Supplementary figure legends

Figure S1.

(a-d) Venn diagrams showing the overlaps of the differentially expressed (DE) genes between brain regions only in controls. FUS (a): fusiform gyrus; HPC (b): hippocampus; TPL (c): temporal lobe; PFC (d): prefrontal cortex.

(e) PathView plot shows the neuroactive ligand-receptor interaction pathway (KEGG: hsa04080) and relevant genes involved in the FUS (left of gene-box) and TPL (right of gene-box). Color key represents the \log_2 (fold-change) of expression in AD compared to normal controls.

(f) PathView plot shows the cytokine-cytokine receptor interaction pathway (KEGG: hsa04060) and relevant genes involved in the HPC (left of gene-box) and PFC (right of gene-box). Color key represents the \log_2 (fold-change) of expression in AD compared to normal controls.

Figure S2.

(a-b) Venn diagrams show the overlap of DE genes in PSEN1-N/WT-N (a) or APOE4-N/WT-N (b) at a cutoff of $FC > 2$ with AD-FUS/Normal at cutoffs of both $FC > 1.5$ and $P\text{-value} < 0.05$.

(c) Venn diagrams illustrate the overlap of DE genes between PSEN1-N, PSEN2-N and APOE4-N versus WT.

(d) GO enrichment analysis of the 1,372 common DE genes between PSEN2-N/WT-N and AD/Normal in the FUS.

(e) PathView plot shows part of the PI3K-AKT signaling pathway (KEGG: hsa04151) and relevant genes involved in iPSC-derived neurons (left of gene-box) and the FUS (right of gene-box). Color key represents \log_2 (fold-change) of expression in AD compared to normal controls.

Figure S3.

Protein-protein interactions (PPI) between known AD risk factors and 566 shared DE genes in PSEN1-N and AD-FUS. Blue dots represent known AD risk factors, while red and green dots stand for up- and down-regulated DE genes in AD, respectively.

Figure S4.

Protein-protein interactions (PPI) between known AD risk factors and 566 shared DE genes in APOE4-N and AD-FUS. Blue dots represent known AD risk factors, while red and green dots stand for up- and down-regulated DE genes in AD, respectively.

Figure S5.

(a-b) Boxplots show 5mC/5hmC/5fC/caC levels on the promoters (a) and gene bodies (b) of all Refseq genes in PSEN2-N and WT-N (all p-values $<2.2e-16$).

(c-d) Boxplots show 5mC/5hmC/5fC/caC levels on the promoters (c) and gene bodies (d) of all Refseq genes in PSEN1-N and WT-N (all p-values $<2.2e-16$).

(e-f) Boxplots show 5mC/5hmC/5fC/caC levels on the promoters (e) and gene bodies (f) of all Refseq genes in APOE4-N and WT-N (all p-values $<2.2e-16$).

(g) Boxplots show the differences in expression (FPKM) fold-changes in methylation-gain and loss on the gene bodies of all Refseq genes. P-values were calculated by Wilcoxon rank sum test ($p<0.05$ (*); $p<0.01$ (**); $p<0.001$ (***)).

Figure S6.

(a-b) Heatmaps show expression fold-changes and methylation fold-changes in PSEN1/WT (a) and APOE4/WT (b). The methylation data are from GSE79144 (n=44). FC: fold-change.
