Title: The role of vascularization in nerve regeneration

Reviewer's Name: Konstantin D. Bergmeister

Reviewer's country: Germany

Date sent for review: 2019-11-22

COMMENTS TO AUTHORS

This review summarizes the available evidence on vascularized nerve grafts for surgical nerve reconstruction. This is a very interesting topic that has been debated for many years. Whilst it is not commonly used in surgical practice as the best of my knowledge, it would if surgically possible, perhaps help to overcome the current limitations of nerve regeneration. The manuscript is written in a very well manner including illustrative figures and detailed descriptions on the involved mechanisms. Overall the manuscript is publishable as it is. I don't see any need for additional improvements.
