

Supplementary Fig. S10. Growth of wild type *S. Typhi* after addition of casaminoacids. *S. Typhi* was grown for 24 hs in TTIM, and subsequently transferred to TTIM or to TTIM containing casaminoacids (1 %), which allows bacteria to re-enter the cell cycle. At the indicated time-points bacterial growth was monitored by measuring the OD₆₀₀. This experiment was repeated at least three times with equivalent results.
