Sauthoff[1,2]. [1]New York University-Langone Health, New York, NY; [2]VA NY Harbor HCS, New York, NY. (Control ID #3391224)

NEEDS AND OBJECTIVES: Point-of-care ultrasound (POCUS) is gaining acceptance in general medicine due to a reduction in procedural complications, an increase in diagnostic accuracy, and an availability of less expensive devices. As formal POCUS curricula for medical students and internal medicine residents are advancing there is a shortage of faculty with the expertise to supervise these trainees. We developed the Integrated Sonography Course at NYU (I-ScaN) to train faculty in POCUS.

SETTING AND PARTICIPANTS: Twenty three hospitalists from 4 academic hospitals participated in I-ScaN.

DESCRIPTION: I-ScaN began with a 2-day course consisting of lectures and hands-on training covering views of the heart, lungs/pleura, abdomen, and leg veins. The faculty then participated in a year-long program with three components: 1. hands-on teaching sessions led by local experts 2. monthly conferences to review scans and 3.creation of an online image portfolio.

We evaluated the impact of I-ScaN using knowledge tests, hands-on tests, confidence and satisfaction surveys given before and upon completion of the two day program and at 1-year. We also assessed barriers to use of ultrasound.

EVALUATION: Eighteen participants completed the year long program and uploaded a total of 2787 clips. Participant confidence was unchanged immediately after the 2-day course and at 1-year (2.9 and 2.8, respectively, out of a possible 4). Participant knowledge increased from before the 2-day course to post-course (56% and 82% correct, respectively, $p<0.001$), without a significant decay at one year (78% correct). There was no difference in the hands-on test scores from immediately after the 2-day

course to one-year (74% and 74% well done). Performance on the 1-year knowledge test correlated highly with results on the 1-year hands-on test (r=0.80, p<0.001). There was a moderate correlation between passing the 1-year hands on test and attending hands-on teaching sessions (r=0.66, p=0.003), with attending monthly conferences (r=0.53, p=0.019), and with the number of clip uploads (r=0.61, p=0.007).

DISCUSSION / REFLECTION / LESSONS LEARNED: Performance on the 1-year hands-on and knowledge tests did not decay suggesting I-ScaN is effective at promoting knowledge and skill retention. Course elements correlating with a passing score on the hands-on test, our measure of participant success, included clip uploading, attendance at hands-on sessions, and attendance at monthly conferences. Assessments correlating with passing the hands-on test included passing the final knowledge test and confidence ratings.

Time was reported as the principal barrier both to overall use of POCUS as well as to uploading clips.

For POCUS programs targeting faculty, it is important that participants participate in key course elements following an introductory course including hands-ons scanning sessions, monthly conferences as well as to practice regularly and upload clips.

PRACTICE MAKES PERFECT: SIMULATION BASED EDUCATION IN ACUTE CARE MANAGEMENT OF SICKLE CELL DISEASE

Cassondra Cramer-Bour[1]; Justin Peterson[2]; Barbara Walsh[3]; Elizabeth S. Klings[4]. [1]Internal Medicine, Boston University Medical Center, Boston, MA; [2]Internal Medicine, Boston University Medical Center, Boston, MA; [3]Emergency Medicine, Boston University Medical Center, Boston, MA; [4]Pulmonary, Boston University Medical Center, Boston, MA. (Control ID #3389951)

NEEDS AND OBJECTIVES: Sickle cell disease (SCD) affects approximately 100,000 Americans and is the most common autosomal recessive genetic disorder worldwide. Despite being a genetic hemoglobinopathy, SCD is a diffuse vascular disease and complications such as acute chest syndrome (ACS), sepsis and stroke are the most common causes of death. Many internists experience relative discomfort in managing SCD patients and we proposed to use simulation based learning, a highly effective tool for hands on management of real time clinical scenarios, to impact education of internal medicine housestaff. We developed a simulation based curriculum on the diagnosis and management of acutely ill hospitalized patients with SCD.

SETTING AND PARTICIPANTS: Different groups of 4-5 2nd year internal medicine residents underwent the 2 hour simulation session using LEAP_Laerdal Learning Application Program for 3G Instructor software and the SimMan 3G patient simulator over four weeks. Each resident completed a pre-test to assess baseline knowledge. After each case simulation, there was a debriefing with discussion of the learning objectives. Residents received the pre-test via email 30 days after the simulation activity (post-test). 17 residents had complete data with a pre-test and post-test and were considered for analysis (an additional 10 surveys were submitted without a matching identifier). Data were considered complete if a pre- and post-test using the same identifier was collected. Data were analyzed using GraphPad software.

DESCRIPTION: Cases of a SCD patient admitted with a vasoocclusive crisis who develop an acute stroke, acute chest syndrome or severe sepsis were created and reviewed by a multi-disciplinary team comprised of internal medicine housestaff, adult and pediatric hematologists, adult pulmonary/critical care physicians and a pediatric emergency medicine physician. Each case had ten learning objectives.

EVALUATION: Seventeen of 27 participants (63.0%) had complete data sets. The mean pre-test score was 34.4% (SD 14.5%). There was a sizeable increase in the post-test score to 60.2% (SD 18.3%) which reached significance as calculated with a paired t test (p=0.0001). Interestingly these results are mirrored when the unmatched pre- and post-test surveys were considered (pre-test score of 34.5% (SD 14.5%) and post-test score of 51.6% (SD 20.1%)). Additionally, A Likert scale of "1 (not very confident) to 5 (very confident)" in managing patients with SCD was conducted across several domains and this increased from 2.6 (SD 0.8) in the pre-test to 3.5 (SD 0.4) in the post-test (p=0.02).

DISCUSSION / REFLECTION / LESSONS LEARNED: We present here an easy-to-implement educational tool that effectively expands education and management of complications of SCD which may be underrecognized in their early stages. This simulation-based curriculum was well received by internal medicine residents and resulted in nearly a two-fold increase in knowledge that was sustained for over 30 days.

PREPARING THE 21ST CENTURY PHYSICIAN: AN INNOVATIVE COURSE IN THE FOUNDATIONS OF SOCIAL, BEHAVIORAL, AND POLICY SCIENCE

Archna Eniasivam[2]; Megha Garg[1]; Daniel Dohan[2]; Jason Satterfield[2]. [1]Medicine, San Francisco VA Medical Center, University of California San Francisco, San Francisco, CA; [2]University of California, San Francisco, San Francisco, CA. (Control ID #3387469)

NEEDS AND OBJECTIVES: The UCSF Bridges curriculum seeks to prepare medical students to address the health and healthcare needs of the twenty-first century. Over 50% of premature morbidity and mortality is attributable to social and behavioral causes. Traditional medical curricula do not address these issues. We sought to develop an innovative social and behavioral sciences (SBS) curriculum that would provide first year medical students with foundational SBS knowledge and prepare them to effectively address social and behavioral causes of ill-health.

SETTING AND PARTICIPANTS: 155 first year students in the School of Medicine.

DESCRIPTION: We used the Kerns 6-step model for curriculum development. We reviewed published literature to develop a map of content areas and themes. Based on this review, we recognized a need to develop an innovative curriculum to provide students with the scientific foundation of SBS. In addition, we identified a need to expand and integrate curriculum on health systems, policy, and advocacy to prepare students to effectively address these causes of ill-health. The literature review also identified a need for coverage of content related to patient/provider identity, behavior change, social/structural determinants of health, and health disparities. Expert and student reviews shaped sessions maximizing learner engagement and scientific rigor.

EVALUATION: In year 1 (AY 2016-17), we implemented a two block, 8-week curriculum: 4 weeks on Health & the Individual (HI) and 4 weeks on Health & Society (HS). In subsequent years, we refined each course in response to student evaluation and feedback. We shortened each course to 3 weeks and improved placement and integration within the broader curriculum. Substantive innovations in the HI/HS curriculum included: a longitudinally-followed "standardized family"; panels on chronic pain, addiction, physician payment, and health insurance; lectures and small groups on intersectional sources of health determinants and disparities; just-in-time small groups on current policy issues; a book club; and enhanced small group facilitator training. In students' overall quantitative evaluation, HI/HS tended to score lower than basic science courses (3.0-4.0 of 5 for HI/HS compared to 4+ for comparator courses). Qualitative comments indicated that students valued HI/HS content and innovations. However, they struggled with the learning materials and small group facilitators. HI/HS course leadership has focused on these areas for year-

over-year improvement and were able to improve facilitator performance while continuing to struggle with student dissatisfaction with learning material differences.

DISCUSSION / REFLECTION / LESSONS LEARNED: Students appreciated in-depth coverage of SBS, noting its relevance to high quality care. Challenges included need for facilitators with topic expertise and abilities to guide discussions of topics such as race and bias. Additional difficulties exist in tailoring the scope of the curriculum to meet the needs of students with a wide range of existing knowledge of these topics.

PRIMARY CARE 101: A MULTIDISCIPLINARY ROTATION DESIGNED FOR FIRST YEAR RESIDENTS

Claire Popplewell[1]; Frank Cacace[2]; Joseph Conigliaro[3]. [1]General Internal Medicine, Northwell Health, Manhasset, NY; [2]GIM, northwell health, Great Neck, NY; [3]Internal Medicine, Zucker School of Medicine, New Hyde Park, NY. (Control ID #3391647)

NEEDS AND OBJECTIVES: Internal Medicine residents are choosing careers as primary care physicians at decreasing rates. Our goal was to create a 2-week rotation during the first year of residency that would expose Internal Medicine residents to patient care services offered by our Division of General Internal Medicine (GIM) as well as familiarize them with the inter-professional collaboration that takes place within the division.

SETTING AND PARTICIPANTS: All first year residents participated in this rotation. The faculty included members of our GIM division, subspecialty physicians in the Department of Medicine, physicians in other departments, and other members of the interdisciplinary team.

DESCRIPTION: This rotation was introduced for the 2018-2019 academic year. We aimed to include experiences that would showcase the inter-professional nature of primary care as well as expose residents to environments they may have had little prior experience with. Residents worked with nurses and pharmacists at our ambulatory sites to more fully understand their roles. Other sessions included home visits, psychiatry crisis center, diabetes wellness visits, smoking cessation groups, obesity medicine visits, stress test observation, and HIV/PrEP clinic. We included self-guided sessions focused on evidence based medicine and advocacy. Based on feedback from the 2018-2019 academic year, we added exposures to heart failure clinic, medical billing, and management of sickle cell disease in a primary care setting.

EVALUATION: Residents were surveyed before and after participating in this rotation regarding their career plans, satisfaction with the experience, and ideas for improvement of the rotation. As of mid-academic year, 19 residents have participated in the 2019-2020 primary care rotation and 12 (63.2%) completed the post- rotation survey. Based on the post-rotation survey, 63.6% of residents were very satisfied with the faculty and 66.7% of residents were very satisfied with the overall rotation. Residents were most satisfied with their experiences in obesity medicine, outpatient sickle cell disease management, and stress test observation. When questioned about career plans after residency, zero residents noted interest in primary care on the pre-rotation survey, but after completing the rotation, 1 (8.3%) resident endorsed primary care as their intended future career.

DISCUSSION / REFLECTION / LESSONS LEARNED: This rotation has exposed residents to the multidisciplinary and varied nature of primary care and furthered their understanding of what a career in modern primary care can entail. Their experiences span the nurse's work station, the patient's home, the physical therapist's treatment room, and the cardiologist's heart failure clinic. They also have been able to strengthen their understanding of evidence based medicine, advocacy, and medical billing.

PROJECT ECHO CANCER SURVIVORSHIP: DESIGNING A CURRICULUM TO PREPARE PRIMARY CARE PHYSICIANS (PCPS) TO MEET THE EVOLVING NEEDS OF CANCER SURVIVORS

Alaina C. Chodoff[4]; Krysta Brown[2]; Jonathan Nesfeder[2]; Luis Murillo[2]; Marielle Bugayong[3]; Youngjee Choi[1]; Kimberly S. Peairs[1]. [1]Internal Medicine, Johns Hopkins School of Medicine, Baltimore, MD; [2]Tower Health/Reading Hospital, Reading, PA; [3]Bloomberg School of Public Health, Johns Hopkins, Baltimore, MD; [4]General Internal Medicine, Johns Hopkins, Baltimore, MD. (Control ID #3390634)

NEEDS AND OBJECTIVES: Primary Care Physicians (PCPs) are increasingly sharing responsibility for cancer survivorship care, but do not feel adequately prepared to provide such care.[1]It has been recommended that specialists create survivorship care plans (SCPs) to guide PCPs on appropriate follow-up treatment, but national data reveals that a majority of PCPs do not receive such documents. The goal of this Project ECHO (Extension for Community Healthcare Outcomes) curriculum is to teach PCPs a structured approach to delivering follow-up care to cancer survivors. Project ECHO is an interactive model of tele-education that has been validated as a successful method for bridging knowledge gaps between specialists and PCPs.[2]

SETTING AND PARTICIPANTS: The targeted learners of the curriculum will be internal medicine and family medicine residents in Reading, Pennsylvania. The curricular sessions will be facilitated by faculty from the Johns Hopkins Primary Care for Cancer Survivors Program using a video conference format.

DESCRIPTION: Using the Project ECHO model, this curriculum will teach PCPs a standardized approach to managing cancer survivors in primary care clinic. Approximately 10 one-hour video conferences will be held over one academic year. Sessions will be a mix of didactic and interactive case presentations in keeping with the Project ECHO format.[2] The curriculum will be divided into three modules—i.e., on breast, colon, and prostate cancer—and will weave common themes in survivorship care including: secondary surveillance, management of late and long-term effects of cancer treatment, health promotion, psychosocial well-being, and care coordination. Residents will be introduced to a protocolized management approach using a templated care plan designed by our team. The didactics and resident presentations will be formatted to align with the template. Subject matter experts will attend sessions as needed to provide expert opinion on challenging topics. The first session is scheduled for May 2020.

EVALUATION: Project ECHO provides an online application that tracks session attendance and ratings. After 5 sessions, participants will be asked to provide specific suggestions for improving the curriculum. Program success will be evaluated by measuring individual responses on pre- and post-curriculum self- assessment forms about managing the essential elements of cancer survivorship care. At the end of the curriculum, participants will also complete an online knowledge test to objectively assess management decisions across a range of clinical scenarios. Responses will be analyzed to identify areas in need of curricular revision.

DISCUSSION / REFLECTION / LESSONS LEARNED: Because oncology is a dynamic field, the curriculum does not focus on imparting cancer knowledge. Rather, it aims to teach PCPs a standardized approach to caring for cancer survivors, and allows them to hone their skills with the assistance of specialist facilitators.

ONLINE RESOURCE URL (OPTIONAL): 1. https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3755767/

2. https://echo.unm.edu/about-echo/model/

PROMOTING STUDENTS' STRUCTURAL COMPETENCY BY CHALLENGING THEM TO ADDRESS THE OPIOID EPIDEMIC FROM AN INSTITUTIONAL PERSPECTIVE

Arnab K. Ghosh[1]; Juliet Aizer[1,2]. [1]Medicine, Weill Cornell Medical College, New York, NY; [2]Hospital for Special Surgery, New York, NY. (Control ID #3388661)

NEEDS AND OBJECTIVES: Physicians have key roles in health-system change. We introduced an innovative session for students to equip them to (1) Apply principles of health equity and structural competency to public health; (2) Describe roles of physicians as advocates for health-system change; (3) Describe institutional resources and data sources to prioritize patient populations for interventions; (4) List methods of systems-level intervention; (5) Analyze data to assess success of institutional interventions, and (6) Recognize limitations of healthcare systems ability to solve public health problems.

SETTING AND PARTICIPANTS: Sept-Oct 2019, second year medical students (n=107) at Weill Cornell Medicine learned about the US healthcare system and social and healthcare needs of various vulnerable patient populations. Following this, we introduced an interactive session for students to propose and discuss institutional responses to the opioid epidemic.

DESCRIPTION: Prior to the session, students read a case of a patient with opioid use disorder (OUD) raising structural issues including transitions of care, implicit bias, iatrogenesis and social constructs of illness, culminating with the plan for a hospital task force to address OUD. At the start of the session, students were oriented and divided into groups of 21 with a faculty member with relevant experience. In teams of 4, students played task force members. They were provided with hospital and NYC Department of Health data and asked to describe subpopulations of patients with OUD. With additional information, they then designed initiatives to address gaps in managing OUD, received program evaluation data and reflected on initiative impact.

EVALUATION: 7 weeks later, students wrote essays describing an issue in healthcare of interest, and how they could promote relevant system change. Thematic analysis of these essays was performed.

DISCUSSION / REFLECTION / LESSONS LEARNED: The opioid epidemic topic was compelling. Due to time, students received selected data; still, they had to sort through it and consider how it could inform institutional decisions. The complexity of materials and novelty of assignment heightened the importance of clear instructions. Issues of interest in students' essays included healthcare access (21%), disparities in healthcare among vulnerable populations (20%), and addressing healthcare costs (15%). Students described themselves promoting systems-change using approaches they had discussed in the interactive session, including physician-led education programs in structural competency (36%), advocacy through evidence- based policy changes (33%), and technology use (16%).

QUALITY NOT QUANTITY: IMPLEMENTATION OF A BRIEF, RESIDENT-DRIVEN, EXPERIENTIAL QUALITY IMPROVEMENT CURRICULUM

Cody Dashiell-Earp[1]; Myrt C. Yamamoto[2]; Christine Haynes[1]; Wendy Simon[3]. [1]Internal Medicine, University of Colorado, Denver, CO; [2]Internal Medicine, UCLA, Santa Monica, CA; [3]Medicine, UCLA, Los Angeles, CA. (Control ID #3390664)

NEEDS AND OBJECTIVES: Our goals were: to create an engaging curriculum that gave residents an understanding of QI methods and hands-on experience with their own project and to provide interested residents with opportunities to gain additional skills.

SETTING AND PARTICIPANTS: 162 internal medicine residents participated in the curriculum over the 3-year measurement period (July, 2016 to June, 2019). 47 residents were exposed to the curriculum twice (via a consolidated version during their first year) and 18 residents served as project leads.

DESCRIPTION: Our curriculum consisted of four one-hour sessions over two years. Each of our five firms were required to select, design, and implement a QI project. Residents from each firm volunteered as leaders to work on the project between sessions during protected administrative time. Leads received additional mentorship and teaching. Each large group session used the selected project to highlight QI themes, including defining and prioritizing problems, completing a current state analysis, creating aims and metrics, performing a root cause analysis, and testing solutions.

Residents were evaluated before and after the curriculum using a self-assessment of knowledge and skills and the QI-KAT-R instrument to assess knowledge application. QI-KATs were graded by two independent reviewers and the change in the mean score was compared before and after our intervention.

EVALUATION: 128 out of 162 (79%) residents completed a pre- and a post survey. Self-reported confidence increased significantly. For example, at baseline, only 27% of residents agreed they could write a problem statement, whereas 75% felt they could do so after curriculum exposure ($p<0.001$). Confidence was greatest among project leads, 100% of whom felt they could write a problem statement by the end of the study. Average scores on the QI-KAT-R increased from 18.2 (out of a possible 27) to 20.8 ($p<0.001$). Residents who experienced the curriculum twice improved the most (18.2 to 22.3, $p<0.001$) as compared to residents who experienced the curriculum only once (18.2 to 20.2, $p<0.001$). Leaders improved their scores (19.8 to 22) but this difference was not significant ($p=0.14$). All 5 projects produced meaningful results and made it through at least one PDSA cycle.

DISCUSSION / REFLECTION / LESSONS LEARNED: A resident-driven, project-based QI curriculum delivered in just four hours over two years can lead to significant gains in confidence and knowledge among residents. Those who were exposed to the curriculum across all 3 years of residency performed the best, suggesting that skills increase with every year of exposure. Though our project leads demonstrated high confidence, improvements in their QI-KAT score were similar to their peers.

RAPID RESPONSE TEAM TO THE CLINIC BATHROOM!: CAN RESIDENTS IDENTIFY AND MANAGE OPIOID OVERDOSE?

Meredith Lynn[1]; Rachael Hayes[1]; Kathleen Hanley[1]; Sondra R. Zabar[1]; Alessandra Calvo-Friedman[2]; Jeffrey Wilhite[3]. [1]Department of Medicine, New York University, Brooklyn, NY; [2]Medicine, NYU School of Medicine, Brooklyn, NY; [3]Division of General Internal Medicine, New York University School of Medicine, New York, NY. (Control ID #3388642)

NEEDS AND OBJECTIVES: Opioid overdose deaths in the U.S. have risen 5-fold in the past 2 decades from 8,048 in 1999 to 47,600 in 2017. At our health center we responded to 6 opioid overdoses within the clinic in a 3-month period. Opioid agonist treatment (OAT) is an effective therapy for opioid use disorder and treatment after overdose has been shown to reduce all-cause mortality. However only a small percentage of patients receive treatment at the time of overdose. We developed an Objective Structured Clinical Exam (OSCE) case to assess our residents' skills in identifying and treating opioid overdose.

SETTING AND PARTICIPANTS: 34 Internal Medicine residents participating in an OSCE.

DESCRIPTION: The opioid overdose case, part of a 10-station annual OSCE, involved a young man found unresponsive in the clinic bathroom. A nurse, the first responder, is in the room when the resident enters. A highly trained standardized patient (SP) evaluated the residents on communication skills and case-specific skills: identifying opioid overdose, treating opioid overdose, assessing opioid use, and counseling on treatment options for opioid withdrawal and opioid use disorder. Assessment items used a behaviorally anchored scale with response options: not done, partly done, well done. Analyses are reported as frequencies of well-done items.

EVALUATION: Of the 34 residents who participated in the case, 91% of residents quickly identified the opioid overdose, 82% administered naloxone correctly, and 88% provided supportive care during the overdose. However only 26% of the residents assessed the patient's opioid use, 38% counseled on opioid withdrawal, 35% discussed short-term treatment options for opioid withdrawal and 32% counseled on long- term treatment options for opioid use disorder. Many residents reported difficulty addressing opioid use and treatment in the setting of overdose. The SP reported that most residents were supportive and non-judgmental but many did not address opioid withdrawal management or offer OAT.

DISCUSSION / REFLECTION / LESSONS LEARNED: While the majority of residents quickly and appropriately responded to the patient's opioid overdose, few residents adequately assessed the patient's opioid use or counseled on treatment options. Performance in this case highlights the need for increased training to improve residents' skills in treating opioid use disorder, particularly at the time of overdose. Given the prevalence of opioid overdose and the life-saving benefits of OAT, including offering treatment at the time of overdose, this is an important area of focus for future educational initiatives.

RE-ESTABLISHING A HEALING RELATIONSHIP: A BRIEF EDUCATIONAL INTERVENTION FOR RESIDENTS ON TREATING WITHDRAWAL AND PAIN IN INPATIENTS WITH OPIOID USE DISORDER

Ayako W. Fujita, Anna LaRosa, Andrea Carter. Internal Medicine, University of Pittsburgh Medical Center, Pittsburgh, PA. (Control ID #3389884)

NEEDS AND OBJECTIVES: Initiating medications for opioid use disorder (MOUD) in the inpatient setting may help minimize readmissions and mortality. Despite evidence supporting use of MOUD, there remain significant barriers to prescribing including insufficient training. Internal medicine (IM) residents, as the primary physicians caring for many inpatients with opioid use disorder (OUD), are optimally positioned to facilitate inpatient use of MOUD. We developed, implemented, and evaluated a brief educational intervention for IM residents with the goal of increasing knowledge and confidence about managing opioid withdrawal and pain in inpatients with OUD.

SETTING AND PARTICIPANTS: Participants included all interns and residents rotating on general medicine wards during November and December 2019 at two hospital sites of a large, urban, academic residency program.

DESCRIPTION: The brief educational intervention consisted of a chief-resident led 35-minute case-based presentation highlighting the basics of managing opioid withdrawal and pain in inpatients with OUD. Main learning points included choosing between methadone and buprenorphine as MOUD for treatment of withdrawal, initial dosing of methadone and buprenorphine, identification and treatment of precipitated withdrawal, and initial dosing of full opioid agonists for treatment of pain in patients on MOUD. This content was adapted from the Chief Resident Immersion Training in Addiction Medicine Program and was reviewed with local content experts to ensure concordance with local practices. The intervention was delivered during pre-existing required orientation sessions to minimize the need for additional teaching space and time.

EVALUATION: We developed a pre- and 1-month post-intervention survey to evaluate participants' knowledge and confidence, which included 5 multiple choice questions to assess knowledge and 5 Likert- scale questions (from 1=Not confident to 5=Extremely confident) to assess confidence. The mean number of knowledge questions correct and the mean confidence Likert-score for each question were compared pre- versus 1-month post-curriculum using paired Student's t-tests with 2-sided p-value<0.05 indicating significance.

Of 60 interns and residents participating in the educational intervention, 23 (38%) completed both surveys and were included in the evaluation. The mean number of knowledge questions correct out of 5 increased from 3.0 pre- to 4.4 post-intervention ($p<0.001$). Mean confidence increased from below 2 pre- to over 3 post-intervention on 4 questions ($p<0.001$ for all) and remained high (above 3.5 both pre- and post-) for the 5th question ($p=0.33$).

DISCUSSION / REFLECTION / LESSONS LEARNED: A brief educational intervention delivered during existing curricular time had a significant impact on residents' knowledge and confidence on inpatient management of opioid withdrawal and pain in patients with OUD. Time of delivery during orientation to an inpatient general medicine ward rotation was key, as the content was relevant and immediately applicable.

RELATIONSHIP BETWEEN SYSTEMS THINKING AND OTHER HEALTH SYSTEMS SCIENCE DOMAINS- RESULTS OF A QUALITATIVE ANALYSIS OF PATIENT NAVIGATOR STUDENT RESPONSES.

Mamta K. Singh[1]; Heidi Gullett[1]; Sarah Koopman- Gonzalez[1]; Amy Wilson-Delfosse[1]; Patricia Thomas[2]. [1]School of Medicine, Case Western Reserve University, Cleveland, OH; [2]Medicine, Case Western Reserve University School of Medicine, Cleveland, OH. (Control ID #3392389)

NEEDS AND OBJECTIVES: Health Systems Science has emerged as a "third pillar" of medical education along with basic and clinical science and includes topics such as health policy, population health, social determinants of health and systems thinking. Patient navigation (PN) experiences has been described in literature as an effective method to teach health systems science concepts. However the relationship between the interlinking domain of systems thinking and the other HSS domains is not clear. We describe a PN elective for first year medical students and a qualitative analysis of student responses to better understand the relationship between specific health science domains and systems thinking.

SETTING AND PARTICIPANTS: First year medical students in a one-year PN elective were integrated in two high performing patient-centered medical home models. Students worked with interprofessional clinical teams to help veterans (VA) and refugee families (federally qualified health center) navigate the respecitve health systems.

DESCRIPTION: Students worked with interprofessional clinical teams to help veterans (VA) and refugee families (federally qualified health center) navigate the health system. Activities included but were not limited to, accompanying patients to medical and testing appointments, medicine reconciliation, phone follow-ups and home visits. Group work and didactics were embedded in the elective.

EVALUATION: Twenty-five students completed the year-long PN elective. Twenty-one (84%) participated in the focus groups. Analysis of the responses demonstrated that while all six core domains of HSS were noted by students, three core domains—population health, health system improvement, and value-based care were mentioned zero times as a single domain and when they were discussed, so was the linking domain of systems thinking.

DISCUSSION / REFLECTION / LESSONS LEARNED: Students participating in a PN elective confirmed that the experience addressed all six HSS domains. Although systems thinking can be part of all the core domains, the domains of health system improvement, value-based care and population health/public health inherently lend themselves to systems thinking. Conceptually, this makes sense as "systems thinking" refers to the knowledge and skills which allow one to have a holistic approach to care and recognize system interdependencies and these three domains inherently require an understanding of health system integration and interconnectedness.

REMAP: A NOVEL RESIDENT CURRICULUM AND COMMUNICATION FRAMEWORK FOR ADVANCE CARE PLANNING IN THE OUTPATIENT SETTING

Jacqueline To[1]; Maki Aoki[2]. [1]Internal Medicine, University of California San Francisco, San Francisco, CA; [2]General Internal Medicine, University of California San Francisco, San Francisco, CA. (Control ID #3390719)

NEEDS AND OBJECTIVES: Residents are expected to conduct goals of care discussions and advance care planning (ACP) early in training, often without formal introduction to a communication framework specific to end-of-life discussions. Outpatient training is more limited, as the majority of resident-led goals of care discussions occur inpatient. A needs assessment among our residents revealed that barriers to conducting ACP discussions in primary care clinic included uncertainty around: a structured approach to discussions (84%), initiating the conversation (91%), appropriate language to use (81%), and navigating time constraints (76%). REMAP is a well-described teaching tool (Reframe, Expect emotion, Map out goals, Align with goals, Propose a plan) developed by VitalTalk® and is specifically aimed to assist clinicians in conducting end-of-life conversations. Our curricular intervention aimed to 1) introduce REMAP as a communication framework for ACP 2) increase resident confidence and knowledge around conducting ACP in a primary care setting and 3) increase ACP completion rates among residents at our clinic site.

SETTING AND PARTICIPANTS: Participants included 17 primary care and 14 categorical residents in the Internal Medicine program at a primary care clinic at the University of California, San Francisco. A control group of 15 residents who did not receive the intervention will be included in the quantitative and qualitative analysis.

DESCRIPTION: The curriculum includes a 1-hour presentation of the REMAP framework and case-based discussion among participants. Cases address common challenges to conducting ACP in the outpatient setting, including time constraints, patient/family member factors, initiating the discussion, heterogeneity of medical conditions, and uncertainty about appropriate language to use. As part of an ongoing panel management curriculum, residents are given dedicated time in a separate 1-hr session to identify and contact panel patients who would benefit from an ACP discussion. A third 1-hour simulation workshop with feedback from faculty trained in the VitalTalk® and REMAP methodology is pending.

EVALUATION: Residents completed a pre/post survey assessing confidence in conducting ACP discussions in the inpatient and outpatient setting. Preliminary data indicates increased confidence in eliciting patient goals and values, timing of ACP discussions, knowledge of concrete language or phrases to use, and providing a recommendation to patients. Final survey data and quantitative data comparing ACP completion rates between residents who received the intervention versus a control group will be available by the SGIM conference.

DISCUSSION / REFLECTION / LESSONS LEARNED: There is a gap in medical resident education around concrete frameworks for serious end-of-life discussions. REMAP is one effective communication tool that can be used in primary care settings to aid trainees in a step-wise approach to ACP discussions. Residents exposed to the REMAP framework are more likely to express confidence in initiating and conducting ACP discussions.

RESIDENTS AS EDUCATORS: IMPLEMENTATION AND EVALUATION OF A CROSS- DISCIPLINARY ELECTIVE

Rachel S. Casas[1]; Amanda B. Cooper[2]; Ami DeWaters[1]; Amy M. Westcott[1]; Jennifer A. Meka[3]. [1]General Internal Medicine, Penn State Health Milton S. Hershey Medical Center, Hershey, PA; [2]Surgery, Penn State Milton S. Hershey Medical Center, Hershey, PA; [3]Jacobs School of Medicine and Biomedical Sciences, Buffalo, NY. (Control ID #3390584)

NEEDS AND OBJECTIVES: The development of teaching skills has been identified as an important component of resident education by the Liaison Council and the Accreditation Council for Graduate Medical Education. Existing published interventions to promote residents' teaching skills primarily describe short, stand-alone programs in single departments. Consequently, we developed, implemented, and evaluated a cross-disciplinary, clinical teaching elective for residents.

SETTING AND PARTICIPANTS: This 2 week elective was piloted in January 2019 with 11, self-selected residents from the Departments of Internal Medicine, Pediatrics, and Neurology at Penn State.

DESCRIPTION: Curricular content included teaching skills, curriculum development, medical education scholarship, and professional development. We utilized multi-modal techniques with an emphasis on active learning, such as observed structured teaching exercises (OSTE) and observing peers' teaching sessions.

EVALUATION: Participants completed surveys measuring attitudes about teaching practice and careers in medical education using locally developed and the Conceptions of Learning and Teaching (COLT) instruments. Surveys were compared pre-course, immediately post-course, and three months post-course using Wilcoxon signed rank tests. Residents' teaching skills were directly observed by faculty in OSTE and peer teaching sessions using a performance rubric compared at the beginning and end of the course. Participants also completed daily exit tickets and a final course evaluation.

DISCUSSION / REFLECTION / LESSONS LEARNED: Nine residents completed course surveys at all time points. In comparisons over time, we found limited statistically significant change in reported attitudes towards education and in directly observed teaching skills. This may be because residents self-selected to participate and many had completed additional educator skill development programs. Evaluation of a comparison group of residents who did not participate in the elective could help clarify these results.

Course evaluations were highly positive with all residents reporting that they agreed or strongly agreed that the "course met my expectations and reasons for enrolling" and "my personal teaching benefited from participating in this course". Recommendations for improvement included recruiting faculty from more departments, increasing the clinical relevance of certain sessions, and adding content on curriculum development.

Key challenges encountered during implementation were balancing residents' varied clinical requirements, baseline knowledge levels, and applicable skills based upon their departments and teaching goals.

SEE ONE, DO ONE, TEACH ONE: COMMUNICATING CHALLENGING NEWS - AN INTERACTIVE RESIDENT AS TEACHER WORKSHOP

Rebecca Shafer[1]; Stephanie Izard[1]; Gabrielle R. Goldberg[3]; Lauren Block[2]. [1]Internal Medicine, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Great Neck, NY; [2]Medicine, Northwell

Health, Lake Success, NY; [3]Department of Science Education, Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY. (Control ID #3389416)

NEEDS AND OBJECTIVES: Communicating challenging news to patients is a core set of skills for internal medicine residents, yet many have variable preparation and comfort level in this area. We believe that training in this skill should be integrated into an internal medicine residency's curriculum. By providing the framework of the SPIKES protocol through an initial interactive workshop, senior residents are then able to act as teachers to new 1st year residents in a subsequent "Resident as Teacher" session.

SETTING AND PARTICIPANTS: Internal medicine residents, including 1st, 2nd and 3rd years, participated in an initial interactive workshop about the skills involved in communicating challenging news during their ambulatory care didactic curriculum. In a follow up "Resident as Teacher" session, current 3rd year residents, who participated in the original workshop 8 months prior, now acted as teachers for the new 1st year residents.

DESCRIPTION: The initial interactive workshop was facilitated by palliative care faculty. It involved a didactic curriculum centered on the SPIKES protocol as a framework and an interactive role play scenario. The "Resident as Teacher" workshop 8 months later allowed now 3rd year residents to teach the SPIKES protocol to new 1st year residents. 2nd year residents acted as observers and assessed the teaching skills of the 3rd years. 1st years then participated in a role play scenario in which they applied the skills taught to them by the "teachers".

EVALUATION: Residents filled out surveys before and after the initial workshop assessing their skill in communicating challenging news. Post-survey self-reported knowledge was relatively better than pre-survey self-reported knowledge ($p < 0.0001$), as was self-reported comfort level ($p < 0.0001$). Preliminary results from the follow up workshops demonstrate that the majority have indicated that they had applied SPIKES since the previous workshop (61.11%), half of participants so far have recalled 4+ words from the SPIKES acronym (50.00%), and the majority agreed that they were more comfortable with the communication skill since the previous workshop (58.33%). Teaching skills of the 3rd years were assessed through the observer checklist filled out by the 2nd years, which demonstrated that 73.68% successfully displayed either 10 or 11 out of 11 of the checklist requirements. In addition, after either observing or teaching the "Resident as Teacher" workshop, the majority agreed that they felt more confident in this communication skill (52.63% for 2nd year observers and 58.82% for 3rd year teachers).

DISCUSSION / REFLECTION / LESSONS LEARNED: Through an interactive workshop, residents not only felt more confident in the skills involved in communicating challenging news, but they were also able to use these tools to act as teachers for new 1st year residents. Residents self-reported feeling more confident communicating challenging news after having the opportunity to teach the skills through the "Resident as Teacher" session.

SOCIAL DETERMINANTS OF HEALTH OSCE: ASSESSING STUDENTS' PATIENT-CENTERED COMMUNICATION AND ATTENTION TO CONTEXTUAL FACTORS

Kristy Y. Kosub[1]; Nehman Andry[1]; Diane Ferguson[2]. [1]Medicine, UT Health San Antonio, San Antonio, TX; [2]Medical Dean, UTHSCSA, San Antonio, TX. (Control ID #3391402)

NEEDS AND OBJECTIVES: Social Determinants of Health (SDoH) are the conditions in which our patients are born, grow, live, work and age[1]. These factors create social and economic inequities in our patients' lives. By understanding patient context and treating the person with the disease, not simply the disease itself, we can provide more effective and equitable care[2]. To assess medical students' ability to effectively elicit and empathically respond to patients affected by social determinants, we developed an objective structure clinical exam (OSCE) case focused on these concepts.

SETTING AND PARTICIPANTS: We have a longitudinal curriculum that addresses topics complementary to our clerkships including SDoH, transitions of care, cost effective care principles, among others. In January 2018, a working group of clerkship directors, an evaluation specialist, and clinical skills director designed and implemented a longitudinal clinical skills OSCE that includes standardized patient (SP) case scenarios in which students practice skills from our longitudinal curriculum. 407 students have participated in the case devoted to understanding SDoH contextual factors involved in patient communication.

DESCRIPTION: The SDoH case involves a patient with uncontrolled diabetes who is affected by poverty, low health literacy, lack of health education, living in an unsafe neighborhood, and challenges with transportation and access to care. Students are assessed on communication skills, identification and exploration of contextual factors, and whether or not the proposed care plan is comprehended by the patient.

EVALUATION: Majority of students (>90%) scored high in demonstrating patient-centered communication skills. Contextual factors discovered by students were variable: 79% identified patient was not taking medication due to expense; 72% explored challenges with diet; 67% explored challenges with transportation; 63% found patient lives in unsafe neighborhood; and 39% discovered patient lacks proper diabetes education. Nearly 90% of students' treatment plans were felt to be manageable and understandable. Student feedback shows >90% of agreed/strongly agreed that knowledge and skills assessed were clinically relevant, sufficient time was given, and setting/context of the case seemed authentic.

DISCUSSION / REFLECTION / LESSONS LEARNED: This is an effective method to observe learners' use of patient-centered communication techniques in a complicated social situation and assess their ability to address SDoH challenges. Student OSCE performance informed teaching of foundational SDoH principles through innovative approaches. We learned the importance of carefully crafting the case to authentically depict the patient's life and contextual factors to enhance student learning.

SOCIAL MEDICINE IMMERSION MONTH: DESIGN OF A SOCIAL JUSTICE AND COMMUNITY BASED CURRICULUM TO EXPAND THE CRITICAL CONSCIOUSNESS OF RESIDENT TRAINEES

Vanessa K. Ferrel[1]; Robert Rock[2]; Chanelle Diaz[3]; Iman F. Hassan[1]; Oladimeji Oki[2]; Luis Gonzalez Corro[1]; Ekua Ansah-Samuels[2]. [1]Internal Medicine, Montefiore Medical Center, Bronx, NY; [2]Family and Social Medicine, Montefiore Medical Center, Bronx, NY; [3]Department of Medicine, Montefiore Medical Center, Bronx, NY. (Control ID #3392469)

NEEDS AND OBJECTIVES: During the 2018-2019 academic year, a group of under-represented minority residents in the Residency Program in Social Medicine at Montefiore restructured existing social medicine orientation curricula using frameworks of critical theory, structural competency, and intersectionality. This restructuring intended to decenter the academic perspective, center community and activist voices, promote self-reflection and increase critical consciousness among trainees in order to sensitize them to barriers patients face, and highlight the resiliency and strength of the Bronx.

SETTING AND PARTICIPANTS: Over the course of three weeks, 26 trainees in social family medicine, internal medicine, pediatrics, and behavioral health participated in the Social Medicine Immersion Month (SMIM). There were a total of 27 one to two hour sessions, in the form of lectures, panel discussions, workshops, and reflection sessions, in addition to optional after-hours off-site activities.

DESCRIPTION: Session topics and learning objectives were designed to provide a theoretical foundation to understand illness through frameworks of power and oppression with the intent of informing future action in using medicine as a means to social justice. Themes included 1) forms of systematic family separation including immigration, mass incarceration, mandated reporting 2) anti-racism and racial equity within public health and medicine; 3) global health partnerships and imperialism; 4) labor movements in health care; and 5) activism, advocacy, and allyship in medicine. Facilitators were solicited by the core planning committee based on their involvement in local or city-wide activism and community organizing experience to ensure best-fit, and were compensated for their time. Most presenters were people of color who lived or worked in the Bronx.

EVALUATION: Pre- and post-course surveys were distributed to collect information on baseline and end-of-course knowledge, attitudes, and behavior. Weekly surveys were administered to collect impact and response to each individual session. A group nominal evaluation was conducted at the end of the course. In 24 out of 27 sessions evaluated, on average >93% of respondents thought the sessions should be repeated with no changes or only minor changes. Overall, participants felt that sessions facilitated needed conversations regarding physicians' power within healthcare delivery to minoritized and oppressed populations. They noted changes in their perception of power dynamics in healthcare within marginalized populations, as well as greater awareness of issues of segregation, critiques of health systems, and community self-determination. Comprehensive data analysis of all components is ongoing.

DISCUSSION / REFLECTION / LESSONS LEARNED: Critical race theory is an important framework for academic and medical curricula. SMIM demonstrates that an effective and impactful curriculum connecting community and clinic experiences can be designed by residents employing selected concepts of critical race theory, structural competency and intersectionality.

SO YOU THINK YOU CAN SUPERVISE?

Christopher D. Jackson[1]; Desiree Burroughs-Ray[2]; Natalie E. Dunlap[1]. [1]Internal Medicine, University of Tennessee Health Science Center, Memphis, TN; [2]Internal Medicine, UTHSC, Memphis, TN. (Control ID #3387892)

NEEDS AND OBJECTIVES: The Accreditation Council for Graduate Medical Education requires residency training programs (RTPs) to allow senior residents to practice with increasing levels of authority and responsibility. Part of this responsibility involves supervising of junior residents in the management of patients in the clinical setting. The transition to supervising resident is one of the most challenging in the life of an internal medicine resident. At the UTHSC Internal Medicine program, all categorical medicine interns participate in a half day retreat in June of intern year to discuss topics pertinent to the new supervising resident. While these retreats have been well received, supervising residents have noted the need for more training on the skills associated with being a supervising resident. In response, we developed the Transition to Supervising Resident Curriculum described here.

SETTING AND PARTICIPANTS: All categorical Internal Medicine and Internal Medicine-Pediatrics UTHSC interns not on night float, vacation, or ICU rotations were included in the intervention, which was implemented during the noon conference lecture schedule in July 2019.

DESCRIPTION: The Transition to Supervising Resident Curriculum consisted of nine interactive modules conducted during the month of July. Traditionally, the noon conference schedule in July is tailored to give our new interns foundational didactics in inpatient and outpatient internal medicine topics. Thus, senior residents (R2s) were excused from this conference to come participate in the supervising resident curriculum. Topics covered include teaching on the wards, discharge planning, time management, effective documentation, navigating transitions of care, feedback, maximizing your workflow, and wellness. During each one-hour session, residents would work in groups and discuss real life scenario cases that reflected the topic for that session. Internal medicine faculty were present to help moderate the session, providing real time feedback on the answers given by the new senior residents.

EVALUATION: 57% of residents turned in post session feedback forms administered using QR codes. Feedback has been tremendously positive, noting how each session gave these new supervising residents tools that could immediately be applied during their work on wards. Constructive feedback regarding topics to be included in future sessions were addressed.

DISCUSSION / REFLECTION / LESSONS LEARNED: Implanting a supervisor's curriculum during noon conference didactic time in July allowed more time to discuss topics pertinent to new supervising residents. These sessions have improved residents' perception of preparation for the transition to supervising resident. The rigor of second year scheduling may have limited participation by residents in July and moving the curriculum to the end of first year might be better suited for maximum impact.

SO YOU WANT TO START AN ASYLUM CLINIC AT YOUR MEDICAL SCHOOL? THE BROWN HUMAN RIGHTS ASYLUM CLINIC EXPERIENCE

Elizabeth T. Toll[1]; Odette Zero[2]; Marga Kempner[2]; Audra Fain[2]; Olivia Stone[2]; Blessed Sheriff[2]. [1]Internal Medicine and Pediatrics, Warren Alpert Medical School of Brown University, Providence, RI; [2]The Warren Alpert Medical School of Brown University, Providence, RI. (Control ID #3389866)

NEEDS AND OBJECTIVES:

Asylum seekers in the United States flee a range of physical and psychological trauma. Every year over 300,000 people from 150+ countries apply for asylum, yet the majority are unsuccessful. However, when asylum applications include a medical affidavit acceptance rates increase from 37.5% to 89%.

BHRAC aims to: Train medical and mental health professionals to conduct medical and psychological evaluations for asylum seekers; Develop a workflow to provide pro-bono affidavits to lawyers for clients seeking asylum; Offer medical students first-hand exposure to asylum medicine as scribes and affidavit-draft writers; Provide medical students with leadership, administrative, and advocacy experience; Work with local community organizations to expand evaluation services to victims of domestic violence, trafficking, and other crimes; Set up a REDCap database to track outcomes for research and evaluation.

SETTING AND PARTICIPANTS:

The Brown Human Rights Asylum Clinic (BHRAC) medical students work with over 100 medical and mental health professionals to create free evaluations and affidavits for clients seeking legal status in Rhode Island. BHRAC is part of an asylum clinic network through Physicians for Human Rights (PHR).

The Board comprises 11 medical students and one faculty advisor. Affidavit requests come from PHR, law offices, social service organizations, and free clinics. 82 practitioners and 27 students attended the 2019 annual training. Medical evaluations are conducted at a free clinic for undocumented patients, a domestic violence prevention agency, and the Wyatt Detention Center.

DESCRIPTION: Through BHRAC, medical students, lawyers, social service agencies, and health professionals work together to support clients seeking asylum. Students develop an appreciation for the social

determinants of health of asylum-seekers and the power of medico-legal partnerships. They gain mentorship and exposure to local human rights work. This innovative model can be adopted by medical schools across the U.S.

EVALUATION:

After asylum evaluations, evaluators debrief with scribes to discuss suggestions and ideas to improve the process and evaluators' approach. BHRAC students track case referral demographics and outcomes through REDCap.

DISCUSSION / REFLECTION / LESSONS LEARNED:

Challenges faced by BHRAC include: Asylum seekers are legal clients, requiring evaluators to maintain impartial relationships; Evaluators strive to obtain detailed and graphic accounts, which can be both difficult and therapeutic for clients; Evaluators and students can experience vicarious trauma from hearing client accounts, underscoring the importance of debriefing.

STARTING THE CONVERSATION: ANALYZING RESPONSES TO A SINGLE QUESTION ENGAGING APPLICANTS IN DISCUSSIONS OF DIVERSITY ON INTERVIEW DAY

Devin Oller. Medicine, University of Kentucky, Lexington, KY. (Control ID #3388387)

NEEDS AND OBJECTIVES: Over the past decade, a growing number of applicants are considering geographic and institutional diversity when applying to residency programs (Dinh and Salas 2019). After analyzing its holistic review process, the University of Kentucky (UK) IM residency program implemented several changes to interview days to help foreground UK's commitment to training a diverse residency corps. A single question that invited applicants to share how they contribute to diversity at UK was introduced to the interview template to spur discussion about the unique experiences and attributes of the applicant.

SETTING AND PARTICIPANTS: Faculty interviewer notes and interview performance scores from IM faculty were reviewed for 189 Categorical and Primary Care resident applicants attending interview days at UK from 10/2019-01/2020.

DESCRIPTION: During one of two faculty interviews, applicants were asked to respond to the following prompt: "Our program is invested in having residents with diverse experiences and life stories. What perspective would you bring to our program?" Prior to their interviews, applicants were made aware that this question would be asked, with the prompt included in the program overview alongside information about diversity at UK and the program's mission statement. Following interviews, faculty were instructed to take notes on the applicant's response. These notes were reviewed with the goal of identifying the categories of experiences and attributes (using AAMC's E-A-M model) emphasized by applicants. Applicant performance scores were compared between the interviewer who asked the diversity prompt and the interviewer who did not.

EVALUATION: 173 of 189 applicants had notes recorded about their response to the diversity prompt. There was no significant difference in mean interview performance scores by interviewers who asked the diversity prompt compared to those who did not [11.22 vs 11.14 (out of 15), P=0.37]. The most common category of experiences or attributes cited by applicants was geography (21.3% of applicants), with family status and life experiences following closely. No applicants discussed sexual orientation, race, or gender identity.

DISCUSSION / REFLECTION / LESSONS LEARNED: Introducing a single prompt addressing diversity to interview templates resulted in discussions about a broad range of applicant attributes and experiences without a significant impact on interview performance scores. Geographic diversity and family status were emphasized by over 40% of applicants combined—with family financial difficulty and rural upbringing highlighted by many. While participants included individuals who commented on their sexual orientation and race in other sections of their applications, these attributes were not discussed by any applicant in response to the question prompt, pointing to the need for further study of both applicant-identified barriers to sharing these attributes and additional structural changes to our interview day that would aid a discussion of how best to ensure URM applicants' thrive at our institution.

STRENGTHENING THE PRIMARY CARE PIPELINE: LESSONS LEARNED FROM A PRE- HEALTH VOLUNTEER PROGRAM THAT ENGAGES STUDENTS IN AN URBAN, UNDERSERVED CLINIC

Harriet Fisher[1]; Jennifer Dong[2]; Sondra Zabar[3]; Isaac Holmes[4]; Lisa Altshuler[1]. [1]PrMEIR, NYU School of Medicine, New York, NY; [2]Internal Medicine, NYU Langone Health, New York, NY; [3]Medicine, NYU School of Medicine, New York, NY; [4]Internal Medicine, NYU, New York, NY. (Control ID #3390467)

NEEDS AND OBJECTIVES: There is a well-documented shortage of primary care providers in the United States, especially in underserved populations. At our adult primary care clinic in one of the nation's oldest public hospitals, we sought to (1) provide pre-health students with opportunities to connect with and learn from physician leaders and role models, and (2) integrate them into healthcare teams to transform the primary care clinic.

SETTING AND PARTICIPANTS: The primary care navigator program attracted students from New York City colleges. Volunteers (n=54/70 total volunteers in program to date) were predominantly female (62%); all were in college or graduate programs, 35% attend public colleges; 74% are non-white; 76% do not have a family member in medicine; 30% are first generation college students.

DESCRIPTION: We developed a student volunteer program in collaboration with many disciplines (physicians, nurses, MAs, clinic leadership). Volunteers help patients navigate the clinic, resupply patient education materials and respond to clinic needs. Students were invited to regular talks and workshops, including meeting with the chief of medicine, a Q&A on medical school admissions, and regular check-ins with program coordinators. We conducted surveys of current volunteers every 6-12 months to understand the impact of our program on the volunteers' career goals.

EVALUATION: When current 2019 students were surveyed (n=16) 80% said the program had made them "yes" or "maybe" more likely to pursue primary care, while all were "yes" or "maybe" more likely to pursue medicine.

DISCUSSION / REFLECTION / LESSONS LEARNED: We learned two key lessons. First, volunteer attendance and engagement increased when they were responsible to multiple team members. In this system, volunteers checked in routinely with a physician, administrator and research assistant. One volunteer expressed, "I was able to get a lot of patient interaction and see how healthcare is provided from different perspectives such as healthcare personnel and mainly the patients." Second, when we connected student volunteers to specific projects in the clinic (chronic disease initiatives, medical scribe pilot), they chose to work more shifts and stayed in the program longer. Most importantly, working in our primary care navigator program reinforced their desire to pursue careers in medicine, specifically primary care, "working as a PC navigator has made me see the beauty of primary care."

SUPPORTING THE DEVELOPMENT OF WHOLE PHYSICIANS THROUGH IMPLEMENTATION OF A LONGITUDINAL, SPIRAL, SKILLS-BASED WELL-BEING CURRICULUM IN ARCH WEEKS

Adrian Anzaldua[1]; Catherine Lomen-Hoerth[3]; Karen E. Hauer[2]; Irina Kryzhanovskaya[1]. [1]Intern Medicine, UCSF, San Francisco, CA; [2]Medicine, UT Southwestern Medical Center, San Francisco, CA; [3]Neurology, UCSF, San Francisco, CA. (Control ID #3391183)

NEEDS AND OBJECTIVES: Medical students experience a high prevalence of burnout1, depression1, and anxiety2. Studies of structured curricula addressing these issues suggest that offering a variety of evidence- based skills training is more effective than mandating training in any one area.3 At the University of California, San Francisco (UCSF), School of Medicine, eight ARCH Weeks (Assessment, Reflection, Coaching, and Health) over four years provide dedicated curricular time for a well-being curriculum designed to meet the following objectives: 1) to generate awareness of the structural and individual factors that predispose medical students to burnout and other mental health challenges, and 2) to develop students' well- being skills that can be incorporated into everyday routines.

SETTING AND PARTICIPANTS: The UCSF Bridges Curriculum includes an 18-month foundational curriculum (F1) with the first four ARCH Weeks. During ARCH weeks, students reflect on their professional development, participate in assessments, explore career opportunities, and, as of 2019, engage in an integrated well-being curriculum. The class of 2023, which includes approximately 160 students, is the first class to participate in the longitudinal ARCH Week skills-based curriculum.

DESCRIPTION: During ARCH Week 1, students receive a foundational didactic on well-being trends and are encouraged to individually reflect on how they attend to their own well-being. Students then choose at least one mandatory well-being skill selective to explore during ARCH weeks 1 through 4 as a foundational self-care practice. Led by local experts, examples of skills trainings offered for exploration include mindfulness, mind-body medicine, outdoor exercise, and reflective writing.

EVALUATION: Outcomes are assessed via student surveys measuring burnout and resilience, evaluations of skill selectives, de-identified individual well-being SMART (Specific, Measurable, Action-Oriented, Realistic, Time-bound) goals, and responses from student focus groups. Initial evaluations from ARCH Week 1 show high ratings for skills selectives (3.55 out of 5, 5=rated highest quality). 28% of students who voluntarily took the Maslach Burnout Inventory showed burnout in at least one domain. Assessment of SMART goals showed 54% of students created a time-bound wellness-related SMART goal after engaging with the wellness curriculum.

DISCUSSION / REFLECTION / LESSONS LEARNED: The well-being curriculum within ARCH Weeks is a novel approach to introducing and incorporating wellness training in medical school. Students showed significant engagement with, and uptake of, this curriculum. Providing protected curricular time to develop well-being skills is critical to the curriculum's success and communicates that the administration values arming students with healthy habits of mind. This well-being curriculum can impact students' intentional engagement with their wellness and the activities that promote it.

TAKING TRANSITIONS OF CARE HOME: AN INNOVATIVE HOME VISIT CURRICULUM FOR MEDICAL STUDENTS CARING FOR SUPER-UTILIZER PATIENTS IN A SAFETY-NET SYSTEM

Vishnu Kulasekaran[1]; Jeremy Long[2]; Jennifer Adams[1]. [1]General Internal Medicine, Denver Health, Denver, CO; [2]GIM, Denver Health, Denver, CO. (Control ID #3388688)

NEEDS AND OBJECTIVES: Improving transitions of care (TOC) is a critical objective with increasing demands to improve quality of care as patients transition from inpatient settings to outpatient settings. Despite this, relatively few medical schools and residencies have formal curricula on TOC. We aimed to develop an innovative longitudinal curriculum in TOC, including home visits, for students enrolled in a Longitudinal Integrated Clerkship (LIC) at a large urban safety-net institution.

A local needs assessment consisted of a survey of 91 faculty as well as a survey of LIC students who participated in the program prior to the development of this curriculum to assess gaps and inform desired outcomes.

The goal of the curriculum is to improve the knowledge, skills, and attitudes of students in transitions of care. The multi-modal curriculum includes small group didactics and discussion, participation in one non-medical home visit accompanied by a primary care provider and a reflective writing assignment.

SETTING AND PARTICIPANTS: Pre-curriculum surveys were collected from prior cohorts of LIC students as well as the intervention group prior to their start of the TOC curriculum. Students received an introduction to TOC including an inter-professional panel discussion with a social worker, care navigator and pharmD. The session was followed by a TOC workshop where students practiced written communication to PCPs on hospital discharge. All students completed a non-medical home visit and reflected on this experience through writing and small group discussion.

DESCRIPTION: Students are encouraged to complete a home visit for a patient they cared for in both outpatient and inpatient settings. 9 out of 10 of students visited a patient they cared for in primary care in the first year of the program. Students reflect on the home environment including access to food, as well as neighborhood resources and challenges after completing the visit. The majority of patients were cared for in Denver Health's hospital super-utilizer clinic (Intensive Outpatient Clinic – IOC) providing ample opportunity for students to participate in various transitions.

EVALUATION: The curriculum was highly rated. In the pilot year, students demonstrated increased confidence in communicating with primary care physicians on hospital discharge for issues requiring follow- up. 90% of students agree or strongly agree that the home visits increased their awareness of the impact of the home environment on the patient's health.

DISCUSSION / REFLECTION / LESSONS LEARNED: Transitions of care curricula are well suited to longitudinal integrated clerkships where students are expected to follow patient care longitudinally. The partnership with the IOC has been critical to the program's success in helping students connect to patients agreeable to home visits. Faculty participation with the students on home visits poses logistical barriers.

TEACHING EMPATHY WITH ALL WE GOT

Areeba Jawed[1]; Diane L. Levine[2]. [1]Internal Medicine - Nephrology, Wayne State University, Grosse Pointe Woods, MI; [2]Internal Medicine, Wayne State University, Detroit, MI. (Control ID #3386770)

NEEDS AND OBJECTIVES: The aim of this intervention was to assess if a low cost intervention in the form of a modified large group 4 hour workshop for MS4 students transitioning into various residencies would result in improved communication skills.

SETTING AND PARTICIPANTS: A 4 hour workshop was offered to 38 medical students in their 4th year at Wayne State University School of Medicine.

DESCRIPTION: Due to limitations of time and resources all 38 students had to be accommodated in a single 4 hour session based on the Vital Talk™ format facilitated by trained faculty. The workshop consisted of a brief didactic followed by an encounter with a simulated patient. Since such sessions are generally held in smaller setting, a group of 7 students was brought forward twice and the rest remained part of the larger audience. Approximately 4 learners from each of the small groups were able to participate in a simulated patient encounter addressing goals of care. Questions and feedback were welcome from the entire group as part of the learning experience. Pre and Post surveys were obtained

EVALUATION: 20 (52%) of the participants were male.5((13%) had a prior rotation in palliative medicine.

89% Agreed/Strongly Agreed that they would recommend a Vital Talk™ Communication Skills course to a colleague, 97% Agreed/ Strongly Agreed that the faculty created an atmosphere where they could learn from their peers, 100% Agreed/Strongly Agreed that the course taught skills useful in residency. Competencies were assessed on a Likert scale (1 to 5) in the domains of preparedness to deliver bad news, negotiate an agenda, respond to emotion, discuss goals of care and deliver a plan of care that includes hospice. Pre and Post means were compared all of which showed significant improvement in the post-test assessment ($p<0.05$)

DISCUSSION / REFLECTION / LESSONS LEARNED: Our low-cost intervention demonstrated that learning from peers and faculty can occur in larger groups in the setting of a structured approach and effective format. While we strive to achieve an ideal learning environment with small groups and experiential learning, smaller efforts to incorporate communication skills training may also have meaningful impact for our learners and must be pursued

TEACHING MEDICAL STUDENTS THE SOCIAL DETERMINANTS OF HEALTH THROUGH SERVICE-LEARNING

Julia E. Noguchi[1,2]; Dana Chofay[1]; Rory Merritt[1,3]; Srilakshmi Mitta[1,4]; Jennifer DiTusa[1]; Steven Rougas[1,3]. [1]Medical Education & Continuous Quality Improvement, Warren Alpert Medical School of Brown University, Rumford, RI; [2]Community Health Sciences, Boston University School of Public Health, Boston, MA; [3]Emergency Medicine, University Emergency Medicine Foundation, Providence, RI; [4]Obstetrical Medicine, Women and Infants Hospital, Providence, RI. (Control ID #3387182)

NEEDS AND OBJECTIVES: Service-learning in medical education is a promising modality to teach medical students the necessary skills to recognize how patients' social contexts influence their lives, their health, and affects their choices. At the Warren Alpert Medical School of Brown University (AMS), we aimed to: 1) implement a longitudinal, two-year, mandatory service-learning component within AMS's Doctoring (clinical skills) Program, 2) develop students' knowledge, attitudes, and skills to identify and to address the social determinants of health, and 3) establish best practices for required service-learning activities that respond to both institutional and community needs.

SETTING AND PARTICIPANTS: All first- and second-year Doctoring students are required to participate in service-learning in a community-based organization that offers resources to underserved patients or clients.

External partners include community residents, community-based organizations, and state agencies. Ten community sites collaborate in the program, in addition to those that are involved in pre-clerkship electives and sites that students identify on their own.

DESCRIPTION: All first- and second-year Doctoring students complete a minimum of four hours of service-learning at a community site each year. We used the LCME's definition of service-learning to develop the program, which includes medical students' 1) service to the community in activities that respond to community-identified concerns; 2) preparation; and 3) reflection. To prepare students for service-learning, AMS hosts orientation sessions led by community experts from organizations partnering in the initiative. Following completion of the activity, students write a reflective field note on key insights that they gained about their role as future medical professionals in teamwork, leadership, and community partnership and engagement.

EVALUATION: Data from course evaluations show that 87% of second-year Doctoring students ($n = 131$) rated service-learning as "good" or better on a 5-point Likert scale, with 19% rating it as "outstanding" ($M = 3.56$, $SD = 0.98$). We are in the process of creating a toolkit consisting of key components for developing a service-learning program, lessons learned from implementation, and characteristics of community-based organizations to consider when selecting sites that other medical schools can use to develop, implement, and evaluate their own service-learning programs.

DISCUSSION / REFLECTION / LESSONS LEARNED: A clinical skills program provides a natural entry point and the curricular structure for service learning. The option to participate in a longitudinal service-learning project allows for deeper student engagement at community sites and a pipeline of students to help advance the work. Results from our pilot project and current program have shown that interacting with community members in locations where they are receiving services, i.e. "on their own turf," encourages students' flexibility, nimbleness, and perspective-taking that students would not otherwise experience in the classroom.

TEACHING PANEL MANAGEMENT AND QUALITY IMPROVEMENT IN THE CLINIC

Amanda Cox, Tammy Ellies, Katie Grzyb. Internal Medicine, University of Michigan, Brighton, MI. (Control ID #3392713)

NEEDS AND OBJECTIVES: Participation in panel management and quality improvement (QI) activities is a requirement of internal medicine residency programs. Due to emphasis on inpatient work, residents have limited opportunities to engage in population health initiatives in the ambulatory setting. Lack of faculty with QI expertise limits the capacity of training programs to provide guidance for projects in the resident clinic setting.

SETTING AND PARTICIPANTS: A curricular intervention was developed to increase resident engagement in panel management and QI activities within their continuity clinics while providing faculty guidance. The setting was a university based internal medicine residency program with 131 residents, with continuity clinics across 6 sites (VA, University Hospital, and 4 academic ambulatory clinic sites), and 50 teaching faculty.

DESCRIPTION: A video module with narrated slide deck was developed covering panel management and the A3 problem solving method. This was viewed by residents and faculty during dedicated clinic teaching time. Residents were asked to set a goal for improving a performance measure in their panel of patients. A facilitator's guide was provided, including a partly pre-filled A3 worksheet for the measure. Using the Kirkpatrick framework for learner outcomes, initial program evaluation occurred with a post-module survey focused on Level 1 (satisfaction) and Level 2 (knowledge and skills acquisition) outcomes. During a later

continuity clinic teaching session, the residents again reviewed their patient panels and quality data. A follow-up survey was used to obtain longitudinal feedback on the program.

EVALUATION: The post-module survey was completed by 29 residents and 8 faculty. Regarding knowledge and skills, 17/23 (74%) residents and 6/8 (75%) faculty agreed the module helped them understand how scientificproblem solving methods can be applied in the clinic. Further, 24/29 (83%) residents reported the module helped them understand the components of panel management. Additionally, 27/29 (93%) residents reported reviewing their own panel data during the module, and 21/27 (78%) residents set a goal to improve the selected measure. Regarding satisfaction, 25/27 (94%) residents and 7/7 (100%) faculty rated the module complexity as “about right". In the follow-up survey 38/48 (79%) residents agreed the session was a valuable part of their training, and 30/54 (55%) received updated panel data, though only 14/53 (26%) could identify a practice change that was implemented. Comments were positive in general about the content, but indicated that more time for it would be helpful.

DISCUSSION / REFLECTION / LESSONS LEARNED: A video module with narrated slide deck and facilitator’s guide was an acceptable method to introduce internal medicine residents and faculty to panel management concepts and A3 problem solving methodology. The format supported faculty in providing the material. Future similar curricula could improve resident engagement in panel management and QI activities, and increase faculty expertise in teaching these concepts.

TEACHING SOCIAL DETERMINANTS IN THE REAL WORLD: A NOVEL RESIDENT ROTATION

Mohan Nadkarni[1]; Drew Harris[1]; Brian Uthlaut[1]; Elizabeth Arant[1]; Daniel Becker[2]; Benjamin Martin[1]. [1]Medicine, University of Virginia, Charlottesville, VA; [2]medicine, university of virginia, Charlottesville, VA. (Control ID #3392448)

NEEDS AND OBJECTIVES: Faculty observed that internal medicine residents at the University of Virginia (UVA) had limited experience with vulnerable or disadvantaged populations outside of traditional hospital and clinic settings. Residents desired a more practical anchoring of teaching of health disparities; additionally, program leadership was interested in creative ways to address burnout by increasing meaningful experiences in training for residents. We designed a novel rotation to build resident confidence and skills in advocacy and care for vulnerable populations with reflection and service time interwoven with clinical experiences.

SETTING AND PARTICIPANTS: Participants are PGY3 internal medicine residents at UVA. Clinical settings include community-based organizations (local free clinic, a resident-developed outreach clinic at a homeless day shelter, two sites affiliated with a federally funded rural community health center, a telemedicine clinic to geographically isolated Appalachian coalminers, a Ryan White HIV clinic, a local addiction clinic, and home visits with a resident’s own primary care patients.

DESCRIPTION: Prior to the rotation's diverse clinical experiences, residents undergo a newly expanded longitudinal curriculum including small group seminars on advocacy, health disparities, social determinants of health, racism and implicit bias. Non-clinical experiences on the rotation include: 1) discussion of literary works (fiction, poetry and essays related to poverty and health) led by UVa faculty; 2) debriefing participants’ own implicit bias; 3) time with a local attorney in a district courtroom where patients with unpaid hospital bills are prosecuted by the hospital or face evictions; 4) protected time for community service, cooking food at a homeless day shelter and/or working at a low income home construction site.

EVALUATION: Residents are surveyed on the program’s impact on their confidence recognizing and addressing barriers to health and healthcare delivery in vulnerable populations/communities. Residents also share in text or photo format a description of a meaningful experience on the rotation. Residents also undergo annual burnout survey and anonymous rotation evaluations.

DISCUSSION / REFLECTION / LESSONS LEARNED: This novel rotation has been well-received. Partnering with organizations outside of the academic setting has been invaluable to residents. Caring for our most vulnerable populations and seeing their needs upclose has allowed residents to better understand the barriers to health these patients face and to deepen knowledge of healthcare systems and advocacy. Community organizations have expressed positive feedback as well. Ensuring regular resident attendance and minimizing absences has been crucial to success with these partners. We believe a continuous presence as opposed to a volunteer-based elective is vital to these patients and community partners. Additionally, we feel this rotation provides unique educational value across ACGME competencies that can be otherwise difficult to teach in a holistic, real-world way.

THE BEST OF BOTH WORLDS: A MODIFIED PROBLEM-BASED LEARNING CURRICULUM TO IMPROVE RESIDENCY EDUCATION, INCREASE KNOWLEDGE RETENTION, FACILITATE COLLABORATION, AND GUIDE CLINICAL REASONING SKILLS

Megan McGervey[1]; Jamal H. Mahar[2]; Mohammad G. Mohmand[2]; Andrew Lewis[1]; Jacob Choi[1]; Carlos Isada[3]. [1]Internal Medicine, Cleveland Clinic, Cleveland, OH; [2]Internal Medicine, Cleveland Clinic Foundation, Cleveland, OH; [3]Infectious Diseases, Cleveland Clinic, Cleveland, OH. (Control ID #3391836)

NEEDS AND OBJECTIVES: Adult learners require different teaching modalities not regularly employed in residency programs. Large programs rely heavily on large group didactics that have proven to have low retention rates. Problem-based learning (PBL) is a learner-centered approach where learners work in groups to solve a problem using an active and iterative process in which knowledge gaps are identified by the learners. While this concept is regularly used in undergraduate medical education, it is not regularly used in residency programs as a longitudinal curriculum. Our objective was to create a residency curriculum using adult learning theory that engages learners and allows for better knowledge retention while allowing for expert opinion in order to shape reasoning patterns.

SETTING AND PARTICIPANTS: Sessions take place at a large academic medical center that hosts over 180 internal medicine residents. All second and third year residents take part in the longitudinal mPBL curriculum that occur during an academic half day within protected learning time during their longitudinal clinic week using a 4+1 block scheduling model.

DESCRIPTION: In the Modified PBL structure, the focus lies on forming self-directed learning and discussion of discrete learning objectives (LOs) derived from a 2 year loop of complex clinical cases in the presence of an expert used to guide and provide appropriate feedback on clinical reasoning and diagnostic schema. Our mPBL consists of two sessions that allow learners to become familiarized with the cases and set discrete learning objectives within small groups. The second session the following day revolves around discussion of LOs with active facilitation to ensure case based learning with input from specialists. The learning is led by residents, while faculty facilitation is centered on more concrete understanding of medical concepts as well as correct interpretation of information, literature, and forming diagnostic schema. The small group discussions allow learners to make the transition from knowledge

gathering to analysis, application and practical utility of knowledge with the ultimate goal of having the learner apply the assimilated knowledge into clinical practice.

EVALUATION: Twenty-nine surveys were collected from second year residents indicating that >75% of participants "agreed" or "strongly agreed" that PBL had supplemented their education. Residents overwhelmingly enjoyed the content expert and the interactive case-based learning. Comments indicated that knowledge retention increased and that residents were made aware of knowledge gaps during discussion with their peers.

DISCUSSION / REFLECTION / LESSONS LEARNED: Based on survey data, we modified cases to incorporate complex differentials allowing for broad learning objectives with expert opinion weigh-in to apply important clinical reasoning framework concepts that can be used in a larger subset of cases.

THE CLINICAL PROBLEM SOLVERS – A DIAGNOSTIC REASONING VENTURE

Sharmin Shekarchian[1]; Arsalan Derakhshan[2]; Daniel Minter[1]; Rabih Geha[1]; reza manesh[3]. [1]Medicine, UCSF, San Francisco, CA; [2]Medicine, University Hospitals Cleveland Medical Center, Cleveland, OH; [3]Medicine, Johns Hopkins, Baltimore, MD. (Control ID #3378747)

NEEDS AND OBJECTIVES: Diagnostic reasoning is at the core of practicing medicine, however this complex process is rarely modeled as deliberate teachable habits. It most often is a passive byproduct of clinical experience. The Institute of Medicine's *Improving Diagnosis in Health Care* report, identified the lack of focus on developing clinical reasoning as a "major gap in education within all health care professions," which can contribute to diagnostic error.

A systematic review (PMID 23619071) concluded that interventions using social media tools were associated with improved knowledge, attitudes, and skills. They identified podcasts along with Twitter and blogs as social media platforms used to engage learners.

The gap identified in clinical reasoning education and the far-reaching power of social media inspired us to create *The Clinical Problem Solvers (CPSolvers) - an internal medicine venture* dedicated to improving diagnosis through a case-based, iterative process. Our aim is to analyze, teach, and democratize the art and science of diagnostic reasoning.

SETTING AND PARTICIPANTS: The *CPSolvers* is a multimodal venture featuring a weekly podcast, email summaries, tweetorials and blog posts that can be accessed by anyone for free.

DESCRIPTION: The podcast has four types of episodes: 1) Schema based in which the focus is teaching a systematic approach to commonly encountered problems through patient cases, 2) An unknown format where a blinded expert discussant is presented a case wherein she shares her clinical reasoning extemporaneously, 3) Trainee-led reasoning series, in collaboration with the *Human Diagnosis* project, where trainees paired with a mentor share their clinical reasoning while solving a Global Morning Report case and 4) Spaced learning series where previously covered schema are reviewed in the context of a new case. In addition, our website has downloadable versions of discussed schemas in PDF format with video explanations for the majority of the schemas. Furthermore, through our summary emails, tweetorials, and blog posts we further expand on some of the learning points raised in these episodes.

EVALUATION: Since the launch of *CPSolvers* in December 2018 we have produced 15 schema based, 22 unknown, 21 trainee-led reasoning, and 2 spaced learning episodes. We have created 11 tweetorials and 6 blog posts.

DISCUSSION / REFLECTION / LESSONS LEARNED: *CPSolvers* on average attracts 12,000 listeners per episode in 143 countries. Our website has >300,000 visits to date. We have ~1300 e-mail subscribers and ~10,700 twitter followers. Furthermore, our products have been used as curriculum at multiple institutions worldwide. Our trainee-led reasoning episodes have featured trainees from 12 different programs.

ONLINE RESOURCE URL (OPTIONAL): https://clinicalproblemsolving.com/

THE CLINIC AND THE COURTROOM: A MEDICAL-LEGAL INTERPROFESSIONAL EDUCATION PROGRAM

Lauren Block[1]; Janet Dolgin[2]; Gino A. Farina[3]; Jared Rosenblatt[2]; Samara Ginzburg[3]. [1]Medicine, Northwell Health, Lake Success, NY; [2]Hofstra University, Hempstead, NY; [3]Science Education, Donald and Barbara Zucker School of Medicine at Hofstra/Northwell, Hempstead, NY. (Control ID #3369487)

NEEDS AND OBJECTIVES: Undergraduate interprofessional education (IPE) helps medical students develop collaborative skills and improve attitudes towards team-based care. IPE initiatives partnering medical and law students have been primarily classroom based and included medical ethics and social determinants of health (SDH). We sought to build a medical-legal IPE program beyond the classroom that embeds students in a primary practice site for both professions: the clinic and the courtroom.

SETTING AND PARTICIPANTS: Medical and law school faculty planned the IPE program alongside students. A two-pronged approach included a mock trial competition and a medical-legal partnership (MLP) in the student-run clinic. The student-run clinic serves an uninsured, largely undocumented urban population. The mock trial competition partnered medical and law students to discuss and debate a medical-legal case, written in the context of current social and ethical issues. Law students from ten schools served as trial lawyers and for the first time, fourth-year medical students from one medical school served as expert witnesses.

DESCRIPTION: Teams of law and medical students and a law coach prepared arguments together. The competition was held in a county courthouse, with a judge presiding and faculty serving as the jury. Medical students participated in expert witness training focused on the basics of a civil case. To avoid professional blame, the trial focused on medication side effects rather than malpractice.

Students screened patients at the student-run clinic for social needs using a validated tool. This allowed a targeted appropriation of legal resources according to patient needs and preferences. To minimize use of legal resources, a HIPAA-compliant Zoom tool was used for initial meetings between lawyers and patients.

EVALUATION: Fifteen fourth year medical students and 39 law students from 10 different law schools participated in the mock trial. A post-trial survey of the participants had a response rate of 57% (51% among law students, 73% among medical students). 83% of respondents reported a positive change in attitudes toward working with students from the other profession. 96% reported the experience would make them more comfortable in interprofessional interactions in future practice.

Twenty screenings were completed during 2019. Among these, 11 patients reported difficulty affording medical services, 8 reported difficulty affording medications, 4 reported employment/workplace issues, 1 reported trouble paying utility bills, and 1 requested help with housing or immigration.

DISCUSSION / REFLECTION / LESSONS LEARNED: Through support from administration, faculty, and students, we designed a two-pronged practice-based medical-legal IPE. Lessons learned include the need for time for collaborative work between students to clarify roles and debunk myths, importance of support from administration, using topics other than medical malpractice, use of evidence-based social needs screening tools, and importance of patient needs and preferences in designing the legal partnership.

THE DEVELOPMENT OF A TRAINING COURSE FOR HOME CARE WORKERS CARING FOR ADULTS WITH HEART FAILURE

Peggy B. Leung[1]; Ariel F. Silva[2]; Jacklyn Cho[2]; Harveen Kaur[3]; Ann Lee[4]; Yanira Escamilla[4]; Faith Wiggins[4]; Monika M. Safford[5]; Lisa M. Kern[6]; Ariel Shalev[5]; Madeline R. Sterling[7]. [1]Internal Medicine, New York Presbyterian/ Weill Cornell, New York, NY; [2]Medicine, Weill Cornell Internal Medicine, New York, NY; [3]Hackensack Meridian Health, Hackensack, NJ; [4]1199SEIU-Home Care Industry Education Fund, New York, NY; [5]Department of Medicine, Weill Cornell Medical College, New York, NY; [6]Healthcare Policy and Research, Weill Cornell Medical College, New York, NY; [7]Internal Medicine - Primary Care, New York Presbyterian - Weill Cornell, New York, NY. (Control ID #3358860)

NEEDS AND OBJECTIVES: Home care workers (HCWs) are increasingly providing post-acute and long- term care to adults with heart failure (HF). Although highly involved in HF patients' self-care, our prior qualitative studies have found that many HCWs lack HF training and do not feel confident caring for HF patients. We aimed to elicit HCWs' educational needs on HF, and based on these findings, design a HF-specific training course for HCWs.

SETTING AND PARTICIPANTS: This study was conducted in partnership with the Home Care Industry Education Fund, an education focused benefit fund of the 1199 Service Employees International Union United Healthcare Workers East, the largest healthcare union in the United States. We recruited 41 English and Spanish speaking HCWs to participate in structured group discussions using a nominal group technique.

DESCRIPTION: To be eligible, HCWs had to have cared for at least one HF patient and have at least one year of experience on the job. In moderated small groups, participants were asked to generate a list of responses to 3 questions: When caring for a HF patient*: (1) What information do you want to understand? (2) What symptoms worry you most?* (3) *What situations do you often struggle with?* With lists generated for each prompt, participants ranked the responses in order of priority using a point system. Data were then consolidated by question.

In response to the first question, participants ranked HF signs and symptoms most highly, followed by HF treatment and HF medications. For question 2, chest pain was most worrisome, followed by neurologic changes. For question 3, participants struggled with encouraging their patients to follow lifestyle recommendations and the care plan.

Informed by these results, an interprofessional team developed a HF training course for HCWs. Based on feedback from HCWs themselves and Education Fund Staff, a 3-hour course was designed. The course covered the topics they wanted to learn about (HF signs and symptoms, managing symptom escalations and emergencies) through case-based learning and role-playing scenarios. Motivational interviewing techniques were taught so HCWs could use this approach to counsel on diet and exercise.

EVALUATION: HCWs' HF knowledge, contribution to HF self-care, and caregiving confidence will be assessed before and after the training course using a survey comprised of validated instrument.

DISCUSSION / REFLECTION / LESSONS LEARNED: HCWs wanted formal training on the signs and symptoms of HF and ways to assist patients with HF self-care. From these findings, and with feedback from our community partner, we designed a novel HF training program for HCWs. This course, which will be piloted and evaluated, has the potential to improve HCWs knowledge and self-efficacy and eventually impact patient care.

THE IDEAL OUTPATIENT PRECEPTOR: RESIDENTS' EXPERIENTIAL PERSPECTIVES

Neil Zhang[1,3]; Jessica Beaman[1,3]; Geoffrey V. Stetson[1,2]. [1]Internal Medicine, University of California, San Francisco, San Francisco, CA; [2]Internal Medicine, San Francisco Veterans Affairs Medical Center, San Francisco, CA; [3]Internal Medicine, Zuckerberg San Francisco General Hospital, San Francisco, CA. (Control ID #3390591)

NEEDS AND OBJECTIVES: Many residents will become outpatient preceptors (OPs) after residency. While inpatient medicine has an intrinsic system of graded responsibility (intern to senior resident), a system does not exist in outpatient medicine. Resident education is more oriented towards inpatient rather than outpatient training (Sisson et al., 2007). Few residents thus receive formal education to become OPs.

Resident input would be critical in the creation of such a curriculum. There are many studies in the literature regarding residents' preferences for OPs (Kisiel et al., 2010 & Peccoralo et al., 2013). However, there are no reports from an "experiential" perspective from after they have taken the role of OP. This study seeks to fill this gap.

SETTING AND PARTICIPANTS: The study population was 26 internal medicine 3rd-year residents participating in a teaching elective. These residents spent time as OPs for other residents with attending oversight. The settings were outpatient primary care clinics at a major academic medical center, Veterans Affairs hospital, and county hospital.

DESCRIPTION: Qualitative surveys were administered to residents before and after their experience as OPs. These included questions about preferred OP attributes, barriers to learning, and tailoring precepting based on learner level. Pre- and post-surveys were anonymized but remained linked.

EVALUATION: After data were collected, a codebook was created using concepts from the literature and open coding of a subset of surveys. Next, a preliminary analysis was performed for emerging themes and associations. The codebook was revised, and all interviews were re-coded. Checks from the senior researcher were used to ensure consistency. Memos and concept maps were created from code reports.

DISCUSSION / REFLECTION / LESSONS LEARNED: In the pre-survey, residents appreciated several OP qualities: adaptability, giving discrete learning points, systems knowledge, strong medical knowledge, empathy/ support, and time cognizance. Time was felt the biggest barrier for learning. In the post-survey, residents also identified time cognizance and adaptability as important attributes. Finally, residents strongly desired a framework for learning outpatient precepting, focused on delivering timely/effective feedback and asking focused/clarifying questions of trainees.

Residents' preferred attributes of OPs were consistent with those described elsewhere in the literature (Kisiel et al., 2010 & Peccoralo et al., 2013). These attributes remained consistent after their outpatient precepting experience. Residents also wished for a specific framework to become better OPs. This study demonstrated that residents desire additional training in outpatient precepting including giving feedback and asking questions.

THE SELF- REPORTED EFFICACY OF A CADAVER-BASED PROCEDURAL SKILLS LAB FOR INTERNAL MEDICINE RESIDENTS

Sara Gould[2]; Emily C. Knowling[1]; Rob Smola[3]; KeAndrea Titer[3]; Kimberly D. Martin[4]. [1]Medical School, University of Alabama at Birmingham, Birmingham, AL; [2]Department of Orthopedics, University of Alabama at Birmingham, Birmingham, AL; [3]Department of Medicine, University of Alabama at Birmingham, Homewood, AL; [4]Epidemiology, University of Alabama at Birmingham, Birmingham, AL. (Control ID #3373280)

NEEDS AND OBJECTIVES: The purpose of this study is to analyze the efficacy of using cadavers in procedural-based skills sessions in internal medicine residency programs by comparing pre- and post-session self-reported confidence with performing various procedures.

SETTING AND PARTICIPANTS: This study was conducted at UAB Hospital with 29 participants, all of whom are part of the UAB Tinsley Harrison Internal Medicine residency program, ranging between their PGY1-PGY3 years. Cadavers were obtained through UAB Anatomical Donor Program. This study analyzes data collected from surveys sent both pre-, immediately post-, and 4 to 6-week post-procedural skills session to analyze resident comfort levels with performing landmark-based and ultrasound-guided arthrocentesis of various joints.

DESCRIPTION: Cadaver-based simulation has been used in many surgical and subspecialty fields to teach procedural skills. However, there is a lack of current data supporting or analyzing the use of such skills sessions for internal medicine residents. We developed a cadaver-based simulation curriculum to enhance internal medicine residents' comfort with arthrocentesis.

EVALUATION: On each survey, participants were asked to rate comfort level on a likert scale of 1-5 (1 representing zero comfort, and 5 representing expert/total comfort) with obtaining ultrasounds for the glenohumeral and patellofemoral joints as well as performing glenohumeral arthrocentesis via posterior and lateral landmark approaches, and patellofemoral arthrocentesis via suprapatellar and infrapatellar landmark approaches.

DISCUSSION / REFLECTION / LESSONS LEARNED: The average number of arthrocentesis performed prior to the skills session across PGY levels was 1.63. On average, participants had a comfort level of 1.74 across all of the aforementioned procedures prior to the skills session, which indicated a comfort level between 1 (zero comfort) and 2 (comfort with maximum supervision). Following the skills session, participants reported an average comfort level of 2.94, indicating a comfort level between 2 and 3 (comfort with moderate assistance). With 4-6 week follow up, participants reported an average comfort level of 2.96. Overall confidence level increased by 70.11% from before the skills camp to the 4-6 week out point. Prior to the skills session, 60.87% of participants averaged a comfort level between 1 and less than 2, with 36.96% between 2 and 3, 2.17% between 3 and 4, and 0% averaging a score between 4 and 5. Following the skills session, only 5.56% of participants reported a comfort level between 1 and less than 2, 38.89% with a comfort level between 2 and 3, 55.56% with a score between 3 and 4, and 0% between 4 and 5. After 4-6 weeks following the session, comfort levels remained higher than pre-skills session quantities, with the majority of participants reporting a comfort level between 2 and 4. Thus, by comparing the pre- and post- skills session surveys, it can be concluded that the cadaver-based procedural skills sessions increase resident comfort level with performing these procedures.

THE VIRTUAL OSCE: PREPARING TRAINEES TO USE TELEMEDICINE AS A TOOL FOR TRANSITIONS OF CARE

Daniel Sartori, MARGARET HORLICK, Rachael Hayes, Jennifer Adams, Sondra R. Zabar. Medicine, NYU Langone Health, Brooklyn, NY. (Control ID #3361063)

NEEDS AND OBJECTIVES: The transition of care between inpatient and outpatient settings represents a particularly vulnerable time for patients. Telemedicine has the potential to help bridge this transition by offering real-time post-discharge surveillance, virtual medicine reconciliation, and coordination of multidisciplinary care. Formal telemedicine curricula do not yet exist in graduate medical education training programs, however will be an essential component of training in the near future. We sought to introduce trainees to a realistic application of telemedicine and to assess what telemedicine-specific learning needs exist in our training program.

SETTING AND PARTICIPANTS: Seventy-eight resident physicians from the NYU Internal Medicine Categorical, Primary Care, and Brooklyn Community Health tracks participated in this case as part of a multi-station observed structured clinical examination (OSCE).

DESCRIPTION: We modeled the case after a remote, synchronous visit between a resident and highly trained standardized patient (SP). The SP was recently hospitalized for decompensated cirrhosis during which diuretics were adjusted and new discharge medications were prescribed. Following discharge the SP began to experience subtle signs of fluid reaccumulation and scheduled a post-discharge video visit. Residents were tasked with taking a history, gathering objective data including a virtual physical exam and making a triage and management plan during a 10 minute scenario.

EVALUATION: We developed a behaviorally-anchored assessment tool that evaluated not only core communication and management skills but also unique telemedicine skills including items reflecting proficiency with the audio/video interface, remote patient identification, virtual physical exam maneuvers, and non-verbal communication. Response options comprised 'not done,' 'partly done,' and 'well done.'

DISCUSSION / REFLECTION / LESSONS LEARNED: Residents performed well in core communication domains: when analyzed in the aggregate, residents received 'well done' evaluations in 95% of assessment items within the Information Gathering domain; 91% of items within Relationship Development; and 78% of items within Education and Counseling. There were only two total assessment items (<1%) evaluated as 'not done' within these domains.

However, residents struggled with telemedicine-specific items. Residents received 'well done' evaluations in only 45% of items within the Telemedicine Skills domain. Specifically, fewer than 25% (n=19) of residents assessed technical barriers during the video visit, and only 18% (n= 14) attempted a virtual physical exam. Only 16% of residents (n=13) received 'well done' evaluations for using video to augment information gathering – a key item that included virtual medicine reconciliation and discussing care plans with onsite collateral. These findings were consistent when data were stratified by training track and training year – there were no significant associations between telemedicine skill evaluation and training track (p=0.57) or post- graduate training year (p=0.91).

TIME TO TAKE ACTION: EMPOWERING TRAINEES THROUGH EDUCATION ABOUT SEXUAL HARASSMENT

Jaya Raj[2,1]; Nicole Piemonte[1,2]; Kristina Chapple[2]. [1]Creighton University School of Medicine, PHOENIX, AZ; [2]Dignity Health St. Joseph's Hospital, PHOENIX, AZ. (Control ID #3342781)

NEEDS AND OBJECTIVES: Sexual harassment is prevalent in academic medicine, but resident education in how to recognize and act upon incidents of sexual harassment is lacking. The objectives for this innovation were to ensure that residents would be able to (1) define sexual harassment, (2) identify examples of sexual harassment, (3) report an incident of sexual harassment, and (4) engage in bystander interventions.

SETTING AND PARTICIPANTS: The audience included PGY-1, 2, and 3 residents in a university- affiliated community Internal Medicine residency program.

DESCRIPTION: The authors developed a 90-minute workshop for Internal Medicine residents aimed at increasing their understanding of sexual harassment and empowering them to act when they experience or witness harassment. The workshop leaders presented four case scenarios illustrating sexual harassment. The case scenarios were written by the

workshop leaders and were based on actual events with names redacted. Each case was followed by a series of discussion questions, which the residents discussed in a large group format.

EVALUATION: Workshop participants were anonymously surveyed before and after the workshop and asked to rate their own ability to perform each of the objectives. Thirty-two out of thirty-eight (84%) residents participated in the survey evaluation. The percentage of respondents who rated their ability as "excellent" increased for all four learning objectives: ability to define sexual harassment increased from 13% before the workshop to 50% after the workshop; ability to identify examples of sexual harassment increased from 19% to 56%; ability to report an incident of sexual harassment increased from 9% to 31%; and ability to engage in bystander intervention increased from 9% before the workshop to 41% afterward. The median score increased by exactly 1 Likert point and was a statistically significant increase at the <.001 or .001 level for all 4 items.

DISCUSSION / REFLECTION / LESSONS LEARNED: Internal Medicine residents who participated in the 90-minute workshop reported an increase in their ability to define and identify examples of sexual harassment. They also rated their ability to report sexual harassment and engage in bystander intervention higher than they did before the workshop. However, more intervention is needed to empower trainees to take action and engage them in actively promoting a culture of zero tolerance for this behavior.

TRAINING TO CURE – IMPLEMENTING A NOVEL HEPATITIS C CLINIC CURRICULUM IN PRIMARY CARE RESIDENCY TRAINING

Yihan Yang[1]; Jeffrey M. Luk[2]; Andre N. Sofair[1]; Siyuan Ma[3]; Yanhong Deng[3]; Joseph Canterino[4]. [1]Internal Medicine, Yale, New Haven, CT; [2]Internal Medicine, YNHH, New Haven, CT; [3]school of public health, Yale university, New Haven, CT; [4]Internal Medicine, Yale University, Hamden, CT. (Control ID #3392466)

NEEDS AND OBJECTIVES: With chronic hepatitis C virus (HCV) infection affecting approximately 2.4 million people in America, a shortage of treatment expertise and referral resources contribute to the challenges of eliminating HCV as a public health threat. Since the introduction of direct antiviral agents, general practitioners are now positioned to help alleviate the treatment bottleneck for patients with HCV. However, internal medicine residents currently have limited exposure to HCV management during training. The Yale Primary Care Hepatitis C (YPC HCV) clinic curriculum was developed to provide internal medicine residents with the training to appropriately treat and provide access to care to patients with chronic HCV infection.

SETTING AND PARTICIPANTS: The YPC HCV clinic is housed in the Adult Primary Care Center at Yale, a resident and faculty-staffed patient-centered medical home within an urban, academic medical center. Learners are residents in the Yale Primary Care/Medicine-Pediatrics residency programs.

DESCRIPTION: Launched in 2015, the YPC HCV clinic is interdisciplinary and staffed by a general internist, an infectious disease-certified attending physician, 2 to 3 residents, a social worker, and a pharmacist. Patients with chronic HCV with or without compensated cirrhosis are seen on a referral basis.

Residents spend 2 half-days during a month-long ambulatory block in the HCV clinic. Prior to clinic, residents review the *YPC HCV Clinic Primer* for a comprehensive summary of screening, evaluation, and management points based upon national guidelines, and also attend interactive pre-clinic didactic sessions which highlight the assessment and treatment of patients with HCV. Supervised patient care includes gathering HCV infection history and risk factors, evaluating for presence of liver fibrosis, initiating direct antiviral agents, drug safety monitoring, as well as patient counseling and education regarding chronic liver disease.

EVALUATION: Between 2015-2017, 34 residents rotated through the clinic. Residents completed pre-clinic (n=34), immediate post-clinic (n=22), and 3-month post-clinic (n=23) surveys regarding their knowledge and confidence in HCV management. Knowledge scores improved from 58% pre-clinic to 76% immediately post-clinic (p<0.001), and remained higher than baseline at 66% 3 months later (p=0.006). More residents felt confident managing HCV immediately post- and 3-months post-clinic compared to baseline. Preliminary patient data show that since launch of the clinic, 53 patients were started on therapy: 33 have been cured, 1 had treatment failure, and 19 are on therapy or awaiting confirmation of cure.

DISCUSSION / REFLECTION / LESSONS LEARNED: An internal medicine residency program, primary care-based HCV clinic experience is feasible. Our curriculum results in residents with increased knowledge and confidence regarding HCV management, and a high cure rate (97%) in patients started on therapy. Our curriculum could be adopted at other institutions to grow the pipeline of internists trained to cure HCV.

ONLINE RESOURCE URL (OPTIONAL): http://tiny.cc/ypcHCVclinic

USING COMICS TO HELP MEDICAL STUDENTS SHARE EXPERIENCES ON THEIR SURGERY ROTATION

Theresa C. Maatman. Internal Medicine, Medical College of Wisconsin, Milwaukee, WI. (Control ID #3392105)

NEEDS AND OBJECTIVES: Medical students encounter considerable stress on their clerkships. The surgical clerkship has classically been a very difficult environment for medical students. To counter stressors in medical education, reflection can be helpful. Comics, a form of reflective writing has been used at the Medical College of Wisconsin to help students and residents reflect on stress in other courses. The surgical clerkship director requested the use of reflective cartooning within the clerkship due to dissatisfaction of the students with the course. The objectives of the cartooning session was to 1. Provide a safe space to allow students to express some of their experiences on their surgery rotation, and 2. Provide time for students to reflect on experiences they have had on the surgery rotation either individually through depiction in their comic or together through the sharing of comics with the class.

SETTING AND PARTICIPANTS: There were 164 third year medical students who took part in cartooning sessions in the surgical clerkship from February of 2019 through October of 2019.

DESCRIPTION:

The surgical clerkship offered a 1-hour session on reflective cartooning after the first month of the two-month rotation. The sessions started with a comic jam as a warm-up activity. participants would start with a simple shape on their paper then transform it into a character in a medical scene. The comic was then passed to their neighbor to draw the next scene of the comic. Students then had an opportunity to share their comic with the rest of the class. Following this activity participants got a brief explanation about comics. Students then had 20-30 minutes to draw comics. They were prompted to draw a comic about a positive and a negative experience on their surgical rotation. The last 10 minutes of the class students were allowed to share their comic creations. Templates were provided for those who did not want to draw their own.

EVALUATION: After the session participants received a link for an online survey. There was completion of the post survey by 91 (55%) participants. 26(29%) reported being highly stressed and 53 (59%) reported being stressed on the surgery clerkship. 72 (80%) reported decreased levels of stress after completing the cartooning session. 79 (88%) reported that is helped them reflect on the situations they depicted. 16 (18%) of participants drew a comic about a negative experience they had not shared before. 43 (49%) and 33(38%) were highly satisfied and satisfied respectively with the session.

DISCUSSION / REFLECTION / LESSONS LEARNED: Overall, the session is successful in helping students reflect and share about their experiences. They have been able to share situations they have not shared before. Participants reported it helped reduce their stress levels. Additionally, satisfaction with the sessions was high. Overall, the session helps participants in a short time to process some of the challenges in a safe and structured environment.

USING TEAM-BASED LEARNING TO IMPROVE THIRD YEAR INTERNAL MEDICINE CLERKSHIP STUDENTS' ECG SKILLS

Clara Wilson[1]; Shirley Eisner[1]; Isabel M. McFarlane[2]. [1]Medicine, SUNY Downstate Medical School, New Hyde Park, NY; [2]Medicine, SUNY Downstate Medical Center, Belle Harbor, NY. (Control ID #3390850)

NEEDS AND OBJECTIVES: The 2005 Clerkship Directors in Internal Medicine (CDIM) Survey found medical schools lacked formal instruction on ECG interpretation. In 2013, half of CDIM reported no changes in ECG instruction in the previous five years (Jablonover & Stagnaro-Green, 2016). One study reported 87% of IM interns felt that ECG training was insufficient (Eslava et al., 2009). We created ECG team-based learning (TBL) modules as an innovative and interactive approach to teach third year IM clerkship students common emergent and non-emergent ECG patterns

SETTING AND PARTICIPANTS: Three sessions of ECG TBL were prepared for use during the IM Clerkship didactic sessions with an IM faculty to lead the sessions.

DESCRIPTION: ECG TBL follows the standard format consisting of three parts: 1) individual readiness assurance test (iRAT), a quiz of six to ten multiple choice questions with clinical vignettes/ECG strips, 2) group readiness assurance test (gRAT), where the iRAT cases are discussed and answers agreed upon as team, and 3) the application exercise containing cases with cardiac pathology and varied ECG morphology, allowing the students to apply the ECG knowledge acquired from prior sessions. At the start of the rotation, ECG reading materials are provided. Students complete the iRAT and gRAT, and the application cases during the three sessions. The faculty facilitator leads the timing, logistics and discussion of rationale for the answers.

EVALUATION: Statistical analysis of the quantitative scores from the iRAT, gRAT, and application exercise will be performed. We will also survey students at the end of the clerkship to assess the impact of the ECG TBL session on their ability to interpret ECG in the clinical setting.

DISCUSSION / REFLECTION / LESSONS LEARNED: We are piloting the ECG TBL as a new modality to teach ECG interpretation as part of a broader institutional initiative to revise clerkship didactic sessions using a more interactive and integrated pedagogy for medical students. This TBL is well suited for clerkship level students because it offers the advantage of engaging students and faculty in a team based interactive approach to reason through clinical problems to obtain a deep understanding of ECG pathology with faculty guidance.

UTILIZING A LONGITUDINAL QI CURRICULUM TO BUILD QI SKILLS AND INCREASE SCHOLARLY OUTPUT IN A COMMUNITY-BASED INTERNAL MEDICINE RESIDENCY PROGRAM

Olivia Gad[1]; Zehra Hussain[3]; John Donnelly[2]; Gretchen Rickards[3]. [1]Internal Medicine, Christiana Care, Bear, DE; [2]Internal Medicine / Pediatrics, Christiana Care Health System, Newark, DE; [3]Medicine, Christiana Care Health System, Kennett Square, PA. (Control ID #3390571)

NEEDS AND OBJECTIVES: Quality improvement training and scholarly activity are required elements of internal medicine residency training but can be difficult to implement and achieve in community-based training programs due to limited time, resources, and faculty expertise. We implemented a longitudinal QI curriculum to provide residents with the basic skills required to identify, develop, implement, and evaluate quality improvement in health care while also fulfilling ACGME-driven scholarly activity requirements.

SETTING AND PARTICIPANTS: ChristianaCare is a community-based university-affiliated internal medicine residency program headquartered in Newark, Delaware. There are 36 residents in the categorical internal medicine program, each of whom participated in this required curriculum annually.

DESCRIPTION: In July 2016 we implemented a longitudinal outpatient QI curriculum as part of our ambulatory half-day education series. Year 1 involved three one- hour didactic sessions and culminated in the development of a team-based QI project. Over the subsequent two years we expanded the program to include six hours of didactic sessions annually on topics to include QI basics (e.g. PDSA cycles, A3 diagramming), root cause analysis tools, measure selection, intervention selection, data analysis, and abstract writing/ poster presentation skills. These didactic sessions also included protected time for residents to work on their QI projects and culminate in the development of an abstract submission and poster or oral presentation.

EVALUATION: Our QI program has grown tremendously over a three-year period. The number of projects associated with the curriculum increased from three to nine concurrent projects annually. The number of faculty project mentors has grown from one to eight. Our "QI Day" grew from an in-class presentation to a statewide symposium sponsored by the Delaware Chapter of the American College of Physicians. Our program's QI-based scholarly output also grew significantly during this period. During the 2016-2017 academic year, residents delivered 10 intramural QI presentations only. During 2018-2019, residents delivered 27 regional and state presentations, 12 national presentations, and received a $10,000 grant all related to QI work.

DISCUSSION / REFLECTION / LESSONS LEARNED: We used annual lessons learned to make incremental improvements to our program to enhance the experience for both residents and faculty. We also utilized the curriculum as an opportunity to develop robust, high-quality scholarly projects and scholarly presentation forums. In the process, we have developed a program culture that values and recognizes QI work among trainees and faculty.

UTILIZING CHAMBER MUSIC AS A MEANS OF TEACHING NON-VERBAL COMMUNICATION TO MEDICAL STUDENTS

Georgiana Marusca[1]; Leo Hall[1]; Diane L. Levine[2]; Simone Brennan[1]. [1]Internal Medicine, Wayne State School of Medicine, Brownstown Township, MI; [2]Internal Medicine, Wayne State University, Detroit, MI. (Control ID #3391499)

NEEDS AND OBJECTIVES: Nonverbal communication is an underappreciated component of medical education. Chamber musicians rely on nonverbal communication to synchronize their performances, and could

serve as potential instructors for medical students. We invited two renowned string quartets to perform and asked a group of third year medical students to take note of any nonverbal communications used by professional musicians.

SETTING AND PARTICIPANTS: Seventy-two third-year medical students on their Internal Medicine clerkship attended the rehearsals of both novice and expert string quartets, the Thalea and Emerson String Quartets, respectively, held at the Wayne State University school of Medicine auditorium.

DESCRIPTION: Pre and post surveys were developed by two medical students (G Marusca and L Hall) with input from communication and education experts, to determine the impact of the seminar on student's clinical education. Questions focused on student's observations of nonverbal cues by the aforementioned quartets to convey musical intention and to determine how students might use these skills clinically.

Questions were open ended and designed to encourage reflection. Two final questions asked students to rate using a 4 point Likert-type scale their confidence (1-high, 2-moderate, 3 slight, 4-no) in identifying non verbal cues in interactions with other health professionals and in interactions with patients. Open-ended responses were reviewed. Likert-type questions were analyzed using two-sided t-tests.

EVALUATION: Of the 72 attending students, 63 performed both pre- and post-surveys (63/72, 87.5% response rate). Thirty-five students, (48.6% of the students) reported no musical background. Comparison of pre- and post-survey results yielded a significant improvement in the students' ability to discern nonverbal interactions both among healthcare professionals ($p<0.01$) and between healthcare professionals and patients ($p<0.01$).

DISCUSSION / REFLECTION / LESSONS LEARNED: Following the workshop, many students commented that they began to appreciate the similarities between nonverbal cues among musicians and medical professionals, and identified specific situations where non-verbal communication would improve interprofessional and teamwork and care delivered to patients.

Chamber music, within the scope of a defined medical curriculum, may serve as a vehicle to instruct medical students on nonverbal communication. Chamber musicians and physicians share myriad similarities such as working in teams comprised of individuals with specific tasks, performing multiple practice iterations, i.e. rehearsals, and retaining a hierarchical structure that promotes mentorship. Most importantly, these two professions utilize nonverbal cues in diverse settings to achieve various goals. Within medical literature, the gravity of nonverbal cues has been well published. The teaching of nonverbal cues, however, has been underrepresented. We hope our study serves as a benchmark for the development of novel curricula related to the cultivation of nonverbal cues among medical students.

VIRTUAL PATIENT SIMULATION TO TEACH CLINICAL REASONING AND REDUCE DIAGNOSTIC ERROR

Amber Pincavage[1]; Michael Dekhtyar[2]; Saumil Chudgar[3]; Kelly Bossenbroek Fedoriw[4]; Yoon S. Park[5]; Michael Fowler[6]; Khadeja Johnson[7]; Judy Kalinyak[8]; Craig Knoche[9]; Nina Mingioni[10]; Fred Sanfilippo[11]; Stephen M. Sozio[12]; Sarah Wood[13]; Scott Stern[1]. [1]Medicine, University of Chicago, Chicago, IL; [2]Medical Education, American Medical Association, Chicago, IL; [3]Medicine, Duke University Medical Center, Durham, NC; [4]University of North Carolina, Chapel Hill, NC; [5]University of Illinois, Chicago, IL; [6]Vanderbilt University, Nashville, TN; [7]Internal Medicine, Morehouse School of Medicine, Atlanta, GA; [8]i-Human Patients, a Kaplan Company, Fort Lauderdale, FL; [9]retired co-founder i-human patients, Fort Lauderdale, FL; [10]Medicine, Sidney Kimmel Medical College, Philadelphia, PA; [11]Emory University, Atlanta, GA; [12]Medicine, Johns Hopkins University School of Medicine, Baltimore, MD; [13]Florida Atlantic University, Boca Raton, FL. (Control ID #3341307)

NEEDS AND OBJECTIVES: The IOM estimated that diagnostic error affects approximately 12 million people in the U.S. each year. Competency in diagnostic reasoning is one of the AAMC's Core Entrustable Professional Activites for Entering Residency and a critical attribute for learners to reduce medical errors. The goal of this was to examine whether technology-enhanced simulation consisting of digital lectures outlining a symptom to diagnosis approach, paired with virtual patient simulations, improved medical students' competency in clinical reasoning and reduced diagnostic errors.

SETTING AND PARTICIPANTS: 2nd and 3rd year medical student volunteers at eight medical schools.

DESCRIPTION: Students were randomized to the specific symptom group of abdominal pain (AP) or loss of consciousness (LOC) between February to December 2018. For the intervention, students were trained in their assigned symptom which included an assigned symptom-based lecture and three simulated cases for that symptom. The primary outcome was the change in the rate of incorrect final diagnoses on computer-based simulation cases between baseline and post intervention. The secondary outcome was the completeness and efficiency of their differential diagnosis on computer-based simulation cases.

EVALUATION: The 285 participants were 48% female with mean age of 25.4 years (SD = 3.00). A total of 141 and 144 students were randomized to the AP and LOC intervention case groups, respectively; there were no significant differences in baseline performance between the two groups.

The AP intervention group had a 27% absolute reduction in incorrect final diagnoses compared to baseline (35% pre-intervention vs. 8% post-intervention, $P < 0.001$). The LOC group had a 32% absolute reduction in incorrect final diagnosis compared to baseline (83% pre-intervention vs. 51% post-intervention, $P < 0.001$. Compared to baseline, learner performance increased for differential diagnoses completeness (33% to 56%; $P < 0.001$ AP group and 15% to 32%; $P = 0.001$ LOC group) and efficiency (36% to 46%; $P = 0.093$ AP group and 10% to 42%; $P < 0.001$ LOC group). The number of students needed to train to prevent an incorrect final diagnosis was 3.1 for LOC and 3.7 for AP.

DISCUSSION / REFLECTION / LESSONS LEARNED: A virtual patient education platform incorporating a diagnostic reasoning framework improved medical students' diagnostic competency and reduced diagnostic errors on computer-based simulation cases.

WHAT DO EARLY PATIENT NAVIGATOR STUDENTS THINK THEY SHOULD KNOW WHEN WORKING WITH VULNERABLE POPULATIONS?

Mamta K. Singh[1,2]; Heidi Gullett[3]; David Margolius[4,3]; Sarah Koopman-Gonzalez[3]; Klara Papp[3]; Amy Wilson-Delfosse[3]; Patricia Thomas[5]. [1]Internal Medicine, Case Western Reserve University, Cleveland, OH; [2]Internal Medicine, Louis Stokes Cleveland VA Medical Center, Cleveland, OH; [3]School of Medicine, Case Western Reserve University, Cleveland, OH; [4]Medicine, MetroHealth, Cleveland, OH; [5]Medicine, Case Western Reserve University School of Medicine, Cleveland, OH. (Control ID #3392362)

NEEDS AND OBJECTIVES: Creating opportunities where students can have meaningful longitudinal clinical experiences among medically underserved populations and learning from these experiences is critical. One such learning is what medical students think they should know when taking care of such populations and how does this knowledge map to traditional education competencies?

SETTING AND PARTICIPANTS: Three high-performing patient-centered medical homes (VA Center of Excellence in Primary Care Education, MetroHealthMedical Center Primary Care, and Neighborhood Family Practice (federally qualified community health center) have integrated first year medical student navigators on their patient centered medical home teams during an elective patient naviagator program serving identified veterans, patients from vulnerable populations and newly arrived refugee families respectively.

DESCRIPTION: Twenty five students worked with interprofessional clinical teams to help veterans (VA) and refugee families (federally qualified health center) navigate the health system. Activities included but were not limited to, accompanying patients to medical and testing appointments, medicine reconciliation, phone follow-ups and home visits. Group work and didactics were embedded in the elective.

EVALUATION: Semi Structured interviews of the first CWRU navigator cohort were conducted after completion of the patient navigator program. Total of 22/25 students participated in the focus groups.

DISCUSSION / REFLECTION / LESSONS LEARNED: Five Critical Domains were Identified by Patient Navigator students: Good communication skills, Relationship-building skills, Many types of expertise needed to have impact on patient health, Self-driven nature of patient navigation, Context of health has major impact.

WITH HER: WOMEN'S HEALTH EDUCATION FOR INTERNAL MEDICINE RESIDENTS. USING THE JIGSAW TEACHING METHOD TO INCREASE IM RESIDENTS' KNOWLEDGE AND CONFIDENCE IN PRECONCEPTION COUNSELING AND MANAGING COMORBIDITIES IN PREGNANCY

Patricia Ng[1]; Ruth Abeles[1]; Kimberly A. Kranz[2]. [1]Internal Medicine, Renaissance School of Medicine at Stony Brook University, Stony Brook, NY; [2]Internal Medicine and Geriatrics, Stony Brook University School of Medicine, Stony Brook, NY. (Control ID #3361154)

NEEDS AND OBJECTIVES: Internal Medicine (IM) residents often care for reproductive aged females, but only 17% provide contraceptive counseling (Lohr 2009). Our residency's needs assessment revealed that residents were unsatisfied with existing women's health (WH) curricula and were not confident in managing core topics.

We aim to develop a 3-year longitudinal WH curriculum, that includes workshops using the Jigsaw Teaching Method (a cooperative learning strategy where peers deliver specific content in teams) to improve IM residents' knowledge and confidence in addressing core WH topics. This abstract will review our 2nd year curricula that focuses on preconception counseling and managing comorbidities in pregnancy.

SETTING AND PARTICIPANTS: Our curriculum was given to 84 IM residents at a university program in Stony Brook, NY during the 2018-2019 academic year.

DESCRIPTION: We delivered a weekly jigsaw workshop over 5 ambulatory blocks, focusing on 5 topics: preconception counseling, contraception, pregnancy with diabetes, thyroid disease and acute illness. Residents divided into teams of 5, their "home group," and each are assigned to be an "expert" in 1 topic. To become "experts," teams split to join peers who have the same assignment and they review readings together.

Later residents return to their home group to peer teach and apply their collective expertise to solve patient cases. To reinforce teaching points, home groups compete in a facilitated gameshow.

EVALUATION: Participants completed a workshop pretest, post-test, and year end survey, which asked questions about demographics, knowledge and confidence on the focused topics, and session feedback.

Response rates were: pretest 78.6%, post-test 83.3% and year end 64.1%. Mean knowledge scores increased from 60.4% to 83.3% at post-test ($p<0.0001$), but year end scores was only 60.9%. At year end, improved knowledge sustained for questions about pregnancy complicated by diabetes (33.3% vs 66.7%, $p<0.0001$) and acute illness (75% vs 100%, $p<0.0001$). More reported "somewhat confident/confident" for contraception counseling (21.5% vs 38.6%, $p<0.05$), and WH counseling (12.3% vs 42.4%, $p<0.05$). Majority (95.72%) were satisfied with the workshop, including the interactive group work and gameshow.

DISCUSSION / REFLECTION / LESSONS LEARNED: Our findings suggest that the Jigsaw Teaching Method may be effective in increasing IM residents' knowledge and confidence in preconception counseling and managing comorbidities in pregnancy but repetition is needed to enhance retention.

We plan to continue to develop and assess our WH curriculum and hope that this can serve as a model for other training programs.

WOMEN IN LEADERSHIP DEVELOPMENT (WILD): YEAR 2 OF A LONGITUDINAL GRADUATE MEDICAL EDUCATION PROGRAM TO SUPPORT REPRESENTATION OF WOMEN IN MEDICAL LEADERSHIP

Colleen McGourty[1]; Grace Donzelli[2]; Bridget Keenan[3]; Maggie Gilbreth[4]; Lekshmi Santhosh[5]. [1]School of Medicine, University of California, San Francisco, San Francisco, CA; [2]Anesthesia, Brigham and Women's Hospital, Boston, MA; [3]Medicine, Division of Hematology/Oncology, University of California, San Francisco, San Francisco, CA; [4]Pediatrics, University of California, San Francisco, San Francisco, CA; [5]Medicine, Division of Pulmonary and Critical Care Medicine, University of California, San Francisco, San Francisco, CA. (Control ID #3387835)

NEEDS AND OBJECTIVES: Although women have achieved equal representation in medical school and some residency training programs, significant gender disparities persist at all levels of medical leadership. Evidence suggests that early career women are at particular risk for leaving the leadership pipeline. Thus we aimed to create a formalized curriculum to foster leadership development of women trainees with specific objectives including to help trainees develop 1) concrete leadership skills, 2) confidence in their ability to seek leadership positions, 3) a network of peer mentors to build leadership, and 4) a sense of agency and empowerment in their ongoing practice of leadership.

SETTING AND PARTICIPANTS: An ongoing longitudinal seminar series starting in 2018 including 136 women residents and fellows from 14 clinical departments within the University of California San Francisco (UCSF) division of graduate medical education

DESCRIPTION: For 2 years, the WILD program and has offered monthly evening seminars and workshops focusing on leadership development topics particularly relevant to female trainees as determined by an internal needs assessment, literature review, and expert opinion. 10 seminars are offered yearly including lecture-based formats (parental and family leave, salary negotiations, networking and mentorship) and exercise-based workshops (public speaking, building a personal brand, peer-share CV workshop). Speakers include UCSF faculty and outside experts.

EVALUATION: We have evaluated one full year of WILD programming using a mixed methods approach including both quantitative surveys and a qualitative focus group. Surveys included baseline and post-session evaluations of all participants' confidence in a range of leadership competencies measured on a 5-point Likert scale. These identified "negotiating a contract", "understanding family leave rights", "garnering political influence", "dealing with microaggressions", and "public speaking skills" as areas of low baseline confidence for trainees. Reported

confidence in each of these domains improved significantly after attending the corresponding WILD session ($p<0.05$). Overall, 97% of surveyed participants found sessions useful, and 99% would recommend them to a friend. For our qualitative evaluation, we conducted semi-structured interviews with a subset of WILD participants who had attended multiple sessions. These women identified a strengthened sense of community with other women at UCSF, and increased confidence in personal branding and promotion as highlights of their participation.

DISCUSSION / REFLECTION / LESSONS LEARNED: WILD sessions were well-attended across specialties despite demanding trainee schedules, highlighting women trainees' desire to engage in leadership development programming. This longitudinal seminar series improved participant confidence in multiple leadership domains while contributing to a sense of community amongst women trainees. This intervention would be easily transferrable to other graduate medical education settings.

ONLINE RESOURCE URL (OPTIONAL): www.ucsfwild.org

WORKING FROM THE TOP DOWN: A FACULTY DEVELOPMENT PROJECT IN WOMEN'S HEALTH EDUCATION

Jen Rusiecki[1]; Amber Pincavage[2]. [1]Internal Medicine, University of Chicago, Chicago, IL; [2]Medicine, University of Chicago, Chicago, IL. (Control ID #3390589)

NEEDS AND OBJECTIVES: Improve faculty's knowledge of and comfort with common women's health (WH) topics encountered in primary care.

Empower faculty to teach residents evidence-based information about WH topics.

Identify specialty providers that provide care to women and build interdisciplinary relationships between specialty providers and primary care.

SETTING AND PARTICIPANTS: To improve the care of female patients and the education of our residents, academic primary care faculty (IM and Med/Peds) from the University of Chicago were invited to participate in a faculty development program. 11 faculty members who frequently care for female patients and supervise residents were identified to form the Core Women's Health Faculty (CWHF). A CWHF member precepts the resident clinic daily.

DESCRIPTION: PCPs care for medically complex women, yet studies have shown inadequate knowledge in many core WH topics. After discovering a lack of confidence in a number of these topics by our faculty, we started a faculty development project in WH including the creation of the CWHF. Based on the results of a needs assessment, we have developed a CME curriculum of hour-long quarterly talks. The core faculty are required to attend the WH update series and an annual WH grand rounds. Utilizing the principals of adult learning theory, these update sessions involved a brief didactic by an institutional expert with the majority of the session directed by faculty questions. Faculty completed a post-test at each session based on the topic of the session.

EVALUATION: A cross-sectional survey was administered to IM and Med/Peds faculty at UCMC in 2018 to assess their knowledge of and attitudes towards core WH topics outlined by the ABIM. 50% (n=20) faculty members completed the needs assessment. 82% of the CWHF completed the survey. The overall knowledge score was 54% correct with questions addressing menopause, BRCA screening and PCOS (65%, 30%, 10% respectably) with the lowest scores. Faculty ranked level of comfort on a 4-point Likert-scale (1= little confidence in my performance, 4=I can teach others). They felt lest confident with managing pelvic pain, PCOS and women's cardiovascular disease (1.6, 2.15, 2.3 respectably). Overall faculty did not rank their confidence on the majority of these topics as "I can teach others."

Thus far we have hosted 5 updates and 2 grand rounds. This has been well attended with at least 65% of the core faculty at each session. Knowledge scores on posttest are 81% correct. Faculty rated their comfort as "I can teach" or "Confidently perform in most situations" on the majority of topics.

DISCUSSION / REFLECTION / LESSONS LEARNED: Based on our needs assessment there are gaps in faculty knowledge and comfort with core WH topics. To address this, we have developed a CWHF and a CME level curriculum including quarterly update sessions and grand rounds. Preliminary knowledge and confidence scores have improved. The next step is to collect resident-level data utilizing the annual residency survey to evaluate if the CWHF has improved resident comfort with core WH topics.

"A PATIENT WITH…": A SUBSTANCE USE DISORDER TRAINING CURRICULUM FOR INTERNAL MEDICINE RESIDENTS

Mim Ari. Department of Medicine, University of Chicago, Chicago, IL. (Control ID #3381091)

NEEDS AND OBJECTIVES: Internal Medicine (IM) residents frequently encounter patients with substance use disorders (SUDs). However, many feel unprepared to diagnose and treat SUDs, which is likely compounded by negative regard for patients with SUDs. The objective of this curriculum is to equip IM residents with skills to care for patients with SUDs by applying this information to their own empaneled patients, with the goal of empowered, compassionate and evidence-based care.

SETTING AND PARTICIPANTS: The curriculum was developed for second and third year IM residents at the University of Chicago. It was piloted during 2019 and was delivered as part of a resident ambulatory curriculum.

DESCRIPTION: Two 1-hour sessions were developed: "A Patient with Opioid Use Disorder (OUD)" and "A Patient with Alcohol Use Disorder (AUD)." During each session, facilitator-presented material covering key concepts about screening, diagnosis & treatment was interwoven with working through a structured worksheet related to a patient from the resident's outpatient panel. A case was provided if the resident did not identify a patient. The worksheet served to reinforce and apply presented concepts culminating in development of an action plan for the patient. A post-session evaluation included questions on knowledge, preparedness & attitude, and residents were asked to identify one "take-away" based on each session.

EVALUATION: Our resident needs assessment (n=44, 42% response rate) showed 86% characterized the amount of instruction received during residency in addiction as "none" or "too little". While residents frequently encountered patients with SUDs, only 56% felt prepared to diagnose and 20% felt prepared to treat SUDs generally. Following the AUD session, all residents (n=22) felt prepared to diagnose and treat AUD. After the OUD session, all residents (n=20) felt prepared to diagnose, and 79% felt prepared to treat OUD. Sixty-eight percent felt "there is little I can do to help" patients with SUDs in the needs assessment. This number decreased to 5% for AUD and 21% for OUD after the sessions. Take-away answers included plans to screen more for SUDs, initiate harm reduction strategies, and consider pharmacotherapy more frequently.

DISCUSSION / REFLECTION / LESSONS LEARNED: A SUD curriculum must empower residents to integrate SUD recognition and management into their practices. Using interactive worksheets and resident empaneled patients are promising strategies to accomplish this and can be adapted across settings and disciplines. Developing effective delivery of SUD content to trainees is paramount to improve care for patients with SUDS.
