

Figure S4: Whole Retinal and Plasma Levels of MPA

In rd10 mice treated with MMF beginning at P12 (MMFP12), whole retinal levels of MPA quantified by LC-MS showed that the retinal concentration was about 3000-4000 times lower than the concentration in plasma, and there was a relative decline in both plasma and retinal MPA levels after P16. P, postnatal day; MMF, mycophenolate mofetil; MPA, mycophenolic acid.
