

Figure S1. The receiver operating characteristics curves of selective fetal growth restriction (sFGR) (a) and small-for-gestational age (SGA) at birth (b) in twin pregnancies as assessed using singleton and twin standards. The area under the curve were significantly higher when the outcomes are assessed with twin standards ($p < 0.05$ for all). The difference persisted in the subgroup analyses according to chorionicity.

MC: monochorionic, DC: dichorionic
