Diabetes & Endocrinology

Supplementary appendix

This appendix formed part of the original submission and has been peer reviewed. We post it as supplied by the authors.

Supplement to: Holman N, Knighton P, Kar P, et al. Risk factors for COVID-19-related mortality in people with type 1 and type 2 diabetes in England: a population-based cohort study. *Lancet Diabetes Endocrinol* 2020; published online August 13. [https://doi.org/10.1016/S2213-8587\(20\)30271-0](https://doi.org/10.1016/S2213-8587(20)30271-0).

Supplementary information

National Diabetes Audit

The National Diabetes Audit (NDA) collates data on nearly all people with diagnosed diabetes registered with a healthcare provider in England. Individuals are included if they have a valid code for diabetes mellitus (excluding gestational diabetes) in their electronic health record. Diagnosis of diabetes is based on usual clinical practice in England which follows guidance from the National Institute for Health and Clinical Excellence who recommend that diagnosis is based on a HbA1c persistently above 48mmol/mol, a random glucose of 11.1mol/L or more, a 2-hour post 75gram glucose load of 11.1mmol/l or more, or a fasting glucose of 7.0mmol/l or more. Demographic and clinical data are extracted from general practice electronic clinical systems using the General Practice Extraction Service (a national centralised data collection service). This is supplemented by data submitted by specialist diabetes services. Each person with diabetes is identified by a unique NHS number. Data from general practices in England is available from 1st April 2003 to 31st December 2019. For the period 1st January 2018 to 31st March 2019 data was collected from 98% of general practices in England. Data was submitted by 113 specialist diabetes services.

Data on demographic characteristics and clinical markers of cardiovascular risk and co-morbidity is extracted from clinical systems. This clinical record data is linked to Hospital Episode Statistics (HES) for data on hospital admissions and discharge diagnoses and to Office of National Statistics data for dates and causes of death. Type of diabetes was based on the coded diagnostic information recorded in clinical records. Where there were inconsistencies in the type of diabetes recorded over time or in different settings the code most recently assigned by a specialist service was used if available or the most recently recorded code noted in primary care if not.

Table S1: Age-sex and multiply adjusted hazard ratios for COVID-19 related mortality by risk factors in people with Type 1 and Type 2 diabetes

	Type 1		Type 2	
	Adjusted for age and sex HR (95% CI)	Adjusted for all variables HR (95% CI)	Adjusted for age and sex HR (95% CI)	Adjusted for all variables HR (95% CI)
Deprivation				
Most deprived	2.93 (2.11 - 4.07)	1.93 (1.36 - 2.72)	1.75 (1.64 - 1.86)	1.46 (1.37 - 1.56)
2nd most deprived	2.30 (1.64 - 3.23)	1.59 (1.13 - 2.25)	1.54 (1.45 - 1.65)	1.28 (1.20 - 1.37)

Previous heart failure	1.80 (1.41 - 2.29)	2.09 (1.99 - 2.21)	2.43 (2.09 - 2.84)	2.60 (2.52 - 2.69)

*Please note also that whilst we included the category 'non-smokers', Table 1 shows that this group is <3% of all categories. We suspect this group is mostly ex-smokers but because the data comes from routinely recorded clinical records, we do not have definitive information (some could be never smokers). For avoidance of confusion, we have left their data out of the figures.

Table S3: Sensitivity analysis examining adjusted hazard ratios for COVID-19 related death in people with Type 1 and Type 2 diabetes stratified by type of classification of cause of death

* This category is used where an individual is not currently a smoker but their history is unknown therefore interpretation of the results is complex.

- indicates that small number of cases in this category meant that it was not possible to calculate a HR with appropriate CI

Table S6: Adjusted hazard ratios for COVID-19 related death in people with Type 2 diabetes stratified by ethnicity

* This category is used where an individual is not currently a smoker but their history is unknown therefore interpretation of the results is complex.

- indicates that small number of cases in this category meant that it was not possible to calculate a HR with appropriate CI
