Supplementary Figure 1. Principal component analysis (PCA) plot of transcriptomic data of skin (S) and flesh (F) from mature green (MG) stage, colour change (CC) stage, and ripe (RP) stage. (A) Skin and flesh tissue from *A. purpurea* (Apur), MaMe Red (MaMered) and MaMe Yellow (MaMeyellow) across three developmental stages. (B) Skin and flesh tissue of *A. purpurea* (Apur) across the three developmental stages. (C) Skin and flesh tissue of MaMe red (MaMered) across the three developmental stages. (D) Skin and flesh tissue of MaMe Yellow (MaMeyellow) across the three developmental stages. Three biological replicates from each tissue type per developmental stages are presented in the same colour code.

Supplementary Figure 2. The expression of other MYBC1-like gene models from the transcriptomic data of *A. purpurea* (A), MaMe Red (B), and MaMe Yellow (C) at the three developmental stages. Gene expression was measured in Reads per Kilobase Millions (RPKM). Data were shown as means \pm SEM of the three biological replicates.

Supplementary Figure 3. The expression of other WRKY-like gene models from the transcriptomic data of *A purpurea* (A), MaMe Red (B), and MaMe Yellow (C) at three developmental stages. Gene expression was measured in Reads per Kilobase Millions (RPKM). Data were shown as means \pm SEM of the three biological replicates.

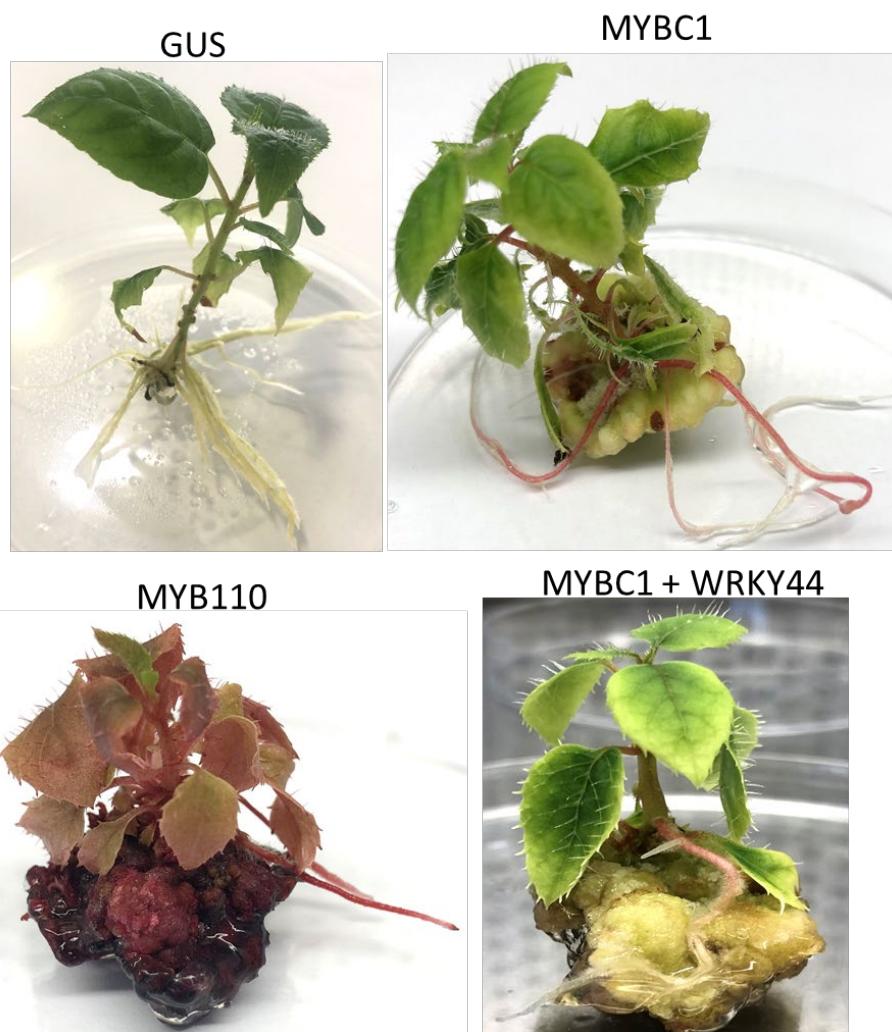

Supplementary Figure 4. Alignment of deduced amino acid of MYBC1 cloned from *A. melanandra*, *A. purpurea*, and MaMe Red with R2R3 MYB TFs from subgroup 5 from other plant species. The R2R3 domains are annotated as the red bar. C1 and C3 motifs are annotated as the grey bar. The TT2 box motif is highlighted in red box as described in Jiang et al., 2018.

Supplementary Figure 5. Alignment of deduced amino acid of WRKY44 cloned from *A. melanandra* and *A. purpurea* with WRKY44 transcription factors from other plant species including *A. chinensis*. The two signature WRKY domains (WRKYGQK) and the potential nuclear localisation motif are annotated. The potential zinc finger like motif is also annotated by the grey boxes.

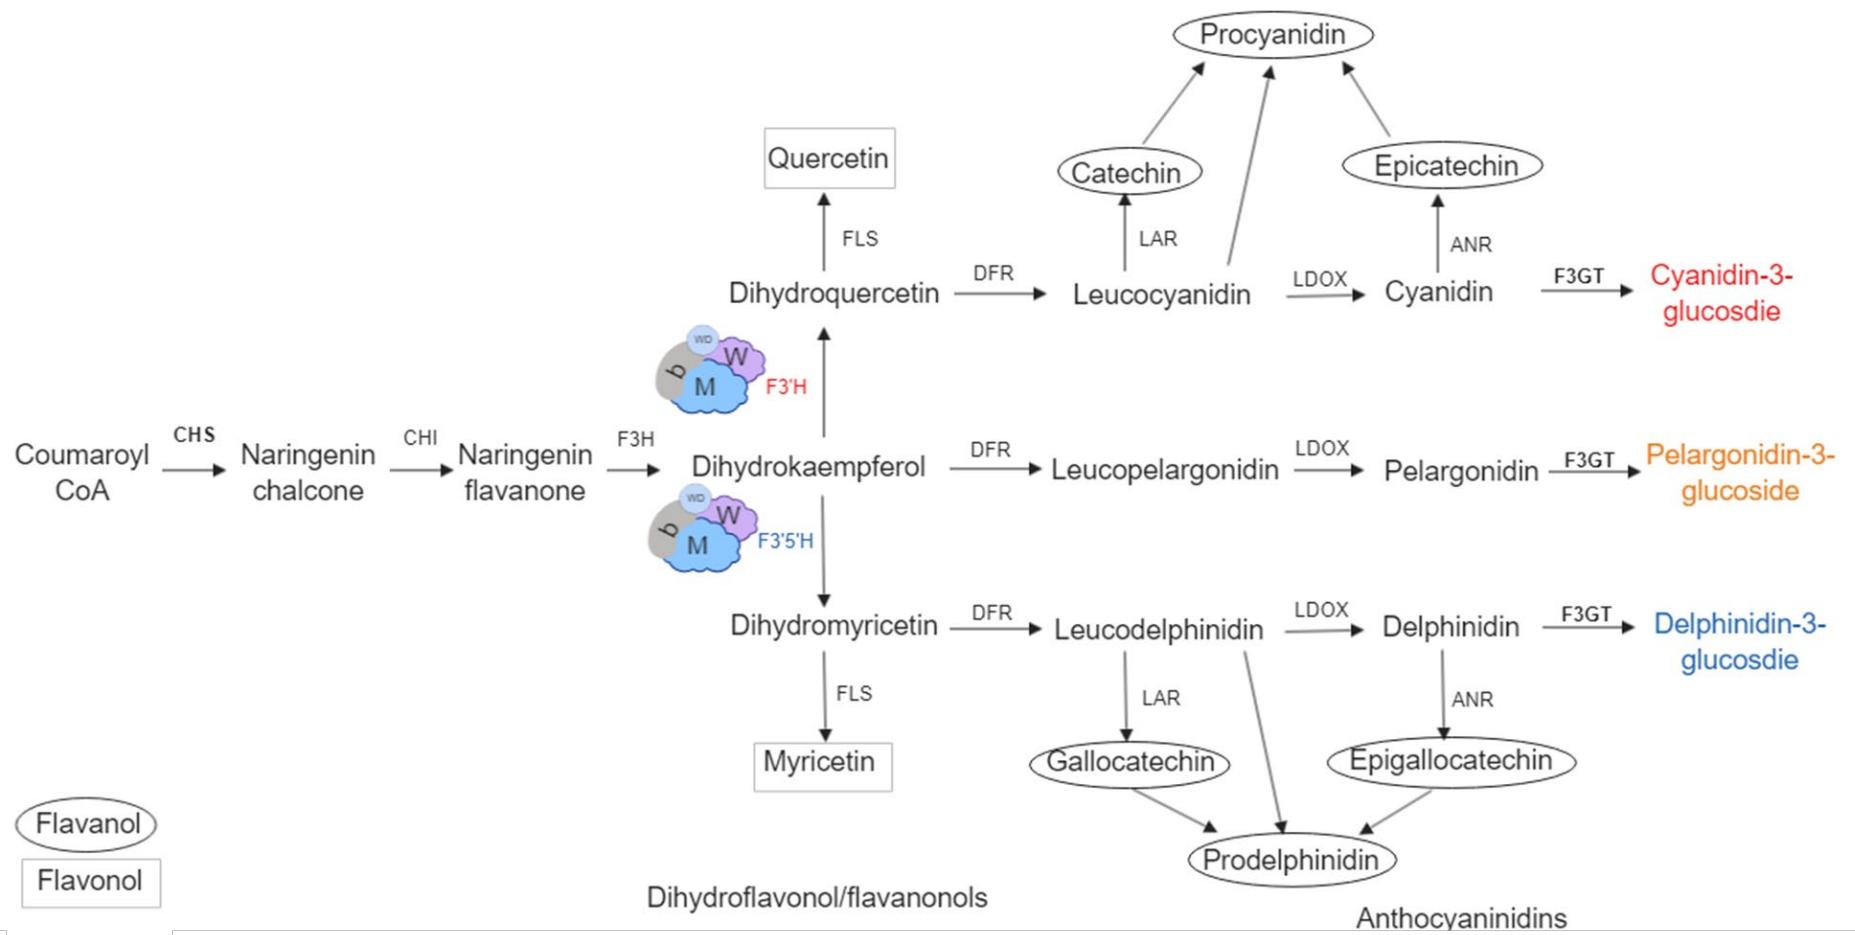

Supplementary Figure 6. Metabolite and gene expression analysis of transgenic *A. arguta* calli over-expressing GUS, MYB110, WRKY44, MYBC1 and MYBC1+WRKY44 co-expression. (A) Amount of cyanidin-based anthocyanin detected in the calli (B) Gene expression analysis of genes involved in proanthocyanin and anthocyanin pathways in the calli. Data were shown as means \pm SEM of three biological replicates. $p < 0.05^*$, $p < 0.01^{**}$, and $p < 0.001^{***}$.

Supplementary Figure 7. Regeneration of plantlets from the stable transformed kiwifruit *Actinidia arguta* 'K2D4' over-expressing GUS (negative control), MYBC1, MYB110 (positive control), and MYBC1 co-infiltrated with WRKY44.

Supplementary Table 8. P-value to indicate the statistical significance of Pearson's correlation coefficient comparing the correlation between metabolite concentration and relative gene expression in callus over-expressing *MYB110*, *MYB5*, and *WRKY44*. Output calculated and produced from R studio.
