A definitive screening design was developed to assess the impact of 10 ingredients found within the chemically defined media. All concentrations are in g/L except trace elements, amino acids and vitamins which are mL/L. Trace element working concentration contained (g/L): 15 FeSO<sub>4</sub>.7H<sub>2</sub>O, 2.4 MnSO<sub>4</sub>.H<sub>2</sub>O, 2.4 ZnSO<sub>4</sub>.7H<sub>2</sub>O, and 0.48 CuSO<sub>4</sub>.5H<sub>2</sub>O. A 100x stock amino acid mix contained (g/L): 12.9 arginine, and 10 each of histidine, leucine and methionine. A 1000x vitamin stock contained (g/L): 0.1 pyridoxine, 0.02 folic acid, 0.05 each of thiamine, riboflavin, niacin, pantothenic acid and nicotinamide. Abbreviations: Fru., fructose, T.E. trace element mixture; A.A., amino acid mixture; Vit., vitamin mixture. The DSD was performed in  $n = 2$  biological replicates.

**Table S3 Definitive Screening Design 2.** A second definitive screening design (DSD2) was performed to assess the impact of the five ingredients identified as contributing significantly to *C. necator* growth.

All concentrations are in g/L except trace elements and amino acids, which are mL/L. Trace element working concentration contained (g/L): 15 FeSO<sub>4</sub>.7H<sub>2</sub>O, 2.4 MnSO<sub>4</sub>.H<sub>2</sub>O, 2.4 ZnSO<sub>4</sub>.7H<sub>2</sub>O, and 0.48 CuSO<sub>4</sub>.5H<sub>2</sub>O. A 100x stock amino acid mix contained (g/L): 12.9 arginine, and 10 each of histidine, leucine and methionine. Abbreviations: Fru., fructose, T.E., trace element mixture; A.A., amino acid mixture. The DSD array was performed in duplicate.

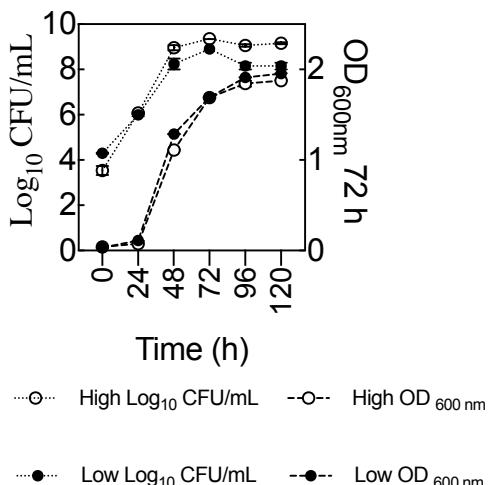

**FIG S1** Correlation of colony forming unit per millilitre (CFU/mL) against optical density (OD<sub>600nm</sub>). Data are for  $n = 3$  biological replicates.

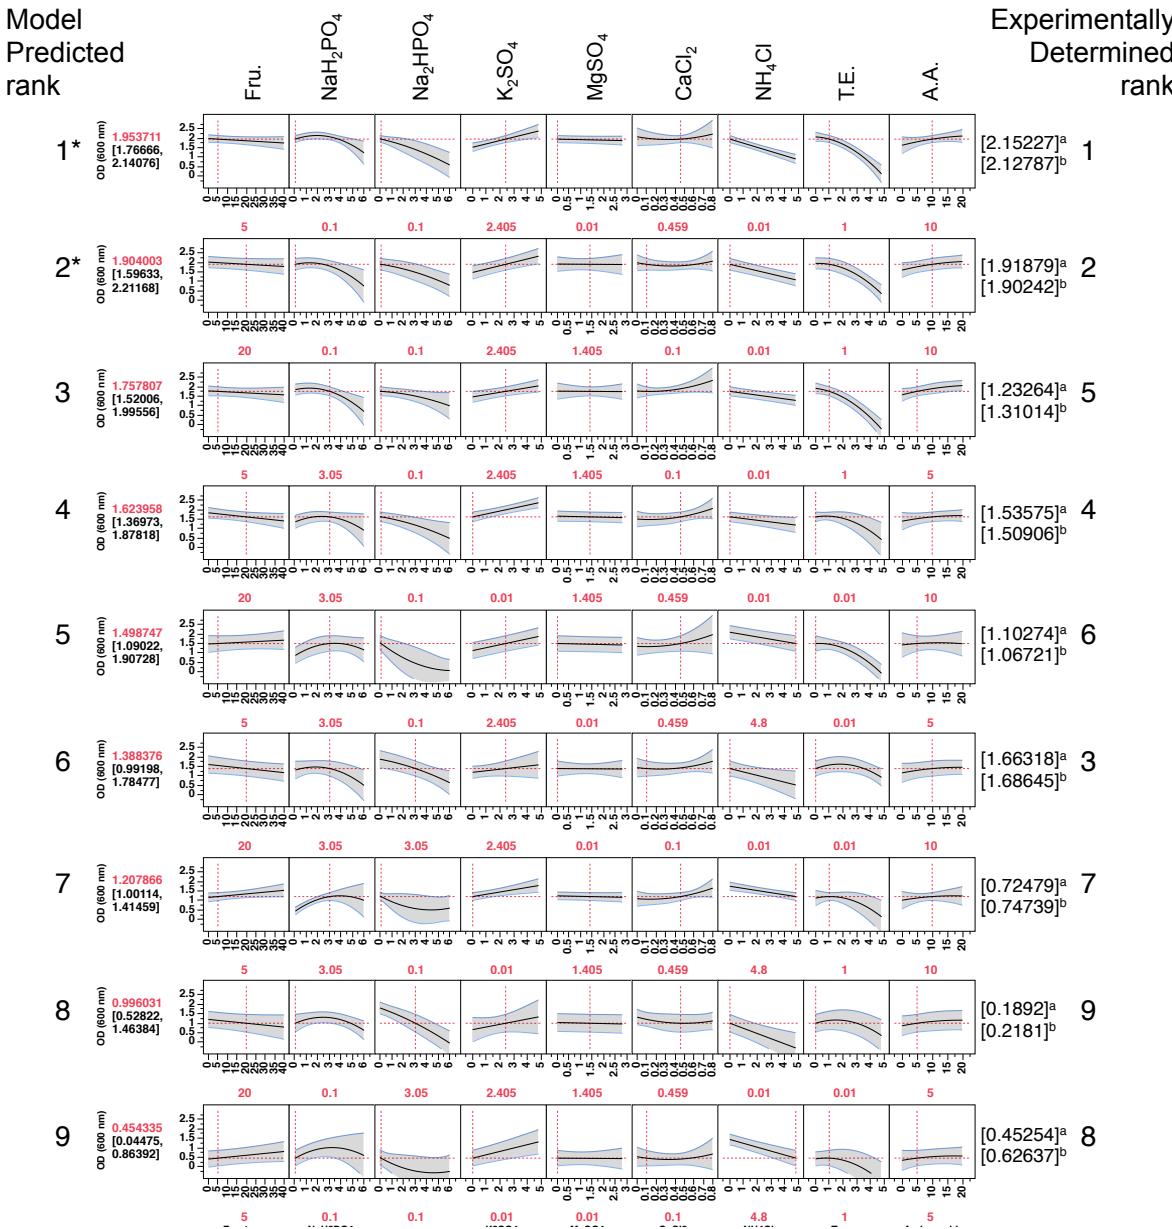

**FIG S2 Two-way interaction between components.** The comparative lengths of the t-ratios for factor interaction are shown. Bars extending to the right have a positive impact on growth at high concentration, those extending to the left have a negative impact on growth at high concentration. The broken vertical lines indicate threshold ( $t < -1.65$  or  $> 1.65$ ) level at 90% confidence level; terms (interaction) surpassing this threshold is deemed to have significant effect on the output, OD<sub>600nm</sub>. Terms deemed significant for model projection are highlighted (blue). Analysis is based on two biological replicated arrays (Table S2).

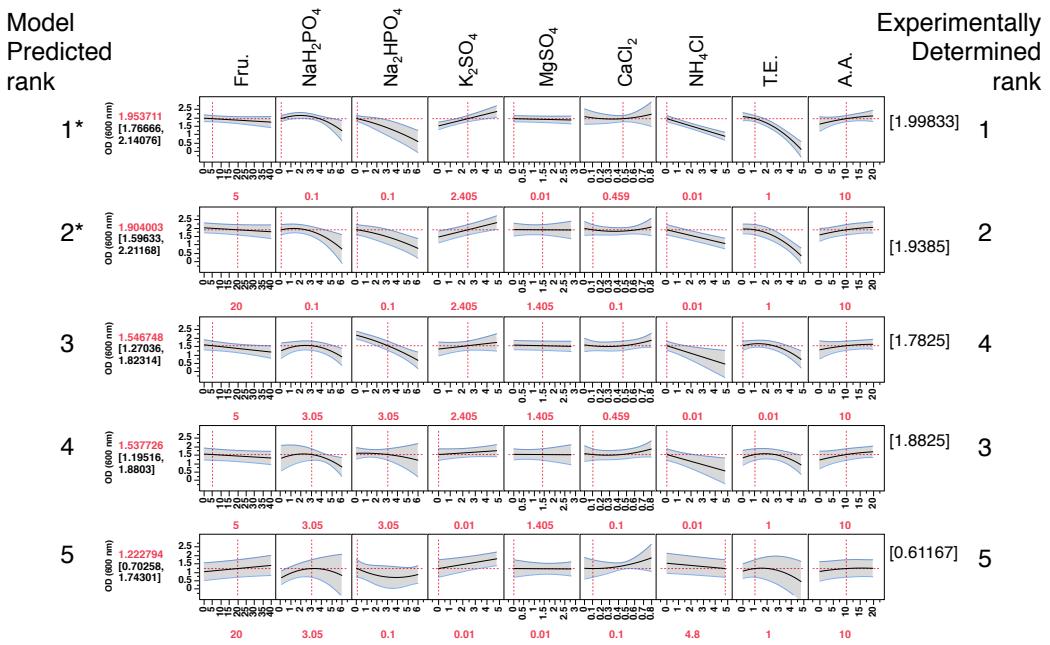

**FIG S3 Distributions of data for Definitive Screening Design 2.** Highlighted in blue crosshatch are the settings that resulted in the greatest OD<sub>600nm</sub> at 72 h for DSD2. Fructose, Na<sub>2</sub>HPO<sub>4</sub> and CaCl<sub>2</sub> may be at either the highest or lowest concentrations (g/L), whereas trace elements and amino acid concentrations are found at the lowest or highest concentrations (mL/L) respectively.

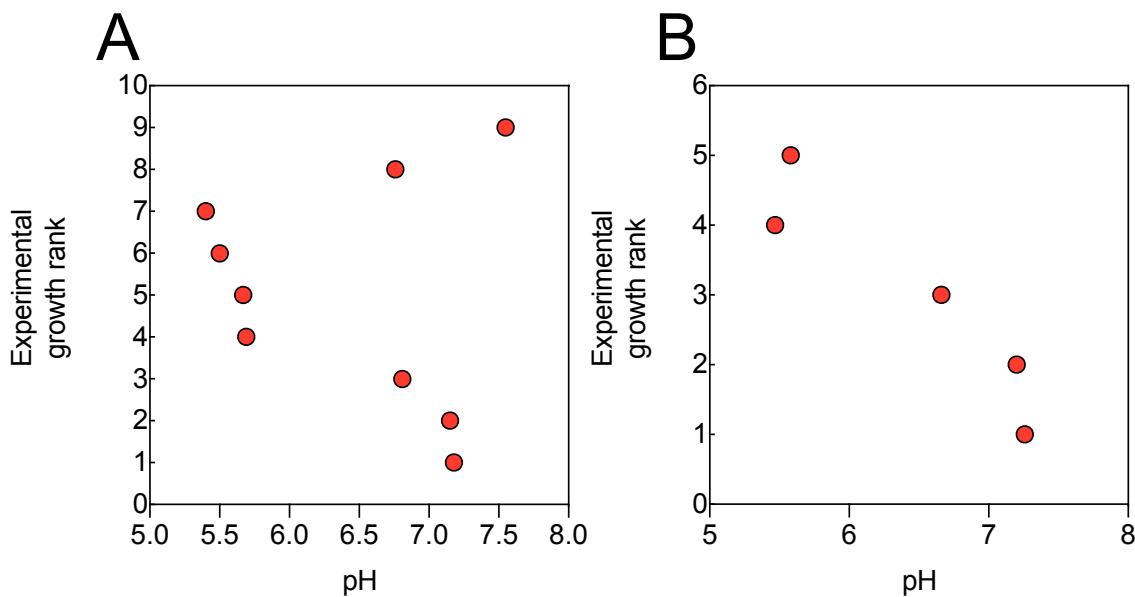

**FIG S4 Validation of OD<sub>600nm</sub> as surrogate for growth measurement.** Viable cells (cfu/mL) of *C. necator* H16 correlated with optical density (OD<sub>600nm</sub>) over prolonged cultivation. Experiment was performed at low and high concentration media formulations, guided by the growth model prediction (Fig. 7A). Cell were grown on defined media and plated on LB agar and incubated as appropriate for *C. necator*. Error bars are S.E. Mean,  $n = 3$  biological replicates.

**FIG S6 One litre (1 L) validation.** Five different formulations were assessed at 1 L culture volumes. For each row, the model predicted rank and OD<sub>600nm</sub> 72 h (values in brackets) are indicated on the left, media settings for each component are indicated in red underneath; the measured OD<sub>600nm</sub> 72 h (values in brackets) and experimentally determined rank are indicated on the right. Controls (\*). All concentrations are in g/L except T.E. and A.A., which are in mL/L. Abbreviations: Fru., fructose; T.E., trace element mixture; A.A., amino acid mixture.

**FIG S7 Effect of pH on growth.** Spearman's correlation of experimentally determined growth ( $OD_{600\text{ nm}}$ ) and pH after 72 h. **A.** Shake flask cultivation ( $\rho = 0.23$ ). **B.** Bioreactor cultivation ( $\rho = 0.52$ ).
